ERRATA FOR VOLUME XXVI OF THE OFFICIAL GAZETTE.

ANNOUNCEMENTS—VOLUME XXVI.

DISCLAIMERS—VOLUME XXVI.

TEXT OF THE OFFICIAL GAZETTE, JANUARY 1 TO MARCH 25, 1884, INCLUSIVE.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE QUARTER YEAR, JANUARY 1 TO MARCH 31, 1884.

ERRATA.

291,141, page 31, second claim, line 1, strike out "electro-motive force or" and insert *electrical;* in same line, after "pressure," insert *or potential;* in same claim, line 4, after "feeders," insert a comma; in claim 4, line 5, after "apparatus," insert a comma.

291,179, page 103, in title, name of assignee, for "Thomas A. Knickenbacker" read *Thomas A. Knickerbacker.*

291,712, page 165, in title, name of inventor, for "William H. Gonne" read *William H. Gonne.*

291,995, page 238, in title, names of last assignees, for "Samuel R. Stratton and John T. Strutton" read *Samuel R. Strattan and John T. Strattan.*

292,037, page 246, in title, after "(Specimens,)" insert *Patented in Belgium Sept.* 24, 1883, *No.* 62,686, *and in Italy Sept.* 26, 1883, *XVII*, 15,904, *and XXXI*, 393.

292,063, page 252, in title, name of inventor, for "Nathan E. Shailer" read *Nathen E. Shailer.*

292,136, page 268, in title, after residence of inventor, insert *assignor to James M. Clark, Jersey City, N. J.*

292,630, page 396, in title, after residence of inventor, insert *assignor to the Duff Manufacturing Company, (Limited,) of Pittsburg, Pa.*

293,011, page 501, first claim, strike out last two lines and insert the same after "stud," at the end of first line in second claim.

293,120, page 518, fifth claim, line 4, for "permit" read *prevent.*

293,184, page 533, in title, after residence of inventor, insert *assignor to the Mechanical Orgunette Company, same place.*

293,255, page 556, first claim, line 1, strike out "the grain running radially" and insert the same after "having" in line 2.

293,477, page 608, in claim, line 3, for "shaft-bearing cam-shaped as described" read *shaft, bearing cam shaped as described.*

293,726, page 670, in title, name of inventor, for "Roman I. Fancher" read *Rosman I. Fancher.*

293,827, page 692, in title, for "Alloy for and Process of the Manufacture of Silicious Copper and Silicious Bronze" read *Alloys for and Process of the Manufacture of Silicious Copper and Silicious Bronze.*

293,838, page 696, in title, for "Process of and Apparatus for Extracting Crystallized Sugar from Ragasse" read *Process of and Apparatus for Extracting Juice and Crystallized Sugar from Bagasse.*

293,871, page 703, first claim, line 2, for "spindle or spring" read *spindle and spring.*

293,886, page 706, in title, after "(No specimens,)" insert *Patented in Canada Sept.* 1, 1883, *No.* 17,575.

294,038, page 749, in title, after "(No model,)" insert *Patented in England Apr.* 23, 1883, *No.* 2,058; *in France June* 12, 1883, *No.* 155,988, *and in Canada July* 26, 1883, *No.* 17,408.

294,039, page 750, in title, after "(No model,)" insert *Patented in England Apr.* 23, 1883, *No.* 2,058; *in France June* 12, 1883, *No.* 155,988, *and in Canada July* 26, 1883, *No.* 17,408.

294,040, page 750, in title, after "(No model,)" insert *Patented in England Apr.* 23, 1883, *No.* 2,058; *in France June* 12, 1883, *No.* 155,988, *and in Canada July* 26, 1883, *No.* 17,408.

294,042, page 751, in title, after "(No model,)" insert *Patented in England Apr.* 23, 1883, *No.* 2,057; *in France June* 7, 1883, *No.* 155,914, *and in Canada July* 26, 1883, *No.* 17,395.

294,043, page 752, in title, after "(No model,)" insert *Patented in England May* 29, 1883, *No.* 2,670.

294,098, page 764, in title, for "Wiring Blind Stiles" read *Wiring Blind-Rods.*

294,680, page 900, in title, name of assignee, for "Moses M. Lahne" read *Moses M. Lahue.*

294,864, page 946, in title, after residence of inventor, insert *assignor to Charles Downs, same place.*

295,016, page 986, in title, for "Reshipping Packing-Boxes" read *Reshipping Packing-Box.*

295,086, page 997, in title, after "(No model,)" insert *Patented in Germany Nov.* 28, 1882, *No.* 25,772; *in England Nov.* 29, 1882, *No.* 5,673; *in France Nov.* 29, 1882, *No.* 152,367; *in Belgium Nov.* 30, 1882, *No.* 59,707; *in Austria-Hungary Feb.* 13, 1883, *No.* 40,898, *and in Spain June* 8, 1883, *No.* 2,920.

295,101, page 1084, in title, after date of filing, for "(No model)" read *(Model.)*

295,107, page 1086, strike out all after number—title, drawing, and claims—and insert WITHDRAWN.

295,525, page 1119, in title, after residence of inventor, strike out "assignor of one-fourth to Joseph Chapman, Philadelphia, Pa."

295,677, page 1156, in title, name of last assignee, for "S. W. Couvin" read *S. W. Corwin.*

295,860, page 1198, in title, name of second assignee, for "John B. Fresey" read *John B. Fieser.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., December 21, 1883.

The Examiner in charge of Division VI is hereby directed to abolish sub-class 7, "Incrustation-Preventives," of Class 23, "Chemicals," and to form a new subdivision in place thereof, and entitle the same "Sub-class 7, Purification of Water."

BENJ. BUTTERWORTH,
Commissioner.

Issue of January 1, 1884.

DESIGNS.

14,528.—TABLE-WARE.—*James Barlow* and *Spencer M. Alpaugh*, Trenton, N. J. Application filed October 20, 1883. Term of patent 3½ years.

14,529 and 14,530.—CARPET.—*Andrew Cochran*, Philadelphia, Pa., assignor to *William E. Montague* and *Thomas E. White*, both of same place. Applications filed November 7, 1883. Term of patents 3½ years.

14,531.—CARPET.—*Etienne Fajon*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed November 6, 1883. Term of patent 3½ years.

14,532.—CLOCK-CASE.—*John Barclay McCarty*, New York, N. Y. Application filed October 17, 1883. Term of patent 3½ years.

14,533.—CARPET.—*David McNair*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed November 6, 1883. Term of patent 3½ years.

14,534.—LADY'S POLONAISE.—*Mary Turner*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed October 27, 1883. Term of patent 3½ years.

TRADE-MARKS.

[Certificate of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,822.—FANCY ARTICLES MANUFACTURED FROM HARD RUBBER.—*The Butler Hard Rubber Company*, New York, N. Y. Application filed November 23, 1883.

"The word 'RUBELLITE.'"

10,823.—CIGARS.—*Fitzpatrick & Draper*, Troy, N. Y. Application filed November 14, 1883.

"The words 'PEG TOP' and an arbitrary symbol formed by two cigars with a peg in the top or smaller end of each."

10,824.—CIGARS.—*Follett & Schorn*, Norwich, N. Y. Application filed December 10, 1883.

"The word-symbol 'JAY-EYE-SEE.'"

10,825.—CERTAIN VETERINARY MEDICINES.—*Charles H. Hickman*, New York, N. Y. Application filed August 23, 1883.

"The word 'HIPPONA.'"

10,826.—CANNED FISH, OYSTERS, FRUITS, MEATS, AND VEGETABLES.—*H. J. Horn & Co.*, Baltimore, Md. Application filed August 23, 1883.

"The representation of a medal supported by two cupids, and bouquets of flowers on each side thereof."

10,827.—CERTAIN MEDICAL AND TOILET PREPARATIONS.—*Albert J. Kaercher*, Allegheny, Pa. Application filed October 31, 1883.

"A combination of mortar and pestle, scale, medicinal plants or stalks, and owl."

10,828.—GIN.—*John De Kuyper & Son*, Rotterdam, Netherlands. Application filed December 5, 1883.

"The firm-name 'JOHN DE KUYPER & SON,' which may be printed or stamped in any character, type, or letter."

10,829.—FLEXIBLE HIP-CORSETS.—*Elmer Leonard*, Bridgeport, Conn. Application filed December 11, 1883.

"The word 'ACQUIBASQUE.'"

10,830.—COOK-STOVES.—*Miami Stove Works*, Lawrenceburg, Ind. Application filed November 27, 1883.

"The word 'MAYFLOWER.'"

10,831.—A REMEDY FOR FEMALE WEAKNESSES.—*John A. McGill*, South Bend, Ind. Application filed November 22, 1883.

"The words 'ORANGE BLOSSOM' and a representation of the same."

10,832.—WHISKY.—*Siebe Bros. & Plagemann*, San Francisco, Cal. Application filed December 10, 1883.

"The word 'ROSEDALE.'"

LABELS.

3,791.—Title: "SYRUP OF FIGS" (FOR A MEDICAL COMPOUND.)—*California Fig Syrup Company*, Reno, Nev., and San Francisco, Cal. Application filed December 5, 1883.

3,792.—Title: "EVERY MAN HIS OWN TINKER." (FOR OUT-FITS FOR SOLDERING.)—*Ben S. Clarke*, Ashland, Nebr. Application filed December 10, 1883.

3,793.—Title: "EXCELSIOR ADVERTISING SIGN COMPANY." (FOR BANNERS, FLAGS AND SIGN BOARDS.)—*Joseph T. Commoss*, New York, N. Y. Application filed December 7, 1883.

3,794.—Title: "CAMPAIGN BANNER AND OUTFIT COMPANY." (FOR BANNERS, FLAGS AND SIGN BOARDS.)—*Joseph T. Commoss*, New York, N. Y. Application filed December 7, 1883.

3,795.—Title: "ORANGE DRIPS." (FOR CORDIALS.)—*G. W. Dunbar's Sons*, New Orleans, La. Application filed December 11, 1883.

3,796.—Title: "VELVET GREEN" (FOR CHEMICAL FERTILIZERS.)—*Farmers' Fertilizing Company*, Syracuse, N. Y. Application filed November 19, 1883.

3,797.—Title: "NUREMBERG CORN REMEDY."—*Georg Hecht*, New York, N. Y. Application filed December 5, 1883.

3,798.—Title: "THE OLD CELEBRATED NUREMBERG CORN REMEDY." *Georg Hecht*, New York, N. Y. Application filed December 5, 1883.

3,799.—Title: "HURLBURT'S TRACHEAL DROPS."—*Charles T. Hurlburt*, New York, N. Y. Application filed December 10, 1883.

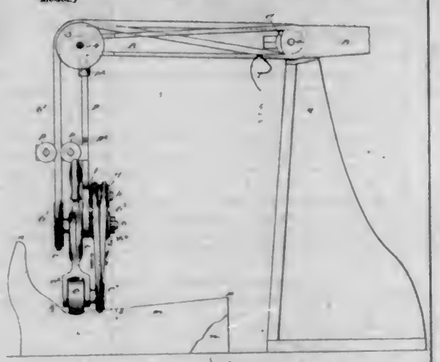
3,800.—Title: "CHERRY-MALT PHOSPHITES."—*William C. Jacobs*, Brooklyn, N. Y. Application filed December 6, 1883.

3,801.—Title: "PROFESSOR HARRY ROBINSON'S SPECIFIC LOTION." (FOR THE HAIR.)—*Harry Robinson*, St. Joseph, Mo. Application filed October 20, 1883.

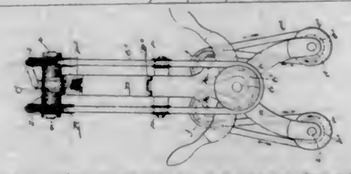
3,802.—Title: "THE WASHINGTON MARKET BRAND." (FOR CANNED TOMATOES.)—*Strang & Tucker*, Washington, D. C. Application filed December 11, 1883.

3,803.—Title: "HYDRARGYRUM SACCHARATUM." ("SUGAR OR SWEET POWDER.")—*Sutphen & Co.*, Noblesville, Ind. Application filed December 6, 1883.

3,804.—Title: "DR. L. E. TOWNE'S COUGH KING."—*L. E. Towne*, Brodhead, Wis. Application filed November 17, 1883.



3,805.—Title: "VIRGINIA NINE." (FOR CIGARS.)—*William Walker*, Richmond, Va. Application filed December 6, 1883.



3,806.—Title: "DIAMOND BRAND MIXED PAINTS."—*Arthur E. Williams*, Belvidere, N. Y. Application filed December 5, 1883.

PATENTS

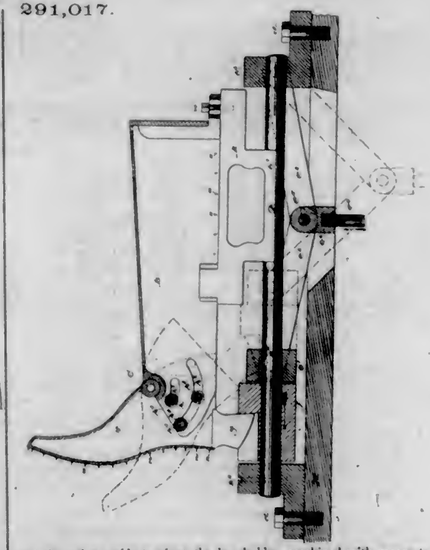
GRANTED JAN. 1, 1884.

291,016. APPARATUS FOR OPERATING UPON THE UPPERS OF BOOTS AND SHOES. HIRAM R. ADAMS, Boston, Mass., assignor to the Adams Manufacturing Company, Portland, Me. Filed May 7, 1883. (No model.)

Claim.—1. In a machine to act upon an upper on a form or holder, two rotating rubbers adapted to bear against the upper at opposite sides of the form or holder, and having rotary movement simultaneously in opposite directions, whereby the upper is simultaneously rubbed at both sides from its center line outward toward its edges, substantially as described.

2. The two simultaneously-rotatable rubbers and levers to sustain their shafts and regulate the pressure of the rubber against the article to be rubbed, combined with a movable pendant, and with means, substantially as described, to rotate the said rubbers.

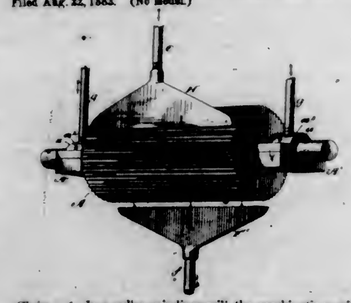
3. The pendant and its driven shaft *b*, combined with the two shafts *d d*, the two pulleys *e'*, the pulley b^3, idler b^4, and the two idle pulleys or sheaves *f f g g*, combined with the endless belt e^3, arranged as described, to simultaneously turn the two shafts *d* and their attached rubbers in opposite directions, substantially as described.



291,017. CRIMPING APPARATUS FOR BOOTS AND SHOES. HIRAM R. ADAMS, Boston, Mass., assignor to the Adams Manufacturing Company, Portland, Me. Filed May 7, 1883. (No model.)

Claim.—1. A boot-crimping form adapted to be turned laterally upon a longitudinal pivot and having its foot portion pivoted to the leg portion, combined with means, substantially as described, to gradually force the foot portion more and more nearly into a position at right angles to the leg portion to crimp the upper, as set forth.

2. In a crimping apparatus, a leg portion and a foot portion pivoted thereto, combined with a rod, b^2, on which said leg portion has a lateral rocking movement, and a block movable longitudinally of said rod and engaging the foot portion to force it into a position more or less at right angles to the leg portion, substantially as described.



3. In a crimping apparatus, the leg and pivoted foot and leg-holder

291,017.

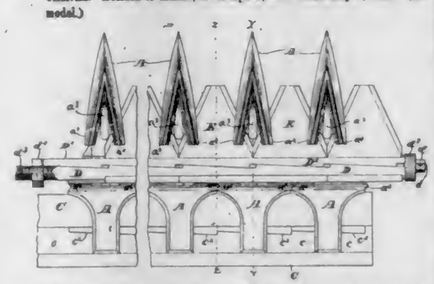
and the rod or guide to pivot the leg-holder, combined with means to automatically operate the foot, as described, while the crimping-form is free to be rocked or turned with the said rod, substantially as described.

291,018. ROLLER GRINDING-MILL. WILSON AGEE, New York, N. Y. Filed Aug. 22, 1883. (No model.)

Claim.—1. In a roller grinding-mill, the combination, with a pair of grinding-rolls arranged side by side to receive the grain between them, of an air-blast device arranged to deliver a blast of air upon the rolls between their adjoining surfaces at or near a point where they receive the grain, and means for delivering blasts of air to the respective journals of the rolls, substantially as described.

2. In a roller grinding-mill, the combination, with a pair of grinding-rolls, of means for delivering air upon the rolls at a point at or near

which they receive the grain, and means for delivering air beneath the rolls at or near the point or points where the chop leaves the rolls, substantially as described.



3. In a roller grinding-mill, the combination, with pairs of grinding-rolls, of blast mechanism, a pipe leading therefrom, and branches extending from said pipe and arranged to deliver blasts of air downward upon the rolls at or near a point where they receive the grain, upward upon the rolls at or near the point where the chop leaves the rolls, and upon the journals of the rolls, substantially as described.

4. The combination, with the rolls of a roller-mill, of a pipe delivering an air-blast downward between said rolls, and separate pipes arranged beneath each and throwing air upward against said rolls at or near the point where the chop leaves them, substantially as described.

5. In a roller grinding-mill, the combination of the grinding-rolls having end journals, the journal-boxes supporting the journals, the caps arranged over the journals and having air-escape perforations, and blast-pipes passing into the caps for delivering air upon the journals, substantially as described.

6. The combination, with the roll-shafts of a roller-mill, of journal-boxes having air-spaces formed in the caps, and air-openings at each end of said spaces, air-pipes tapped into said caps, and means for forcing a continuous blast through the same, substantially as described.

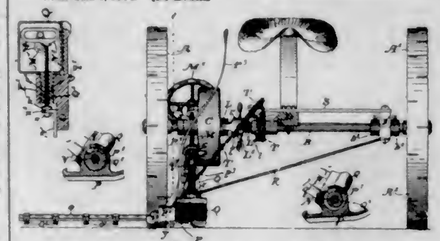
291,019. CUTTER-BAR, &c., FOR MOWING AND REAPING MACHINES. HORACE R. ALLEN, Indianapolis, Ind. Filed May 5, 1883. (No model.)

Claim.—1. The combination, with knives or sections for mowing or reaping machines, the rear portions of which are formed to receive and partly encircle the cutter-bar, of a cutter-bar having upon one edge a series of inclined faces, and a wedge-bar having a corresponding series of inclined faces, and means for operating the same, whereby said knives may be secured upon said bar, substantially as set forth.

2. In combination with the knives or sections for mowing or reaping machines, the cutter-bar D, having a series of inclined faces upon one edge, and the wedge-bar D′, with a corresponding series of inclined faces adapted to slide upon those of the bar D, said bar D having screw-threaded portions with nuts thereon as a means for operating the same, substantially as shown and described, and for the purposes specified.

3. The combination, in a guard-finger for mowers or reapers, of a ledger-plate, the rear portion of which is bent down and adapted to fit to the front wall of an opening, a^2, in said guard-finger, and a wedge, B′, adapted to fit in between said bent-down portion and the rear wall of said opening, whereby said ledger-plate is secured in position, substantially as set forth.

4. The combination, with a guard-finger, A, having an opening, a^2, and a recess, a^4, of a ledger-plate, the front end of which is adapted to fit into said recess, and the rear portion of which is bent down into said opening, and a wedge, B′, the rear end of which is adapted to slide in a groove, e, formed upon the rear wall of the opening a^2, and the front portion of which is adapted to bear against said bent-down portion of the ledger-plate B and securely hold it in position, substantially as shown and specified.



5. The combination of a guard-finger for mowers or reapers having upon its rear end a flange or projection, a, and upon its opposite side a dovetailed rib or hook, a', one being formed upon the top and the other upon the under side of said rear end of said finger, and a finger-bar, C, the front edge of which is adapted to slide between the flange a and the opposite portion of said finger, and having a groove, c, adapted to receive the dovetailed rib or hook a', whereby said finger is secured to said finger-bar, substantially as shown and described, and for the purposes specified.

6. The combination of the finger A, having an opening, a^2, the ledger-plate B, having a turned-down portion, b, the wedge B′, adapted to fit between the bent-down piece b and the rear wall of the opening a^2, and the finger-bar C, having a groove, c, formed so as to receive the rib or hook a' upon the finger, and the front portion adapted to slide between the flange a and the opposite portion of said finger, all substantially as shown and specified.

7. The combination of the finger-bar C, having a dovetailed groove therein, and the finger A, having a dovetailed rib formed to fit into said groove, said dovetailed formation serving to secure said finger-bar and finger together, substantially as specified.

8. The combination of the fingers A, having dovetailed ribs a' and projections a^3, the finger-bar C, having notches c' and the keys c^2, substantially as described, and for the purposes specified.

291,020. MOWING-MACHINE. HORACE R. ALLEN, Indianapolis, Ind. Filed Dec. 1, 1882. (No model.)

Claim.—1. The combination, with the shaft M of a mowing-machine, which connects the driving-gear and the cutter-bar, said shaft having the ratchet-faced hub m rigidly mounted thereon, of the fly-wheel M′, loosely mounted on said shaft, and having the ratchet-faced hub m', which is adapted to engage with the hub m, the teeth of said ratchets being inclined in the direction which permits the shaft to turn without turning the fly-wheel, substantially as and for the purposes set forth.

2. The combination of the gear-case C, the casting Q, and the shoe P, said casting Q being secured to said gear-case by being screwed directly into a portion of said gear-case and to said shoe by having a portion, Q′, thereof inserted in a suitable opening in a projection, P′, thereon, said parts being secured together by the formation thereof, substantially as set forth.

3. The combination of the casting Q and the shoe P, said casting being provided with the projection Q′, having a groove, and said shoe having a projection, P′, through which is an opening, in which is a suitable lag to engage with said groove, substantially as set forth.

4. The combination of the shoe P, having projection P′ and portion P^2, and casting Q, having projecting portion Q′, and a face fitting the portion P^2, said face and said portion being provided, respectively, with the groove q^2 and the rib p^2, substantially as shown and specified.

5. The combination of the casting Q and the shoe P, said casting having a segmental slide, q^2, and said shoe having a combined lever and brace, P^3, on which is a stem, p^3, which engages with said segmental slide, substantially as shown and specified.

6. The combination, in a mowing-machine, with the axle, tongue, and cutter-bar lifter, of the brace S, secured to said axle at one end by a bearing, B′, located between collars b' b', and to said tongue near the other end, and extending across said tongue and supporting said cutter-bar lifter upon its projecting end, substantially as shown and specified.

7. The combination, in a mowing-machine, of the axle B, wheel A, spokes a, turned out at the lower end where they enter the hub, the ratchet-wheels A^2, the pawls a', and springs a^2, substantially as described, and for the purposes specified.

291,021. STEAM-PUMP. MOSES F. BAGLEY and JOSEPH C. DAWSON, Mount Vernon, Ill. Filed June 21, 1883. (No model.)

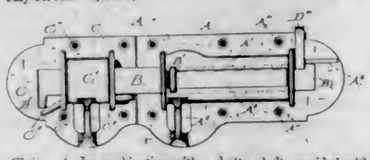
Claim.—1. In a steam-pump, a cylinder provided with a steam-chest, a valve, and proper steamways, in combination with two pistons moving simultaneously, and an intermediate water-way valve operated by the pressure on the water by each piston alternately, substantially as set forth.

2. The cylinder provided with ports *l l′* and ingress-pipe I, in combination with valve H, provided with openings *k k*, and stationary abutment F, all constructed, arranged, and operated as set forth.

3. The cylinder provided with ports P P′ *l l′*, and steam-chest having a main valve and proper steam-connections, in combination with the piston-rod, carrying two pistons, L L′, intermediate valve, H, having heads with openings *k k*, abutment F, ingress-pipe I, chamber M, and discharge-pipe O, all constructed, combined, and operated substantially as set forth

291,022. COVER FOR CULINARY AND OTHER RECEPTACLES. JOS. BEAUPIED, San Juan, Porto Rico, West Indies. Filed June 14, 1883. (No model.)

Claim.—1. As an article of manufacture, a cover for a receptacle, provided with an inwardly and upwardly projecting free flap, secured to the inner surface of a depending flange at its rim, substantially as specified.



2. The combination of a free flap, B, an inner hoop, b, and concave cover A, having a depending flange, a', substantially as shown and described.

3. A cover for a receptacle having a free inclined flap or flaps, and adapted to fit vessels of various sizes, substantially as specified.

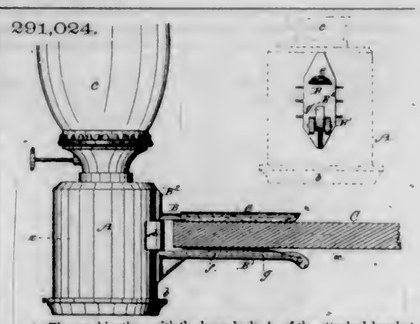
4. The combination of the cover A, having a concave inner surface, a, with a depending flange, a', at its rim, with an inclined annular free flap, B, and a retaining hoop or band, b, substantially as shown and described.

5. The method herein set forth of securing a rubber or textile flap to covers for receptacles, which consists in crimping the securing-hoop to reduce its circumference and expanding the same against the interposed flap and flange of the cover by straightening or smoothing the crimps, substantially as and for the purposes set forth.

291,023. SHUTTER-BOLT. GEORGE M. BRENTZ, Reading, Pa. Filed July 31, 1883. (Model.)

Claim.—1. In combination with a shutter-bolt provided with the usual bolt and keeper case, a series of notches, B^3, on the rear upper edge of the bolt, and a locking-bar, D, with a stop, D^2, adapted to seat therein, a ledge, A^3, to support the stop when not engaged with the bolt, the bar thickened at its forward end to lock the bolt downward, the keeper-case provided with an inclined plane, C^3, bowing seat C^5, and both keeper and bolt cases, and plates having shutter-pulls A^5 and C^6 cast integral therewith, substantially as shown, and for the purpose set forth.

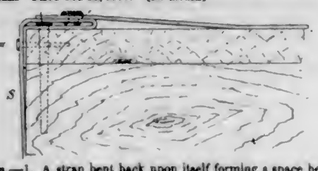
2. A locking-bar, D, provided with a clip, D′, a thickened head, D^2, abutting-stop D^3, head D^4, and locking-stop D^5, in combination with bolt-case A′, keeper-case C′, and plates A C, provided with shutter-pulls A^5 C^6, cast integral therewith, bowing seat C^5, bolt B, and notches B^3, whereby, when the bolt B is in either a locked or bowed position and the bar D thrown forward, the bolt B is rigidly locked downward in the keeper-case C′ or upon the bowing seat C^5, the withdrawal of the bar D, with its foot D^6 placed upon the ledge A^3, releasing the bolt B and giving greater freedom of movement thereto, substantially as and for the purpose described.



3. As an improved construction of shutter-bolts, the shutter-pulls A^5 and C^6, as shown and described, cast integral with the bolt and keeper cases and plates thereof, whereby the shutter-fittings are made more compact and accessible, substantially as and for the purpose set forth.

291,024. LAMP. CHARLES H. BENNETT, Bloomburg, Pa. Filed May 23, 1883. (No model.)

Claim.—1. The combination, with a lamp-body, of an attached clamp having upper and lower fixed jaws arranged to project parallel with one another, and at a suitable distance apart from the side of said body, and an interposed clamping-spring applied to one of the said jaws, substantially as specified.

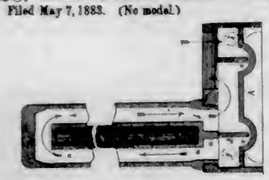


2. The holding bracket or clamp composed of a base or end piece, B′, constructed to fit on or against and be supported by the body of a lamp, fixed upper and lower parallel jaws, B B′, arranged to project from the face of said base, and a clamping-spring applied to the lower one of said jaws, essentially as specified.

291,024.

3. The combination, with the lamp-body A, of the attached bracket or clamp-base B′, the parallel upper and lower jaws, B B′, having a fixed relation to said base, and projecting therefrom at right angles to the body A, and constructed to form a handle for the lamp, and the longitudinal clamping-spring g, secured at its outer end to the lower jaw, but free at its opposite end, and arranged to work in and out of a longitudinal groove, f, in the face of the lower jaw, substantially as shown and described, and for the purposes herein set forth.

291,025. SEALED BINDING-STRAP. FRANCIS W. BLACKER, Worcester, Mass. Filed Oct. 18, 1883. (No model.)

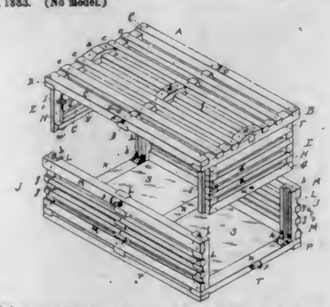


Claim.—1. A strap bent back upon itself forming a space between the two parts of the strap, in which space is inclosed the head of a nail or its equivalent, in combination with said nail and a rivet which fastens one end of said strap to the doubled end, the whole arranged substantially as and for the purpose specified.

2. The method of securing and sealing binding-straps by means of a nail or its equivalent, having its head inclosed in the space formed between two parts of the strap by bending said strap back upon itself, and a rivet by which one end of the strap is fastened to the doubled end, arranged substantially as and for the purpose specified.

3. The method of sealing binding-straps by means of a nail, having its head inclosed in the space formed between two parts of the strap by bending said strap back upon itself, and a rivet uniting the end with the doubled part of the said strap, which rivet is impressed with a sealing device, substantially as and for the purpose specified.

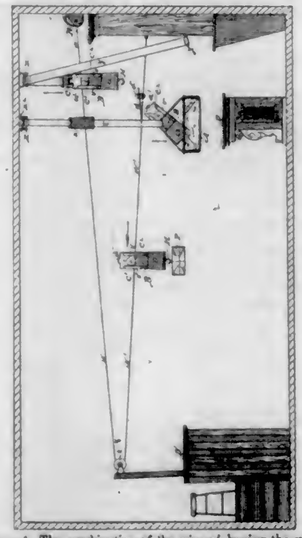
291,026. STEAM-RADIATOR. WILLIAM H. BROOKS, West Point, N.Y. Filed May 7, 1883. (No model.)



Claim.—1. In combination with the radiator-base, one or more division-plates running the entire length of said base and located beneath the centers of the tube-holes, and the traps or depressions in the base beneath the division-plates arranged to close the openings between the several compartments at the lower margins of said division-plates, substantially as shown and described, and for the purposes set forth.

2. In a radiator-base, the division-plates running the entire length thereof, located beneath the centers of the tube-holes, and the traps or depressions below said division-plates arranged to close the communication between the several compartments of the base, except through the medium of the superposed circulating-tubes, all combined and arranged substantially as and for the purposes set forth.

3. In a steam-radiator of the character herein set forth, the combination, with the base having the division-plates extending beneath the centers of the tube-holes, of the herein-described clusters of radiator-tubes arranged in pairs cast in a single piece with their cross-strips, and



the traps or depressions beneath the plates in the base, all arranged to compel a circulation through the tubes, substantially as shown and described.

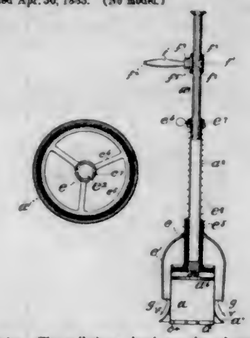
291,027. KNOCKDOWN COOP. JOHN BURNS, Chicago, Ill. Filed Oct. 12, 1883. (No model.)

Claim.—A knockdown coop consisting of two main parts or sections, the upper one of which comprises the top A, hinged to the ends E, the cross-pieces U U, tenons I I, and sliding slat *f*, and the lower section, comprising the bottom T, hinged to the sides J J, the two sections being combined by means of the tongues I I, grooves *g*, and hooks and screws *n*, and the said sections constructed, as shown, to be folded in knockdown shape, and be held in position by the bolts *w w*, substantially as shown and described.

291,028. CASH AND PARCEL CARRIER. JAMES BURNS, Chicago, Ill. Filed Nov. 9, 1883. (No model.)

Claim.—1. The combination of the wire *w'*, having the switch *d*, wire *w*, carrier B, having the cash-receptacle *a*, hooks *a'* and H, sheave-wheel *c'*, and spring-arms *v v*, as and for the purpose set forth.

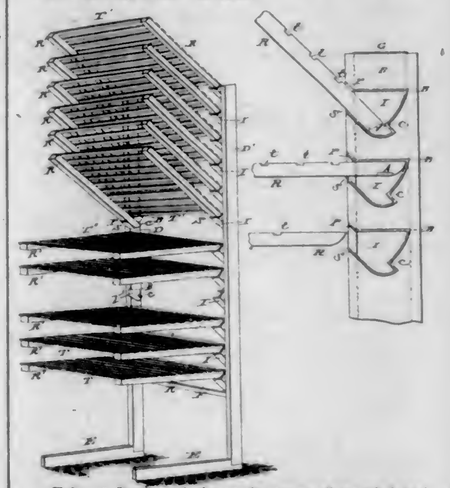
2. The cash and parcel carrier B, having the cash-receptacle *a*, hooks *a'* and H, sheave *c'*, and spring-arms *v v*, adapted to operate as and for the purpose set forth.



3. The combination of the carrier B, wires *w* and *w'*, strap *y*, plate *c*, having the perforation c^2, and roller *z'*, as and for the purpose set forth.

4. The combination of the carrier B, wire *w*, wire *w'*, having the switch *d* and bumper *d'*, and catch-basket A, and straps *t t*, having the stop-pins x^2 x^3 and weights *x x*, and pulley *z*, as and for the purpose set forth.

5. The combination of the basket A, straps *t t*, having the stop-pins x^2 x^3, rollers *z z*, and weights *x x*, as and for the purpose set forth.



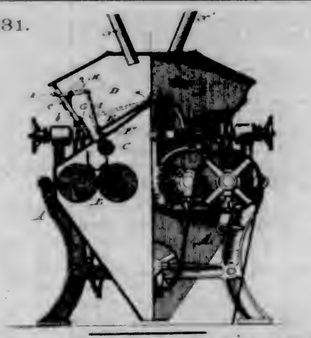
6. In a parcel and cash carrier, the track-wire *w w'*, having the switch *d* and bumper *d'*, and ratchet R and pulley *r*, as and for the purpose set forth.

291,029. CLOTHES-POUNDER. EDGAR S. BURNHAM, Buffalo, N. Y. Filed Apr. 30, 1883. (No model.)

Claim.—The cylinder *a*, having a rim, *a'*, commencing closely at the sides of the same and gradually curving outward, as specified, in combination with a piston-head, a^2, an open ring, c^1, at the bottom, a rod, a^3, and handle, a spring, c^3, adjustable collar c^2, and a detachable cover, c^4, projecting down over and slightly inclining inward toward the sides of the cylinder *a*, substantially as and for the purposes specified.

291,030. PRINTER'S DRY-RACK. GEORGE A. CLAFFEE, Wooster, Ohio. Filed Sept. 3, 1883. (No model.)

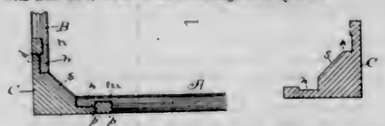
Claim.—1. In a dry-rack, the opposite corresponding notched standards, D D', opposite corresponding notches or supports, I I, having bearings B S, and one or more ratchet-stops, C, adjustable lattice-leaves T, having shafts R R', adapted to enter the supports I I', substantially as and for the purpose specified.



2. In a dry-rack, the combination of the standards D D', united to form a rack-frame with opposite notches or supports, I I', in or upon the inner side of the standards D D', each having opposite bearings, B S, and one or more ratchet-stops, C, substantially as and for the purpose specified.

3. In a dry-rack, the combination, with the perpendicular rack-frame D D, having shelf-supporting notches or supports I I, of adjustable leaves or shelves T, adapted to connect with and be supported by said notches or supports, so as to project from the rack-frame either horizontally or obliquely upward, and also to be detached from the supports and rack-frame at will, substantially as and for the purpose specified.

291,031. FEED MECHANISM FOR GRINDING-MILLS. ELIJAH CURTIS CLARK and ALVAH DEWEY, Cannelton, Ind. Filed Aug. 30, 1883. (No model.)



Claim.—In a feed-controlling mechanism, the hopper and the hinged board in its bottom, combined with the sliding gate, the lever, link, and sliding plate connecting the board and gate, the external spring, and the adjusting-screw combined with said spring.

291,031.

291,032. MANUFACTURE OF SOLID WOOD CORNERS. ISAAC G. S. CLELAND, New Hartford, N. Y. Filed Nov. 9, 1883. (No model.)

Brief.—A solid wood corner having extension-arms provided with longitudinal grooves and right-angle shoulders, and side pieces provided with cross-slots, which fit into said longitudinal grooves.

Claim.—1. In an article of manufacture, solid wood corner C, with extension-arms, as described, provided on the inner side of each arm with longitudinal slots or grooves *n n*, as described, as and for the purposes stated.

2. In an article of manufacture, solid wood corner C, with extension-arms, as described, with a right-angle shoulder on the inside of each arm, as described, as and for the purposes stated.

3. In an article of manufacture, side piece A, provided with cross slot or groove *m*, in combination with solid wood corner C, provided with longitudinal slot or groove *n n*, as described, as and for the purposes stated.

4. In an article of manufacture, solid wood corner C, provided with longitudinal grooves *n n*, in combination with side pieces A and B, provided with cross slots or grooves *m m*, with shoulders *p' p'*, as described, as and for the purposes stated.

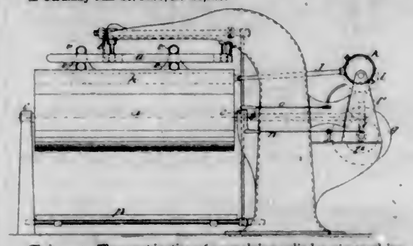
291,033. FLEXIBLE MIRROR FOR HAT-TIPS AND OTHER PURPOSES. ALBERT CHARLES COUCH, Boston, Mass. Filed Nov. 23, 1883. (No model.)

Claim.—1, A flexible reflector consisting of a sheet of gelatine, with one face silvered or coated to afford a reflecting-surface, substantially as set forth.

2. A reflector consisting of a flexible sheet of insoluble gelatine having one face silvered or coated, substantially as specified.

3. A hat-tip composed of a sheet of flexible gelatine silvered or coated on one side to afford a reflecting-surface, substantially as set forth.

291,034. HAT-TIP. ALBERT CHARLES COUCH, Boston, Mass. Filed Nov. 22, 1883. (No model.)

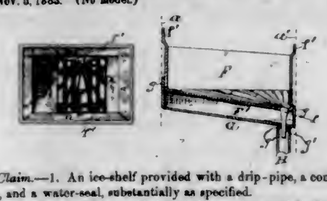


Claim.—1. A hat-tip consisting of a sheet of ornamented fabric and a separate flexible covering-sheet, formed of an artificial transparent or translucent material in one continuous piece, substantially as set forth.

2. The combination, in a hat-tip, of an ornamented fabric and a covering of colored gelatine formed into a separate continuous sheet, substantially as set forth.

3. The combination, in a hat-tip, of an ornamented or printed fabric, and a separate gelatine sheet connected together and adapted for application for hat or cap, substantially as specified.

4. A hat-tip composed in whole or in part of a continuous sheet of bichromatized or other insoluble gelatine, as set forth.

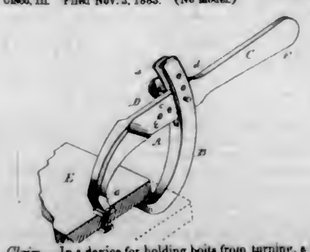


291,035. IRONING-MACHINE. WILLIAM H. DAVEY and HENRY FARMAN, London, England. Filed Jan. 20, 1883. (No model.) Patented in England May 20, 1881, No. 2,206; in France Jan. 25, 1883, No. 153,220, and in Germany Jan. 22, 1883, No. 23,961.

Claim.—1. The combination of a revolving cylinder, a curved ironing-bed, *h*, connecting and operating mechanism, substantially as described, the worm e, worm-shaft *f*, worm-wheel *d*, shaft *b* of the cylinder, the clutch *m* on said shaft *d*, and its actuating-lever for said clutch, as and for the purpose specified.

2. In combination with the cylinder *a*, ironing-bed *h*, and the described means for actuating them and for arresting the motion of the bed, as desired, the treadle *p*, its connections *q*, *r*, *s*, and *t*, and the rising and falling frame *u*, the combination being and operating as and for the purposes set forth.

291,036. REFRIGERATOR. WM. H. DAVIS, Syracuse, N. Y. Filed Nov. 5, 1883. (No model.)



Claim.—1. An ice-shelf provided with a drip-pipe, a confined air-space, and a water-seal, substantially as specified.

2. The ice-shelf F, provided with the supplemental shelf G, secured thereto by the flanges *g*, and with the drip-pipe *f*, passing through a notched opening in the shelf G, substantially as shown and described.

3. The ice-shelf F, provided with the flanges *f'*, and the dead-air chamber F', constructed as described, whereby it may be secured in place in a refrigerator after completion, substantially as specified.

4. The ice-shelf F, provided with the flanges *f'* and with the dead-air chamber F', having a notched opening, *g'*, in combination with the drip-pipe *f* and drain-pipe H, substantially as shown and described.

291,037. DEVICE FOR HOLDING BOLTS. WILLIAM S. DAWSON, Cisco, Ill. Filed Nov. 3, 1883. (No model.)

Claim.—In a device for holding bolts from turning, a lever provided with a suitable handle, and having a downward extension provided with serrations on its end, in combination with a hook bifurcated or slotted at its upper end to receive the lever, openings *d e* in the hook and lever, respectively, and a thumb-screw, D, the hook being provided with an upward extension having serrations on its face, arranged and operating for the purpose set forth.

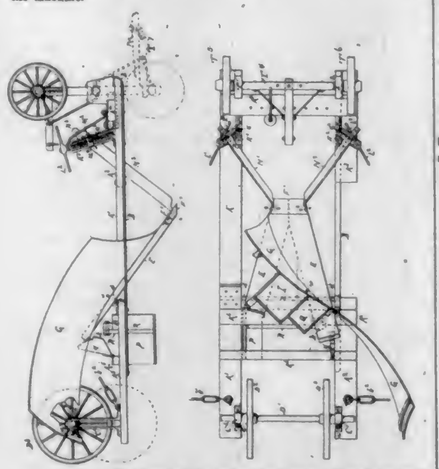
291,038. SPRING HARROW-TOOTH. BENJAMIN F. EATON, Coxsackie, N. Y. Filed Mar. 17, 1883. (No model.)

Claim.—A curved flat-faced spring harrow-tooth having one or

291,038.

both edges bent rearward to form longitudinal edge flanges on the rear side of the tooth, substantially as set forth.

291,039. NUT-LOCK. AARON EDGELL, Newport, Ohio. Filed May 24, 1883. (No model.)



Claim.—1. The combination of the bolt A, having right and left handed screw-threads, the nut *f*, having screw-threaded recesses *i*, the set-screw *c*, and the nut *e*, having the screw-threaded cavity *d'*.

2. The combination of the bolt *h* with its right and left handed screws and screw-threaded cavity *n*, the nuts *e* and *f*, having screw-threaded cavities *d'* and *i*, and the screws *c* and *d*.

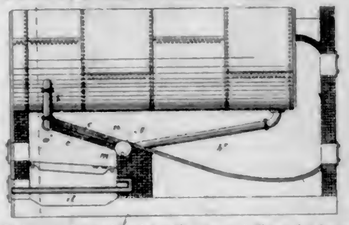
291,040. DITCHING-MACHINE. CHARLES DOUGLASS EDWARDS, Albert Lea, Minn. Filed Oct. 16, 1882. (No model.)

Brief.—A stepped block is hinged to the rear frame and employed to raise or lower the pitch of the excavator. The rear wheels are lowered in the guides and the forward wheels turn down for transporting the machine.

Claim.—1. The brace H, hinged to cross-piece A^3, and having a graduated notched upper end, in combination with the hinged frame E, substantially as and for the purpose set forth.

2. The combination of standard K', a nut, M', having three of its sides grooved and fitted between the two sides of the standard, a cutter, N', on one side of the standard, and a binding-plate, M^3, on the other side, and a yoke-bolt, A', fitting into the grooved sides of nut M', and through cutter N' and plate M^3, so as to hold them to the standard, substantially as and for the purpose set forth.

3. The combination of standard K', a cutter, N', a plate, M^3, provided with flanges fitting around the sides of standard K', a nut within the standard, and a screw for raising and lowering it, and a bolt connecting the cutter and plate to the nut within the standard, substantially as and for the purpose set forth.

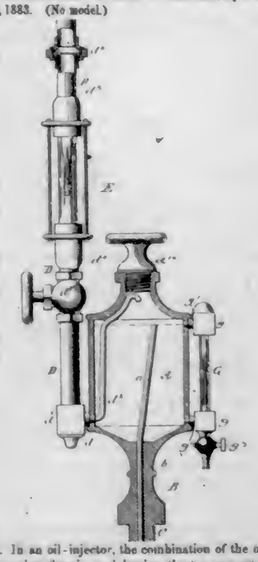


4. The standard K' and the cutter N' adjustable thereon, and having a hoe at its lower end, in combination with the shoe on the end of frame E, having an undercut slot in it to receive the hooked end of the cutter substantially as and for the purpose set forth.

5. The hinged plate P, in combination with the brace R, pivoted at one end to a cross-piece, A^3, whereby it is adapted to be raised edgewise, and supported by its lower edge resting upon the plate P, as set forth.

6. In a ditching-plow, the axle-frame T^3, hinged to the ditcher-frame, in combination with the axle T^4, pivotally connected to the axle-frame by bolster-plate T^7 and fifth-wheel *w*, substantially as and for the purpose set forth.

7. In a ditching-plow, the axle-frame T^3, of the form shown, and pivoted in standards T' T^2, in combination with axle T^4 and its wheels, whereby a wheeled truck is formed, which may be operated as shown and described, for the purpose set forth.



291,041. STEAM-BOILER AND FURNACE. WILLIAM U. FAIRBAIRN, Hyde Park, Mass. Filed Nov. 20, 1882. (No model.)

Claim.—1. In combination with a steam-boiler and a furnace, the arrangement of pipes herein described, consisting of the side pipes, *b b'*, connecting with the opposite sides of the boiler near the front, and communicating with the interior of the same, the cross-pipe *a'*, the parallel pipes *a*, protected with a suitable covering, *e*, the cross-pipe A, so placed in relation to the cross-pipe *a'* that the parallel pipes *a* will incline toward the front of the boiler, and a pipe, *b²*, communicating with the interior of the boiler at the bottom and near the back end thereof, all adapted to induce a circulation of water within the boiler and within the said pipes, and to aid in the deflection of the fire and heat in the combustion-chamber to and against the shell of the boiler from the front to the rear without obstructing the rear draft-passage under the boiler, substantially as and for the purposes set forth.

2. In the combustion-chamber of a furnace, the air-passage *d*, extending from the front to the back of the ash-pit, and adapted to deliver air at the back end of the grate-bars, and to induce a draft from the back toward the front of the combustion-chamber, and in combination with the pipes A *a'* and the parallel inclined deflecting-pipes *a*, suitably connected with a steam-boiler, substantially as and for the purposes set forth.

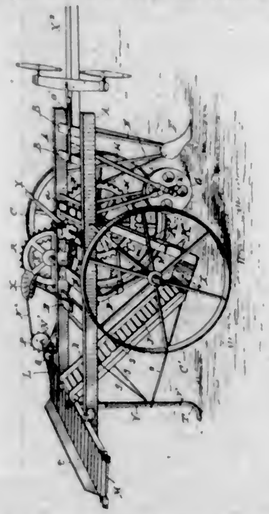
291,042. LUBRICATOR. WILLIAM U. FAIRBAIRN, Hyde Park, Mass. Filed Feb. 13, 1883. (No model.)

Claim.—1. In an oil-injector, the combination of the oil-reservoir A and pipe E opening therein, and having the transparent chamber or tube E partially filled with air under pressure, through which water passes in drops, all substantially as and for the purposes described.

2. The combination of the oil-chamber, the tube or pipe D, connected therewith, and the sight chamber or tube E, dividing the tube or pipe D into two parts above the oil-chamber, and the controlling-valve d^3, all substantially as and for the purposes described.

3. The combination of the reservoir or cup A, the pipe D connected therewith, the chamber E, the nozzle F, arranged above the oil-chamber, and the controlling-valve d^3, all substantially as and for the purposes described.

4. The combination, in an oil-injector, of the chamber or tube E, the nozzle or teat F, the tube or pipe D, and the gauze d^7, all substantially as and for the purposes described.



5. The combination, in an oil-injector, of the reservoir A, having the oil-gage G, with the pipe or tube D, having a sight-feed-indicating device above the height of the oil in the reservoir, all substantially as and for the purposes described.

6. In an oil-injector in which the oil is injected by the weight of a water column, a sight-feed, substantially as specified, arranged in an air-chamber in said column, and a valve for controlling the passage of water through said air-chamber, all substantially as and for the purposes described.

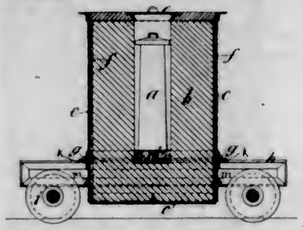
7. The combination of the tube D and gauze d^7, with the oil-cup A and screw-plug d^{10}, having the passage d^9, all substantially as and for the purposes described.

291,043. DITCHING-MACHINE. JOHN T. FITZPATRICK, Monticello, Ohio. Filed Sept. 5, 1883. (No model.)

Brief.—By a main frame are carried a plow by means of four downward-converging rods, a roller-wheel by similar means, with a series of holes for adjustment, and an adjustable shoe by means of a vertical standard braced to the excavating-scoop. A two-part crank-axle has projecting arms, (braced both to the spindle ends and the vertical portions of such axle,) having chains running to a shaft operated by lever and ratchet, with locking-pawl for adjusting the frame. The main horizontal portion of one axle part is extended to form a pintle for a sprocket and a gear-wheel engaging a gear-wheel on the riding-wheel spindle for driving endless belts.

Claim.—1. In a ditching-machine, the combination, with plow F and converging rods E, of wheel G, converging rods H, rear shoe, T, and standard V, substantially as set forth.

2. In a ditching-machine, the combination, with axle part D, having truck-wheel C' mounted thereon, of axle part D^2, having truck-wheel C mounted thereon, said axle part D^2 being provided with spindle *d*, having wheels R and S mounted thereon, substantially as set forth.

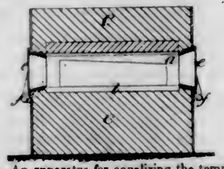


3. In a ditching-machine, the combination, with a crank-axle provided with arms *l*, of braces *m* and *m'*, substantially as set forth.

4. In a ditching-machine, the combination, with oscillating crank-axle D D^2, of hand-lever Y, revolving shaft *j*, cog-wheel *z*, chains *k*, arms *l*, pulleys *l'*, and braces *m m'*, substantially as set forth.

5. In a ditching-machine, the combination, with scoop I and brace *e*, of depending standard V, shoe T, and adjusting device *r'*, substantially as set forth.

6. In a ditching-machine, the combination, with axle part D^2, provided with spindle *d*, of wheels R and S, mounted on said spindle, substantially as set forth.



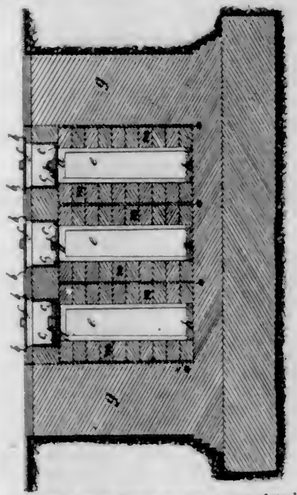
291,044. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. (No model.) Patented in France May 8, 1882, No. 143,829; in Germany May 9, 1882, No. 21,716; in Belgium May 12, 1882, No. 57,891; in England July 26, 1882, No. 3,545, and in Luxemburg Oct. 30, 1883, No. 317.

Claim.—1. A portable apparatus for equalizing the temperature of steel ingots, comprising a mass of brick-work or its equivalent, designed to act as an accumulator of heat, and having formed therein a vertical ingot-cell (or vertical ingot-cells) with cover, and a strong metal box or casing, *c*, mounted on wheels and inclosing said brick-work, the whole so constructed and arranged that ingots may be inserted and allowed to soak, (with exclusion of air,) so as to attain throughout a suitable temperature for rolling off successfully into blooms, or directly into a finished article, without reheating in a furnace, substantially as described.

2. In a portable apparatus for equalizing the temperature of steel ingots to enable them to be rolled into blooms or finished articles without recourse to a reheating-furnace, the combination of the mass of brick-work *b*, strong metal box or casing *c*, vertical chambers with sand bottoms *d* and covers, angle-pieces *g*, girders *h*, axles, and wheels *i*, all constructed, arranged, and operating substantially as described.

291,045. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. (No model.) Patented in Germany May 9, 1882, No. 21,716; in England July 26, 1882, No. 3,545; in Belgium Apr. 13, 1883, No. 61,080, and in Luxemburg Oct. 30, 1883, No. 317.

Claim.—1. An apparatus for equalizing the temperature of steel ingots, comprising a series of permanent horizontal chambers resembling pigeon-holes formed in a mass of brick-work constructed to act as an accumulator of heat, and each chamber being arranged to inclose an ingot (or ingots) and allow it (or them) to soak, (with exclusion of air,) so as to attain throughout a suitable temperature for rolling off successfully into blooms or directly into a finished article without reheating in a furnace, substantially as described.



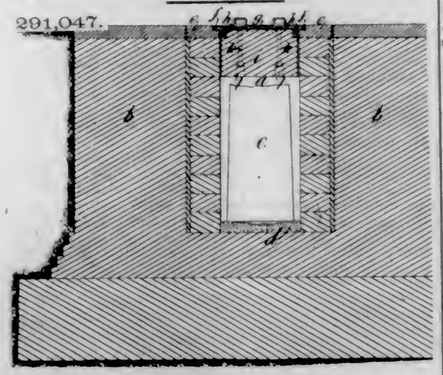
2. In an apparatus for equalizing the temperature of steel ingots, a series of horizontal chambers resembling pigeon-holes formed in and extending entirely through a mass of brick-work constructed to act as an accumulator of heat, each of said chambers being provided at each end with a removable cover, so that ingots may be inserted at one end, be inclosed in the chamber, (with exclusion of air,) so as to soak therein, and be afterward withdrawn at the other end of the chamber, substantially as described, for the purpose specified.

3. In an apparatus for equalizing the temperature of steel ingots, a cell or chamber constructed in the manner of a pigeon-hole in a mass of brick-work designed to act as an accumulator of heat, said chamber being provided with a ledge or projection, *b*, for the ingot to rest upon and to facilitate the charging, and also with a cover at each end, so arranged that an ingot may be fed in at one end, then inclosed within the chamber practically to the exclusion of air, and afterward may be withdrawn at the other end, substantially as described, for the purpose specified.

4. A horizontal chamber for equalizing the temperature of steel ingots, constructed to open at the end or ends, and not at the top, substantially as described.

291,046. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. (No model.) Patented in France May 3, 1882, No. 148,329; in Belgium May 12, 1882, No. 57,891; in England Feb. 15, 1883, No. 847, and in Luxemburg Oct. 30, 1883, No. 317.

Brief.—The wells of the several pits are separated by thick joints of fire-clay.



Claim.—1. In a pit for equalizing the temperature of steel ingots, an enlarged mouth, in combination with a cover capable of being let down and supported in said mouth just above the level of the top of the ingot, whereby a chamber is formed above said cover, which can be filled with some material that does not readily conduct heat, substantially as described.

2. In a pit for equalizing the temperature of steel ingots, an enlarged mouth, in combination with a lower cover capable of being let down and supported in said mouth just above the level of the top of the ingot, and an upper cover supported in said mouth above the lower cover, whereby a space is formed between said covers capable of being filled with some material that does not readily conduct heat, substantially as described.

3. In an apparatus for equalizing the temperature of steel ingots so as to enable them to be rolled into blooms or finished articles without treatment in a reheating-furnace, a mass of brick-work containing a series of vertical pits, each constructed of a cross-section somewhat exceeding that of the ingots to be treated and of a depth somewhat greater than the length of the longest ingot the pit is designed to receive, and with an enlarged upper end or mouth with metal lining, two ledges, shoulders, or seats, *b c*, and two covers, *d f*, inclosing a space or chamber between them, all substantially as described and illustrated, for the purpose set forth.

291,047.

291,047. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. (No model.) Patented in France May 3, 1882, No. 148,329; in Belgium May 12, 1882, No. 57,891; in England Feb. 15, 1883, No. 847, and in Luxemburg Oct. 30, 1883, No. 317.

Claim.—1. An apparatus for equalizing the temperature of steel ingots, comprising a vertical pit, *a*, formed in a mass of brick-work or its equivalent, and a cover comprising a metal plate, *g*, and a deep block of brick or its equivalent, *i*, suspended to said metal plate *g*, substantially as described.

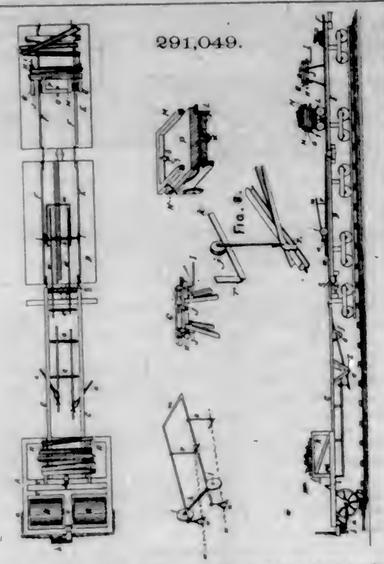
2. A cover for a pit for equalizing the temperature of steel ingots, consisting of a metal plate, *g*, with fillet *h*, deep block of brick or its equivalent *i*, and eyebolts *k*, the whole constructed as described and illustrated.

291,048. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. (No model.) Patented in Germany May 9, 1882, No. 21,716; in England July 26, 1882, No. 3,545; in Belgium Apr. 13, 1883, No. 61,080, and in Luxemburg Oct. 30, 1883, No. 317.

Claim.—1. An apparatus for equalizing the temperature of steel ingots, comprising a long chamber resembling a flue, constructed in a mass of brick-work and provided with a traveling platform or support to carry the ingots along while under treatment, the arrangement being such that while the ingots are in the flue-like chamber their temperature will be caused to become throughout sufficiently uniform to enable them to be rolled without reheating in a furnace, substantially as described.

2. The improved apparatus for equalizing the temperature of steel ingots, comprising the flue-like chamber *c*, with inlet *e*, removable cover *e'*, outlet *f*, removable cover *f'*, rollers *g*, and mechanism for operating same, all substantially as described and illustrated.

291,049. APPARATUS FOR LAYING RAILROAD-TRACKS. CHAS. R. GOODMAN, Hammond, Ind. Filed May 9, 1883. (No model.)

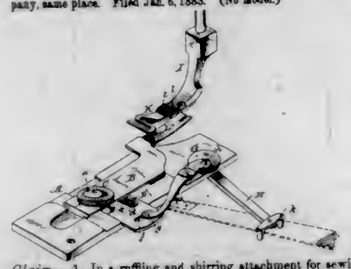


Brief.—A track-layer consisting of a traction-truck running on the graded road. In rear of the traction-truck is a platform for guiding the truck which carries the ties. A construction-car is also attached, provided with a track, thus making a continuous track from front to rear. On the track are placed adjustable horses. A clutch-truck is used to move the rails. Grappling-tongs are employed to draw the rails forward or back. These tongs are supported by rail-hangers which run on a track suspended below the platform.

Claim.—1. The traction-truck A, connected to the car D by means of platform C, for forming a continuous track from the car E to the traction-truck A, as and for the purpose specified.

2. The horses on the car E, constructed with adjustable bearers G G, in combination with the tie-carrying truck, substantially as described, and for the purpose specified.

3. The tie-carrying truck, provided with a pivoted bed or table, P, and the bed combined with the elevating and depressing frame M, lever O *g*, stop *d*, and horses R on traction-truck A, as specified.



291,049.

4. The rail-truck *i A m*, combined with hooks *v v*, and tongs *n n* for moving rails from the car D to rollers S *e e*.

5. The tongs Z Z, provided with roll-hanger *j*, in combination with track *k*, attached to platform C, and rollers *e e* B, as specified and shown.

291,050. RUFFLING ATTACHMENT FOR SEWING-MACHINES. CHARLES GROTZ, Oskaloosa, Iowa, assignor to the Garretson Ruffler Company, same place. Filed Jan. 5, 1883. (No model.)

Claim.—1. In a ruffling and shirring attachment for sewing-machines, the combination of a blade-carrier and an arm or lever connected to the shuttle-bar of the machine with an intermediate means for connecting the arm or lever to the blade-carrier consisting, substantially, of a pivoted lever and transversely-sliding plate, substantially as and for the purpose described.

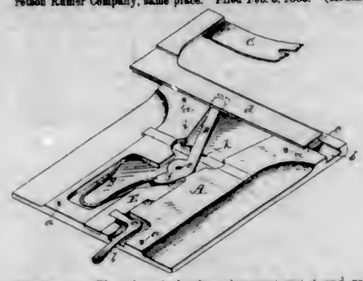
2. The carrier B, having connected thereto a suitable ruffler-blade and a transversely-sliding plate, E, in combination with the pivoted lever F and means for operating it, substantially as and for the purpose specified.

3. The blade-carrier B, having suitably connected thereto the slotted plate E, in combination with the lever F, eccentrically-pivoted plate G, and the arm H, connected thereto, substantially as and for the purpose set forth.

4. The blade-carrier B, having pivoted thereto the slotted plate D, in combination with the nut or disk C, having upon its under side groove *b*, to receive the pin *c*, substantially as and for the purpose set forth.

5. The slotted plate E, in combination with the pivoted lever F, slotted plate G, and arm H, substantially as and for the purpose specified.

6. The carrier B, and nut or disk C, having groove *b*, in combination with the slotted plates D E, substantially as and for the purpose set forth.

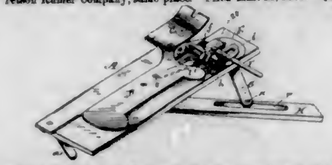


7. The carrier B, having pivoted thereto the slotted plate D, carrying pin *c*, in combination with the slotted plate E, nut or disk C, and lever F, substantially as described.

8. In a ruffling and shirring attachment for sewing-machines, the combination, with the pivoted lever F, having at its ends pins *g h*, of the slotted transversely-sliding plate E, and means for connecting it to the blade-carrier and the eccentrically-pivoted and slotted plate G, the pins upon the lever entering the slots in the plates, substantially as and for the purpose specified.

9. The carrier B, slotted plate D, and grooved nut or disk C, constructed substantially as shown, in combination with the plate E, lever F, plate G, and arm H, substantially as and for the purpose specified.

10. The longitudinally-sliding plate B, and the slotted transversely-sliding plate E, supported by the base-plate A, in combination with the regulating nut or disk C, slotted plate D, pivoted to the carrier or sliding plate B, the lever F, pivoted to the base-plate, the slotted eccentrically-pivoted plate or disk G, and arm H, substantially as and for the purpose set forth.



291,051. RUFFLING AND SHIRRING ATTACHMENT FOR SEWING-MACHINES. CHARLES GROTZ, Oskaloosa, Iowa, assignor to the Garretson Ruffler Company, same place. Filed Feb. 3, 1883. (Model.)

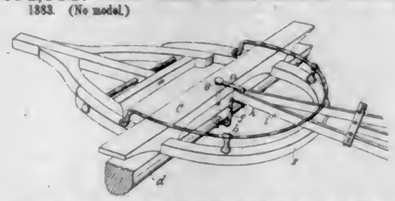
Claim.—1. The plate A, having elongated slot *k* and recessed bracket G, in combination with the L-shaped plate F, having an arm or shoulder, *i*, extending up through the slot in the plate A, the lever D, and the gatherer-blade and arm, with means for returning the lever D to its normal position, substantially as and for the purpose set forth.

2. The base-plate A, recessed, as shown, and having elongated slot *k*, in combination with the lever D, formed with extension *f*, the plate E, lever *l*, arm *d*, and plate F, having shoulder *i*, substantially as and for the purpose set forth.

291,052. RUFFLING AND SHIRRING ATTACHMENT FOR SEWING-MACHINES. CHARLES GROTZ, Oskaloosa, Iowa, assignor to the Garretson Ruffler Company, same place. Filed Mar. 16, 1883. (Model.)

Claim.—1. In a ruffling and shirring attachment, the plate A, adapted to serve the purpose of a shuttle-covering slide and be secured in the bed-plate, a blade, and a reciprocating blade-carrier connected with the said plate, combined with a vertical shaft extended through the plate A from bottom to top, a crank and crank-pin attached to the same above the plate A, a slotted throw-lever vibrated by the crank and crank-pin, and an adjustable connection between it and the blade-carrier, and with a lever or arm attached to the lower end of the said shaft, and adapted to be vibrated horizontally parallel with the surface of the bed-plate by means of the usual shuttle-mover, substantially as described.

2. In a ruffling and shirring attachment for sewing-machines, a base-plate adapted to be secured in horizontal position parallel with the cloth-plate and above the path of movement of the shuttle, and provided with a vertical bearing-passage extended through the said plate from its upper to its under side, a short shaft having projecting from its lower end below the said plate and the cloth-plate of the machine an arm which is extended horizontally backward under the said cloth-plate, to be engaged and vibrated by a shuttle-moving lever, and provided at its upper end with a crank and crank-pin, combined with a blade-carrier and blade, and with suitable means to connect the said crank-pin with the blade, whereby the oscillations of the said shaft impart reciprocating motion to the blade-carrier and blade, substantially as described.

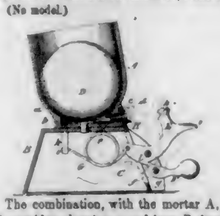


3. In a ruffling and gathering attachment for a sewing-machine, a plate, A, adapted to serve the purpose of a base-plate and shuttle-covering slide, and a blade-carrier and blade, and a vertical shaft having its bearings in the said plate, and provided at its lower end with a horizontal backwardly-extended arm adapted to be connected with and actuated by a shuttle-moving lever, and at its upper end with a crank and crank-pin, combined with a pivoted throw-lever slotted as described, and with

a link connecting the throw-lever with the blade-carrier, and with the regulating-lever or device to change the position or point of connection of the pin of the said link with the said throw-lever, substantially as described.

4. In a ruffling and gathering attachment for a sewing-machine, the plate A, adapted to serve as a base-plate for the attachment and as a shuttle-covering slide, and provided with a recess at its upper side, combined with the vertical shaft *m* therein, the horizontal arm extended backwardly from the under side of the said plate, and with the crank made as a disk fitted into the said recess, the said crank being provided with a crank-pin, by which to impart reciprocating motions to a blade-carrier and blade, with means for operating the horizontally-extended arm under the cloth-plate, substantially as described.

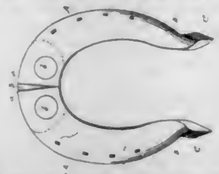
5. In a ruffling and gathering attachment for a sewing-machine, the plate A, adapted to serve as a base-plate for the attachment and as a shuttle-covering slide, and provided at its upper side with a recess, combined with a reciprocating ruffling-blade carrier loosely connected with the said plate, and with a link attached to the under side of the said blade-carrier, the said link moving both longitudinally and laterally in the said recess, with means for operating the horizontally-extended arm under the cloth-plate, substantially as described.



291,053. CLEVIS. ROBERT HAMILTON, Franklin, Ind. Filed Oct. 8 1883. (No model.)

Claim.—1. A clevis for the purpose specified, having arms of unequal length connected by an offset-bar adapted to receive and support a truck-tongue, and said arms provided with eyes to receive a king-bolt, all substantially as shown and described.

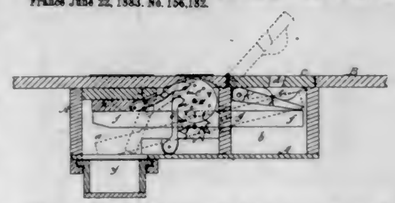
2. The combination, with the forward axle of a wagon and the sand-bar thereon, and the tongue of a truck, of a clevis adapted to embrace between its arms said axle and sand-bar, and to receive a king-bolt, and having the offset A, for the purpose specified.



291,054. MORTAR. WILLIAM A. HARWOOD, Montclair, N. J. Filed Nov. 17, 1883. (No model.)

Claim.—1. The combination, with the mortar A, having an air-chamber, *b*, lateral cartridge-chamber *c*, and base B, formed of a hollow truncated pyramid, of a coiled-wire spring, G, hammer E, and weighted trigger F, substantially as set forth, the said trigger extending from the base at the back of the hammer, as described.

2. The combination, with the mortar A and hanging latch H, of the hammer E, provided with the nib *h*, the said latch and nib being so arranged relative to each other that the said nib *h* will strike over the said latch H, and act as a catch for preventing the swinging of the latch, as herein described.

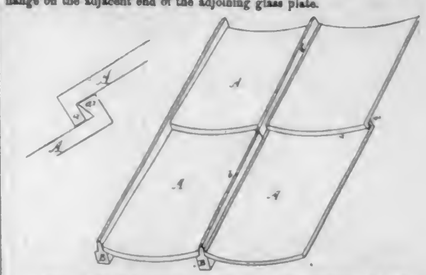


291,055. SHOE FOR HOOF-BOUND HORSES. WILLIAM H. HENDRICKS, Whitehall, Ind. Filed Nov. 3, 1883. (No model.)

Claim.—1. In a shoe for hoof-bound horses, the parts A, having joint *a* and rounded parts D, in combination with plate B, as shown and described, and for the purposes set forth.

2. In a shoe for hoof-bound horses, the plates A, having rounded parts D at the heel, and outwardly-flared calks *c* and the joint *a*, in combination with plate B, secured thereto by rivets *b*, as described, and for the purposes set forth.

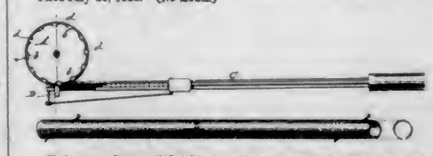
291,056. APPARATUS FOR CHECKING AND REGISTERING THE NUMBER OF GAMES OR DEALS PLAYED AT CARDS, &c. GEO. F. HOWARD, London, England. Filed June 26, 1883. (No model.) Patented in England May 25, 1883, No. 2,612; in Germany June 21, 1883, and in France June 22, 1883, No. 156,182.



Claim.—1. A checking and registering apparatus having a lid or cover the opening of which serves to release a lever, and thereby to actuate a pawl which operates a registering counter or counters, all substantially as shown and described.

2. In combination with the box or receiver A, the lid *c*, levers *k* and *f*, flap *h*, pawl *l*, and counter-cylinder C, the combination being and operating all substantially as described.

3. In combination with the box or receiver A, the lid *c*, levers *k* and *f*, flap *h*, pawl *l*, cylinder C, ratchet *p*, shaft *q*, toothed wheel *z*, and cylinder D, the combination being and operating all substantially as described.



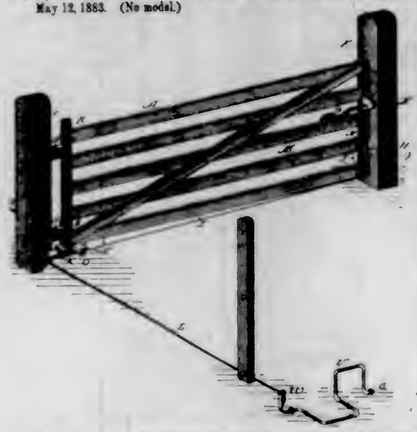
291,057. SKYLIGHT. OLIVER C. RUSSELL, Cleveland, Ohio. Filed Aug. 13, 1883. (No model.)

Brief.—Employs concavo-convex glass plates having on one of their adjacent ends a depending straight flange, which overlaps a beveled flange on the adjacent end of the adjoining glass plate.

Claim.—The glass plates A, formed with concavo-convex surfaces, and having a straight flange, *a*, and a beveled flange, *a'*, formed on their ends, in combination with sash-rails B, substantially as shown and described.

291,058. NAIL-MACHINE. JETHRO B. HORTON, Vergennes, Vt. Filed July 20, 1883. (No model.)

Claim.—1. In a nail-finishing machine, a revolving disk provided with peripheral recesses to receive the heads of the nails, and a slotted guide terminating adjacent to the periphery of said disk, in combination with a dog or carrier arranged to reciprocate past the end of the tube to and from the disk, and means, substantially as described, for imparting motion to said dog, whereby the nails are transferred positively and individually from the guide to the recesses of the disk.



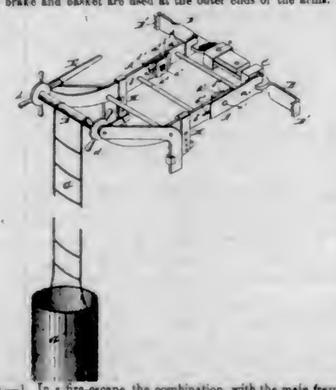
2. In combination with the peripherally-notched disk, the grooved or slotted guide terminating adjacent thereto, the dog or carrier arranged to reciprocate past the end of the guide, the toothed wheel to move said dog backward, and the spring applied to drive the same forward.

3. In combination with the notched disk and the slotted guide, the tube, the spring-supported dog at the end of said tube, and a toothed disk secured above and concentric with the notched disk, substantially as shown.

4. In combination with the slotted guide adapted to sustain the nails by their heads, the slotted tubular extension at the end of said guide, and the detachable slotted tube whereby the series of nails may be supported and transferred to the guide.

5. The improved device for transferring nails to the feed mechanism of the nail-machine, consisting of a longitudinally-slotted tube provided at its end with removable pins or stops to retain the nails therein.

291,059. FARM-GATE. WILLIAM C. KIEKER, Mequon, Wis. Filed May 12, 1883. (No model.)



Claim.—1. In that class of gates which are opened and closed by an approaching and receding carriage, the devices herein described for transmitting motion from the tripping-arm to the latch, consisting in the combination, with the connecting-rods, of the tripping devices, of the bracket K, provided with arm O, bracket S, rod J, elbow-crank lever I, rod H, latch D, and catch E, said bracket K being loosely socketed upon the shoulder T of bracket S, substantially as and for the purpose specified.

2. The combination of bracket K, provided with arm O, with rods Q and L, tripping-rods G and P, rod J, lever I, rod H, spring D, and catch E, substantially as and for the purpose specified.

291,060. FIRE-ESCAPE. WILLIAM F. KRENTOFF and PHILIPP BERTRES, Englewood, Ill. Filed Feb. 19, 1883. (No model.)

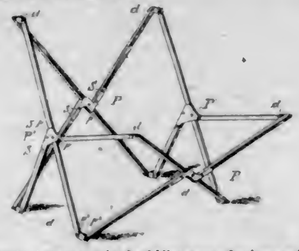
Brief.—The cross-bar is made in two parts hinged together and provided with a slide and spring-catch to hold them together; also, the side bars are made in two parts, one part being corrugated to mesh with a corrugated nut moving on a bolt on the other part. A ladder and reel with a brake and basket are used at the outer ends of the arms.

Claim.—1. In a fire-escape, the combination, with the main frame, of a cross-bar for engagement with the inside of a window-frame, made in two parts, hinged together, and provided with means for locking them in position, substantially as and for the purpose set forth.

2. In a fire-escape, the frame A, in combination with the arms B B, hinged together, and provided with the spring-catch *c'* and slide C, whereby the arms may be thrown out of line with each other or secured firmly in their proper position, substantially as shown and described.

3. In a fire-escape, the side bars made in two parts, one of which is slotted and formed with a series of corrugations, and the other provided with a bolt or stud, a corrugated plate, and a set-nut, substantially as and for the purpose set forth.

4. A fire-escape consisting, essentially, of the frame A, having extension side bars, substantially as herein described, the hinged arms B B, secured by a spring-catch, *c'*, adjustable supports H, reel D, having a ladder, G, and receptacle G', and the lever E, adapted to act as a brake, all combined, constructed, and arranged to operate substantially as described and shown.



291,061. DEVICE FOR CUTTING OFF THE FLOW OF GAS, &c., IN CASE OF FIRE. JOSEPH A. LAEMLE, Stapleton, N. Y. Filed May 23, 1883. (No model.)

Claim.—1. In combination with the gas-pipe of a building, a valve held normally open, having a stem and lever outside of the pipe, a weight or spring tending to force said lever against the pressure of the gas to close the valve, and a combustible or fusible connection outside the pipe holding said lever till melted or consumed, substantially as described.

2. The combination of the valve in the gas-pipe, having its stem projecting through the pipe, a lever connected therewith, means, substantially as described, for forcing said lever to close the valve, and fusible or combustible devices for holding said lever to keep the valve open, said devices being adjustable, whereby the lever and valve may be set at an angle, substantially as set forth.

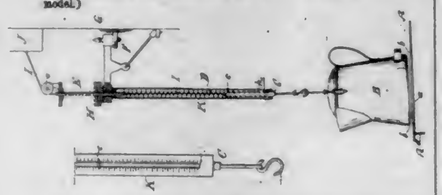
291,062. FOLDING-JOINT FOR CAMP-FURNITURE. PIERRE LATOUR, Ottawa, Ontario, Canada. Filed Aug. 10, 1882. (Model.) Patented in Canada Oct. 25, 1882, No. 15,694.

Claim.—1. A toning-joint for folding camp-furniture and similar articles, consisting of a pair of plates, P, following more or less closely the shape, angle, and relative position of the two short bars B' B^2, which are rigidly secured thereto by screws S, or equivalents, forming a straight or offset line, the through-piece B passing between the two ends of the pieces B' B^2, being secured to the joint-plates by a pivot, *p*.

2. A folding-joint for folding camp-furniture and similar articles, consisting of a pair of plates, P', following more or less closely the shape, angle, and relative position of the two short bars b' b^2, one being rigidly connected to one end of the plates by screws S, or equivalents, and the other being pivoted to the other end by a pivot, p', the pieces b' b^2 forming an offset elbow, the through-piece *b* passing between the two ends of the pieces b' b^2, and being secured to the joint-plates by a pivot, *p*.

3. The combination of the through-pieces B and cross-pieces B' B^2, connected by plates P, as described, through-pieces *b* and cross-pieces b' b^2, connected by the plates P', as described, and the corner joint, *d*, all substantially as shown and described, and for the purpose set forth.

291,063. ELECTRICAL ANNUNCIATOR. ALBERT E. LEITOR, Dayton, Ohio, assignor of one-half to Charles A. Phillips, same place. Filed Sept. 15, 1883. (No model.)



Claim.—1. The combination, in an electrical annunciator, of a series of electro-magnets with suitable electric connections and a series of

corresponding pivoted permanent magnets within the case, to which are attached a corresponding series of index-needles and a series of numbers upon the face of the annunciator, substantially in the manner and for the purpose specified.

2. The combination, in an electrical annunciator, of a series of magnets with suitabe electric connections, a series of corresponding pivoted permanent magnets within the case, to which are attached a corresponding series of index-needles upon the face of the annunciator, a series of numbers upon the face of the annunciator, and one or more diamagnetic gravitating tripping-rods, substantially as and for the purpose specified.

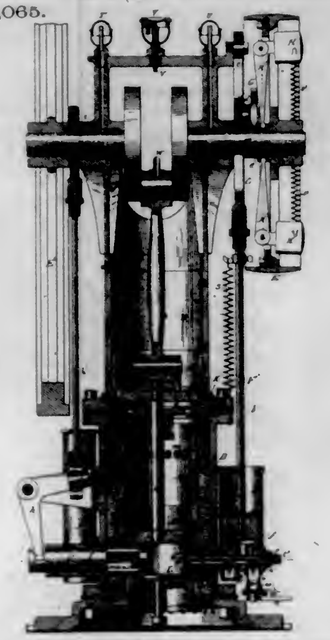
291,064. COMBINED BOILER, FIRE-REGULATOR, AND ALARM. CHARLES STEWART LOCKWOOD, Newburg, N. Y. Filed Feb. 21, 1883. (No model.)

Claim.—1. The combination, with a support arranged above a cook-stove or range, of a vessel suspended from said support by an elastic connection over the stove or range, substantially as herein shown and described, whereby the vessel will be raised by the evaporation of its contents, as set forth.

2. The combination, with a support, of a spring attached to the same, and a vessel adapted to be supported over a hole of a cooking-stove or range by said spring, substantially as herein shown and described, whereby the vessel will be raised by the evaporation of its contents and the fire correspondingly checked, as set forth.

3. The combination, with a support arranged above a cook-stove or range, of a spring attached to said support, a vessel attached to the lower end of the spring, and an alarm connected to said spring, substantially as herein shown and described, whereby the vessel will be raised by the evaporation of its contents and an alarm sounded, as set forth.

4. The combination, with the stove A, of the vessel B, rod C, spring D, screw-shaft E, nut H, and bracket-support F, substantially as and for the purposes set forth.



5. The combination, with the stove A, of the vessel B, rod C, spring D, shaft E, nut H, bracket F, cord I, and alarm J, substantially as shown and described.

6. The combination, with the stove and spring-supported vessel B, of the cord I, connecting the vessel with the alarm J, said cord passing through the hollow screw-shaft E, substantially as shown and described.

7. The combination, with the stove A, spring-supported vessel B, cord I, and alarm J, of the anti-friction-roller *e*, substantially as shown and described.

8. The combination, with a support arranged above a cook-stove or range, of the rod C, provided with the pointer *c*, the vessel B, the spring D, and the slotted tube K, surrounding the said rod and spring, substantially as herein shown and described, and for the purpose set forth.

291,065. GAS-MOTOR. HIRAM S. MAXIM, Paris, France. Filed Jan. 16, 1883. (No model.)

Claim.—1. An air or gas engine comprising, in combination, the following instrumentalities, to wit: a working-cylinder and means for exploding therein charges of gas and air, a piston impelled by such explosions, a vacuous chamber brought into communication with the working-cylinder by the movement of the piston, a valve for admitting air into the cylinder when connected with the vacuous chamber, and means for introducing explosive charges into the cylinder, these parts being constructed and combined for co-operative action in substantially the manner set forth.

2. In a gas-engine, the combination, with the working-cylinder and piston, of a vacuum-cylinder of greater capacity, a piston working therein, and an intermediate recess or chamber with which the working-cylinder is brought into communication by the withdrawal of its piston, whereby at the end of each stroke the gases are withdrawn from the working-cylinder, in the manner described.

3. The combination, with the working-cylinder of a gas-engine, of a pump for introducing explosive charges into said cylinder, means for positively raising the piston of the pump and then disengaging it, and a spring for forcing it downward, all as set forth.

4. The combination, in a gas-engine, of the working and vacuum cylinders connected in the manner described, the pistons working in said cylinders, and the intermediate chambers of communication at and around the ends of said cylinders, as described.

5. The combination, with the working and vacuum cylinders and pistons contained therein, of intermediate chambers of communication at or around the ends of the cylinders, the working-cylinder being perforated in substantially the manner described, whereby communication is established between the two cylinders through said intermediate chambers on the partial withdrawal of the pistons, as and for the purpose set forth.

6. The combination, with the working and vacuum cylinders and pistons contained therein, of chambers or vacuous spaces located around the ends of and between said cylinders, and exhaust connected with the said chambers, as and for the purposes set forth.

7. The combination, in a gas-engine, of a working cylinder and piston and a vacuum cylinder and piston, an automatic air-check valve opening into the working-cylinder, and an exhaust-valve opening outward, these parts being combined in substantially the manner described.

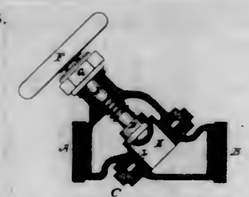
8. The combination, with the working-cylinder of a gas-engine, of a pump for introducing charges of air and gas into the cylinder, and a valve located between the cylinder and pump, and provided with a number of perforations, through which the air and gas are forced when the valve is open, as and for the purpose set forth.

9. The combination, with the working-cylinder, of the pump F, the perforated valve M, with air and gas inlet valves, and means for controlling the same, as and for the purpose specified.

10. The combination, with the pump F, piston-rod *f*, and plate G, of spring S and cam G', all as set forth.

11. The combination, with the working-cylinder, of the chambered piston, the flame-chimney, a bell-crank lever connected with the piston, and an eccentric for operating the bell-crank lever, all as set forth.

12. The combination of the bell-crank lever A, rod *k'*, eccentric *i*, piston I, containing a chamber at its inner end, and the flame-chimney J, these parts being constructed and arranged in such a manner that the piston I thrusts the flame directly into the interior of the working or explosion cylinder, in the manner described.



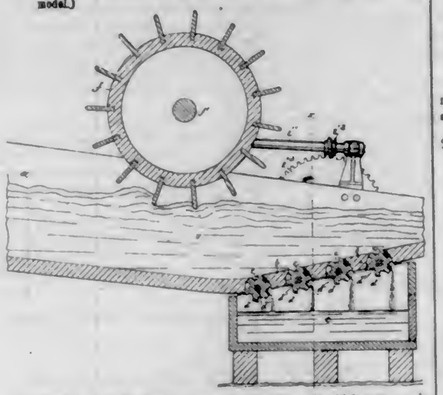
13. The combination, with the working-cylinder, of an induction-valve, L, perforated valve M, pump F, and valves connecting therewith, and exhaust-valve, these parts being constructed in the manner specified.

291,066. VALVE AND UNION. JAS R. MAXWELL, Cincinnati, Ohio. Filed Apr. 27, 1883. (No model.)

Claim.—1. A valve-body formed with two parts fitted to connect with pipes and united to swivel with reference to each other upon an axis disposed at an angle to the plane or planes occupied by the pipes, which may be connected by such valve-body.

2. A valve-body having its nose formed integral with one of its pipe-receivers and having its other pipe-receiver separably joined by a swiveling union.

291,066.



3. A valve-body having its nose formed integral with one of its pipe-receivers and having its other pipe-receiver separable in a plane at an angle to the axis of both pipe-receivers.

4. Two pipe-receivers, a means for uniting them, and a spherical ring seating against said receivers to pack the joint and give flexibility to the union, substantially as set forth.

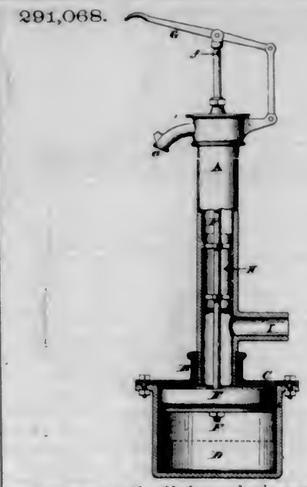
5. A valve-body combined with a separable seat, having a spherical exterior, seating in said valve-body.

291,067. ORE-SEPARATOR. GORDON MCKAY, Newport, R. I., and HADLEY P. FAIRFIELD, West Medford, Mass. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination of a sluice through which a stream is kept continuously running, a series of riffles having pockets or receptacles to receive the heavier particles, and mechanism, substantially as described, operated by the running stream in the sluice, to automatically rotate said riffles periodically to discharge their contents and simultaneously present an empty pocket or receptacle for the reception of the material to be separated, substantially as and for the purpose specified.

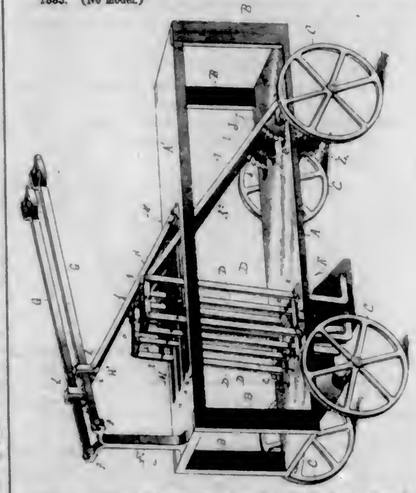
2. The combination of a sluice through which a stream is kept continuously running, a series of riffles having pockets or receptacles to receive the heavier particles, mechanism, substantially as described, operated by the running stream in the sluice, to automatically rotate said riffles periodically to discharge their contents and simultaneously present an empty pocket or receptacle for the reception of the material to be separated, and the tight strong box *s* beneath said riffles, into which the riffles discharge, substantially as and for the purpose specified.

3. The sluice, the series of riffles, the sprocket-wheels on the shaft of said riffles, the connecting-chain, a pawl-and-ratchet mechanism on the shaft of one of said riffles, and gearing connecting said mechanism with a wheel in the sluiceway, combined and arranged substantially as described.



4. The sluice and series of rotary riffle-carriers and connecting-gearing therefor, combined with the actuating-ratchet and pawl-carrier, and mechanism actuated by the flow of the stream in the sluice for moving the said pawl-carrier intermittingly, as and for the purpose described.

291,068. HYDRANT. CARL MEYER and WILLIAM H. LAUFERSICK, Cincinnati, Ohio. Filed June 19, 1883. (No model.)



Claim.—1. In combination with the stock A I, chamber D, and piston E, of a non-wasting hydrant, the hollow piston-rod F, carrying the cut-off H, and having near its upper end a ventage, *f*, that permits the escape of air from chamber D when said piston is depressed, as herein described.

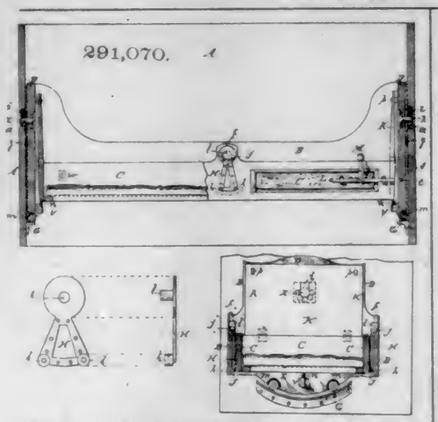
2. In combination with a non-wasting hydrant having a hollow piston-rod, F, provided with a plunger, E, cut-off H, and ventage *f*, which ventage permits escape of air from the chamber D, as herein described, the valved spout *a* K, pipe J, lever G, rope L, and sheave N, which lever, rope, and sheave enable said piston-rod to be operated from the upper stories of a house, substantially as explained.

291,068.

291,069. MOTOR. NIELS MIKKELSEN, Chicago, Ill. Filed Oct. 30, 1883. (No model.)

Claim.—1. In the apparatus described, the L-shaped bars D, arranged in groups of four, pivoted to base A, and carrying weights E, in combination with levers G H H' K K' and intermediate gearing for imparting motion to said vehicle, as described and shown.

2. In the apparatus described, the L-shaped bars D, pivoted to base A, and carrying weights E, in combination with levers G H H' K K', springs M, and intermediate gearing for imparting motion to said vehicle, as described and shown.



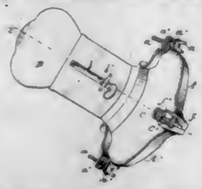
3. The L-shaped bars D, carrying weights E, and rollers *g g'*, in combination with levers H H', carrying rollers *i*, levers G and K K', springs M, and intermediate gearing for imparting motion to the vehicle, as described and shown.

291,070. SELF-LEVELING BERTH FOR SHIPS. JOSEPH H. MILLIGAN, Boston, Mass., assignor of one-half to William Newsome, same place. Filed Sept. 14, 1883. (No model.)

Claim.—1. In a self-leveling ship's berth, the guard-boards K, provided with the rollers *p*, in combination with the crib C, substantially as and for the purpose set forth.

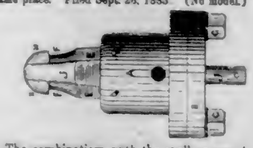
2. In a self-leveling ship's berth, the elongated bearings *i*, provided

291,070.



with the friction-rollers *a*, in combination with the bunk B, provided with the studs *x*, to enable said bunk to rise and fall as the rollers *m* approach and recede from the ends of the curved bearing G, substantially as specified.

3. In a self-leveling ship's berth, the elongated bearings *f*, provided with the friction-rollers *j*, in combination with the crib C, provided with the studs *l*, to enable said crib to rise and fall as the rollers *h* approach and recede from the ends of the curved bearing J, substantially as set forth.



4. The improved self-leveling ship's berth herein described, the same consisting of the bunk B, provided with the studs *x*, bearings J, rollers *m*, springs *n*, and bearings *f*, and the crib C, provided with the studs *l*, rollers *h*, bar L, and guards K, in combination with the walls A, provided with the curved bearings G, and elongated bearings *i*, constructed, combined, and arranged to operate substantially as specified.

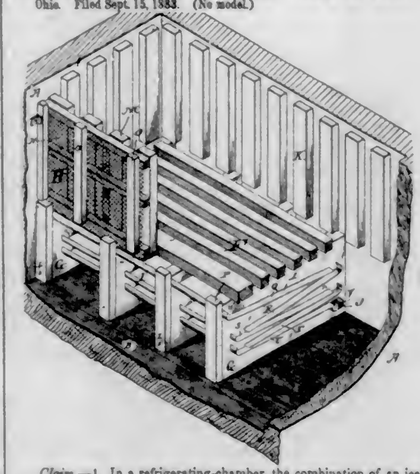
291,071. DEVICE FOR AID IN VOCAL CULTURE. CHAS. LEWIS MITCHELL, Boston, Mass. Filed June 30, 1883. (No model.)

Claim.—A device for aid in vocal culture, composed of the adjustable mouth-holder A, provided with the adjustable tooth-holder *c*, and combined with the adjustable detachable tongue-plate B, the whole constructed, arranged, and combined substantially as described and shown, and for the purposes set forth.

291,072. PRESS FOR MOLDING GLASS INSULATORS. EDWARD J. MURPHY, Boston, Mass., assignor to Lawrence B. Gray and Joseph Ham, both of same place. Filed Sept. 26, 1883. (No model.)

Claim.—The combination, with the shell or case A, of the pivoted side pieces, E, having incline faces, and the tapering center piece, J, adapted to be slid back and forth therein, whereby the end portion of the plunger may be expanded and contracted, as and for the purposes set forth.

291,073. STATION-INDICATOR. CHAS. W. MUSGROVE, Lock Haven, Pa. Filed Sept. 6, 1883. (No model.)



Claim.—1. In combination with rollers G G', to which the ends of the indicating cloth or strip are fastened, and which successively receive and deliver it, having square projections *g g'* extending therefrom, the plate M, which serves by rotation to afford access alternately to the projection *g* or *g'*, according to the direction pursued by the cloth, for which purpose it is suitably perforated, catch N serving to reciprocate its end *n*, and hence the spring *n'*, affixed thereto, when it is desired to rotate the plate M, and crank L, by which rotation is imparted either to the projection *g* or *g'* on the roller G or G', according as it becomes a receiver.

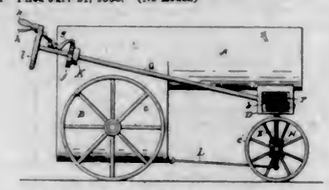
2. In combination with the receiving and delivery rollers G G', guide-rollers I I', serving to change the direction of the cloth, guide-frame F', located between and in front of such rollers to guide the cloth between them, glass E, whereby the information is exposed, frame F, in which the mechanism is mounted, and which is removable from the outer casing, and cloth K, which bears the indications and is attached to both rollers G and G', substantially as and for the purpose set forth.

3. In indicators, the rollers G G', having square projections *g g'*, plate M, affording access thereto, catch N, having end *n*, to which is attached the inner end of a spring, *n'*, which serves normally to hold the plate M stationary, and only permits its rotation when raised from its bed by the catch, and crank L, in combination with guide-rollers I I', guide-frame F', glass E, frame F, and cloth K.

4. In indicators, the frame A, being an outer casing for the entire device, having lid B, the removable frame F, glass E, slide D, serving to remove the glass E for cleaning and other purposes, the glass being mounted in the slide, rollers G G' I I', guide-frame F', plate M, catch N, having end *n* and spring *n'*, crank L, and cloth K.

291,074. REFRIGERATING-CHAMBER. AARON MYERS, Hamilton, Ohio. Filed Sept. 15, 1883. (No model.)

Claim.—1. In a refrigerating-chamber, the combination of an ice-crib with a floor formed of slats or other open-work, a series of shelves below the ice-crib arranged with decreasing slope, as set forth, and an outlet-pipe arranged to receive the water from the lower pan, substantially as and for the purpose set forth.



2. In a refrigerating-chamber, the combination of an ice-crib with a slatted or other open floor, and a slatted or other open front, and a series of draining-shelves arranged below the ice-crib and open at the front for the free admission of air between the shelves, substantially as and for the purpose set forth.

3. In a refrigerating-chamber, the combination, substantially as set forth, of an ice-crib with an open-work bottom and front, a series of draining-shelves arranged below the ice-crib in such manner that the air may circulate freely over them horizontally and past their edges vertically, substantially as and for the purpose set forth.

4. In a refrigerating-chamber, the combination, with the floor and walls of the ice-crib having open-work front to the ice-crib formed of interior slats, of a netting of wire-cloth exterior to said slats, substantially as and for the purpose set forth.

5. In a refrigerating-chamber, the base structure for the ice-crib, consisting of the slatted or open floor F, the legs G, and the shelves I, passing through said legs, combined substantially as and for the purpose set forth.

291,075. TRACTION-ENGINE. WILSON S. OWINGS, Collier's Station, W. Va. Filed July 21, 1883. (No model.)

Claim.—1. In a device for leveling boilers, a rod revolubly secured to the boiler, and provided on its forward end with a worm-screw, a threaded king-bolt having a spirally-toothed wheel fixed on the upper end thereof, said worm-screw and toothed wheel meshing, in combination with an axle provided with a threaded oscillating nut for the reception of said king-bolt, substantially as described, and for the purpose set forth.

2. In a device for leveling boilers, a rod revolubly secured to the boiler, and provided on its forward end with a worm-screw, a threaded king-bolt having a toothed wheel fixed on the upper end thereof, said worm-screw and toothed wheel meshing, in combination with an axle provided with a bevel-socket block, said block having an oscillating nut therein for the reception of the king-bolt, substantially as described, and for the purpose set forth.

3. In a device for leveling boilers, a rod revolubly secured to the boiler, and provided on its forward end with a worm-screw, the forward end of said rod being journaled in a box under the front end of the boiler, said box having a toothed wheel therein, said wheel being mounted upon the upper end of the threaded king-bolt, in combination with the forward axle of the machine provided with a socket-block having oscillating threaded nut therein, adapted to receive the threaded king-bolt, substantially as described, and for the purpose set forth.

4. In a device for leveling boilers, a rod revolubly mounted in a lug projecting from the side of the boiler, said lug having a spur-wheel fixed thereto, said rod being provided on its upper end with an actuating crank-wheel and a spring-actuated pawl adapted to engage the spur-wheel and prevent the revolution of said rod, the forward end of the rod being provided with a worm-screw, in combination with a spirally-toothed wheel rigidly mounted upon a threaded king-bolt, said king-bolt being mounted in a threaded oscillating nut in a socket-block on the forward axle, substantially as described, and for the purpose set forth.

5. The combination, with the crank-rod G, of the pawl *g*, ratchet-wheel *f*, and lever *h*, for releasing the same, substantially as and for the purpose set forth.

291,076. DUMMY FOR DISPLAYING CLOTHING. JOSEPH B. PALMERTREE, New York, N. Y. Filed Aug. 10, 1883. (No model.)

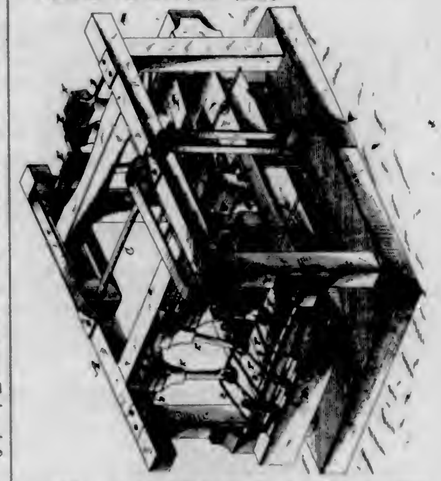
Claim.—1. The combination of shell *a* and its head-piece *a'*, with shell *b* and its head-piece *b'*, in separate pieces, adapted to be united, and with the annular disk *f*, shaft B, and base D, substantially as specified.

2. The combination of shell *a* and its head-piece *a'*, with shell *b* and its head-piece *b'*, in separate pieces, adapted to be united, and with disk *f*, strips *d e*, shaft B, and base D, substantially as specified.

3. The combination of shell *a* and its head-piece *a'*, with shell *b* and its head-piece *b'*, in separate pieces, adapted to be united, and with covering *h* folded over upper side of said head-pieces, and with thread *i* drawn through upper edge of said covering, substantially as specified.

4. The combination of shell *a* and its head-piece *a'*, with shell *b* and its head-piece *b'*, in separate pieces, adapted to be united, and with disk *f*, button *j*, shaft B, and base D, substantially as herein shown and described.

291,077. INSTEP-HOLDER FOR LASTING BOOTS AND SHOES. JAMES H. PARKER, Milford, Mass. Filed May 31, 1883. (No model.)

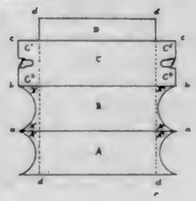


Claim.—1. The combination, with a last, of a double hook adapted to confine the two sides of a shoe-upper and prevent the lacing-slit from being strained apart in the operation of lasting, as set forth.

2. The combination, with a last, of a double hook adjustably attached to the instep thereof, and adapted to engage the eyelets or lacing-holes in a shoe-upper for retaining said upper in position during the operation of lasting, substantially as set forth.

3. The combination, with a last, of a double hook adapted to have free longitudinal movement toward or from the toe, while it is confined from lateral movement, substantially as and for the purpose set forth.

4. The combination, with the instep of a last, of the slotted plate E and double hook C, swiveled therein, substantially as and for the purpose set forth.



291,078. STONE-DRESSING MACHINE. WHEELER PERKINS, Methuen, Mass. Filed June 23, 1883. (Model.)

Claim.—1. In a stone-cutting machine, the bed B, having a central opening, G, and the sliding blocks *g*, operated by levers *h*, in combination with the pivoted spring cutter-arms F, provided with heads *d*, and carrying the cutters or chisels, and the springs *b*, located under said arms, the hammers E, connected to the bed by pivoted yokes *c*, and constructed to operate substantially as and for the purpose set forth.

2. The combination, with a stone-cutting machine, having secured thereto a bed, B, provided with a central opening, spring-arms F, hammers E, and sliding blocks *g*, of the tool-holder K, having springs *k*, and the cutters or chisels, having shoulders *i*, substantially as and for the purpose set forth.

291,079. ENVELOPE. GEORGE B. POST, New York, N. Y. Filed Feb. 9, 1883. (No model.)

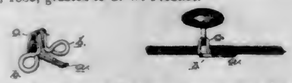
Claim.—1. An envelope-blank in which the four flaps surrounding either one of the main faces B or C of the envelope are joined each to the adjacent flap by a corner-extension of the blank beyond the angle of the said main face, and in which the side flaps of the address-face C have apertures cut in their ends, through which, when the envelope is folded, can be seen both the flaps B and D, and in which the side flaps of the face B and of the extension-flap A are cut away at the parts falling below the said apertures in the side flaps of C, substantially as described.

2. An envelope provided with the top flap, D, the address-face C, having apertured flaps, and the back face, B, provided with flaps narrower at their center than the flaps of the face C, substantially as described.

3. An envelope-blank having the address-face C, back flap, B, top flap, D, and interior extension-flap, A, with side projections, A′ A′, B′ C², A^2 A^2, and B^2 C^2, and with the apertures *f f* in the ends of the address-face C, substantially as described.

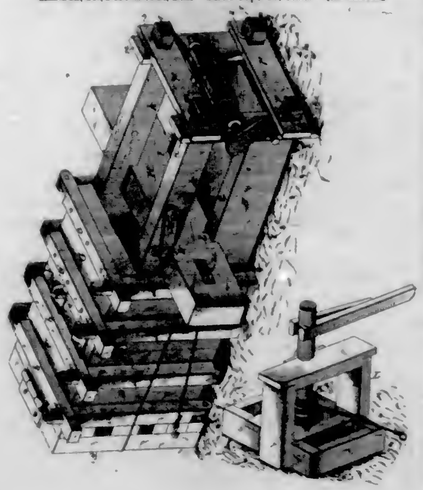
4. An envelope-blank having the address face C, the flaps B and D, with apertures in the ends of the flap B, and with apertures in the ends of the flaps of the address-face C of less depth than the apertures in the flap B, and of such width that the edges *f c f b* of the address-face C may be folded over diagonally to come within the sides of the apertures *f f*, substantially as and for the purposes described.

291,080. BUTTON-FASTENER. GEORGE W. PRENTICE, Providence, R. I. Filed Nov. 2, 1883. (No model.)



Brief.—Improvement on Letters Patent No. 284,978, dated September 11, 1883.

Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the tongue *a*, provided with the spring-loop *b*, and side wings, *c*, all being formed from a short length of wire, and the ends of said tongue and side wings being curved upwardly, in the manner substantially as and for the purpose specified.



291,081. BUTTON-FASTENER. GEORGE W. PRENTICE, Providence, R. I. Filed Nov. 2, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 284,978, dated September 11, 1883, granted to G. W. Prentice.

Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the side wings or loops, *b*, having the elongated tongue *a*, which is bent around over and beneath the central portion between the side wings to form a spring-loop, *c*, and projecting end, which serves, in connection with said side wings, to form a smooth base or table, substantially as and for the purpose specified.

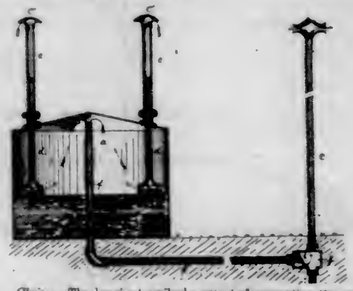
291,082. COMBINED HAY-PRESS AND HORSE-POWER. WILLIAM RANDLE, Sr., Fort Worth, Tex. Filed Sept. 17, 1883. (No model.)

Claim.—1. In a baling-press, the combination, with the plunger C, of the box A, provided with hinged side doors, D E, and the several staple-arms *b c* and hasp-arms *a d* and keys *e*, and the hinged top doors, F G, the latter having the staple *j* and the former the metal hasps *f*, having downwardly-projecting flanges *g*, adapted to enter recesses *h* in the opposite hinged door, substantially as and for the purpose set forth.

2. The combination, with the press-box A, having its several hinged doors and means for fastening them closed, of the plunger C, beam H, formed with recesses *l*, and the extension B, having ways or tracks *i k*, the windlass I, and cord or rope *m*, substantially as and for the purpose specified.

3. The press-box A, having its hinged doors and fastenings, and the extension B, provided with ways or tracks *i k*, and notched weighted dogs M, in combination with the plunger C, cross-beam H, having recesses *l*, fitting over the ways or tracks, and provided with the pulleys *u*, the cord or ropes *t v*, and windlass K, substantially as and for the purpose described.

4. A baling-press consisting of the box A and hinged doors D E F G and its fastening devices, the extension B, having tracks or ways *i k*, notched weighted dogs M, windlass I, and cord or rope *m*, the plunger C, cross-beam H, having recesses *l* and pulleys *u*, cords or ropes *t v*, and the windlass K, provided with spiral seats *w*, all constructed and arranged to operate substantially as and for the purpose set forth.

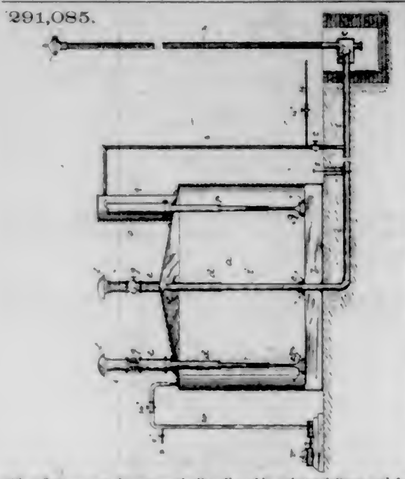


291,083. WATER-FILTER. JOHN REID, Wheeling, W. Va. Filed Apr. 9, 1883. (No model.)

Claim.—1. The combination, with the filtering apparatus, consisting of the case A, suitable inlet and outlet openings, and perforated diaphragms inclosing suitable filtering material, of the pipe D and cup B, said cup containing filtering material, and adapted to operate in connection with the filter, as set forth.

2. The combination, in a filtering apparatus, of the case A, having an inlet-pipe, F, at the bottom, outlet-pipe G at the top, perforated partition I, filtering material N N^1 N^2, removable perforated disk or head M, with central tube, *d*, spiral spring *e*, screw-cap E, central stud, *c*, secured to the under side, rubber pipe D, cup B, and sponge C, substantially as and for the purpose herein described.

291,084. METHOD OF PREVENTING THE ACCUMULATION OF INFLAMMABLE GASES IN OIL-TANKS. JOHN P. RENNEKE, Pittsburg, Pa. Filed Aug. 3, 1883. (No model.)



Claim.—The herein-described method of preventing the accumulation of inflammable gases in an oil-tank, by an induced current of air entering the tank and displacing the gases, substantially as and for the purposes specified.

291,085. SAFETY APPARATUS FOR OIL-TANKS. JOHN P. RENNEKE, Pittsburg, Pa. Filed Nov. 22, 1883. (No model.)

Claim.—1. The combination, with an oil-tank, of an air-induction pipe and a gas-eduction pipe, said pipes arranged with their open ends on different horizontal planes within the tank, substantially as and for the purpose specified.

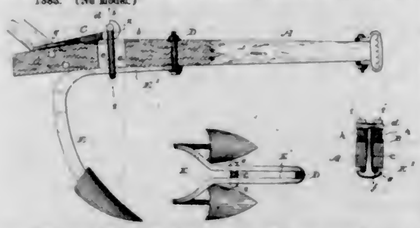
2. The combination, with an oil-tank, of an air-induction pipe and a gas-eduction pipe, said pipes arranged with their open ends on different horizontal planes within the tank, one of said pipes being provided

291,085.

with a float, so as to be automatically adjustable, substantially as and for the purpose specified.

3. The combination, with an oil-tank, of an air-induction pipe, a gas-eduction pipe, and a pump for creating a draft through the tank above the surface of the oil, substantially as specified.

291,086. GLASS CASTER. DANIEL C. RIPLEY, Pittsburg, Pa. Filed Nov. 13, 1883. (No model.)

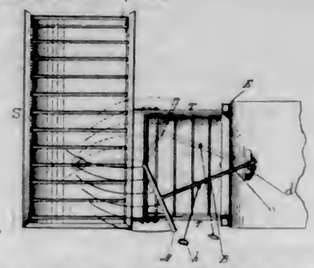


Claim.—1. A glass caster having a common receptacle for the bottles, divided into compartments by a central wing-piece provided with radially-projecting wings or arms, substantially as and for the purposes described.

2. A glass caster having a common receptacle for the bottles, and central stem secured thereto, and provided with radially-projecting wings or arms, substantially as and for the purposes described.

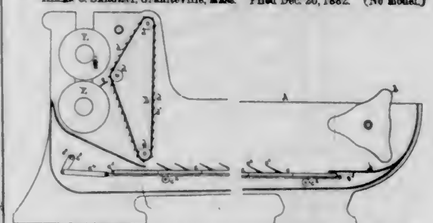
3. A glass caster having a common receptacle for the bottles, and a metallic central piece having radial arms or wings for dividing the receptacle into bottle-compartments, substantially as and for the purposes described.

4. A glass caster having a common receptacle for the bottles and internal ribs or projections on the sides, so as to extend between adjacent bottles, substantially as and for the purposes described.



291,087. PLOW. AARON A. ROBERTS, Quitman, Ark. Filed Sept. 12, 1883. (No model.)

Claim.—1. The combination of the beam, the cam-lever C, pivoted thereon and forked at the end, and the clamping-bolt having the cross-head which engages with the forked end of the cam-lever, substantially as specified.



2. The combination of the beam, the cutting implement having the looped shank-extension E′, the cam-lever C, and the clamping device B, adapted to secure the extension to the beam, as set forth.

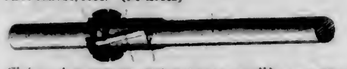
291,088. STRAW-STACKER. FRANCIS W. ROBINSON, Richmond, Ind. Filed June 14, 1883. (No model.)

Claim.—The combination, with a thrashing and separating machine and straw-stacker, of the guide or fork, consisting of the head A, tines or teeth 1 2 3 4 5 6, and the handle B, the guide-rod *h*, ring *d*, bolt *i*, and framing E, substantially as and for the purposes set forth.

291,089. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Dec. 20, 1882. (No model.)

Claim.—1. In a wool-washing machine, the combination of the bowl A, squeeze-rolls E E, and the vertical feed-apron D, moving at an incline downward toward the nip of said rolls, substantially as described.

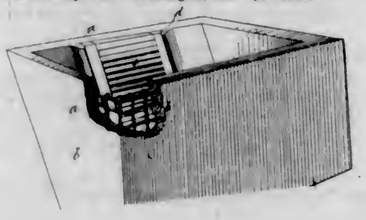
2. The combination of the vertical downward-delivery feed-apron D, the chute *c*, the squeeze-rolls E E, and the bowl A, substantially as described.



3. The combination, with the bowl A, of the reciprocating bottom C, provided with teeth *c*′, and the feed-apron D, substantially as described.

4. The combination of the reciprocating carrier C, provided with teeth *c*′, the feed-apron D, and the squeeze-rolls E E, substantially as described.

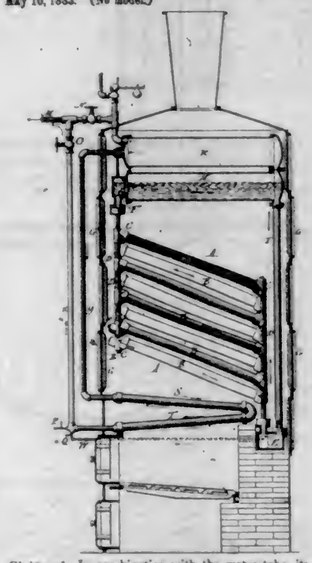
5. In combination with the bowl A, the reciprocating bottom C, formed of platforms *c c* and bars *c*′, substantially as described.



6. The combination of the feed-roll H, the reciprocating bottom C, provided with teeth *c*′, feed-apron D, and the squeeze-rolls E E, substantially as described.

291,090. UMBRELLA-CATCH. GEORGE G. SAYE, New York, N. Y. Filed Mar. 26, 1883. (No model.)

Claim.—A permanent catch and runner or slide so constructed and operated that in passing over the catch it shall be made to slightly rotate by the use of a groove or other means, and then so adjust itself as to be supported or held by said catch.



291,091. MANUFACTURE OF TUBS OR VESSELS OF HYDRAULIC CEMENT. GEORGE L. SCHMIDT, New York, N. Y., assignor to Andrew G. Myers and Fredericke M. H. Schmidt, same place, and Frederick W. Lawrence, Brooklyn, N. Y. Filed Aug. 13, 1881. (No model.)

Claim.—1. A tub or vessel of hydraulic cement constructed with a wire frame, made complete, of form corresponding to that of the tub when finished, the horizontal wires of said frame being continuous around the corners joining the sides to the ends and embedded in the cement walls, substantially as herein specified.

2. A laundry-tub provided with two guide and socket ribs on its front wall adapted to receive and retain a removable wash-board, substantially as herein set forth.

291,092. STEAM-BOILER. LOUIS SCHUTTE, Philadelphia, Pa. Filed May 10, 1883. (No model.)

Claim.—1. In combination with the water-tube, its cap or fitting C, provided with the opening *a*, and having the pocket or receptacle cast integral therewith, the valve *b*, plate *d*, and screw *c*.

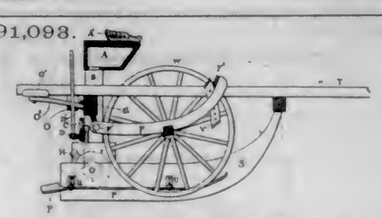
2. The cap or fitting C, cast complete in one piece, with the opening *a*, to afford access to the tube, and with the external pocket to admit the valve and valve-supporting devices.

3. In combination with the tube B, the cap or fitting C, provided with an opening, *a*, having a diameter less than that of the tube, and arranged with its axis below that of the tube, and means, substantially as described, for closing said opening, whereby the introduction of a tool upon the lower surface of the tube is permitted.

4. In combination with the tubular boiler, having the mud-drum at the base and the steam-drum at the top, the superheater, the steam-discharge pipe from the steam drum, and provided with a closing-valve, a pipe connecting the steam-drum with the superheater, a second pipe provided with a closing-valve, connecting the superheater with the steam-discharge pipe, and a third pipe provided with a closing-valve, connecting the superheater with the mud-drum, whereby the superheater may be used as a portion of the generating apparatus at will.

5. The combinations of the tubes B, and the vertical connections at their ends communicating-drums H and K, pipe I, mud-drum E, the superheater-pipes *x y*, and W, and the valves Q, N, and O.

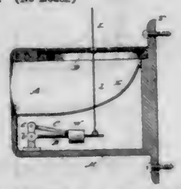
6. The improved plate for a boiler-casing, consisting of the flat body portion, having the ribs *g* formed on its two surfaces, combined with the anchors *h*, and the body of refractory or non-conducting material applied to one face of the plate within the flange.



7. The combination of the plates flanged upon both faces, the body of refractory material applied to one surface within the flange, and the body of refractory material applied to one face outside of said flange.

291,093. CORN-PLANTER. WILLIAM G. SELBY, Princeville, Ill. Filed Feb. 5, 1883. (No model.)

Claim.—1. A frame F F² hinged or pivoted at one end to the frame-work of a corn-planter, in combination with supporting-wheels having bearings in said frame midway between its pivoted end F' and free end F², whereby, when the driver rests his weight upon said free end F², the said corn-planter is raised wholly or partially from the ground, substantially as and for the purpose specified.



2. The seed-box A, spouts B B, shoes S S, having gage-plates and packers P P', recessed disks J J', brushes H H, disks O O, pawls E, bar

291,093.

D, and lever D', in combination with suitable frame-work, the pivoted frame F F², stop-plate V, and the wheels W W, substantially as and for the purpose set forth.

291,094. MECHANICAL TELEPHONE. CHAS. SELDEN, St. Louis, Mo. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, in a mechanical telephone, with the diaphragm or other vibratory surface with which the line or cord is connected, of a counter-balance for counteracting the strain of the line or cord upon the diaphragm.

2. The combination, with the diaphragm or other vibratory surface for a mechanical telephone, of means for exerting a strain or pull counter to that of the line or cord upon the diaphragm, so as to oppose the tendency of the latter to bias under the strain of the line.

3. The combination, with the diaphragm or other vibratory surface for a mechanical telephone, of an adjustable counterbalancing weight or spring, arranged to exert a pull upon the diaphragm contrary to that of the line.

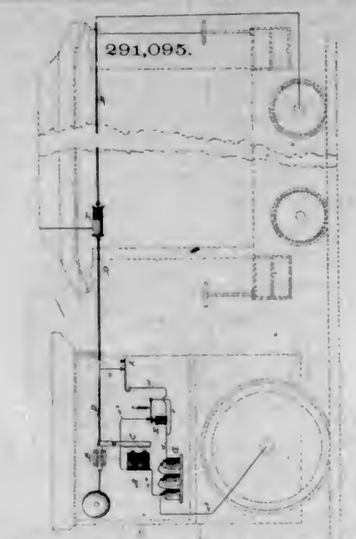
4. The combination, with the diaphragm or other vibratory surface for a mechanical telephone, of a self-adjusting counter-balance that acts on the diaphragm in contrary direction to the strain or pull of the line.

5. The combination, with the diaphragm, of a lever connected by a cord to the side of the diaphragm opposite the line, and a weight adjustable on said lever, as and for the purpose described.

291,095. RAILWAY-TRAIN SIGNAL APPARATUS. CHAS. SELDEN, St. Louis, Mo. Filed Apr. 2, 1883. (No model.)

Brief.—Normally-closed circuit through train returns by rails of track, the conductor being carried in the ordinary bell-rope. Pulling the rope breaks the circuit at P, (piston circuit-breaker,) thereby closing local circuit and sounding alarm on engine, or operates the alarm mechanically in the ordinary way. Key on engine enables engineer to test condition of electrical connections. Brace-rods of cars utilized as conductors.

Claim.—1. The combination, with the bell or other signal on the locomotive, of means for actuating the same mechanically, extending through the train, an operating electro-magnet connected to the same mechanism and in a normally-open local circuit, and a normally-closed circuit extending through the train and containing an electro-magnet which controls the local circuit.



2. The combination, with the bell mechanism in the locomotive, of the operating-cord D, connected therewith, the magnet A, having an armature, C, connected also with said mechanism, battery or generator G, and electro-magnet E, the two latter being in a normally-closed circuit which includes a conductor in or on the bell-cord.

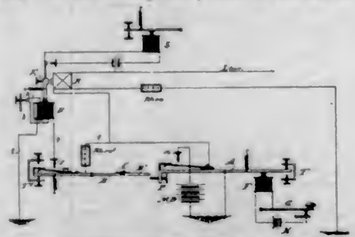
3. The combination, with the bell mechanism on the locomotive, of an operating-cord and an electro-magnet, both connected to the same, the said electro-magnet being in a normally-open circuit, a relay electro-magnet in a normally-closed circuit including a conductor in or on the bell-cord, and circuit-breaking devices interposed in said bell-cord, so that by subjecting said cord to tension the normally-closed circuit may be broken and the operating-magnet of the bell mechanism made to actuate the same.

4. The combination of the bell mechanism, bar B, the armature C, magnet A, in a normally-open local circuit from generator G, and relay-magnet E, in a normally-closed circuit extending through the train and including the battery G, conductor X², and the rails of the track.

5. The combination, with a cylinder or guideway, H, made in two parts, that are respectively conducting and non-conducting, of spindle or bar H³, having a conducting stud or head adapted to make electrical contact with the conducting portion of the cylinder or guide, and a spring

291,095.

for holding said stud or head against one end of the guide or cylinder, said guide or cylinder and said bar and cylinder being provided at opposite ends with means for the attachment of a conductor.



6. The combination, with the cylinder H, one portion of which has an interior surface of conducting and the other portion of non-conducting material, of the piston, the edges of which slide in contact with the interior surface, the spindle, and the spring H⁶, as and for the purpose described.

7. The combination, with the cylinder or tube made conducting at one end and non-conducting upon its interior at the other, of a piston or stud moving in said tube and normally held against the conducting-head of said tube, a spindle or bar for drawing said piston into the non-conducting portion of the cylinder, and means for electrically connecting conductors with the spindle and with the conducting-head at the opposite end of the tube.

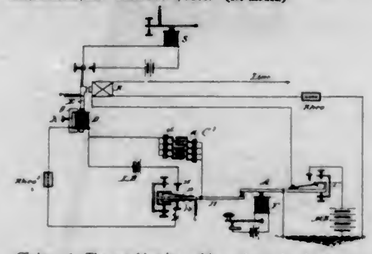
8. The combination, with the bell-magnet A on normally-open local circuit from a suitable generator, of relay-magnet E, on a normally-closed circuit from the same generator, extending through the train, and a suitable normally-closed circuit-breaking device on the caboose or other car, as and for the purpose described.

291,096. STATIC NEUTRALIZER FOR TELEGRAPHS. CHAS. SELDEN, St. Louis, Mo. Filed Feb. 7, 1883. (No model.)

Brief.—The static discharge itself produces the neutralization.

Claim.—1. The combination with a relay, of an auxiliary electro-responsive device arranged to neutralize the effects of a static discharge-current flowing in the relay-coils, and means for connecting said auxiliary device with the line simultaneously with the flow of the static discharge-current in the relay-coils, so that the said discharge may flow in whole or in part through said auxiliary device.

2. The combination, with a relay, of auxiliary coils or helices for neutralizing the effects of the static discharge-current in the relay, and means for admitting the static discharge-current to said helices simultaneously with its flow in the coils of the relay.



3. The combination, with a relay, of auxiliary coils D, branch connection 9, and means for closing the latter simultaneously with the flow of the static discharge-current in the relay, whereby a portion of said current may flow in branch 9 and neutralize the effects of such current in the relay-coils.

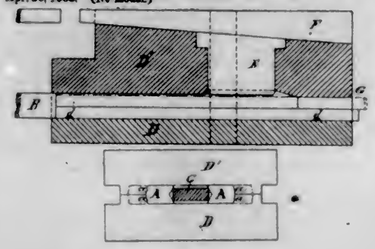
4. The combination of an auxiliary neutralizing device, a transmitter, and a circuit-closer for connecting the auxiliary device with the line simultaneously with the movement of the transmitter in removing the main battery from line, so as to admit a portion or all of the static discharge-current to the auxiliary neutralizing device, as and for the purpose described.

5. The combination of coils D, circuit 9, transmitter, and supplemental circuit-closer operated simultaneously with the transmitter, and serving to close circuit 9, connected to main line, so that when the circuit is closed the static discharge-current may flow into the same simultaneously with the movement of the transmitter in disconnecting the battery.

6. The combination of neutralizing-coil D, circuit 9, connected to main line, so as when closed to receive a current of static discharge, circuit-closer B B', and transmitter A.

291,097. STATIC NEUTRALIZER FOR TELEGRAPHS. CHAS. SELDEN, St. Louis, Mo. Filed Feb. 7, 1883. (No model.)

Claim.—1. The combination, with a relay, a local battery, a condenser, a local auxiliary neutralizing-coil normally out of circuit with said condenser, and a circuit-controller for switching the auxiliary coils into a discharge-circuit with the condenser simultaneously with the flow of the static discharge-current in the relay.



2. The combination, substantially as described, of a relay, an auxiliary local neutralizing-coil for neutralizing in the relay the effects of the static discharge-current, a local battery, a condenser in the local circuit, a circuit-controller for connecting a pole of the condenser alternately to the local battery and the auxiliary coils, and means for operating said controller, so as to allow the condenser to discharge through the auxiliary coils simultaneously with the withdrawl of the main-line battery and the connection of said line to earth.

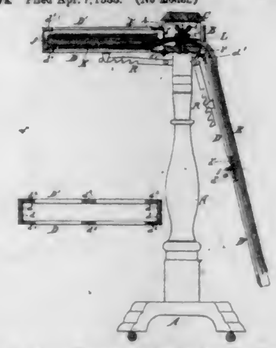
3. The combination of a relay-armature, an auxiliary coil acting on said armature in opposition to the relay-coils when affected by static discharge-current, a local battery and condenser, and means for connecting a pole of the condenser alternately with the local battery and the auxiliary coil, the connection with the latter being effected simultaneously with the flow of the static discharge-current in the relay.

4. The combination of a relay, a local auxiliary coil acting inductively on said relay in opposition to the relay-coils when traversed by the static discharge-current, a local battery and condenser, and means for connecting a pole of the condenser alternately, first to the battery and then to the auxiliary coils, simultaneously with the flow of the static discharge-current in the relay-coil.

5. The combination of a relay, an auxiliary coil acting in opposition to the relay-coils when affected by the static discharge, a local battery and condenser, and a supplemental circuit-closer operated by the transmitter and connecting a pole of the condenser alternately to the battery and the auxiliary coils.

291,098. ART OF UPSETTING AND SHAPING METAL BARS. WILLIAM SELLERS, Philadelphia, and GEORGE H. SELLERS, Ridley Park, Pa., said Geo. H. Sellers assignor to John Sellers, Jr., Philadelphia, Pa. Filed Apr. 26, 1883. (No model.)

Claim.—1. The improvement in the art of upsetting metal bars without piling and without folding, which consists in sustaining so much of the bar as is to be upset by supports, one or more of which, when pushed by the upsetting-ram, will recede laterally without ceasing to act as supports, and thickening and spreading the bar simultaneously by upsetting it while so supported, substantially as described.



2. The combination, with an upsetting-die, of supports, one or more of which, without ceasing to act as such, will recede, substantially as and for the purposes set forth.

3. The combination, with an upsetting-die, of a guiding relieving-plunger, substantially as and for the purposes set forth.

4. The combination, with the upsetting-die, the guiding relieving-plunger, the wedge-block, and the upsetting-ram, of devices for changing the rate of movement of the guiding relieving-plunger relatively to that of the ram, substantially as and for the purposes described.

5. The combination, with an upsetting-die, of the movable piece *d d*, substantially as and for the purposes set forth.

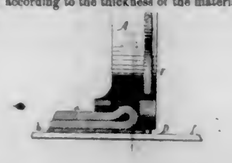
291,099. WALL-PAPER EXHIBITOR. FRANCIS H. SHEPHERD, Davenport, Iowa. Filed Apr. 7, 1883. (No model.)

Claim.—1. In a wall-paper exhibitor, the box B, within which are confined the ends of the paper E, in combination with folding frames D and D′, and locking device *g*, substantially as and for the purpose described.

2. The frames D D′, provided with cross-slats *d′*, slats d^2, and side slats, *d*, hinged together at *e e*, and hinged at *d′ d′* to the bottom b^2 of the box B, in combination with the ratchets R R, adapted to hold the frames in a horizontal position on each side of the column A′, substantially as and for the purpose described.

3. The box B, provided with the bottom b^2 and end pieces, *b b′*, and open sides, whereby the wall-paper E may be secured in position on the screw-pin *h* by the clamp-nut H_1 and adapted to be turned over from right to left or left to right for exhibition, the cover C being removed, substantially as described.

4. The combination of the column A′, folding frames D D′, box B, screw-pin *h*, clamping-nut H, and holding-board *i*, substantially as and for the purpose described.



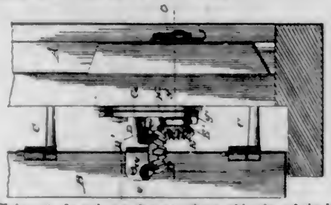
5. The folding frames D and D′, hinged together at *e e*, hinged to the box B, and provided with flexible supports *f*, for holding up the wall-paper E when the frames are folded up, substantially as described.

6. A wall-paper exhibitor having folding frames on both sides of its supporting-column, and with an open-sided box mounted on the column, wherein one end of sheets of wall-paper are confined in position, substantially as and for the purpose described.

7. The combination of the column A′, folding frames D D′, box B, means for holding the ends of the paper E within the box B, and border-holder L, substantially as and for the purpose described.

291,100. WHIPPING-GUIDE FOR SEWING-MACHINES. GEORGE SIMPSON, Moravia, N. Y., assignor of one-half to Stephen M. Titus, same place. Filed June 14, 1883. (No model.)

Brief.—The device is adapted to "whip" the linings to boot or shoe uppers in "blind stitching." The tapered pin acts by the resistance of the bed-plate, and through the downward pressure of the presser-foot, to adjust the movable guide-plate under the presser-foot with reference to the needle and according to the thickness of the material operated upon.

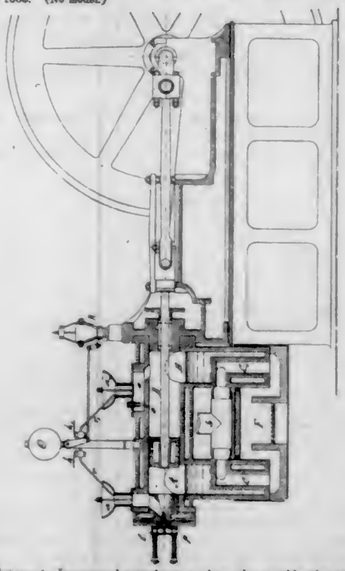


Claim.—1. The combination, with the presser-foot of a sewing-machine, of a whipping-guide and means whereby said guide is adapted to be automatically adjusted laterally under the presser-foot as the latter rises or falls, substantially as described.

2. The combination, with the presser-foot and bed-plate of a sewing-machine and the guide C, of the adjusting-pin D and intermediate means constructed and arranged to move the guide toward the needle as the foot descends, substantially as described.

3. The combination, with the presser-foot and bed-plate of a sewing-machine, of the spring-guide C, the tapering pin D, plug E, and spring F, substantially as and for the purpose specified.

291,101. SHUTTER WORKER AND FASTENER. ASA C. SESSON, Easton, Mass. Filed May 10, 1883. (Model.)

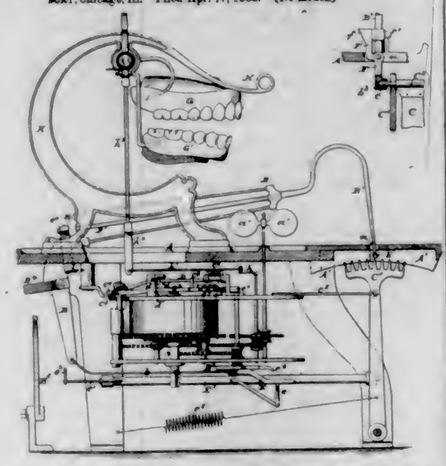


Claim.—1. In a shutter-fastener, the combination of the key-post, the cam and toothed segment thereon, the flanged vertically-movable plate having a locking-toe, and the toothed segment having notches to receive said toe, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination of a face-plate rigidly secured to the window-frame, a key-post having a single-throw cam and an oscillating toothed segment on one end, a vertically-sliding flanged plate having a locking-toe formed on this plate, and a toothed segment having a notched top, which is rigidly secured to the shutter, and adapted to engage with the said oscillating toothed segment and the toe of the sliding flanged plate, all constructed and adapted to operate substantially in the manner and for the purposes described.

3. A shutter-fastener composed of the following elements: toothed segments D E, a frame or plate having acute-edge locking-toe, flanges *g g′*, and slots through it, and means for raising and depressing said frame or plate, all constructed and adapted to operate substantially in the manner and for the purposes described.

291,102. GAS-MOTOR. JOHANNES SPIEL, Berlin, Germany. Filed Aug. 13, 1883. (No model.)



Claim.—1. In gas and petroleum engines, the combination of the power-cylinder with a water and steam chamber constantly communicating with the interior of the cylinder, and a separate fire-place and flue adapted to heat and evaporate the water in the said chamber from outside.

2. In gas-engines, the combination of the power-cylinder with a water-receptacle constantly communicating with the interior of the cylinder, and provided with an inlet for combustible gas mixture, as well as with an igniting mechanism, and a separate fire-place and flue adapted to heat and evaporate the water in the said chamber from the outside.

3. An igniting apparatus for gas-engines, comprising in its construction a hollow burner, *b*, situated in an intermediate chamber, *s*, having near the base of the burner an enlargement, to which the combustible mixture serving to feed the igniting-flame is admitted through a channel, *q*, for the purpose of heating the said mixture by its successive contact with the outer and inner surface of the burner before it is ignited, substantially as described.

4. In a gas-engine, the combination of a water-receptacle, communicating with the cylinder, with a fire-place, F, and flues C C′, leading the products of combustion from the latter through the water-receptacle, substantially as described.

291,103. AUTOMATIC ADVERTISING DEVICE. JOSEPH A. STANBURY, Chicago, Ill. Filed Apr. 17, 1883. (No model.)

Claim.—1. In an automatic advertising apparatus, a set of independent cards supported in an intermittingly-moving rack arranged within a suitable housing, in combination with vibrating lifting-arms that successively engage such cards and bring them into view, substantially as described, and for the purpose set forth.

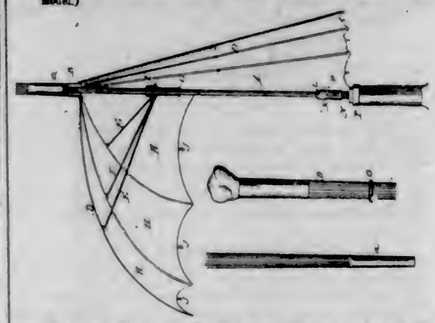
2. In an automatic advertising apparatus, a series of independent detached cards supported in an intermittingly-moving rack, in combination with a pair of intermittingly-vibrating arms, substantially as described, and for the purpose set forth.

3. In an automatic advertising apparatus, the combination of the intermittingly-moving card-holding racks C′ C′ with the table A, having card-opening *a*, and projecting ribs A′, substantially as described, and for the purpose set forth.

4. In an automatic advertising apparatus, the combination of the card-lifting arms B B′, wiper E, lever e', and rock-shaft E′ with the cam-yoke B^3, having a spur projection, e^6, as described, and for the purpose set forth.

5. In an automatic advertising apparatus, as herein described, the combination of the card-holding rack C′ with the wiper e', ratchet-sector e^2 e^3 e^5, lever e^4, rod e^3, pawl e^6, arm D, spring e^8, and pin projections e^9 e^{10}, substantially as described, and for the purpose set forth.

6. In an automatic advertising apparatus, as herein described, the combination of the card-lifting arms B B′, heart-shaped cam B^3, cam-yoke B^2, and connecting-rod *b*, as described, and for the purpose set forth.



7. In an automatic advertising apparatus, as herein described, the combination of the card-lifting arms B B′ with the bell-crank levers e^4, connecting-rod e^3, lever e', rock-shaft E′, inclined-faced lever or arm *e*, and rotating arm or wiper E, as described, and for the purpose set forth.

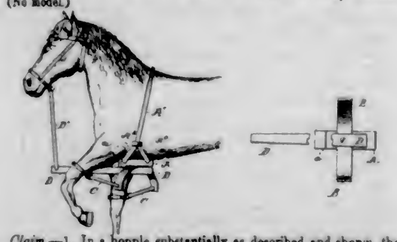
8. In an automatic advertising apparatus, the combination of intermittingly-moving card-lifting arms and card-holding racks with the advertising-cards C, provided with pintle-rods *c*, as described, and for the purpose set forth.

9. In an automatic advertising apparatus, the combination of intermittently-moving card-lifting arms and card-holding racks with the advertising-cards C, having pintles *c*, and attaching-clips C^3, having beveled ends, as described, and for the purpose set forth.

10. In an automatic advertising apparatus, as herein described, the combination of the locking rock-arm B^5 with the connecting-bar B^4 of the lifting-arms B B′, as described, and for the purpose set forth.

291,104. UMBRELLA. MARVIN C. STONE, Washington, D. C., assignor of one-half to John McCormick, same place. Filed Dec. 22, 1882. (No model.)

Claim.—1. The combination, in an umbrella, of a series of cloth-sustaining ribs, the cloth or covering applied internally upon said ribs, and means, substantially as described, acting at the center to effect the winding or coiling of the cloth.



2. In combination with the handle, the ribs, the internally-applied cloth, the braces, and the brace-supporting collar F, arranged to slide upward toward the inner ends of the ribs as the latter are closed, substantially as shown.

3. In combination with the ribs, the internally-applied cloth, the braces, and the sleeve or collar to sustain said braces, the rotating handle, the sliding collar K, and means, substantially as described, for connecting said collar temporarily with the cloth or cover, whereby the winding of the cloth from the center outward is effected.

4. In combination with the external ribs, the cloth, and the handle, the sliding collar K, a spring, N, tending to urge said collar endwise, and means, substantially as shown, for connecting said collar temporarily to the edges of the cloth or covering, whereby the cloth is subjected to a yielding strain or pressure while being wound from the center.

5. In an umbrella, the combination of the cloth, the external supporting-ribs, and the internal strips or plates, I, applied as described and shown.

291,105. HOPPLE. LORENZO STOW, Rome, Tenn. Filed Sept. 24, 1883. (No model.)

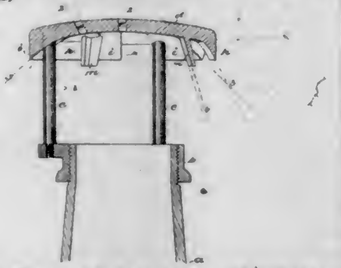
Claim.—1. In a hopple substantially as described and shown, the combination of a yoke pivoted centrally on a suitable support in rear of the animal's fore legs, and straps connecting the outer ends of said yoke with the animal's legs, and means whereby the support may be attached to the animal's body, as and for the purposes specified.

2. In a hopple, the combination of a suitable support, means whereby said support is attached to the animal's body, a yoke pivoted centrally to said support, and having its outer ends arranged in a plane below that of the support, and straps secured to the ends of said yoke and adapted to connect the same with the animal's fore legs, substantially as set forth.

3. In a hopple, the arc-shaped yoke pivoted at its crown to a suitable support, and having its lower ends provided with straps whereby it may be connected with the animal's fore legs, in combination with said support and means whereby it may be attached to the animal's body, all substantially as and for the purposes specified.

4. In a hopple, the combination, with a suitable support held under the animal's breast in rear of and close to the fore legs, of the head-holding bar, having its rear end pivoted to the said support and extended forward between the animal's fore legs and connected at its forward end with the animal's head, and adapted to be swung laterally, substantially as set forth.

5. In a bopple, the combination of the supporting-block, having on its under side a shoulder or stop, *a*, the yoke pivoted centrally to the said block in rear of the said shoulder or stop, and straps secured to the ends of said yoke, and means whereby the said supporting-block is held to the animal's body, all substantially as and for the purposes specified.

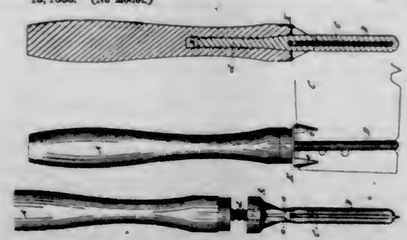


291,106. PICTURE-CASE FOR TOMBSTONES. WILLIAM STRONG, Kalamazoo, Mich. Filed June 26, 1883. (No model.)

Claim.—1. The combination, with a tombstone or equivalent grave-marking device having the securing-holes in the upper and lower beveled sides, of a picture-case containing a picture accessible to the sight and impervious to the weather, having studs on its upper side and holes through its lower side, and a hinged lid having studs adapted to enter said holes and extend into the holes in the mortise, all substantially as set forth.

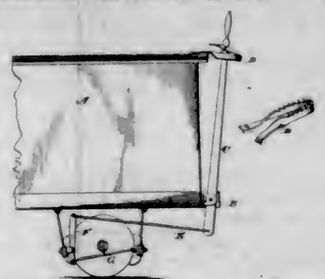
2. A tombstone or other grave-marking device having a recess adapted to shield the picture from the weather, and provided with slanting holes in its upper and lower side, in combination with a picture-case containing a picture accessible to the sight, having the slanting studs on its upper side, and a lid having studs on its lower face adapted to enter the lower holes, said lid adapted to hide the mode of securing the case in the stone, and having its upper face polished to contain an inscription, all substantially as described.

291,107. HOSE-NOZZLE ATTACHMENT. RICHARD F. TOBIN, South Boston, assignor to Caleb C. Walworth, Boston, Mass. Filed Feb. 16, 1883. (No model.)



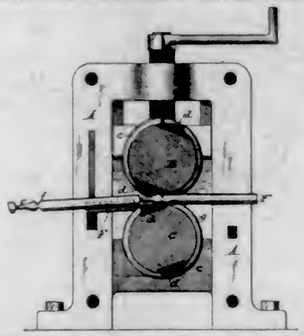
Claim.—1. The water-deflecting plate having cut therein on its under side the guiding-grooves *h i k*, of different depths and curvatures, extending to the periphery of the said plate, combined with the arm *c*, to support the said plate across the path of the stream issuing from a hose or pipe, whereby the said stream is thrown at different angles with relation to the direction of the issuance of the stream, as set forth.

2. A water-deflecting plate having cut therein the grooves *h i k*, of different depths and curvatures, combined with the projections *m* and arms *c*, to support the said deflecting-plate across the path of a stream from a hose or pipe, substantially as shown, and for the purpose described.



3. A water-deflecting plate having cut therein the grooves *h i k*, of different depths and curvatures, and the holes *s*, combined with the projection *m* and arms *c*, to support the said deflecting-plate across the path of the stream issuing from the hose or pipe, substantially as and for the purpose described.

291,108. SAW-HANDLE. MOSES E. TREE, Batavia, N. Y. Filed Apr 13, 1883. (No model.)

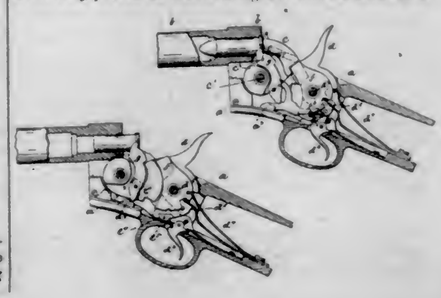


Claim.—In a handle for a crescent-saw, the combination of the longitudinally-slotted clamping-rod D, having the screw-threaded end *d*, the handle A, having the central threaded bore, B, and the ferrule E, having a smooth bore, and lips or braces *e*, engaging with the sides of the saw blade, substantially as shown and described.

291,109. CAR-BRAKE. MARSHALL TURLY and REUBEN T. BRYANT, Council Bluffs, Iowa. Filed Oct. 12, 1883. (No model.)

Claim.—The combination, with suitable brake mechanism, of a lever pivoted near its lower end to the car-body, and connected below said pivoted point to the brake mechanism, a U-shaped rack-bar secured to the car-body and embracing the lever near its upper end, and a dog pivoted to the lever, all of the above parts combined and adapted to operate as described.

291,110. MACHINE FOR ROLLING COUPLING-PINS. ROBERT REDARDSON TURNER, West Middlesex, Pa. Filed Mar. 10, 1883. (No model.)



Claim.—1. In a machine for rolling car-coupling pins, the two co-operating rolls, each provided with a semicircular groove, rabbets or shoulders following the sides of the groove, and a heading and pointing die seated wholly within the periphery of the roll, as described and shown.

2. In a machine for rolling coupling-pins, the two rolls B C, each provided with a semicircular groove, *c*, the circumferential recess *g*, and the die *d*, as described, in combination with the guide having its end seated in the recesses, as described and shown.

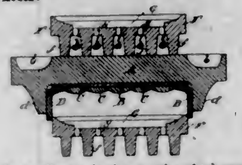
291,111. BREECH-LOADING FIRE-ARM. HORACE UPDEGRAFF, Hampton, Kans. Filed Oct. 5, 1882. (Model.)

Claim.—1. In a breech-loading fire-arm, the combination of a breech-block, a firing-pin arranged within the breech-block, and having its rear end slightly projected therefrom, a pivoted breech-block support arranged to drop behind the breech-block and against the projected end of the firing-pin, and the hammer arranged to strike the breech-block

supports and force the latter downward against the end of the firing-pin and behind the breech-block, substantially as set forth.

2. In a breech-loading fire-arm, the combination, substantially as hereinbefore set forth, of the frame or casing, a stop, a^2, fixed upon the under plate of the frame, the breech block having a side mortise or recess, c^3, formed in rear of its pivotal center, and cam c^4, and the extractor placed within the mortise c^3 in the breech-block, and pivoted to the side plate of the frame, in position to be engaged by the cam c^4 and forced against the stop a^2, as set forth.

3. In a breech-loading fire-arm, the combination, substantially as hereinbefore set forth, of a breech-block having notch or shoulder c^2 on its rear sides, a firing-pin placed within the breech-block and having its rear end slightly projected therefrom, a breech-block support or cross-piece having head f^3, to receive the blow of the hammer, and provided with a recess, f^3, in its forward or upper end, to receive the projected end of the firing-pin, and pivoted and turning on the same pin with the hammer, and hammer arranged to fall upon the upper side of and force the breech-block support downward against the projected end of the firing-pin and behind the breech-block, as set forth.



4. The combination of the breech-block, the intermediate hammer, having its lower end constructed with the projections f^3, the main hammer *d*, the sear *e*, and the lugs e^4, secured on the sear *e*, and arranged in position to engage the projections f^3 on the intermediate hammer, *f*, and lift the said hammer *f* when the hammer *d* is drawn back, substantially as and for the purposes set forth.

5. The combination, substantially as set forth, of the breech-block, the hammer *d*, the sear *e*, and a cam or inclined plate, *a'*, fixed on the framing *a*, and arranged in position to engage and lift the forward end of the sear in the operation of the device, substantially as and for the purposes set forth.

6. In a breech-loading fire-arm, the combination of the breech-block, the hammer *d*, the sear *e*, provided with the lug e^4, having pin e^5 projected therefrom, and the cam or inclined projection a^2, formed on the framing *a*, and arranged in position to be engaged by the pin e^5, and raise the lug e^4 clear of the trigger when the gun has been fired, substantially as set forth.

7. In a breech-loading fire-arm, the hammer *d*, constructed with full-cock notch d^2, and the sear *e*, constructed with the half-cock notch e^3, in combination with the breech-block *c* and trigger d^4, all supported in a suitable framing, substantially as specified.

291,112. OIL-PRESS. JOHN H. VAILE, Dayton, Ohio. Filed Sept. 21, 1883. (No model.)

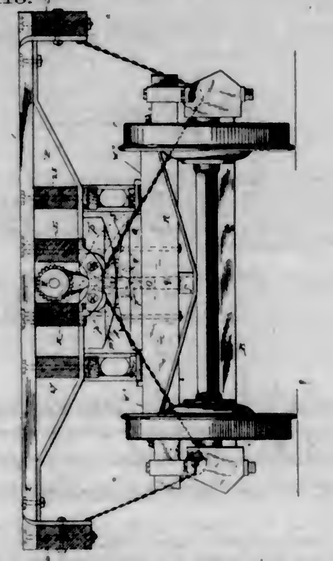
Claim.—1. In an oil-press having a series of telescopic boxes, the combination, with each of said boxes, of removable supplemental ribs, forming the top walls thereof.

2. In an oil-press having a series of telescopic boxes, the combination, with each of said boxes, of supplemental ribs, forming the top walls thereof, and supplemental side walls extending up and bent in for some distance, so as to abut against the supplemental ribs and form smooth unbroken surfaces at the sides, as and for the purpose specified.

3. In an oil-press having a series of telescopic boxes, the combination, with each of said boxes, of removable supplemental ribs, side plates, D, and end plates, E, substantially as described.

4. In an oil-press having telescopic boxes and removable meal-supporting plates, the combination, with said boxes and plates, of transversely-corrugated front portions, whereby the meal is retained and prevented from being squeezed out, as set forth.

5. In an oil-press having a series of telescopic boxes, the box A, having a smooth, flat top, *a*, with a surrounding gutter, *b*, pendent side walls, *d*, supplemental ribs C, secured to a removable plate, B, angular side plates, D, and end plates, E, substantially as described.



6. In an oil-press, the perforated division-plates, having on their under sides longitudinal or transverse ribs and on their upper surfaces supplemental transverse or longitudinal ribs, with interstices opening into the perforations in the plates.

7. In an oil-press, the combination and arrangement of the boxes A, division-plates F, and steam-pipes *i*, said steam-pipes occupying spaces between the division-plates and boxes, substantially as described.

291,113. DUMPING-CAR. MATTHEW VAN WORMER, Melrose, Mass. Filed Sept. 8, 1883. (No model.)

Claim.—1. The oil-box C for the incasing and oiling of the worm-wheel and its worm E, constructed, as set forth, with a removable end

291,118.

piece and removable cover, the concave bottom having flat parts *j* and *j'*, and the raised part *m*, the construction permitting the box to hold a large supply of fluid nearly up to the axis of the worm-wheel, as and for the purposes described.

2. In a dumping-car and in combination with the rocker *a*, the king-bolt O, made, as described, in two parts, jointed or hinged together, one part being provided with a head by which it is connected firmly to the rocker and the other part being lodged loosely in a socket in the rocker-bed, all as shown and set forth.

3. In combination, the downwardly-curved hangers *u*, made with the opening and bearings for the two small pulleys *w w*, the said pulleys supported therein in near proximity to each other, the hanger and its pulleys being applied relatively to the inside stringers and to the large pulley *z*, as set forth, and for the purposes described.

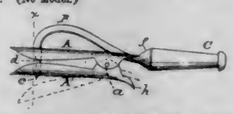
4. The transom 1, constructed of the series of solid iron bars 2, set edgewise, and of the wood pieces between such bars, all these parts being firmly bolted together, the upper surface being adapted to form a part of the car-floor, some of the bars resting on the outside sills and others being twisted and secured to the inside of said sills.

5. In combination with the oil-box C and the worm-wheel D and worm-gear E within the same, the gear-wheel 7 on the worm-wheel shaft and outside of the oil-box, and the gear-wheel 8 on the main shaft and also outside of the oil-box, the combination permitting the worm-wheel and its worm-gear to revolve freely in the oil while keeping the oil from the other gears, all substantially as set forth.

6. The side bearings, 10 10', each made in a single piece and with extended flat rollerless bottoms, and arranged to slide lengthwise of the car, in combination each with a pair of rollers, 11 11, on the bolster, these side bearings on each side of the car being connected by rods 15 16 and a chain, 17, and pulleys 18 18, and whereby, when the rod 16 is given an endwise movement, the side bearings shall move in opposite directions, as and for the purposes set forth.

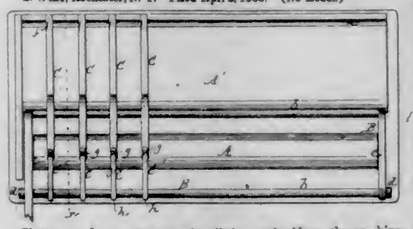
7. In combination with the side bearings, 10 10', rollers 11 11 on the bolster, rods 15 16, chain 17, and its pulleys 18, the cross-lever 19 chain 20, and staff 21, the combination being and operating substantially as set forth.

291,114. BUILDING-BLOCK. JOSEPH WADLEIGH, Milks Grove, Ill. Filed Apr. 9, 1883. (No model.)



Claim.—1. A building-block composed chiefly, as to its bulk, of straw pressed flat, with so much concrete or clay intermixed as to cement the pressed straw together, and the blocks bound together by wire, as specified.

2. In apparatus for manufacturing building-blocks which are composed of pressed straw and concrete, the combination of the curved-bottomed mixing-trough, the clay or cement mixing trough connected there-



with, and the press connected with the curved mixing-trough, as specified.

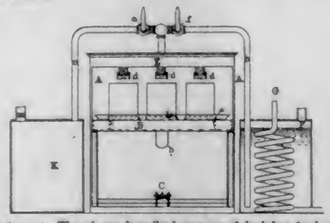
291,115. CIGAR-HOLDER. ALBERT L. WEBB, Clinton, Iowa. Filed June 29, 1883. (No model.)

Claim.—A cigar-holder consisting of the hinged jaws A A', spring *b*, mouth-piece C, and the tube B, provided with the opening *d* near its pointed end, which is extended transversely through the jaws, the other end of the tube being connected with the mouth-piece, substantially as and for the purposes described.

291,116. APPARATUS FOR SLITTING EMBROIDERY. JONATHAN B. WEST, Rochester, N. Y. Filed Apr. 2, 1883. (No model.)

Claim.—1. In an apparatus for slitting embroidery, the combination of a bed upon which the embroidered sheet is laid, a friction device for holding the sheet in position as it is drawn forward, and one or more bars resting upon the bed and over the sheet and guided by the raised line of embroidery, and provided with a knife to do the slitting, as herein described.

2. The combination of a bed upon which the sheet is laid, one or more bars provided with knives resting over the bed and upon the sheet, and guided by the raised line of embroidery, and a frame to which the bar or bars are attached, serving as a friction device for controlling the sheet, and as an elevator to raise the bar or bars above the sheet, as specified.

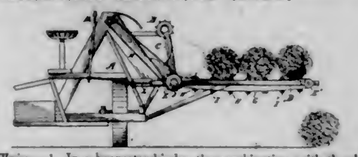


3. The combination of the bed A, provided with the raised portion A', the frame B, pivoted at its rear so as to be elevated at its front, and the bars C, resting on the frame and attached at the rear, and the knives *f*, attached to the front ends of the bars, as herein shown and described.

4. In an apparatus for slitting embroidery, the combination of the knife-bar adapted to rest upon the cloth, and the arm pivoted to its rear end and provided with means for attachment to a support behind, as set forth.

5. In an apparatus for slitting embroidery, a knife-bar adapted to rest upon the cloth, and provided at one lower edge with a guide of such length as to extend from point to point of the embroidery, as set forth.

6. In an apparatus for slitting embroidery, the combination of a bed upon which the embroidered sheet is laid, and two or more knife-bars resting thereon, capable of lateral adjustment on their supports, to be fitted to the lines of embroidery on the sheet, as set forth.

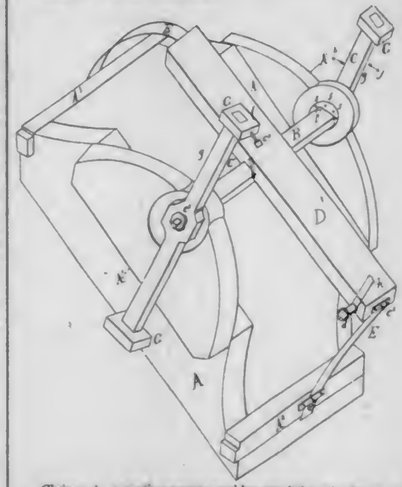


291,117. METHOD OF AND DEVICE FOR FILLING AND DRAINING FOOD-CANS. WILLIAM A. WILKS, Baltimore, Md. Filed Nov. 6, 1883. (No model.)

Claim.—1. The above-described process of draining food-cans and preparing them for sealing or closing by introducing air or gas under pressure into one of the vent-holes and blowing a portion of the liquid out of the other, substantially as described, and for the purposes set forth.

2. In an apparatus for filling food-cans with liquid, the tank K, containing compressed air or its equivalent, provided with means for transmitting and regulating the passage of compressed air from the tank through the vent-holes of the cans, substantially as and for the purposes described.

291,118. SHEAF-CARRIER FOR HARVESTERS. EDWIN S. WILLIAMS, Howard, and JAMES E. HARDER, Niles, assignors of one-third to A. V. Cleland, Niles, Mich. Filed Feb. 21, 1883. (No model.)

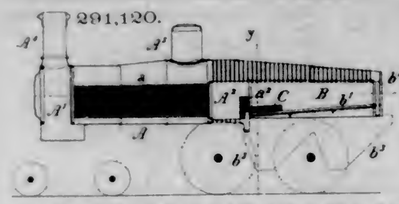


Claim.—1. In a harvester-binder, the combination, with the sheaf-discharging mechanism, of an endless apron mounted on rollers and arranged to receive at one end the bound sheaves from said discharging mechanism and deliver them at the other end, the said apron being adapted to be moved by the force of the discharging mechanism as each sheaf is discharged from the latter, the operating-gear of the harvester, and means for throwing the driving-roller of the said apron in and out of gear with the operating mechanism or gear of the harvester, substantially as specified, and for the purposes set forth.

2. In a harvester-binder, the combination of the discharge-arms C C, the endless apron G, mounted on rollers and arranged as specified with relation to the said arms, the said apron being adapted to be moved by the force of the discharging mechanism as each sheaf is discharged from the latter, the operating-gear of the harvester, and means for throwing the driving-roller of the said apron in and out of gear with the operating mechanism of the harvester, the said means consisting, essentially, of a clutch controlled by means of a lever adapted and arranged to be shifted by the driver, substantially as and for the purposes specified.

3. In a harvester-binder, the combination of the discharge-arms C C, the endless traveling apron G, arranged to receive at one end the bound sheaves from the said arms and deliver them at the other end, the said apron being adapted to be moved by the said arms while in contact with the bundle last deposited upon the apron, the loose sliding wheel J, provided with its notch *a*, the engaging-lug K, gearing for rotating the said wheel, and the levers for throwing the said wheel in and out of gear with the said lug, substantially as and for the purposes specified.

291,119. MOTIVE-POWER MACHINE. JOHN WINTER, Neosho, Mo. Filed Sept. 26, 1883. (No model.)



Claim.—1. A motive-power machine consisting of a frame, A, rod *a*, rocking shaft B, arms C, with scale *q* and adjustable governors G, treadle D, with piece *d*, to attach a pitman, A, and springs E, all substantially as shown and described, for the purpose set forth.

2. In a vibrating motive-power machine, a frame, A, supporting a rocking shaft, B, upon which are scaled arms C, with adjustable governors G, said rocking shaft having a treadle, D, with piece *d*, and spring E, in combination with non-frictional roller-bearings F, all substantially as shown and described, for the purpose set forth.

291,120. LOCOMOTIVE-BOILER. JOHN E. WOOTTEN, Philadelphia, Pa. Filed Aug. 23, 1883. (No model.)

Claim.—1. A table or repository located transversely to the fire-box of a locomotive-boiler at the front end, and covering the forward

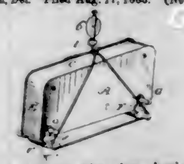
291,120.

portion of the grate thereof, the rear end of said table being closed from its top to the surface of the grate, and its upper surface being located above the surface of the grate at or about the ordinary level of the bed of fuel thereon, substantially as set forth.

2. A table or repository located on and supported by the forward portion of the grate of a locomotive-boiler, its upper surface being located above the surface of the grate at or about the ordinary level of the bed of fuel thereon, substantially as set forth.

3. A table or repository constructed substantially as described, composed of one or a series of tiles, bricks, or sections of refractory material, built into the forward portion of the fire-box of a locomotive-boiler, and supported by the grate thereof, substantially as set forth.

4. The combination, in a locomotive-boiler, of a laterally-extended fire-box, a fire-bridge, and a table or repository extending rearwardly from said fire-bridge and across the fire-box, substantially as and for the purpose set forth.



291,121. FORCE-PUMP. HENRY M. WYETH, Salt Lake City, Utah. Filed June 27, 1883. (No model.)

Claim.—1. The combination, with the cylinder A, constructed as described, of the block J, having the water-passages L and S, and valves, and provided with flanges M and the bolts N, as and for the purpose set forth.

2. As an improvement in pumps, the combination of the cylinder A, having openings G G H and plunger F, with the block J, having bore L, channel S, chambers O P T, and valves R Q U, all arranged and operating substantially as described, for the purpose set forth.

291,122. HOISTING MECHANISM FOR PIANOS, &c. WILLIAM H. YOUNG, Wilmington, Del. Filed Aug. 17, 1883. (No model.)

Claim.—1. A device for supporting pianos having a pad, a support for the pad, which holds it independently of the top or cover of the piano, and means for securing the pad-support to the bottom of the piano, substantially as set forth.

2. In a support for a piano during transportation, a slotted plate adapted to be secured to the bottom of the piano, a plate carried thereby parallel with the edge of the piano, offsets or arms projecting downwardly from said plate, and a roller mounted therein, substantially as set forth.

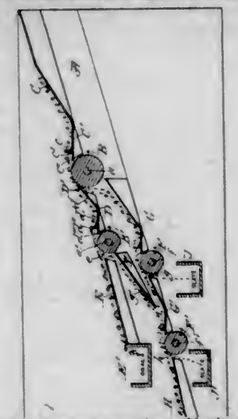
3. In a device for supporting a piano during transportation, a plate adapted to be secured to the bottom of a piano, a roller mounted in bearings carried by said plate, and a pad or cushion interposed between the piano and the roller, substantially as set forth.

4. The combination of the roller, the bearings therefor, the bearing-support arranged to be rocked or turned relatively to the piano, and the devices for clamping the bearing-supports to the edge of the piano, substantially as set forth.

5. The combination of the roller, the bearings therefor, the cushion-support, the support for the roller-bearings connected by a swivel or pivot to the cushion-support, and means for clamping the cushion-support against the edge of the piano, substantially as set forth.

6. The combination of the roller, the bearings for the roller situated outside of the ends thereof, and the handles projecting outwardly from said bearings, substantially as set forth.

7. The combination of the roller, the bearings therefor situated outside of the ends of the roller, means for securing the roller to the edge of the piano, and a detachable handle adapted to be secured to the roller, substantially as set forth.



8. The combination of the wooden roller, the bearings therefor, the devices for securing the roller-bearings to the edge of the piano, and the metallic axle for the roller projecting therefrom at the ends sufficiently to form journals for the bearings, substantially as set forth.

9. The combination of the roller, the bearings therefor, devices for securing the roller-bearings to the piano, the aperture in the roller, and the detachable handle adapted to be connected with the roller by inserting it or a portion thereof into the aperture of the roller, substantially as set forth.

10. The combination of the roller, the tubular axle or journal-piece inserted into the roller, and a detachable handle having a spindle or arm adapted to be inserted into said tubular axle or journal-piece, substantially as set forth.

11. The combination of the roller-bearings, the support for said bearings, the means for clamping said bearing-support to the edge of the piano, and a detachable roller, substantially as set forth.

291,123. MACHINE FOR SEPARATING SLATE FROM COAL. CHARLES W. ZIEGLER, Scranton, Pa. Filed Oct. 13, 1883. (No model.)

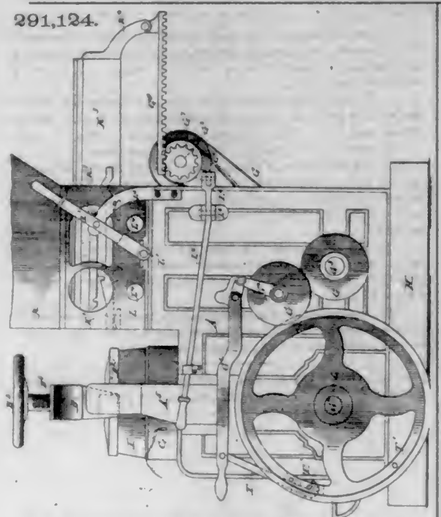
Claim.—1. In a coal-separator, the combination of aprons or chutes C, D, G, and G', each having a descending incline, a level portion, an ascending part, a perpendicular offset, and a second horizontal part, and the cylinders, substantially as described.

2. The combination of the aprons or chutes C and D, constructed, as described, with the revolving cylinders B and B', forming, with said chutes, the spaces D' and *e*, and the incline E, as and for the purposes described.

3. In a coal-separator, the combination of the aprons or chutes C and D, cylinders B and B', the secondary aprons or chutes G and G', and cylinders F and F', forming with the said chutes G and G' openings *g* and A, as described.

291,124. MACHINE FOR MOLDING IN SAND. WILLIAM AIKIN and WILLIAM W. DRUMMOND, Louisville, Ky. Filed May 14, 1883. (No model.)

Claim.—1. In combination with the binder-plate, the hand-wheel B^3 and system of three spur-pinions, B^4, and traveling, threaded, and grooved bars B^2, the eyes of the exterior pinions being provided with splines to fit the grooves across the threads, so that the bars, while rotating with their respective pinions, shall also travel longitudinally through them, substantially as set forth.

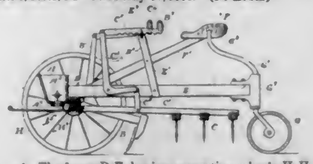


2. The combination, with the sand-box and flask, of swinging pins and sockets for confining in place either cope or drag, substantially as set forth.

3. In combination with the plunger-head and actuating-wheel and the driver-wheel, the intermediate wheel for communicating motion from the driver-wheel to the cams, and the detaching mechanism, substantially as shown, for throwing the wheels out of gear automatically.

4. In combination with the sand-box, the hopper, hopper-frame, and drawer, and raising and lowering mechanism for adjusting the level of the lower edge of the drawer to that of the top of a flask carried on the sand-box, whereby sand may be supplied in quantities proper for filling flasks of different depths, substantially as set forth.

5. The combination, with the sand-drawer and its bottom, of the vertically-adjustable hopper, and the cams and lever for raising and lowering the hopper, substantially as set forth.



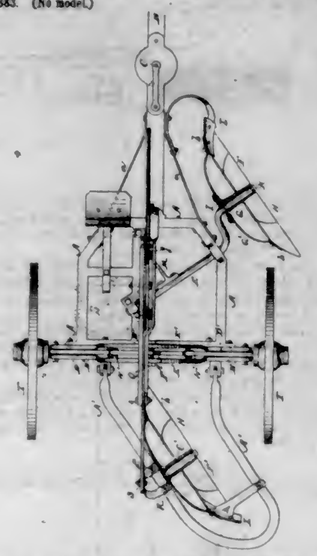
291,124.

6. In combination with the sand-box, hopper, and drawer, a rack attached to the drawer, and a pinion, having rotation in different directions, engaging the rack to project and retract the drawer, substantially as set forth.

7. The combination, with the sand-drawer, of the pinion G', engaging directly into the rack, and the pulleys, belts, and clutch for rotating the pinion in one direction or the other, substantially as set forth.

291,125. COMBINED SEEDER, PLOW, AND HARROW. PETER S. ARMSTRONG, Secor, Ill. Filed May 17, 1883. (No model.)

Claim.—1. The frame D E, having supporting-wheels H H and G, in combination with the harrow C C', pivoted to the frame-beam D, rod C^3, angle-iron C^2, notched bar C^4, and braces E', having collars C^5, substantially as and for the purpose set forth.

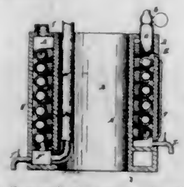


2. In a combined seeder, plow, and harrow, the frame D E, having supporting-wheels H H and G, in combination with the plow-frames B, pivoted independently to the beam D, vertical arms B', notched bars B^2, braces E', collars E^2 E^3, seat, and supporting-beam F', substantially as specified.

291,126. SAFETY-VALVE. HENRY G. ASHTON, Somerville, Mass. Filed Sept. 10, 1880. (No model.) Patented in England Sept. 22, 1880, No. 3,349; in Belgium Sept. 27, 1880, No. 52,656; in Canada Sept. 28, 1880, No. 11,739; in France Sept. 29, 1880, No. 138,867, and in Germany Oct. 3, 1880, No. 13,446.

Claim.—The combination of shell A, bushing B, and valve G with the ring *f*, the upper part of shell A serving, in connection with ring *f*, to form a casing for the spring D, and the lower part of shell A forming, in connection with ring *f*, the chamber *a*', as and for the purpose specified.

291,127. ROTARY PLOW. JOHN ARBUTHNOT, Chicago, Ill. Filed May 16, 1883. (No model.)

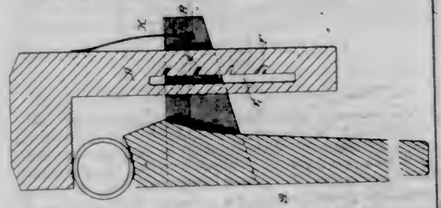


Claim.—1. The combination, substantially as specified, with the frame of a rotary plow having a diagonally-arranged plowing-disk, of the draft-wheels T T, the vertically-tilting sectional axles D' D', carrying the said wheels and pivoted to the said frame, and an adjusting-lever jointed to the said axles, for the purpose of thereby admitting of the said wheels being both inclined laterally in the same direction by means of the same lever.

2. The combination of the wheels T T, the vertically-tilting axles D' D', the bar B', the T-lever F^{w}, the links H' H', and means for temporarily locking the said lever, in connection with the plow-frame, carrying diagonally-arranged rotary plowing-disks, substantially as and for the purposes specified.

3. A rotary plow-disk consisting of the combination of the hub G and flange G', all made in one and the same piece, and having therein the pockets or depressions *c c*, and the blade H, made in sections, fastened to the rim of the said flange, the radial edges of the said sections having between them spaces opening into the said pockets, substantially as and for the purposes specified.

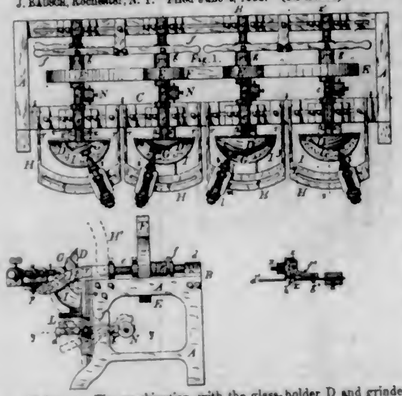
291,128. CARBURETOR. DELOS R. BAKER, Ludlow, Ky. Filed Dec. 27, 1882. (No model.)



Claim.—1. For use in the process of enriching or impregnating gases, and in combination with the receptacle for liquid hydrocarbon, and with means for supplying air or gas, a tubular wall impervious to liquid except by osmosis, interposed between the volatile liquid hydrocarbon and the gas to be enriched or impregnated, whereby the hydrocarbon is prevented from mingling in a liquid state with said gas, but is enabled to be conveyed through said tubular wall to said gas in a state of vapor, substantially as and for the purposes specified.

2. The combination of receptacle A, tubing B, made of material impervious to liquids except by osmosis, and the chamber F, communicating with the interior of the lower portion of the tubing, and provided with a suitable discharge-orifice closed and opened by a suitable device, as *f'*, substantially as and for the purposes specified.

3. The combination of receptacle A, holding a volatile hydrocarbon liquid, the tubing B, impervious to liquid except by osmosis, and mechanism for enabling the operator to regulate the amount of exterior surface of the tubing which shall be in contact with the hydrocarbon, substantially as and for the purposes specified.



4. For use in the process of enriching and impregnating gases, and in combination with the receptacle for liquid hydrocarbon, and with means for supplying air or gas, a tubular wall made of pure rubber, caoutchouc, its allied gums, or the compounds thereof, or artificial rubbers, interposed between a volatile liquid hydrocarbon and the gas to be enriched or impregnated therewith, for enabling the hydrocarbon to enrich and impregnate the gas, substantially as and for the purposes specified.

291,129. WRENCH. WILLIAM C. BASKIN, Red Elephant, assignor of one-half to Frederick W. Best and Edgar N. Green, both of Denver, Colo. Filed June 11, 1883. (Model.)

Claim.—In a wrench, the combination of the lever A, the supports B, the jaw D, provided with the slot E and recesses F, the pivotal bolt C, and a spring, K, the parts being combined and arranged to operate substantially as shown.

291,130. MACHINE FOR GRINDING SPECTACLE-LENSES. JOHN J. RAUSCH, Rochester, N. Y. Filed June 4, 1883. (No model.)

Claim.—1. The combination, with the glass-holder D and grinder G, of the tank I, arranged to supply abrading material to the grinding-surfaces, substantially as and for the purposes set forth.

2. The combination with the glass-holder D and grinder G, of the adjustable tank I, and mechanism for varying its position relatively to the holder, substantially as and for the purposes set forth.

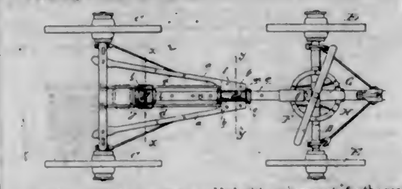
3. The combination, with a suitable supporting-frame, of the glass-holder D, grinder G, tank I, rack *w*, and dog *x*, substantially as and for the purposes set forth.

4. The combination, with the rotating glass-holder D, of the revolving friction-driven grinder G, provided with central recess, *l'*, substantially as described.

5. The combination, with a suitable supporting-frame, of the revolving glass-holder D, grinder G, and swinging frame H, substantially as described.

6. The combination, with the glass-holder D and grinder G, of the spindle *i*, collar *o*, spring *n*, and adjustable sleeve *t*, substantially as described.

7. The combination, with the revolving glass-holder D and grinder G, of the spindle *i*, and suitable mechanism for adjusting and supporting the spindle at any desired angle with the axis of rotation of the holder, substantially as described.



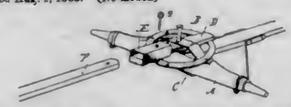
8. The combination, with the revolving glass-holder D and grinder G, of the spindle *i*, plate *m*, having bearings *l l* for the spindle, and supporting-frame H, provided with slot *q*, and bolt and nut *p*, substantially as described.

291,131. WAGON-POLE. ALEXANDER H. BEACH and RALPH H. BEACH, Flint, Mich. Filed Apr. 19, 1883. (No model.)

Claim.—As a new article of manufacture, a wagon-tongue formed of a continuous strip of sheet metal, bent into rectangular form in cross-section to give closed sides and top with open bottom, filled in with a wooden backing, and having longitudinal taper in opposite directions from the point *a*, substantially as described.

291,132. WAGON RUNNING-GEAR. ALLEN J. BEACH, Flint, Mich. Filed Aug. 8, 1883. (No model.)

Claim.—1. A farm-wagon provided with two supports for the reach, one secured at a fixed distance from the rear axle, and the other situated between the rear axle and the fixed support, and constructed to allow the reach to turn therein, and to move with the reach as the latter is adjusted, substantially as described.



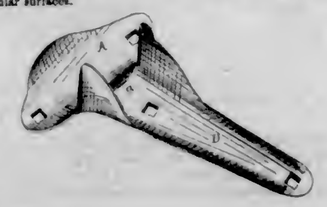
2. In a farm-wagon, a reach adapted to roll in quasi metal cylinders, one of which secures the forward end of the rear hounds together, while the other slides upon guide-rods, such cylinders being provided with slots, by means of which, and suitable pins engaging the parts together, the roll of the reach is limited, substantially as specified.

3. In a farm-wagon, the combination, with the reach *e* and filling-plates *f*, of the plates *b*, securing the hounds together, and forming, with the hounds, a hollow cylinder, in which the reach and filling-plates turn, substantially as described.

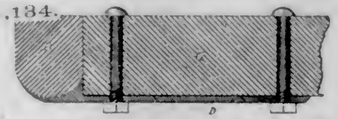
4. As a means of securing the rear end of a rolling reach and assisting in the extensibility thereof, the flat ring *j*, provided with circular ears *k*, in combination with the guide-rods, the rear ends of which are secured to the rear axle and the forward ends to the forward ends of the hounds, substantially as and for the purposes described.

5. In a farm-wagon, the combination therewith of the rear hounds, *a*, plates *b*, guide-rods *d*, reach *e*, filler-plates *f*, rings *g*, filler-bars *h*, rings *i*, flat rings *j*, such plates and flat rings being provided with slots *l*, and suitable pins and holes in the reach and filler-bars, the parts being constructed, arranged, and operating substantially as and for the purposes set forth.

291,133. WAGON RUNNING-GEAR. ALLEN J. BEACH, Flint, Mich. Filed Aug. 1, 1883. (No model.)



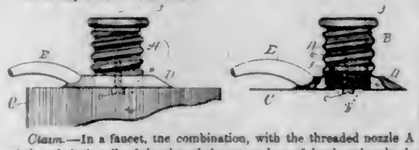
Claim.—1. The draw-bar D, made separate from the reach, and pivoted to the axle by the king-bolt, in combination with the clip E, constructed to embrace both draw-bar and reach, to hold the reach above the draw-bar, and to prevent the wear or splitting of said draw-bar and reach, substantially as described.



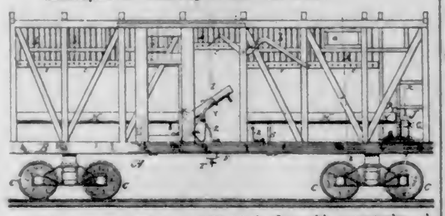
2. In a wagon, the combination, with the axle A, fifth-wheel B, and yoke C, of the draw-bar D, resting on the fifth-wheel below said yoke, and secured by the king-bolt, and provided with the bend-clip E, as and for the purpose set forth.

291,134. CLIP FOR SECURING IRREGULAR SURFACES TOGETHER. ALEXANDER H. BEACH, Flint, Mich. Filed Apr. 19, 1883. (No model.)

Brief.—A clip provided with an abutment at the point of conjunction of the two arms thereof, which fills the inequalities of surface of two irregular surfaces.



291,134.



Claim.—A clip for the purposes described, provided with an abutment at the point of conjunction of the two arms of the clip, adapted to fill the inequalities of surface in two pieces of irregular surfaces which it is desired to secure together, substantially as specified.

291,135. FAUCET. ANTHONY A. BENNETT, West Stratford, Conn. Filed July 5, 1881. (No model.)

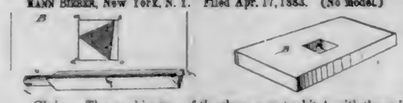
Claim.—In a faucet, the combination, with the threaded nozzle A and threaded plug B, of the threaded center piece, *f*, having the elastic packing-disk *a* secured to its lower end, substantially as described, and for the purpose as set forth.

291,136. STOCK-CAR. ANTHONY BERDANIER and ADAM F. BERDANIER, Philadelphia, Pa. Filed Aug. 16, 1883. (No model.)

Claim.—1. A stock-car provided in its floor with water-tanks and within the car with a watering-trough, overflow-pipes connecting the trough and tanks, and a pump, the pump being actuating by the movement of the car to draw the water from the tanks and discharge it into the trough, whereby and by means of the overflow-pipes a continuous current of the water is provided during the movement of the car, substantially as set forth.

2. The combination, in a car, of the tanks E, pump J, pipes Q R, trough H, and overflow-pipes S, connecting the trough and tanks, the whole being arranged and adapted to operate substantially as set forth.

3. In a stock-car, the trough H, provided with the section W, hinged at one end, and supplied with detachable connecting pipe or hose Z, and adapted to have one of its ends elevated, as specified, by the opening of the car-door, substantially as set forth.

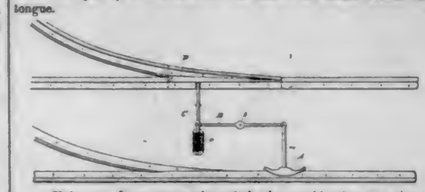


4. The trough H, provided with the section W, lever Y, and detachable pipes, substantially as set forth.

5. The combination, in a car, of the tanks E, pump J, pipes Q R, trough H, overflow-pipes S, the pump-operating rod N, and eccentric P, substantially as set forth.

6. In a stock-car having doors *e*, the grain-racks consisting of the bent rods *b*, connecting-bars *c*, and hangers *d*, those portions of the racks on each side of the car opposite to the car-doors being independently adjustable, substantially as specified.

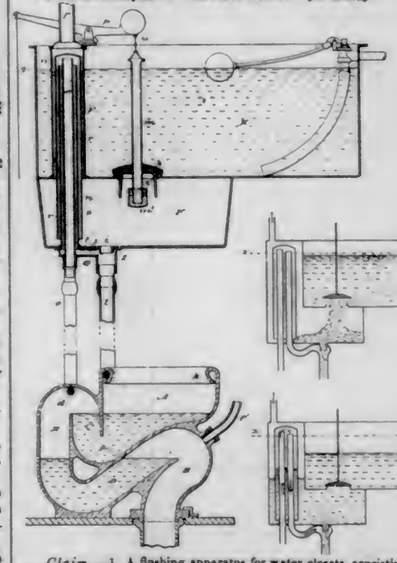
7. The combination, in a car, of the tanks E, receptacles G, trough H, pump J, pipes Q R, and overflow-pipes S, connecting the trough and tanks, the pump being actuated by the movement of the car, substantially as set forth.



291,137. DEVICE FOR DRILLING SQUARE HOLES. ERNST HERRMANN BIERER, New York, N. Y. Filed Apr. 17, 1883. (No model.)

Claim.—The combination of the three-angular bit A with the guide-plate B, having a square hole, *h*, substantially as and for the purpose herein described.

291,138. AUTOMATIC STREET-RAILWAY SWITCH. EARL BILL, Cleveland, Ohio. Filed June 9, 1883. (No model.)



Brief.—The switch-bar yieldingly held to the main by a spring is pivotally attached to one end of a lever extended lengthwise of the track between the rails and centrally pivoted to the track, to the other end of which lever is pivoted the stem of a sliding block arranged near the rail opposite the switch-tongue, leaving room for passage of a train upon the main, and arranged to be struck and moved up to a stop by the wheel of a car facing and turned toward the switch and required to enter the turn-out, whereby the tongue is shifted and the wheel opposite the shifting-wheel guided upon the siding-rail. The tongue is of sufficient length to be held open by one wheel until the next wheel enters behind the tongue.

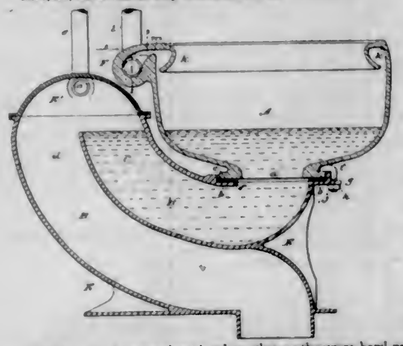
Claim.—1. In an automatic switch, the combination of a pivoted tongue, a sliding shifting-block situated in close proximity to the rail opposite the tongue, a lever situated between the rails, one end of the said lever being pivoted to the extension *a* of the sliding block, and a spring-actuated rod pivotally secured to the lever and to the sliding tongue, substantially as set forth.

2. The combination of the block A, the rod *a*, the lever B, the rod C, the spring *c*, and the tongue D, substantially as described, and for the purpose specified.

291,139. FLUSHING APPARATUS FOR WATER-CLOSETS. JAS. E. BOYLE, Brooklyn, N. Y. Filed Mar. 12, 1883. (No model.)

Claim.—1. A flushing apparatus for water-closets, consisting of a reservoir-tank, a flushing-chamber adapted to be filled therefrom, a valve controlling the admission of water from said tank to said chamber, a suction-injector arranged beneath the outlet from said chamber, a flushing-pipe leading from said injector, and a suction or air pipe communicating with said injector, all combined and arranged substantially as set forth, whereby the water in escaping from said chamber into the flushing-pipe traverses said injector, and sucks the air from said suction-pipe.

2. The combination of a reservoir-tank, a flushing-chamber, a valve controlling the admission of water from said tank to said chamber, a suction-pipe terminating at the upper part of said chamber, an injector beneath the outlet from said chamber, a flushing-pipe leading downward from said injector, and a suction-passage affording communication from said injector to said suction-pipe, substantially as and for the purposes set forth.



3. A flushing apparatus for water-closets, consisting of a reservoir-tank, a flushing-chamber, a valve controlling the admission of water from said tank to said chamber, a suction-injector beneath the outlet from said chamber, a flushing-pipe leading downward from said injector, a suction or air pipe opening into the upper part of said chamber, and a suction-passage extending from said pipe to said injector, whereby the passage of water through said injector into the flushing-pipe will develop a suction in said suction-passage and suction-pipe, in combination with means, substantially as described, for admitting air to said suction passage or pipe, and so breaking the vacuum therein before all the water has escaped from the chamber, whereby an after-wash is secured, all combined and arranged to operate substantially as set forth.

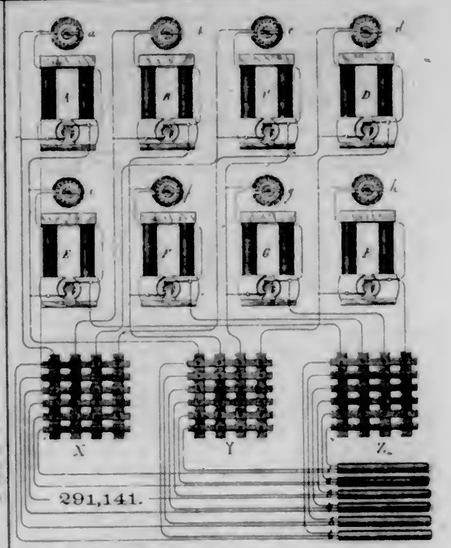
4. In combination, the tank E, the chamber F, provided with inlet-orifice A' and outlet-orifice *i*, the valve A, the suction-injector I, the flushing-pipe *l*, the air-pipe *e*, the suction-passage *t*, and the air-bell *n*, substantially as set forth.

5. A flushing apparatus for a water-closet, consisting of the combination of a reservoir-tank, a flushing-chamber provided with an inlet-orifice of large area communicating with said tank, and with an outlet-orifice of contracted area proportioned to the area of said inlet-orifice, substantially as specified, a valve adapted to close said inlet-orifice, an air-pipe opening into said flushing-chamber, and a flushing-pipe leading from said outlet-orifice, all arranged and adapted to operate substantially as set forth.

6. The combination, with tank E and chamber F, of the valve A thereof, its stem consisting of an overflow-tube, *m*, and a sealing-cup, *m'*, below the valve, in which cup the lower end of the overflow-tube is immersed, substantially as set forth.

291,140. WATER-CLOSET AND OTHER BOWLS AND PIPE-CONNECTION THEREFOR. JAS. E. BOYLE, Brooklyn, N. Y. Filed Mar. 12, 1883. (No model.) Patented in England Feb. 23, 1882, No. 882; in France Feb. 28, 1882, No. 147,614; in Germany Mar. 2, 1882, No. 20,286; in Belgium Mar. 13, 1882, No. 57,349; in Austria-Hungary May 8, 1882, No. 3,063, and in Canada July 3, 1882, No. 31,219.

Claim.—1. A water-closet bowl or other earthenware bowl used in plumbing, provided on its exterior with a hollow tubular barrel molded in one piece with it, having opposite open ends, and with a port or opening through the side of the bowl, affording communication between the cavity of the barrel and the interior of the bowl, substantially as set forth.



2. An earthenware bowl provided with an open-ended cylindrical barrel on its exterior, and an opening extending from its interior to the cavity of said barrel, in combination with a thimble entering one end of said barrel, a cap closing the other end thereof, and a clamp for pressing said thimble and cap forcibly toward each other, thereby embracing the barrel between them, substantially as set forth.

3. The combination, with bowl A, provided with barrel F, of thimble G, having tie-bars J J, screw J', and screw-cap H, engaging said screw, substantially as set forth.

4. The combination, with bowl A, provided with barrel F, of thimble G, having tie-bars J J, screw J', screw-cap H, union-nut K, and spud L, substantially as set forth.

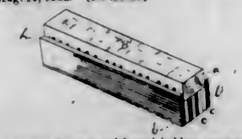
5. A water-closet bowl formed with a tubular barrel for connecting with the flushing-pipe, and provided with a trap or water-seal at the connection between the pipe and the bowl, whereby the air in the pipe is normally isolated from the bowl, substantially as set forth.

291,141. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES S. BRADLEY, New York, N. Y. Filed Aug. 18, 1883. (No model.)

291,141.

Claim.—1. The method of regulating the electrical pressure or potential in an electrical-supply system, which consists in feeding different points of the system from two or more independent sources of supply of electrical energy, and in separately regulating the electro-motive forces of these sources, according to the conditions of the load.

2. The method of regulating the electro-motive force or pressure in a multiple-arc system of current-supplying conductors or mains, consisting in conveying the current to different points of the mains by means of feeders, supplying the feeders with electric currents by independent sources of electrical energy, and separately regulating their electro-motive forces, so as to maintain different pressures in the various feeders, according to the conditions of the load, substantially as described.



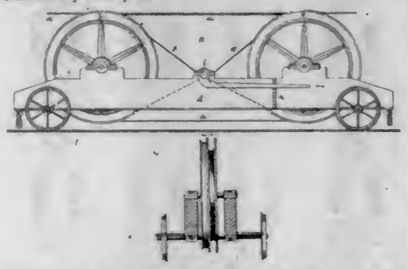
3. The method of regulating the electrical pressure or potential in a multiple-arc system of current-supplying conductors or mains from which the lamps or other converting devices are directly supplied, consisting in conveying the current from a generating-station to different points of the mains, by means of independent feeding-conductors, supplying these feeders with electric currents by independent dynamo-machines, and separately regulating their electro-motive forces according to the conditions of the load, substantially as described.

4. The combination, with a multiple-arc system of conductors or mains, and two or more conductors or feeders connecting it at different points with a central station, of two or more independent dynamo-machines, each of which is provided with an independent regulating apparatus and a set of switching contrivances, whereby any of the dynamo-machines may be separately connected to any of the feeders, substantially as and for the purpose described.

291,142. BASE FOR PAINTS. ATWATER E. BROCKETT, Branford, Conn., assignor to Lemira H. Brockett, same place. Filed Dec. 18, 1882. (No specimens.)

Claim.—The base for a paint made of pine-tar or Stockholm tar, caoutchouc gum, gutta-percha, gum-shellac, gum-copal or copal (oil) varnish, and linseed-oil, or their equivalents, made substantially as specified.

291,143. PIANO-FORTE BRIDGE. JOHN R. BROWN, Jamestown, N. Y. Filed Aug. 19, 1882. (No model.)

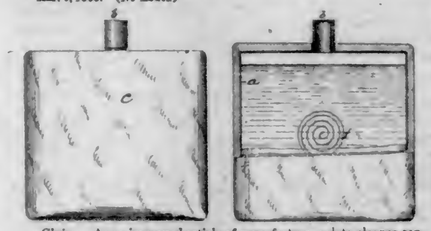


Claim.—1. A piano-forte sound-board bridge composed of veneers and end wood, the veneers forming the base and partly inclosing the sides of the end wood, substantially as shown and described, and for the purpose set forth.

2. A piano-forte sound-board bridge composed of veneers and end wood, the veneers forming the base and partly inclosing the sides of the end wood, which has holes or grooves for holding the strings and governing their bearing and position, substantially as shown and described, and for the purpose set forth.

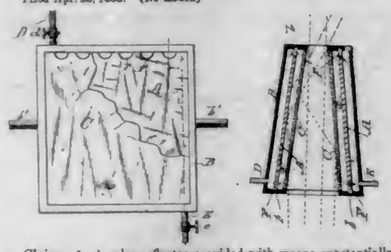
291,144. CABLE-MOTOR. CHARLES R. BROWN, Imperial, assignor of one-half to William McCreery, Pittsburg, Pa. Filed Sept. 7, 1883. (No model.)

Brief.—A double-grooved wheel or wheels upon car receives the



propelling-cable in one groove and a strap-brake in the other. The brake is controlled by a rotary shaft.

Claim.—1. In combination with an endless cable, a car having mounted thereon a revolving wheel provided with a cable-groove and a brake-band groove, a brake-band arranged in the brake-groove of the wheel, and mechanism for tightening and loosening the brake-band, substantially as and for the purposes specified.



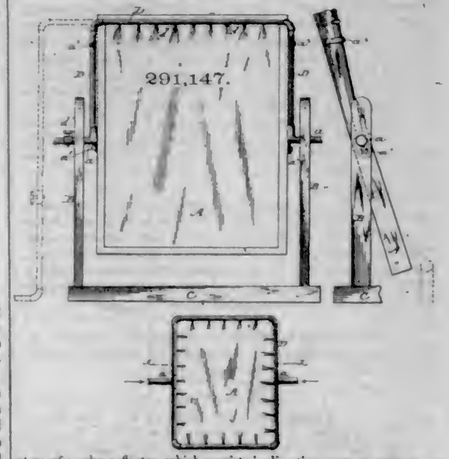
2. The combination, with a car or truck adapted to be driven by an endless band or cable, of two revolving wheels mounted on the car, each of said wheels having a cable-groove, two brake-bands, one arranged around each of said wheels, and a rotating shaft arranged between the wheels, and to which the brake-bands are secured, substantially as and for the purposes specified.

291,145. SLATE-CLEANER. JOHN BURLING, Millburn, N. J. Filed Mar. 9, 1883. (No model.)

Claim.—As an improved article of manufacture, a slate-cleaner consisting of a hollow, comparatively thin, and flat receptacle supplied with a water-exit and covered with a suitable soft water-absorbing material, all substantially as shown, for the purpose described.

291,146. SOLAR REFLECTOR. WILLIAM CALVER, Washington, D. C. Filed Apr. 25, 1883. (No model.)

Claim.—1. A solar reflector provided with means, substantially as specified, for maintaining a confined current of refrigerative substance in contact therewith, substantially as and for the purpose set forth.



2. The combination of a reflector having apertures therein with a water and air tight inclosing-case having a transparent face and an inlet and outlet, substantially as specified.

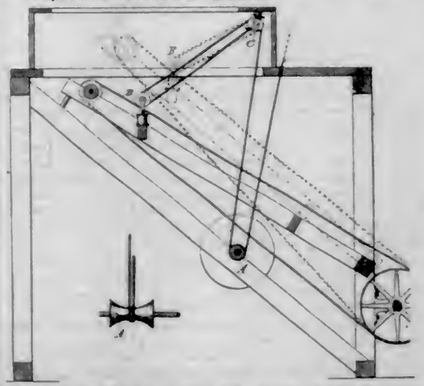
3. The combination of the reflector A, frame B, transparent face C, inlet D *d*, and outlet E *e*, substantially as shown and described.

4. The combination of the frame B, grooved as at *b*, and provided with trunnions *b'*, and inlet D and outlet E, with the reflector A, provided with apertures F, substantially as shown and described.

291,147. METHOD OF AND MEANS FOR CONTROLLING THE TEMPERATURE OF SOLAR HEATERS. WILLIAM CALVER, Washington, D. C. Filed Apr. 25, 1883. (No model.)

Claim.—1. The method herein set forth of controlling the temperature of a solar reflector, which consists in directing upon an outer surface of the same a sheet, jet, or spray of water or other refrigerative substance.

2. A reflector in combination with means, substantially as specified, for directing upon an outer surface of the reflector a refrigerative substance, for the purpose set forth.



3. The combination of a reflector and a slitted or perforated pipe arranged to direct a refrigerant upon the reflector, substantially as shown and described.

4. The combination of a reflector and a slotted or perforated pipe having lateral arms forming trunnions, substantially as specified.

5. The combination of the reflector A and the pipe D, constituting a frame thereof, and slitted at *d d*, substantially as shown and described.

6. The combination of a reflector or a refractor and means for cooling its reflecting or refracting surface or medium, substantially as and for the purpose set forth.

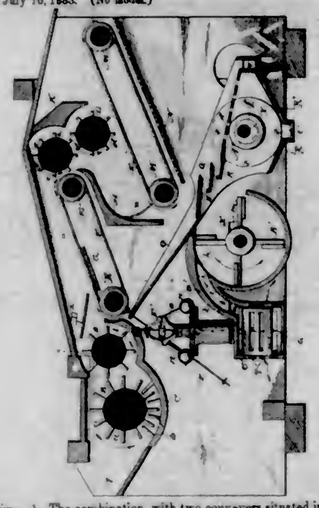
291,148. MEANS FOR OPERATING BUTTING-SAWS. JOB CARDY, Tampa, Fla. Filed Oct. 6, 1883. (Model.)

Claim.—The simple mechanism as fully shown—the slowly-revolving concave pulley A, the tension-rope feed D, passing through pulley-block B, attached to saw-frame, and pulley-block C, attached to top of saw-box, from thence three times around concave drum A, the end of said friction-rope passing up through deck to hand of operator, all of which is adapted to the operating of butting-saws, as herein substantially set forth.

291,149. CAR-COUPLING. DANIEL CARLOUGH, Paterson, N. J. Filed Nov. 26, 1883. (No model.)

Claim.—The combination of the pawl B, having lugs B' B², pivoted in the coupling-box A, coupling-box A, having vertically-arranged slots R, slot L, opening P, catch or stop T, pivot-bolts S, having washer S', key S², coupling-links C, adapted to work on pivots S, the pivots adapted to work in slots R, link N', and stop H, substantially as set forth.

291,149.



291,150. BRACELET-FASTENING. JOHN M. CHANDLER, Cleveland, Ohio. Filed Oct. 18, 1883. (No model.)

Claim.—The combination, with the band of a bracelet, of the box B, plate C, cam c, and lever D, substantially as and for the purposes specified.

291,151. THRASHER. ALEXANDER H. CLARK, Fond du Lac, Wis. Filed July 10, 1883. (No model.)

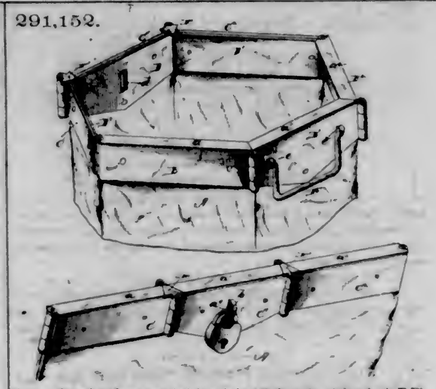
Claim.—1. The combination, with two conveyers situated in planes of different elevations and lapping each other in the direction of travel, of two oppositely-revolving pickers situated in the rear of the upper conveyer and above the lower conveyer, and adapted to receive the grain from one conveyer and transfer it to the other, and the deflector K, situated in the rear of both pickers, substantially as described.

2. The combination, with two endless conveyers situated in planes of different elevations and lapping each other in the direction of travel, of two pickers running in opposite directions at different rates of speed, and adapted to take the straw from one conveyer and transfer it to the other, and the deflector K, substantially as described.

3. The combination, with the two conveyers, the two pickers acting therewith, and the deflector K, of a table or chute, N, situated below the lower conveyer, and a shoe situated below the chute, substantially as described.

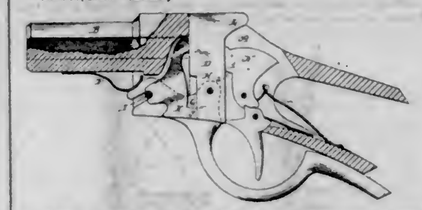
4. The combination, with the two conveyers, two pickers, a deflector situated behind the pickers, and a deflector situated in front of them, of the chute or table N, and a shoe situated below the table or chute, substantially as described.

5. In a thrashing-machine, the combination, with a fan and fan-cylinder, of an air-chest, and means for conveying air from the chest to the front and each end of the cylinder, substantially as set forth.



6. In a thrashing-machine, the combination, with a fan and casing, of an air-chest, a valve, a governor, the stem of which is secured to the valve, and means for conveying the air from the chest to the front and to each end of the fan-casing, substantially as set forth.

7. The combination, with the combined chute, sieve, and shoe of the fan X and cylinder B', of the chest C', valve G', governor F', and chamber D', the above parts combined and adapted to operate substantially as described.

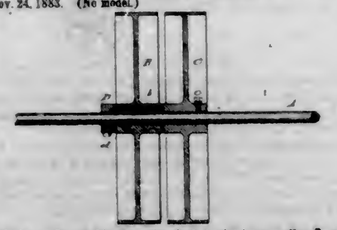


291,152. MAIL-BAG. HAMILTON CLIFF, Leipsic, and FRANCES MARION BROCK, New Providence, Ind. Filed Oct. 17, 1883. (No model.)

Claim.—The combination, with the bag A, having a mouth-piece comprising the hinged sections B B' B², and C C' C², the former having the overhanging flanges *a a' a²*, beveled at their ends, of the plates F F', pivotally secured upon the pintles of the hinges of the plates C C' C², and adapted to fit in the spaces formed by the beveled ends of the plates B B' B² when the bag is closed, as set forth.

291,152.

291,153. FIRE-ARM. DAVID S. COLE, Columbus Junction, Iowa. Filed Mar. 17, 1883. (Model.)

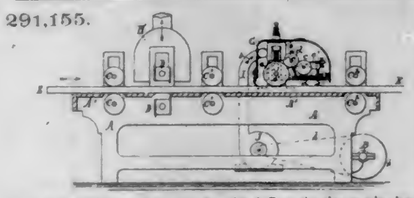


Claim.—1. In breech-loading fire-arms, the combination of a vertically-moving breech-block, D, provided with an extension, L, upon its upper rear corner, the operating-lever, which is connected directly to the breech-block, and the hammer N, having a straight surface, 1, and the recess 2, formed on its front edge, substantially as shown.

2. In a breech-loading fire-arm, the combination of a single pivotal pin, I, the cartridge-extractor, K, and the operating-lever having an open-ended slot in its front end, and the vertically-moving breech-block D, which is pivoted to the operating-lever, whereby when the pin which connects the lever and the breech-block together is removed the lever, the cartridge-extractor, and the breech-block can all be removed from the gun, substantially as specified.

3. The combination of a breech-block having the extension formed upon its rear side to operate the hammer, and provided with a shoulder, with a cartridge-extractor which has a shoulder formed upon its lower rear corner for the breech-block to strike against, substantially as described.

291,154. LUBRICATOR. CHARLES E. COLLINS, Baltimore, Md. Filed Nov. 24, 1883. (No model.)

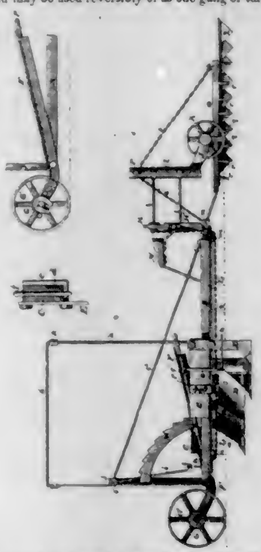


Claim.—In combination, the shaft A, the loose pulley B, mounted thereon, and having perforations *b*, communicating with the central bore, the fast pulley secured to the shaft and adjoining the loose pulley, and the collar D, secured to the shaft on the other side of the loose pulley, all as and for the purpose set forth.

291,155. MACHINE FOR PLANING AND PRINTING WOOD. WM. A. COMPTON, Liberty Corner, N. J. Filed Dec. 15, 1882. (No model.)

Claim.—1. The combination, in an organized machine, of a wood-

291,155.



planing mechanism, as a rotary cutter-head, D, a cleaning mechanism, as the wiper A, and a printing mechanism, as the roller *e*, the whole being combined substantially as described, to plane, clean, and print the surface of the wood in a continuous operation, as and for the purpose set forth.

2. The combination, with the planing-machine having the cutter D and feed-roller for propelling the boards, of the impression-roller *e*, provided with inking devices, and rotated by a connection, as pulleys *p* and belt *q*, to the feed-roller of the planing-machine, as and for the purpose set forth.

291,156. GANG-PLOW. HAMILTON M. CORMACK, Malden, MASS. Filed Sept. 11, 1883. (No model.)

Brief.—A main frame has two plow-carrying frames resting upon it side by side, and hinged to it at the rear end. The plow-frames may be lifted at front by a lever with a right-angled hook-arm. To the rear end of the main frame is secured a vertical plate or slide arranged to slide in guides attached to the posts of a caster-wheel. By a system of chains, pulleys, and a lever-frame the whole may be raised or lowered. A series of swivel-plows are arranged to move to any point on the longitudinal bars, and may be used reversibly or as one gang of turn-plows.

Claim.—1. In a gang-plow, the combination of the frame A, the auxiliary frames B B, each pivoted thereto at one end, and provided with two or more plows, D D, and means for independently raising or lowering said frames about their axes, and holding the same in any required position, substantially as and for the purposes described.

2. In a gang-plow, the combination of the frame B, pivoted to the frame A, and provided with a set of plows, the ring *h*, secured thereto, the hooked rocker-arm *i*, the shaft *i'*, mounted in suitable bearings, the hand-lever i^3, the hook *k*, and the support *k'*, all arranged and adapted to operate substantially as and for the purposes described.

3. In a gang-plow, the combination of the frame A, the auxiliary frames B B, each provided with two or more swivel-plows, and means of adjusting said plows lengthwise of the frames B, whereby said two gangs of plows are adapted to be used independently of each other, and to turn their furrows in opposite directions, or to be used in conjunction, and to turn their furrows in the same direction, but toward either side of the frame A, substantially as and for the purposes described.

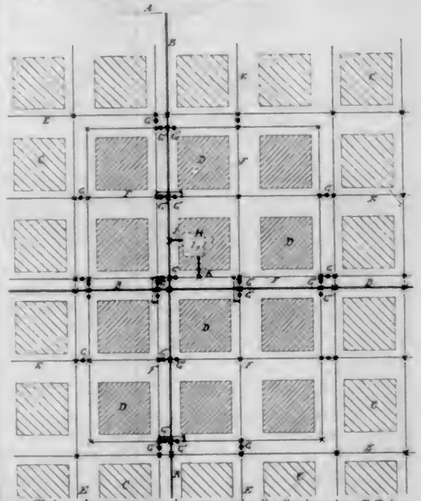
4. In a gang-plow, the combination of the frame A, the lever-frame F, pivoted thereto, and fulcrumed upon the axle G, the toothed segment M and the catch *o* for maintaining the frame F in any required position about its axis, substantially as and for the purposes described.

5. In a gang-plow, the combination of the frame A, the lever-frame F, pivoted thereto, and fulcrumed upon the axle G, the toothed segment M, the forked rod *p*, the catch *o*, the support H I J K, the chain L, and the sheaves or pulleys *m* and *n*, all arranged and adapted to operate substantially as and for the purposes described.

6. In a gang-plow, the combination of the frame A, two harrows, O O, arranged obliquely to said frame in opposite directions and pivoted thereto, the chain *s s*, the supporting swivel-head P, and the hooks *u u*, as a means for raising said harrows, and holding them from contact with the ground, substantially as and for the purposes described.

7. In a gang-plow, the combination of the slide H, adapted to move in suitable guides secured to the frame A, the bearing I, secured thereto and provided with the forked bearing J and wheel K, and means for vertically adjusting said slide H and holding it in a fixed position, substantially as and for the purposes described.

291,157. SWEAT-BAND FOR HATS. ALBERT CHARLES COUCH, Boston, MASS. Filed Nov. 22, 1883. (No model.)

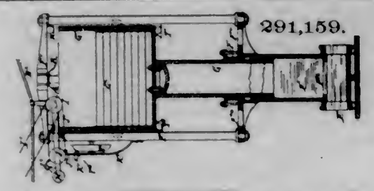


Claim.—1. A sweat-band for hats, consisting, in whole or in part, of a strip of insoluble gelatine, substantially as set forth.

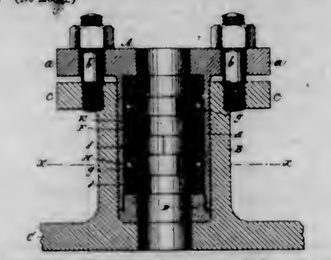
2. The combination, in a sweat-band for hats, of a strip of insoluble gelatine and a connecting strip of fabric, substantially as specified.

3. The combination of a hat or cap and a sweat-band consisting of a strip of insoluble gelatine connected within the hat, substantially as specified.

291,158. WATER-SUPPLY FOR CITIES. DEWITT C. CREGIER, Chicago, Ill. Filed Apr. 15, 1882. (No model.)



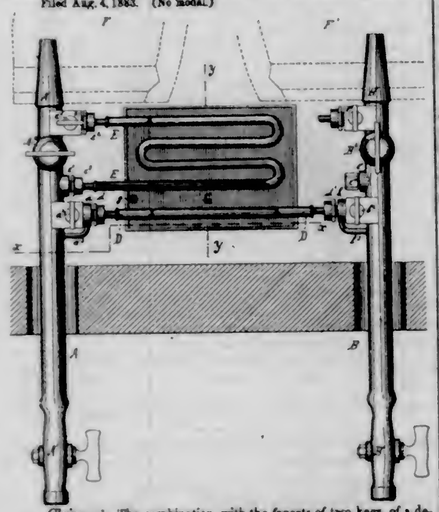
Claim.—In a water-supply system, the distributing-pipes E F, having valves G between them, in combination with the mains B, opening directly into the pipes E, and with a pump, I, as intermediate connection between the mains B and pipes F, substantially as herein specified, and for the purposes set forth.



291,159. WATER-SUPPLY FOR CITIES AND TOWNS. DEWITT C. CREGIER, Chicago, Ill. Filed Mar. 9, 1882. (No model.)

Claim.—In a water-supply for cities and towns, wherein the water is supplied under separate high and low pressures, and in combination with the duplex series of pipes W and E and the pump D, the plunger G, carriage G', and adjustable weights G^2, for varying the pressure in high-pressure pipes, and the devices, substantially as described, for maintaining the pressure uniform after the proper degree has been attained, as set forth.

291,159.

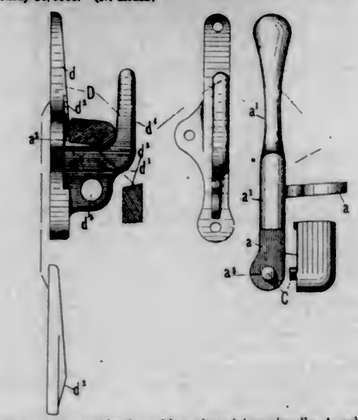


291,160. METALLIC PACKING FOR STUFFING-BOXES. JEREMIAH J. CROWLEY, Savannah, Ga., assignor of two-thirds to John D. Richardson, Brooklyn, and Francis L. Manchester, New York, N. Y. Filed Aug. 24, 1883. (No model.)

Claim.—1. A stuffing-box packing composed of one or more divided outer rings, E, having internal recesses, *g g*, divided inner rings, F, fitted to the recesses *g g* of said rings E, and a spring or springs applied to press externally upon the outer divided rings, E, substantially as herein described.

2. The combination, with a stuffing-box or gland, of outer divided packing-rings, E, of substantially T-shaped transverse section, inner divided packing-rings, F, fitted to the rabbeted recesses in the interiors of the said packing-rings E, and coiled springs G, encircling the said packing-rings E, and arranged within recesses in the exteriors thereof, substantially as herein described.

291,161. FAUCET ATTACHMENT. LOUIS DANKHOFF, Passaic, N. J. Filed Aug. 4, 1883. (No model.)



Claim.—1. The combination, with the faucets of two kegs, of a detachable connecting-pipe, means for coupling the same to the barrels of said faucets, and stop-cocks, by which the connection of said coupling-pipe with said faucets may be established or interrupted, substantially as set forth.

2. The combination, with the faucets of two kegs, of a connecting-pipe, means for coupling the same to the barrels of said faucets, auxiliary stop-cocks applied to the lateral nipples of the faucet-barrels, and auxiliary discharge-pipes that communicate directly with the connecting-pipe, and are provided with auxiliary stop-cocks at their delivery ends, substantially as set forth.

3. The combination, with the faucets of two kegs, of a connecting-pipe, means for coupling the same to the barrels of said faucets, and an ice-water receptacle located between said faucets, the coupling-pipe being bent to pass through said cooling-vessel, substantially as set forth.

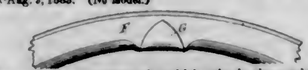
291,162. DOOR-FASTENER. OSCAR DE MARIE, Alexandria, Va. Filed May 26, 1883. (No model.)

Claim.—1. In combination with a pivoted lever-handle, A, substantially as described, attached to the door-casing, a casting, D, substantially as described, having a supporting-bearing, d^2, and a bearing, d^3, with a double incline, substantially as and for the purpose described.

2. In combination with the casting D, having an inclined bearing-surface, the lever A, and the pivot-bolt C, the bearing-plate E, having the flange portion *e*, as described, the flange serving to take a portion of the strain exerted upon the pivot-bolt by the lever and inclined bearing-surface upon the casting.

3. The fastener described, having the lever A, with bearing a^2, right-angled projection a^3, with opening a^4, the bearing-plate B, the pivot-bolt C, and the casting D, with double incline and opening d^3, combined and arranged as and for the purpose described.

291,163. MANUFACTURE OF FERRO-CYANIDES. GEORGES DE VIGNE, Lille, France. Filed May 23, 1883. (No specimens.)



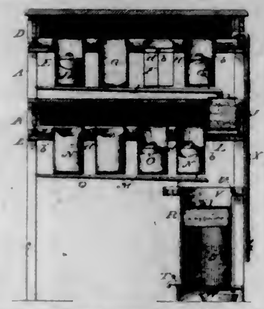
Claim.—The process of obtaining ferro-cyanides from coal-gas or other gas or smoke containing cyanogen or hydrocyanic acid, consisting in cooling the gas or smoke and depriving it of tarry products, in subjecting the gas or smoke in a cool state to the action of a mixture of iron in any of its various forms and an alkaline salt, and in subsequently washing the mixture and evaporating the solution so obtained, substantially as and for the purpose herein described.

291,164. VENEER. AUGUST DICKMAN and MICHEL HEINTZ, Detroit, Mich. Filed Mar. 10, 1883. (Specimens.)

Claim.—1. A veneering composition consisting of glue and wood-shavings built up in alternate layers of the same, substantially as described.

2. In a new article of manufacture, a composition veneer built up in alternate layers of wood-shavings and glue, substantially in the manner described.

291,165. VEHICLE-WHEEL. GREGORY M. DILLARD, Macon, Miss. Filed Aug. 9, 1883. (No model.)



Claim.—As an improvement in vehicle-wheels, the combination of the spokes, the metallic thimbles B, secured to the outer ends of the spokes and formed with internal screw-threads, *b*, the separate bolt C, having the screw-threaded portion *c*, that is received by the threads *b*, and the smooth cylindrical end portion, the nut *d* on screw-threads *c*, the washer D, interposed between the end of the thimble and the nut, and the felly having the hole or perforation, all arranged and operating substantially as and for the purpose set forth.

291,166. REFRIGERATING APPARATUS. FRANCIS A. DODGE, Brady, Tex. Filed Sept. 19, 1883. (No model.)

Brief.—Water passes through porous fabric, cools by part evapo-

rating, is filtered, and further cooled by repeating the operation below; also cools contents of vessels set in depending bags of the wet fabric in wire cages.

Claim.—1. In a cooling apparatus, the combination of a water-pan provided with a walled opening in its bottom, a cage or frame suspended beneath said opening, a fibrous jacket curled over the wall of said opening and extending downward into the cage, and a vessel placed within said cage and jacket and adapted to receive the matter to be cooled.

2. In combination with pan D, having openings *b* and flanges *c*, cages F, suspended beneath the pan, jackets G, having their upper edge turned over the flanges *c* and into the pan, and vessels H within the jackets and cages, all substantially as shown and described.

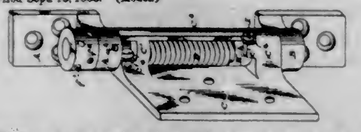
3. In combination with the pan D and the jackets G, extending downward therefrom, vessels H within the jackets, and a trough or conductor, I, beneath the jackets, to catch the drip therefrom and conduct it to a suitable receptacle.

4. In combination with an upper water-pan, a fibrous jacket dipping therein and suspended therefrom, and a vessel arranged within said jacket, a second pan, jacket, and vessel below the first, said second pan being arranged to receive the water dripping from the jacket of the first, whereby the second vessel is supplied with water already partially cooled.

5. In combination with an upper water-pan, one or more jackets dipping into and suspended therefrom, and a vessel or vessels arranged within the jackets, a second water-pan, jacket or jackets, and vessel or vessels below the first, and an intermediate filter, substantially as and for the purpose set forth.

6. The herein-described cooling apparatus, consisting of frame A, pans D K U, cages F M, jackets G N, vessels H O, and filters J R, the latter provided with water-chamber S, and with porous jacket V, all substantially as shown and described.

7. In a cooling apparatus substantially such as described, the combination of a frame having its sides covered with gauze and provided with a door, a water-pan placed within the inclosed space and having openings through which to insert and remove vessels, a cage or support for the vessels beneath the pan, and a fibrous jacket encircling the vessel and dipping into the pan, all substantially as shown and described.



291,167. PROCESS OF PURIFYING WATER. CHARLES B. DUDLEY, Altoona, Pa. Filed Aug. 25, 1883. (No specimens.)

Claim.—The herein-described method of purifying water for boiler use, consisting in treating the water with caustic baryta in addition to the soda-lime, the whole process being in one operation, substantially as set forth.

291,168. METHOD OF PURIFYING WATER FOR BOILER USE. CHARLES B. DUDLEY, Altoona, Pa. Filed Aug. 25, 1883. (No specimens.)

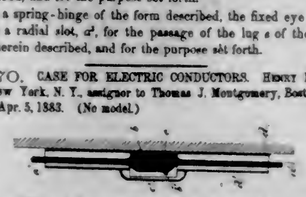
Claim.—The herein-described method of purifying waters, consisting in treating the same first with caustic baryta and then with carbonate of soda, the whole process being in one operation, as set forth.

291,169. SPRING-HINGE. WALTER DUNCAN, Chicago, Ill., assignor of one-fourth to the Union Brass Manufacturing Company, same place. Filed Sept. 18, 1883. (Model.)

Claim.—1. In a spring-hinge of the class described, the hinge-pintle provided with a stop lug or spline, in combination with the movable member provided with an adjustable abutment-screw, as described, and for the purpose set forth.

2. In a spring-hinge of the class described, the combination of the movable and fixed members with a pintle or spindle composed of a tubular portion, E, provided with a stop-lug, *e*, and a stem portion, F, connected to the operating-spring, with means for adjusting the parts E F in relation to each other, substantially as described, and for the purpose set forth.

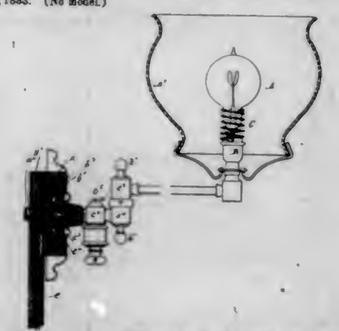
3. In a spring-hinge of the class described, the combination of the collar H, having lugs A A', stationary pintle G, having stop-lug *g*, and movable member C, having abutment-offset *c'*, as described, and for the purpose set forth.



4. A spring-hinge consisting of fixed member A, having curved slot *a* in its pivot-eye, member B, having fixed pintle G, in combination with the movable member C, having adjustable abutment-screws I, and the pintle or spindle E, having stop-lug *e*, as described, and for the purpose set forth.

5. In a spring-hinge having its pintle formed of a tubular stem, E, having a limited movement in the fixed eye of the hinge, and a stem, F, attached to the spring, and adjustably secured to the stem E by a series of radial slots, *d' f'*, and locking-pin f^3, substantially as described, and for the purpose set forth.

6. In a spring-hinge of the form described, the fixed eye A, provided with a hole or opening, a^3, communicating with the curved recess *a*, as described, and for the purpose set forth.



7. In a spring-hinge of the form described, the fixed eye A, provided with a radial slot, a^3, for the passage of the lug *s* of the hinge-pintle, as herein described, and for the purpose set forth.

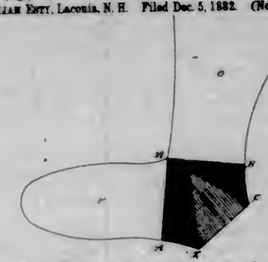
291,170. CASE FOR ELECTRIC CONDUCTORS. HENRY EDMUNDS, Jr., New York, N. Y., assignor to Thomas J. Montgomery, Boston, Mass. Filed Apr. 5, 1883. (No model.)

Claim.—The metallic case *d*, adapted to be fastened to the wall or ceiling, and the metallic cover *d'*, resting upon the same, in combination with the grooved intersection-block or junction-box *c*, of insulating material, and the electric conductors introduced into such grooves, and the cap-piece c^2, secured at the intersection, substantially as set forth.

291,171. BRACKET FOR ELECTRIC LAMPS. HENRY EDMUNDS, Jr., New York, N. Y., assignor to Thomas J. Montgomery, Boston, Mass. Filed Apr. 5, 1883. (No model.)

Claim.—1. The wall-plate H' and the circuit-connections thereon, in combination with the contact-rings b^2 b^3, the secondary wall-plate K and its conductors, and the fixture for an electric lamp screwed upon the hub of the wall-plate, substantially as set forth.

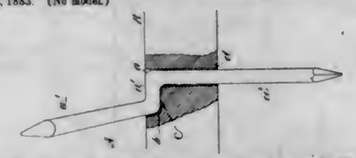
2. In combination with the bracket-arm for an electric lamp, the joint-pivot, the concentrically-grooved plates of insulating material, the naked ends of the conductors in such grooves, and spring-contacts in the grooves between the respective conductors, substantially as set forth.



291,172. DEVICE FOR CLAMPING CORDS, &c. DIEDRICH WILHELM ERNSTING, Bremen, Germany. Filed Oct. 24, 1883. (No model.)

Claim.—1. A device for clamping cords, ropes, or chains, consisting of a flanged main plate, A, a U-shaped clasp-plate, B, pivoted to the main plate, and of a second U-shaped clasp-plate pivoted with its open side toward the clasp-plate B, substantially as set forth.

2. The combination of a supporting main plate, A, a U-shaped clasp-plate, B, pivoted to the main plate, a second U-shaped clasp, C, pivoted with its open side toward the clasp-plate to the same, and a cord, rope, or chain, T, that is passed through the space between the pivots of the clasp-plates and the closed middle portion of the clasp-plate C, and adapted to be clamped by the lower edges or jaws of the clasp-plates, substantially as specified.



291,173. STOCKING AND THE ART OF KNITTING THE SAME. WILLIAM ESTY, Laconia, N. H. Filed Dec. 5, 1882. (No model.)

Claim.—1. The process herein described of knitting a heel and stocking, consisting in throwing out of action on top of the foot two of the needles upon each side at a time, and then forming the heel by first throwing two needles upon each side into action and then out of action, and then throwing two needles upon each side into action again, for the purpose of knitting the foot at right angles, substantially as set forth.

2. A stocking having that portion of its heel which is comprised between the lines C D E knit at an angle both to the foot and the leg, substantially as specified.

291,174. HARROW. AUSTIN C. EVANS, Springfield, Ohio. Filed Sept. 13, 1883. (No model.)

Claim.—1. In a reversible harrow, a tooth bent at opposite angles in the middle, and having one limb of the same extending in a slanting direction from the beam to the point of the same, as set forth.

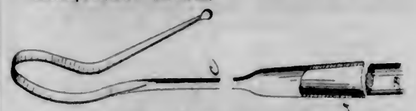
2. In a harrow, a tooth pointed at each end and bent at two opposite angles in the middle, to form a straight tooth of one section and a slanting tooth of the other section, and to adapt it to be driven into the harrow-beam, as set forth.

3. The combination, in a reversible harrow, with the beam having a straight hole and a recess leading from said hole at right angles with the latter, of a tooth having two opposite angular bends, one section or limb of said tooth slanting from the beam to the end or point of the same.

4. The combination, with the tooth A, having the angles *a* and *b*, and the horizontal part *a'* between them, the angle *a* being a right angle, to form the straight section a^2 and the angle *b* about seventy to seventy-five degrees, to form the slanting section *a'*, of the beam B, having the straight hole *d*, adapted for the insertion of section a^2, and the slot *e*, extending therefrom at an angle with the central longitudinal line of the beam, as and for the purpose set forth.

5. A harrow-tooth combining in a single piece a straight and a slanting tooth, and bent in the middle of the same at two opposite angles away from and back toward the vertical line of the same, whereby the central part between said angles is formed at right angles to said vertical line, to allow the tooth to be driven into the harrow-beam, and to adapt it to engage with the slot formed in the latter, for the purpose set forth.

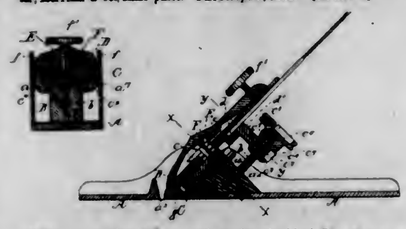
291,175. EXTRACTING NAPHTHA FROM OIL. JOHN W. EVANS, Cleveland, Ohio. Filed June 18, 1883. (No model.)



Claim.—The process herein described for extracting naphtha from oil, consisting in first heating the oil to the desired temperature, then admitting live steam in direct contact with the heated oil, and driving off the naphtha in the form of vapor, substantially as set forth.

291,176. FIRE-PROOF COMPOUND. LAWRENCE FELLOM, San Francisco, Cal. Filed June 18, 1883. (No specimens.)

Claim.—The herein-described composition of matter to be used as a fire-proof compound, and consisting of water, pulverized fire-clay, asbestos, green vitriol, sulphuric acid, sal-ammoniac, sulphur, silica, and crude sulphuret of antimony, in about the proportions specified.



291,177. SHEPHERD'S CROOK. SUMNER D. FELT, Jackson, Mich. Filed Apr. 13, 1883. (No model.)

Claim.—1. The herein-described implement for catching and holding sheep, it having a shank, C, and a loop formed of a bent bar, which has the diameter or width transverse to the plane or loop greater than the thickness of the bar, whereby the crook may be made highly elastic.

2. The herein-described implement for catching and holding sheep, it having a loop for holding the leg of the animal made of elastic material rounded upon the inner side, whereby it prevents the harming of the animal, and flattened upon the outer side or face, whereby the elasticity is increased, substantially as set forth.

291,178. PLANE. WILLIAM B. FENN, Meriden, Conn., assignor to Foster, Merriam & Co., same place. Filed Sept. 3, 1883. (No model.)

Claim.—1. A plane bed or stock having the block B, cast upon or fastened to the inside thereof, of less width than the body of the plane, and provided with ways or guides for the support of a movable plane knife or iron supporting carriage formed thereon by means of the projections a^7, all substantially as and for the purposes described.

2. The combination of the plane bed or stop A, the block B, fastened or secured thereto, narrower than the plane-stock, and having the projecting guides a^7, with a movable or knife-supporting carriage, C, having the outwardly-projecting portions or wings c^2, which lap under the under surface of the guides, all substantially as and for the purposes described.

3. The combination, in a plane, of the stock or bed A, the block B, fastened thereto as described, and of less width than the body of the plane, provided with the ways or guides a^7, which project therefrom, as specified, the threaded spindle or screw *b*, the plane knife or iron supporting carriage C, having the projecting portions c^2, which lap upon the under surface of the guides or flanges a^7, and the nut c^4, secured to said carriage, as described, all substantially as and for the purposes set forth.

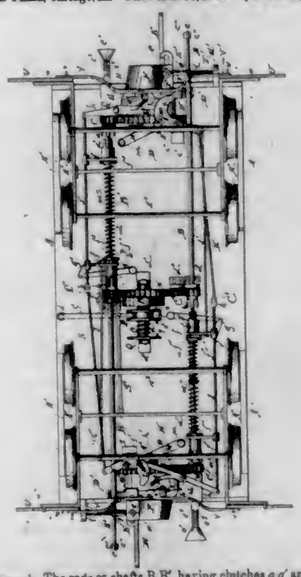
4. The combination, in a plane, of the threaded spindle or stem fixed in the body of the plane, the plane iron or knife supporting carriage C, having the projections c^2, which straddle the nut c^4, the said nut c^4, which works upon the threaded stem, all substantially as and for the purposes described.

5. The plane knife or iron supporting carriage C, having the bracket or projection c^3, whose projecting ends straddle the grooved or recessed nut c^4 between the shoulders c^2 c^2, all substantially as and for the purposes described.

6. The combination of the adjustable screw or lug E, having in the movable carriage C the plane iron or irons D, and the key F, having the undercut recess in its under surface, adapted to receive the head of the screw or lug, and the locking-screw *f'*, all substantially as and for the purposes described.

291,179. PRESS-PLATEN. JAMES FERGUSON, Bridgewater, Mass. Filed Sept. 29, 1883. (No model.)

Claim.—1. In combination with the press-platen A, the spring-hook *a*, adapted to bring a longitudinal tension upon the band, substantially as described.



291,179.

2. In combination with the press-platen, the band-hook *a*, and the protecting-shield B, substantially as described.

3. In combination with the press-platen, the band-hook *a*, provided with a claw-shaped end, substantially as described.

291,180. APPARATUS FOR OPERATING RAILWAY-TRAINS. BERNARD FRESE, Chicago, Ill. Filed Mar. 31, 1882. (No model.)

Claim.—1. The rods or shafts B B', having clutches *a a'* and *b b'*, and provided with a head, *c*, at one end, and a socket or coupling, *c'*, at the other, for making a continuous line of shafting through a train of cars, substantially as and for the purposes specified.

2. The heads of shafts B B', each provided with couplings *a a' b b'*, head *c*, and socket or coupling *c'*, in combination with pinions C and cog-wheel D, for operating the wheel D, substantially as and for the purposes specified.

3. The rods or shafts B B', each having clutches *a a' b b'*, head *c*, and socket or coupling *c'*, in combination with the pinions C, wheel D, disk D', and a coupling-link, E, for locking the link when in position, substantially as and for the purposes specified.

4. The link E, in combination with the lever H, rod J, having forks *f*, rods or shafts B B', having clutches *a a' b b'*, for automatically setting the clutches by the contact of the link with the lever, substantially as and for the purposes specified.

5. The link E, in combination with the lever H, lever I, rods J, having forks *f*, rods K, rods or shafts B, provided with clutches *a a' b b'*, for operating the clutches, substantially as and for the purposes specified.

6. The link E, lever H, connecting-rod J, and forks *f*, in combination with the clutches *a a' b b'*, rods or shafts B B', pinions C, and wheel D, for giving the wheel D a rotary movement, substantially as and for the purposes specified.

7. The link E, lever H, rods J K, and forks *f*, in combination with the clutches *a a' b b'*, rods or shafts B B', pinions C, wheel D, and disk D', for operating the disk D', substantially as and for the purposes specified.

8. The link E, lever H, lever I, connecting-rod J, and forks *f*, in combination with the clutches *a a' b b'*, rods or shafts B B', pinions C, and wheel D, for giving the wheel D a rotary movement, substantially as and for the purposes specified.

9. The link E, lever H, lever I, rods J K, and forks *f*, in combination with the clutches *a a' b b'*, rods or shafts B B', pinions C, wheel D, and disk D', for operating the disk D', substantially as and for the purposes specified.

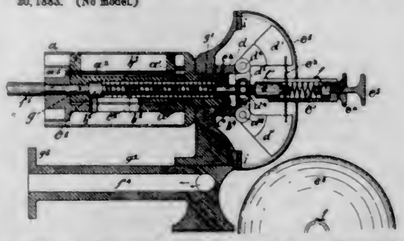
10. The shaft or rod B, having a head, *c*, and a socket, *c'*, in combination with a clutch, *b b'*, pinion C', wheel N, screw-shaft O, nut or spool P, and a connection between the nut or spool and the brakes of the car, for applying or releasing the brakes, substantially as specified.

11. The rods or shafts B B', each having a clutch, *b b'*, and a pinion, C', in combination with a pinion, C'', wheel N, screw-shaft O, traveling nut or spool P, and a connection between the nut or spool and the car-brake, for enabling the brakes to be applied and the connections to be made in case of a reverse of a car, substantially as specified.

12. The wheel N, actuated from the rod or shaft B or B' through the pinions C', in combination with the disk R', ring R'', screw-shaft O, traveling nut or spool P, and a connection between the nut or screw and the car-brakes, for preventing overwinding, substantially as described.

13. The wheel N, driving shafts or rods B or B', and pinions C', in combination with the screw-shaft O, traveling nut or spool P, having stops *o o'*, disk Q, having stop *q*, box R, having stops *o''*, disk R', ring R'', and a connection between the traveling spool and the brakes for preventing overwinding in either applying or releasing the brakes, substantially as specified.

14. The levers H and I, located at each end of the car and connected by suitable rods or links one with the other, in combination with rotating shafts B B', having clutches thereon, and provided with pinions C' C'' and link E, for actuating the clutches for coupling and braking purposes, substantially as specified.



15. The lever M and cam or flange L, in combination with the rod J', clutches *b b'*, and rods or shafts B B', for throwing the clutches into engagement independently to operate a brake-actuating mechanism through the pinions C', substantially as described.

16. The signals U and arms or levers V V', in combination with a coupling-link and a coupling-disk, for raising and lowering the signals, substantially as and for the purposes specified.

17. The wheel W', provided with numerals on its face, in combination with a driving-pinion and a coupling-shaft, through which a coupling-disk is operated, for indicating the position of different cars when coupled in a train, substantially as specified.

18. The sliding head T, in combination with the link E E', head F, having slot F', and disk D, having slot *e²*, for holding the link in position to pass into the slots F' and *e²*, substantially as and for the purposes specified.

291,181. CUT-OFF-VALVE GEAR. FREDERICK A. GARDNER, Buffalo, N. Y., assignor of one-half to R. Dunbar & Son, same place. Filed Apr. 20, 1883. (No model.)

Claim.—1. The combination of the eccentric having a diagonal slot, and arranged on the center bar, *a²*, the reversing-bar provided with a friction-roller, a spring for operating it one way, and the governor-weights for operating it the other way, all connected for joint operation, substantially as specified.

2. The combination, substantially as described, of the bolt *e*, spring *e'*, and thumb-screw *e²*, for the purposes specified.

3. The case *a*, the pivoted eccentric having the diagonal slot, the reversing-bar provided with the friction-roller and the spring *b²*, the governor-weights connected thereto, substantially as specified, and the case *e²*, for the purposes described.

291,182. SNOW-PLOW. DAVID B. GARTON, Barrie, Ontario, Canada, assignor of one-half to Edmund C. Edmonds, Albany, N. Y. Filed Aug. 24, 1883. (No model.)

Brief.—Parting and slicing blades are secured to the oppositely-inclined sides of the supporting-shoe, and have their upper marginal portions gradually extended and curved outwardly.

Claim.—1. In snow-plows for railways, the combination, with the angular or inclined sides of shoe A, of the oppositely-located and vertically-arranged parting-blades B B, which have each their upper marginal portions inclined and made to curve outwardly with a gradually-increasing extension of lateral projection of said margin portions as they are made to run upwardly and rearwardly, substantially as and for the purpose set forth.

2. In snow-plows for railways, the combination, with the oppositely-inclined sides *a a* of shoe A, and the vertically-arranged parting-blades B B situated at the outer sides of said shoe, and made to have their upper marginal edge portions extended outwardly with a gradually-increasing curve as they run rearwardly and upwardly, of a series of one or more intermediate and vertically-arranged slicing-blades, which have a gradually-increasing vertical extension above blades B B, and outwardly-curved and laterally-projecting marginal portions, which gradually increase in the outward throw of curve as said curved portions run upwardly and rearwardly, substantially as and for the purpose set forth.

3. In a snow-plow for railways, the combination, with shoe A, having oppositely-inclined sides, of the vertically-arranged outer side parting-blades, B B, and the series of vertically-arranged slicing-blades situated intermediate between said parting-blades, and having a gradually-increasing vertical extension above the said parting-blades as they run rearwardly and upwardly, all substantially as and for the purpose set forth.

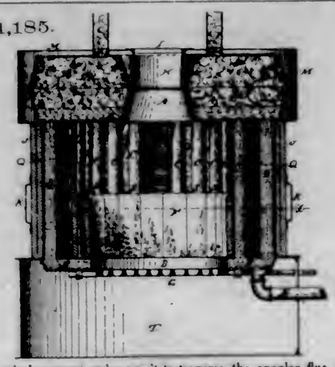
291,183. GRAIN-DRILL. THEODORE D. GERK, Owego, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—1. In a grain-drill, the combination, with a vertical distributing-wheel having a side groove or channel formed therein, of a laterally-swinging gate formed upon an arm pivoted outside of the distributing-wheel casing and adjustable transversely within and across said channel, for regulating the capacity of the channel, substantially as described.

2. In a grain-drill, the distributer-wheel casing provided with an orifice in its side, in combination with a laterally-swinging gate formed upon an arm pivoted outside of the distributing-wheel casing and adjustable through said orifice transversely of the distributer-wheel, and means for adjusting said gate, substantially as described.

3. In a grain-drill, a pivoted laterally-adjustable gate, in combination with a worm or screw for adjusting said gate, substantially as described.

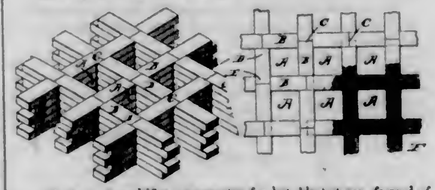
4. The combination, with a vertically-rotating distributer-wheel, of a casing inclosing said wheel, provided with an opening in the form of an arc of a circle, a hinged and laterally-adjustable gate corresponding in form to the shape of the opening, and a worm or screw for adjusting said gate, substantially as specified.



291,184. TIE FOR SECURING BAGS, BALES, &c. WILLIAM GIBSON, Adamsville, Quebec, Canada. Filed Mar. 29, 1883. (No model.)

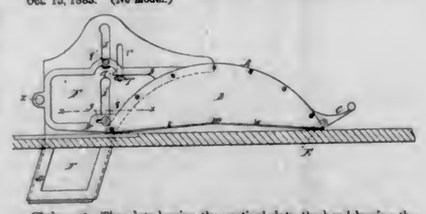
Claim.—A tie for securing bags, bales, and other like receptacles, consisting of a plate or disk provided with a lug or projection on its flat inner surface to form a lock or catch, and a cord connected to said plate and forming a permanent loop, which encircles and closes in the mouth of the bag, substantially in the manner described.

291,185. STEAM-GENERATOR. EDWARD F. GORDON and HORATIO HOBBS, Concord, N. H. Filed Apr. 9, 1883. (No model.)



Claim.—1. A steam-generator having the water-ring and steam-chamber united by two concentric series of independent water-pipes surrounding the fire-pot, with an annular space between them, forming a horizontal flue, in combination with a deflector arranged to deflect the entire caloric-current and cause it to traverse the annular flue entirely around the fire-pot, substantially as and for the purpose set forth.

2. In a steam-generator having an annular water-ring and steam-chamber united by two concentric series of distinct water-pipes, and provided with a deflector adapted to direct the entire caloric-current into the annular flue, that it may pass horizontally around the fire-pot, as described, the vertical bars L, fitting the space between adjacent tubes of the inner row, for the purpose set forth.



3. In a steam-generator, an annular water-ring and a water and steam space communicating therewith through a double row of vertical pipes, which stand at each side of a horizontal annular flue and present their convex surfaces transversely to the caloric-current through said flue, in combination with an exterior casing made in sections, so as to be removable, substantially as and for the purpose set forth.

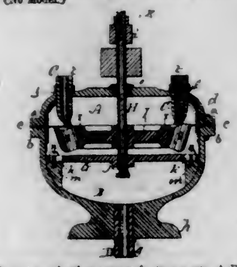
291,186. HOT-BLAST STOVE. FRED. W. GORDON, Pittsburg, Pa. Filed Sept. 24, 1883. (No model.)

Claim.—A multiflue regenerator for hot-blast stoves, formed of closed-sided flues constructed of bricks of uniform size, each brick abutting with one end against the end of another brick, and with its other end against the side joint of two similarly-abutting bricks, as shown and described.

291,187. SAW-GUARD. JOSEPH G. GROFF, Connersville, Ind. Filed Oct. 15, 1883. (No model.)

Claim.—1. The plate having the vertical slots, the hood having the rearwardly-extended arms embracing the plate, the lower arms having the horizontal slots, in combination with the rollers carried by said arms and working in the slots of the plate, substantially as described.

2. The combination of the plate having the two vertical slots for the rollers and the third slot for the adjusting set-screw, with the hood having the rearwardly-extending arms provided with the horizontal slots, the rollers carried by said arms, and the adjusting set-screw, substantially as described.

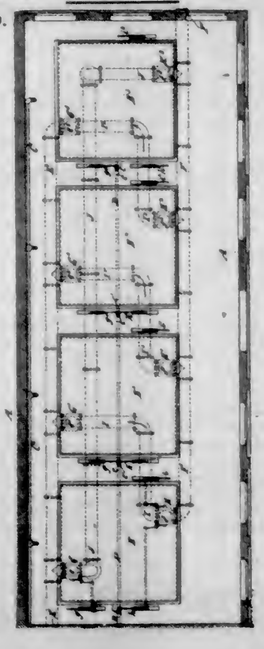


291,188. DEVICE FOR EXPANDING THE UPPERS OF BOOTS AND SHOES. CHARLES L. HIGGINS, Montreal, Quebec, Canada, assignor to John E. Wheeler, Trustee, Lynn, Mass. Filed Oct. 22, 1883. (Model.)

291,188.

Claim.—A device for giving form or shape to a boot or shoe upper or other flexible hollow article, having the general shape of the interior of such article, capable of inflation, and provided with an inward-extending fold, *a*, all substantially as and for the purpose described.

291,189. HYDRAULIC MOTOR. JAMES HENRY HINCH, Laconia, assignor of three-fourths to Walter Henry Philbrick, Belmont, N. H. Filed Sept. 1, 1883. (No model.)



Claim.—1. A water-wheel case cast in two parts, A B, with water-inlet apertures in the top part and water-discharge aperture in the bottom part, provided with an outside yoke, E, for the upper bearing of the wheel-shaft, and an inside bridge-tree, G, for the lower bearing of the shaft, substantially as set forth.

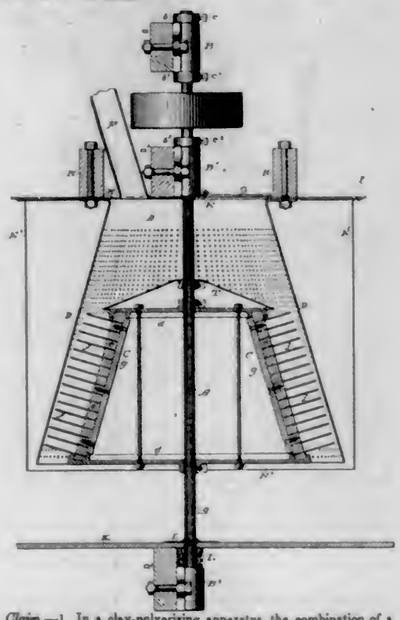
2. The combination of the wheel-shaft H, having conical hollow journals at the ends, and screw-bearings *i j*, with the yoke E and bridge-tree G, substantially as set forth.

3. The combination of the water-wheel I, having the obliquely-set buckets *s s* secured around its periphery, with a nozzle, C, having a laterally-curved ajutage at its inner end, substantially as and for the purpose herein specified.

291,190.

291,190. GAS-PURIFYING BOX. CHARLES W. IRELL, New York, N. Y. Filed Mar. 17, 1883. (No model.)

Claim.—1. The combination of a number of purifying-boxes, B B' B² B², having inlets *c c' c² c²* and outlets *f f' f² f²*, the inlet-pipe E, the valve-casings G G' G² G², each containing a single valve, the outlet-pipe F, the valve-casings H H' H² H², each containing two valves, the pipes I I' I², and the pipe J, all arranged and adapted for operation substantially as described.



2. The combination, with a number of purifying-boxes, B B' B² B², the inlet and outlet pipes E F, the connecting-pipes I I' I² J, and the valves controlling the passage of gas through said pipes to and from said boxes, of the valve-operating levers projecting upward above the floor of the purifying-house, and arranged between the boxes and on the outer sides of the two end boxes, all constructed and adapted for operation substantially as described.

3. The combination, with a number or series of purifying-boxes, of a pipe having separate communications with said boxes, and also communicating with the exhauster of the retort whence the gas to be purified is obtained, whereby provision is afforded for exhausting the gas from any one box before its cover is removed, and for returning the gas so exhausted to be again passed through the purifying-boxes, substantially as described.

4. The combination, with a valve-casing, H, containing a seat, *j*, of a disk-valve, *k*, a rock-shaft, J', and an arm, *m*, pivoted to the valve, so that the valve will hang vertically or nearly vertically therefrom, all organized so that as the said arm approaches a horizontal position the valve will be caused to scrape or clean its seat, substantially as described.

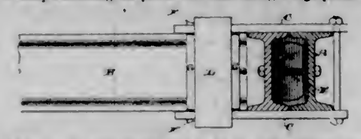
5. The combination, with the valve-casing H, having oppositely-arranged seats *j*, of the disk-valves *k*, the divided rock-shaft J' J², and arms *m*, to which the valves are pivoted, all arranged and adapted to operate substantially as described, and for the purpose set forth.

291,191. CLAY-PULVERIZER. ANTHONY JITNER, St. Louis, Mo. Filed Nov. 2, 1883. (No model.)

Claim.—1. In a clay-pulverizing apparatus, the combination of a frustum-shaped adjustable rotating brush with a perforated metallic case, substantially as set forth.

2. In a clay-pulverizing apparatus, the combination of the adjustable shaft and brush, the perforated case, the cover E, and the hopper spout or inlet, substantially as set forth.

3. In a clay-pulverizing apparatus, the combination of a brush rotating on a vertical axis and inclosed by a perforated case, and a hopper-spout or equivalent means for permitting the feed of clay at the top, substantially as set forth.



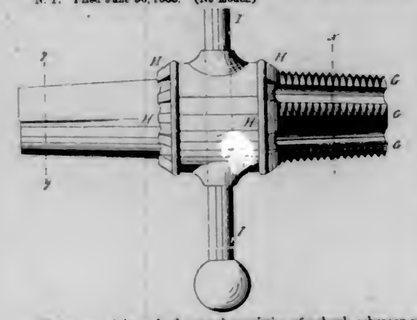
4. In a clay-pulverizing apparatus, the combination of a brush rotating on a vertical axis within a perforated case, and the whole inclosed within a covering, E', substantially as set forth.

5. In a clay-pulverizing apparatus, the combination of a brush rotating on a vertical axis within a perforated case, and a cap, T, substantially as set forth.

6. In a clay-pulverizing apparatus, the combination of a brush rotating on a vertical axis within a perforated case, a cap, T, and an inclined hopper-spout, F, substantially as and for the purpose set forth.

291,192. SUPPORT FOR BEAMS AND GIRDERS. PETER H. JACKSON, San Francisco, Cal. Filed Oct. 25, 1883. (No model.)

Brief.—A girder and abutting beam are secured together by plates extending across the girder and above and below the end of the beam, and a clamp embracing the plates with intervening wedge-pieces.

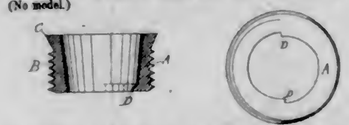


Claim.—1. In combination with girder A A and abutting beam B, the independent wrought-iron plates extending across the girder and above and below the beam, and a clamp, as means for securing the end of the abutting beam and the plates together, substantially as herein described.

2. The girder A A and abutting beam B, in combination with the plates C and flanges to secure them to the end of the abutting beam, substantially as herein described.

3. The girder A A and abutting beam B, in combination with the plates C, extending across the girder and upon the end of the beam above and below, with means for securing and clamping said plates, and cheek-pieces fitting between the end of the beam and the bolts or clamp, substantially as herein described.

291,193. BUNG-BUSH WRENCH. SAMUEL H. JENKINS, New York, N. Y. Filed June 30, 1883. (No model.)



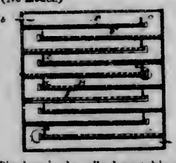
Claim.—1. A bung-bush wrench consisting of a shank, whereon are located one or more eccentric projections, substantially as shown and described.

2. A metal shank having one or more eccentric projections at one extremity, forming a wrench, and a screw-cutting tap at the other, a handle being secured to said shank, and adapted and arranged to operate either wrench or tap, substantially as shown and described.

3. In a bung-bush wrench of the character herein specified, shank E, bearing one or more eccentric projections, F, tap G, cutter or cutters H, and lever-handle I, the whole combined and arranged to operate substantially as shown and described.

291,194. BUSHING FOR BUNG-HOLES AND BUNG FOR USE THEREWITH. SAMUEL H. JENKINS, New York, N. Y. Filed Apr. 23, 1883. (No model.)

Claim.—1. A metallic bung-hole bush, the outer wall whereof is vertical, screw-threaded, and provided with a beveled shoulder, as set forth, and a tapering perforation passing through the bush, one or more inwardly-projecting shoulders being located at or near the small extremity of said perforation, the face of said shoulder or shoulders being radial to the body of the bush, and the inner surface of the bush eccentric in form, substantially as and for the uses and purposes shown and described.



2. The combination, with a bung-bush having body A, vertical exterior screw-thread, B, and beveled flange C, of inwardly-projecting shoulders D, the bearing-faces of said shoulders being radial to the body of the bush and the inner surface of the metal eccentric in form where said shoulders are located, substantially as shown and described.

3. A wooden bung partially bored through its center, as set forth, and provided with a detachable cap-piece formed by a circumferential cut around the periphery of the bung near its smaller extremity, substantially as and for the uses and purposes shown and described.

4. A wooden bung having a hole partially cut or bored through its center, as set forth, and a bevel upon its smaller extremity, substantially as and for the uses and purposes shown and described.

5. Bung J, the center whereof is cut away at K, the extremity of the bung being beveled at L, and provided with a circumferential cut, *l*, forming a cap-piece, substantially as and for the uses and purposes shown and described.

291,195. FISH-PACKAGE. RALPH S. JENNINGS, Boston, Mass. Filed Feb. 23, 1883. (No model.)

Claim.—1. The herein-described portable package for transporting fish, it having a tight top and bottom and tight sides, except that one side has an air-aperture at or near the bottom and the other side has another air-aperture at or near the top, in combination with partitions or shelves formed of narrow cross-bars constructed to allow large air-spaces between them, and arranged, substantially as set forth, to compel the air which enters the lower aperture through the side of the package to move in a broken or circuitous passage to the upper aperture, substantially as set forth.

2. The herein-described portable package for transporting fish, it consisting of an outside casing and interior partitions or shelves constructed of strips or supporting-pieces arranged to allow a free passage of air between them, and each arranged to project part way across the side of the package opposite to the side from which the adjacent partitions or shelves project, and air-apertures through the sides of the casing, substantially as set forth.

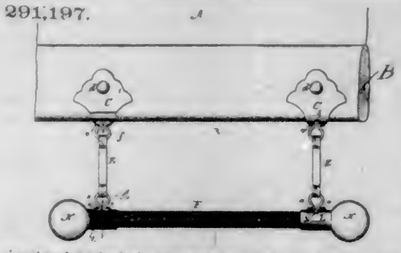
3. In a portable package for transporting fish, the combination of the external casing and the interior partitions or supports, each having at one edge a cut-away portion or passage for air, and means, substantially as set forth, to prevent the fish from moving over said passage.

291,196. INHALER. WILLIAM A. JOHNSTON, Clifton, and ARTHUR W. BROWNE, Pleasant Plains, N. Y., assignors to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Apr. 2, 1883. (No model.)

Claim.—1. The combination of the draft-tube with the mouth-tube by means of a prismatic coupling or chamber-piece, substantially as described.

2. A prismatic chamber-piece for inhalers, having openings therein communicating with a mouth-tube, draft-tube, and an air-inlet, and provided with detachable connections for said tubes, substantially as described.

3. The combination, substantially as hereinbefore set forth, of the mouth and draft tubes with two valves and an operating mechanism for said valves, substantially as described, whereby said operating mechanism in one position permits said valves to act automatically and in another position closes one of said valves and opens the other.



4. The combination of the draft and mouth tubes, the chamber-piece or coupling, the operating-valves, the rock-shaft carrying a cam or its equivalent to control said valves, and a handle to operate said rock-shaft.

5. The combination of the draft and mouth tubes, the chamber-piece or coupling, the valves, the rock-shaft carrying a cam or its equivalent to control said valves, the spring acting upon said rock-shaft, the handle or finger-piece to operate said shaft, and a detent to retain said shaft against the force of its spring.

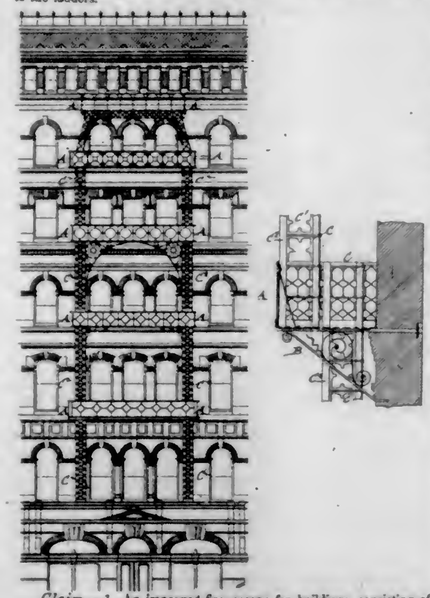
291,197. WINDOW-SHADE BAR. HUBERT L. JUDD, Brooklyn, N. Y. Filed Aug. 24, 1883. (No model.)

Claim.—1. The combination, with the clip C, of the eye *f*, the clip

291,197.

being slotted at 3 for the insertion of the ends of the eye and recessed at 4, so that the eye is held in place when the clip is fastened in place, substantially as set forth.

2. The combination, with the bar F, of the sheet-metal end L and the suspending-eye *g*, the metal end L_1 being slotted for the ends of the eye to be passed in, and recessed to receive such ends, so that they will be firmly held by the insertion of the bar F, as set forth.



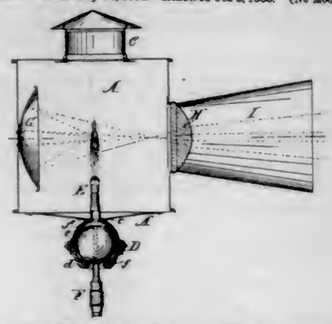
3. The window-shade bar formed of wood or similar material with braiding upon the surface thereof, in combination with metallic end pieces that are slipped on outside the braiding to secure the same, substantially as set forth.

4. The combination, with the window-shade slots, of clips to be attached to the same, the suspending-eyes *f* passing into openings in the clips and having their ends turned outwardly, links E, and bar F, substantially as set forth.

5. The combination, with the bar F, of the eyes *g*, having ends that are turned outwardly, the suspending-links E, and the clips C, substantially as set forth.

291,198. FIRE-ESCAPE. HUGO KAFKA, New York, N. Y. Filed July 30, 1883. (No model.)

Brief.—Vertical ladders connect the balconies of the several stories, and panels of lattice-work, the cross-ribs of which are substantially parallel with the ladder-rungs, are arranged in front of and also at an angle to the ladders.

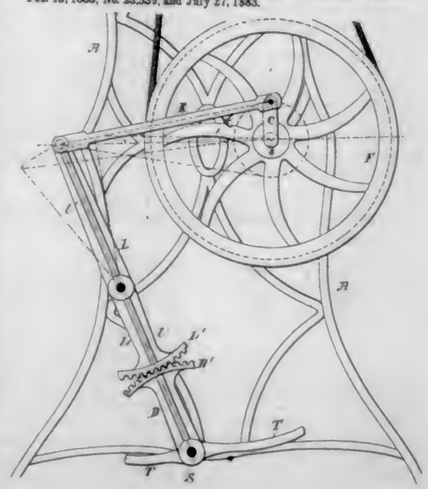


Claim.—1. An improved fire-escape for buildings, consisting of balconies for the several stories, ladders connecting the same, and panels of lattice-work arranged in front of and parallel to the ladders, the cross-ribs of the panels being arranged at a level, or nearly so, with the rungs of the ladder, substantially as set forth.

2. An improved fire-escape for buildings, consisting of balconies for the several stories, ladders connecting the balconies, and panels of lattice-work extending in front of and at suitable angles to the ladders, so as to form a screen and guard-rail for the same, substantially as set forth.

3. An improved fire-escape for buildings, consisting of balconies for the several stories, said balconies having an opening or openings alternately closer to or farther from the wall of the building, ladders made in sections and communicating alternately with said openings, and panels of lattice-work arranged in front of and at a suitable angle to the ladders, so as to form a screen and railing for the same, substantially as set forth.

291,199. REFLECTOR FOR GAS-BURNERS. JÜRGEN KASSCHAU, New York, N. Y. Filed July 20, 1882. Renewed Oct. 2, 1883. (No model.)



Claim.—1. A reflector for gas-burners, consisting of a camera having an interior reflector and a light-directing tube opposite the reflector, and a ball-and-socket joint having a gas-burner connected to one member thereof, and a tubular socket connected to the other member thereof substantially as set forth.

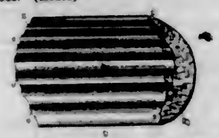
2. A reflector for gas-burners, consisting of a camera having an interior reflector and a lens opposite the reflector, and a ball-and-socket joint having a gas-burner connected to one member thereof, and a tubular socket connected to the other member thereof, substantially as set forth.

3. A reflector for gas-burners, composed of a camera having an interior reflector, a lens and light-emitting tube, and a ball-and-socket joint having a burner connected to the socket and a supporting-sleeve connected to the ball, substantially as and for the purpose set forth.

4. In a reflector for gas-burners, the combination of the camera with a ball-and-socket joint, the socket part of which carries a gas-burner, while the ball is provided with a sleeve, the socket being applied by a screw-clamping section and interior elastic rings to the ball, substantially as and for the purpose set forth.

291,200. TREADLE-MOTION. JOHN KAYSER, Kaiserslautern, Bavaria, Germany. Filed Aug. 13, 1883. (No model.) Patented in Germany Feb. 13, 1883, No. 23,339, and July 27, 1883.

Claim.—1. In a treadle-motion for sewing-machines, the combination, with the driven crank, a treadle-shaft, and a treadle carried by and oscillating on or with said shaft, of a connecting-rod, R, and intermediate mechanism to transmit the oscillations of the treadle or its shaft to the crank through the medium of the connecting-rod, as described.



2. In a treadle-motion for sewing-machines, the combination, with the driven crank and a treadle carried by and oscillating on or with said shaft, of a connecting-rod, R, a two-armed rock-lever, and intermediate appliances to transmit the vibrations of the treadle to the lever, and through the latter to the connecting-rod and crank, as described.

3. In a treadle-motion for sewing-machines, the combination of the driven crank, a connecting-rod, and an intermediate two-armed lever connected to said rod, with a treadle-shaft, a treadle, and a lever carried by and vibrating on or with said shaft, through which lever the vibrations of the treadle or its shaft are transmitted to the rock-lever and connecting-rod to rotate the crank, as described.

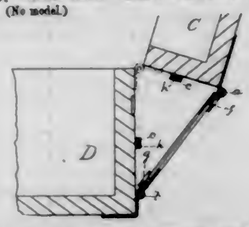
4. The combination, with the crank C, connecting-rod R, and lever L, of the lever D and treadle T, and means, substantially such as shown and described, to transmit the movement of the lever D to the lever L, as described, for the purposes specified.

5. The combination, with the crank C, connecting-rod R, and lever L, terminating in a segment, the face of which is provided with teeth or their specified equivalent, of the lever D, terminating in a segment, the face of which is also provided with teeth or their specified equivalent, and the treadle T, all arranged for operation substantially as and for the purposes specified.

291,201. CIGARETTE-CASE. FRANCIS S. KINNEY, New Brighton, N. Y. Filed Mar. 3, 1883. (Model.)

Claim.—1. A cigarette-case consisting of a collapsible tubular body, as A, closed at one end by a piece of flexible material, as B, the edges of which are secured to the inside of the body and project inward, so as to be concealed within the case, substantially as described.

2. A cigarette-case having a flexible bottom and a collapsible tubular body provided with longitudinal corrugations extending around its entire circumference, whereby said body is made to conform to the shape of the cigarettes contained therein, substantially as described.



3. A cigarette-case consisting of a tubular body, as A, provided with a series of corrugations, as *c*, and having one end closed by a flexible bottom, as B, the edges of which are secured to the inside of the body and project inward, so as to be concealed within the case, substantially as described.

291,202. BELT-FASTENER. PHILIPPE KOCK, Neuss-on-the-Rhine, Germany, assignor to Nicholas Godes, Preston, Iowa. Filed Aug. 30, 1883. (No model.) Patented in Germany Mar. 24, 1878, No. 3,041, and July 25, 1880, No. 12,293.

Claim.—The belt-fastener herein described, consisting of an upper part, A, of concave shape, and a lower part, B, of convex shape, corresponding with the curve of the lower side of the upper part, and provided on their faces next to the belt ends with teeth or points, and the lower part with nipples having screw-threads to receive the screws, which hold the parts together and against the belt ends, all substantially as shown and specified.

291,203. TRUNK-STAY. JAMES E. LADD, Bristol, Conn. Filed Oct. 26, 1883. (No model.)

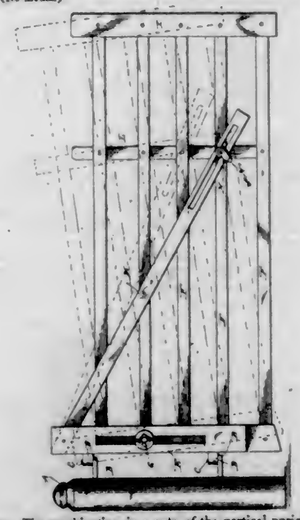
Claim.—1. The herein-described trunk-stay, consisting of the two connected and longitudinally-sliding straps, hinged respectively to the trunk cover and body at or near the rear corners thereof, substantially as described, and for the purpose specified.

2. The hinged straps connected so as to move longitudinally one upon the other, in combination with the engaging sockets or saddles at the back of the trunk, substantially as described, and for the purpose specified.

3. The combination of a trunk cover and body, the sliding stay applied to the outside thereof at the rear, and means, substantially as described, which limit the extent of the sliding movement of the stay and form a tie when the trunk is closed, substantially as described, and for the purpose specified.

4. The combination of the hinged straps, adapted to be applied to the outside and rear of the trunk, and the engaging sockets or saddles, also applied to the back of the trunk, substantially as described, and for the purpose specified.

291,204. COMBINED FOLDING CARRIAGE AND CRADLE. HERRMAN LADEWIG, Camden, N. J. Filed Aug. 9, 1883. (No model.)

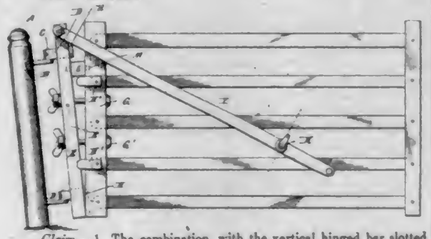


Claim.—1. In a carriage, a removable body having a fastening cross-head whose ends are attachable to the reaches of said body, substantially as and for the purpose set forth.

2. Running-gear, in combination with a carriage-body, having on its under side a cross-head and fastening-screw H, substantially as and for the purpose set forth.

3. In a folding carriage, the combination, with a body and reaches, of running-gear, consisting of front side pieces, rear side pieces pivoted thereto, and a cross-bar against which the rear side pieces abut, the reaches being connected at rear with said cross-bar, substantially as and for the purpose set forth.

4. A carriage, having a removable body, which is provided with rockers, forming a cradle, and means for fastening it to the running-gear, substantially as and for the purpose set forth.

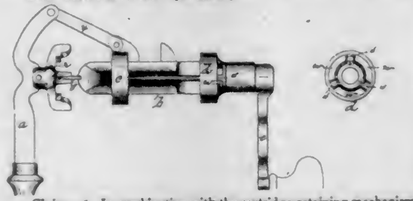


291,205. GATE. ISRAEL L. LANDIS, Lancaster, Pa. Filed May 15, 1883. (No model.)

Claim.—The combination, in a gate, of the vertical upright hinged to the gate-post and longitudinally slotted from side to side, the vertical

bars secured to one side of the same by means of the lateral bolt and nut, and the oblique bar and fastening devices, the whole arranged to operate substantially as specified.

291,206. GATE. ISRAEL L. LANDIS, Lancaster, Pa. Filed May 15, 1883. (No model.)



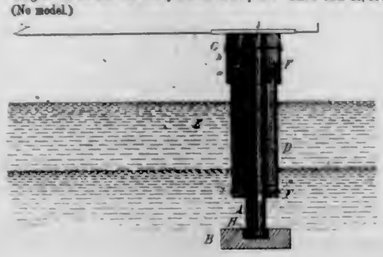
Claim.—1. The combination, with the vertical hinged bar slotted longitudinally and the rear vertical bars of the gate, of one or more screw-bolts, whereby the gate is secured to the hinged bar, substantially as and for the purposes set forth.

2. In combination with the vertical hinged bar and the rear bars of the gate and the connecting-bolt, the wedge provided with lugs or pins, and adapted to sit between the vertical hinged bar and the vertical supporting-bars of the gate, substantially as specified.

3. The combination, with the rear vertically-slotted bar, and the vertical bars to which the rear ends of the horizontal bars of the gate are secured, of the connecting bolt or bolts and the oblique bars, the latter being secured to the rear vertical bar and embracing the horizontal bars of the gate, and the clamping-bolt and crank arranged to hold the gate in any desired adjusted position, substantially as specified.

291,207. CARTRIDGE-CLOSING MACHINE. CHARLES S. LEET and WILLIAM H. NORTHALL, Bridgeport, Conn.; said Northall assignor to said Leet. Filed Jan. 2, 1883. (No model.)

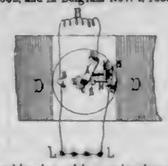
Claim.—1. In combination with the cartridge-retaining mechanism of a cartridge-closing machine, a closer-cup having perforations or openings in the bottom thereof, substantially as described.



2. In combination with the cartridge-retaining mechanism of a cartridge-closing machine, a closer-cup provided with radial projections, as *z*, on its inner hub, substantially as stated.

3. In combination with the cartridge-retaining mechanism of a cartridge-closing machine, the closer-cup having openings through the bottom thereof between its shell-turning bosses, and having projections, as *z*, on its inner hub, substantially as described.

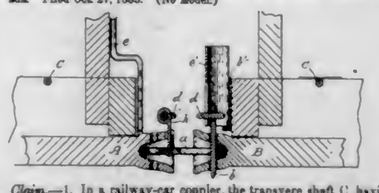
4. In combination with the head-plate of a cartridge implement, the clamping-lever pivoted to said plate, and arranged, as described, to bear upon the side of the head of the cartridge as the cartridge is forced against said plate, substantially as stated.



5. In a cartridge-closing machine, a closer-cup composed of Babbitt metal or similar material, substantially as described, and for the purpose stated.

291,208. SHIELD FOR POSTS. OSCAR S. LESLIE, Milwaukee, Wis., assignor of one-half to Henry Landt, same place. Filed Jan. 26, 1883. (No model.)

Claim.—The combination of post A, inclosing-shield D, upper and lower packing-rings F F, interposed between said post and said shield, supporting-base B, packing H, interposed between said base and said post, water-shed G, and supporting-rods *b b*, all substantially as and for the purpose specified.

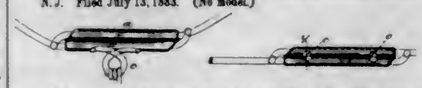


291,209. EXCITING-CIRCUIT FOR DYNAMO-ELECTRIC MACHINES. CHARLES LEVER, Bowdon, County of Chester, England. Filed Feb. 19, 1883. (No model.) Patented in England May 3, 1882, No. 2,093; in France Nov. 3, 1882, and in Belgium Nov. 4, 1882.

Claim.—1. In combination with a series dynamo-electric machine and with shunt electric-arc lamps arranged in series; a shunt or derived circuit having a resistance equal to said lamps, and through which the current passes for the purpose of exciting the dynamo, and a circuit-breaker for breaking the said shunt-circuit when the dynamo has excited itself, and causing the current to pass through the magnets of the lamps to form their arcs, substantially as specified.

2. In combination with a series dynamo-electric machine and with shunt electric-arc lamps arranged in series, the magnet E in a shunt-circuit from the dynamo D, and having a resistance about equal to the arcs, the pivoted armature A, spring J, contact-piece C, stud S, and wire connections, substantially as specified, whereby the armature will be moved when the dynamo has excited itself, thus breaking said shunt-circuit and causing the current to pass through the magnets of the lamps and to form their arcs, substantially as specified.

291,210. CAR-COUPLING. PIERRE MAYRAND, Montreal, Quebec, Canada. Filed Oct. 27, 1883. (No model.)



Claim.—1. In a railway-car coupler, the transvere shaft C, having the hand-wheels *c c*, the lifting-arm *d*, connected with the coupling-pin *b*, the lever D, fixed rigidly to the shaft C, the latch-lever E, spring *f*, and the bar *g*, substantially as shown and described.

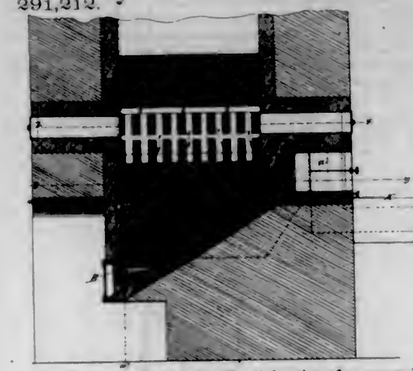
2. In a railway-car coupler, the shaft C, on which is fixed the lifting-arm *d*, connected with the coupling-link *a* by the eyebolt *h*, so that the link may be raised by operating the hand-wheels *c c* or the lifting-rod *e*, as shown and described.

3. In a railway-car coupler, the combination of the lifting-rod *e* with the coupling-link *a*, lifting-arm *d*, and shaft C, substantially as described.

4. The combination of the lifting-rod *e* with the coupling-pin *b*, lifting-arm *d*, shaft C, lever D, latch-lever E, and spring *f*, substantially as shown and described.

291,211. TELEGRAPH-WIRE JOINT. CHARLES MCINTIRE, Newark, N. J. Filed July 13, 1883. (No model.)

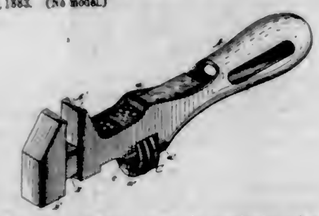
Claim.—1. A telegraph-wire joint provided with a hook, loop, or device adapted to receive a holding-wire, substantially as and for the purposes set forth.



2. In a telegraph-wire joint, a partition adapted to separate the wires, and having soldering-openings *c*, adapted to allow the entrance of solder to both chambers at the same time, substantially as shown and described.

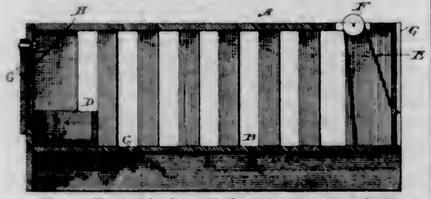
3. A telegraph-wire joint formed of two tubes, flattened, as shown, and secured together, and having soldering-openings *c* therein, as a new article of manufacture.

291,212. LIMEKILN. JOHN T. MEREDITH, Milwaukee, Wis. Filed June 25, 1883. (No model.)



Claim.—1. The combination, in a limekiln, of air and gas flues arranged in series, and alternating with each other, and leading into a mixing-chamber, substantially as set forth.

291,212.



2. The combination, in a limekiln, of air and gas flues arranged in series, and a mixing-chamber containing a fire-bed, substantially as set forth.

291,213. MONKEY-WRENCH. CHAS. H. MILLER, Erie, Pa., assignor to the Lovell Manufacturing Company, (Limited,) same place. Filed June 9, 1883. (No model.)

Claim.—In a monkey-wrench, the combination, substantially as shown, of the following elements: a body or handle, A, having a longitudinal opening or cavity to receive the movable part, the fixed jaw A', and the worm-wheel supports *a' a'*, the movable part consisting of a bar or stem, B, with worm-wheel notches or teeth *b* on its back, and the movable jaw B', and finally the worm-wheel C, mounted between the supports or ears *a' a'* on the rivet *c*, and meshing with the teeth *b* on the said movable part.

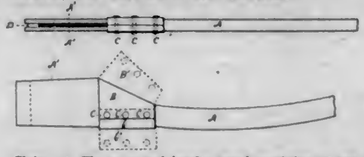
291,214. HEN'S NEST. NATHANIEL MITCHELL, Sailor Springs, Ill. Filed July 21, 1883. (No model.)

Claim.—The combination, with the case or coop A, of the hinged bottom B, provided at its rear end with the nest D and at its forward end with the cords E, secured thereto, passing over the pulleys F, and thence attached to the sliding door G, the whole constructed and arranged substantially as and for the purposes set forth.

291,215. METHOD OF DECORATING WALLS, &c. MATTHEW MONTEMENT, Philadelphia, Pa. Filed Nov. 16, 1883. (No model.)

Brief.—Decorating walls, consisting of trees, shrubs, &c., disposed in the place of plastering, and having a transparent or other covering, and a trough for the reception of earth and water, in case living plants are used.

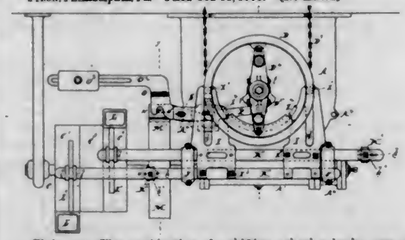
Claim.—1. A decoration for walls, &c., employed in lieu of plastering, consisting of trees, vines, &c., harmoniously disposed in the space occupied by the plastering, substantially as and for the purpose set forth.



2. A decoration for walls, &c., employed in lieu of plastering, consisting of trees, vines, &c., occupying the space of the plastering, and having a transparent covering, substantially as and for the purpose set forth.

3. A decoration for walls, &c., employed in lieu of plastering, consisting of trees, vines, &c., occupying the space of plastering, and having a transparent covering, in combination with a bottom trough, substantially as and for the purpose set forth.

291,215.



291,216. AX AND TOOL HANDLE GUARD. GEORGE P. MORRILL, Canterbury, N. H. Filed Mar. 12, 1883. (No model.)

Claim.—1. The ax or tool handle guard consisting of two metal plates inserted in a slot passing through the center of the handle, with the edges of each plate projecting from opposite sides of the handle, and being bent down upon the handle, so that the projecting edges of each plate will inclose the surface of one-half of the handle, the edges of each plate overlapping each other and being secured by means of nails or screws passing into the wood forming the handle, or by rivets passing through the handle, as shown and described, and for the purpose set forth.

2. The combination, with an ax or tool handle having the end slotted as described, and having a metallic guard consisting of plates inserted in the slot and bent around the handle, as described, of the tongue-pieces A' A', attached to the guard and extending forward beneath the ax or tool, for the purpose of partially filling the slot and holding the guard more firmly in place, as and for the purpose set forth.

291,217. HOISTING-MACHINE. STEPHEN A. MORSE and CHARLES TYSON, Philadelphia, Pa. Filed Oct. 11, 1883. (No model.)

Claim.—1. The combination of a shifting-wheel, a brake-cam secured thereto, mechanism actuated by said wheel to actuate the driving-belts, and gravity-brake mechanism arranged to be thrown out of action upon rotating said shifting-wheel in either direction, and into action when said wheel is in its normal position, or between said motions, substantially as and for the purpose specified.

2. The combination of a brake-cam and brake with the driving-shaft of a hoisting-machine, and means to vary the position of the brake-shoe with reference to its actuating-lever, substantially as set forth, to regulate or vary the time of the application of said brake, substantially as and for the purpose specified.

3. The combination of a brake-cam and brake with the driving-shaft of a hoisting-machine, a brake-wheel upon said driving-shaft, a driving-wheel, and two idler-wheels, belt-shifters, and shifting mechanism to actuate said belt-shifters, and means to vary the position of the brake-shoe with reference to its actuating-lever, substantially as set forth, to regulate or vary the time of the application of said brake to said brake-wheel, substantially as and for the purpose specified.

4. The combination of the casing A, frame N N^1, pivot *n'*, brake-shoe M^1, frame O, having arm O^2, weight O^3, arm P, screw Q, and cam mechanism to vibrate said arm P, substantially as and for the purpose specified.

5. The combination of the casing A, having apertures or holes A^2 on each end thereof, frame N, having two legs or arms, N^2, arranged to strad-

dle said case A, pivot s', brake-shoe M', frame O, pivoted to frame N, having arm O^2, and arms O^4, also arranged to straddle said case A, weight O^3, arm P, screw Q, and cam mechanism to vibrate said arm P, whereby said brake mechanism may be made right or left handed on the said case A, substantially as and for the purpose specified.

6. A belt-shifting device for hoisting-machines, which consists of a shifting-wheel provided with two pins arranged diametrically opposite to each other, in combination with shifting-bars and slotted plates secured thereto, within which the said pins work to move said bars, and suitable devices, substantially as set forth, to hold one of said bars stationary while the other is being moved, or vice versa, substantially as and for the purpose specified.

7. A belt-shifting device for hoisting-machines, which consists of a shifting-wheel provided with two pins arranged diametrically opposite to each other, and a circumferential slot or groove arranged between said pins, in combination with shifting-bars and slotted plates secured thereto, within which the said pins work to move said bars, and also lugs or projections which fit into the circumferential groove, and thereby prevent the said plates from moving, said circumferential groove and one of said pins on said shifting-wheel acting respectively upon the separate shifting-bars and their plates at the same time, whereby one is held stationary while the other is being moved, substantially as and for the purpose specified.

8. The combination of wheel D, having pins I' I' and circumferential groove H, shifting-bars K K, having plates I I, provided with slots *i i*, and lugs I^2 I^2, substantially as and for the purpose specified.

9. The combination of wheel D, having pins I' I' and circumferential groove H, shifting-bars K K, having plates I I, provided with slots *i i*, and lugs I^2 I^2, the said lugs I^2 and groove H limiting the throw of the bars K in one direction, and suitable buffers secured to said bars K, to limit the throw of same in the opposite directions, substantially as and for the purpose specified.

10. The combination of wheel D, having pins I' I' and circumferential groove H, shifting-bars K K, having plates I I, provided with slots *i i*, and lugs I^2 I^2, the said lugs I^2 and groove H limiting the throw of the bars K in one direction, and suitable adjustable buffers secured to said bars K, to regulate and limit the throw of same in the opposite directions, substantially as and for the purpose specified.

11. The combination of wheel D, having pins I' I' and circumferential groove H, shifting-bars K K, having plates I I, provided with slots *i i*, lugs I^2 I^2, and buffers K', consisting of plate L^2 and rubber or flexible cushion L^2, substantially as and for the purpose specified.

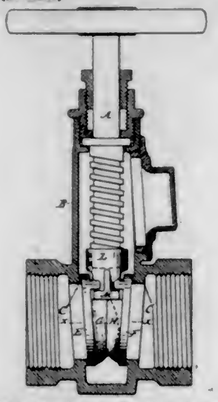
12. The combination of the pins I' I', arranged substantially opposite to each other, and adapted to move around a fixed point, with plates I, having slots *i*, there being a time when both of said pins are in said slots when the plates are held stationary, but when said pins are moved in either direction one of same passes out of the slot in one of said plates, while the other passes in and shifts the other of said plates, substantially as and for the purpose specified.

13. The combination of the pins I' I', arranged substantially opposite to each other, and adapted to move around a fixed point, with plates I, having working-slots *i*, there being a time when both of said pins are in said slots when the plates are held stationary, but when said pins are moved in either direction one of same passes out of the working-slot in one of said plates, while the other passes in and shifts the other of said plates, and mechanism, substantially as set forth, to hold one of said plates stationary while the other is being shifted, substantially as and for the purpose specified.

14. The combination of shaft C, worm B^3, worm-wheel B', shaft B, having a screw-thread, *b*, on its end, stationary but adjustable nuts F' F^3, clamped upon the screw-threaded end of shaft B by bolts *f f*, and traveling nut F, and suitable mechanism actuated, when the said nut F comes in contact with either of said nuts F' F^3, to automatically stop the rotation of shaft B, substantially as and for the purpose specified.

15. The combination of shaft C, worm B^3, worm-wheel B', shaft B, having a screw-thread, *b*, on its end, stationary nuts F' F^3, traveling nut F, arranged to slide longitudinally in a frame, D^3, shifting-wheel D, and shifting devices actuated upon said wheel being rotated in either direction, substantially as and for the purpose specified.

16. The shifting-bars K, in combination with the shifting-arms L' and clamping-plates *l*, having lugs l^2, and secured together by bolts *l'*, substantially as and for the purpose specified.



17. The shifting-arm for a belt-shifter, consisting of a wrought-iron rod or bar, L', having a cast-iron loop riveted to its end, substantially as and for the purpose specified.

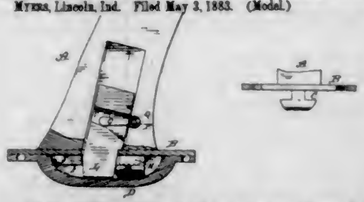
18. The combination of brake-wheel M, a pivoted frame, N, having bearings N', a brake-shoe, M', secured to said frame N by flexible or universal joint frame O, supported on said bearings, and having arms P and O^2, weight O^3, and cam D^4, having projections D^5 D^5, and recess D^6, substantially as and for the purpose specified.

19. An adjustable shifting-arm for belts, in combination with a shifting-bar arranged to reciprocate in fixed guides, said arm being arranged at right angles to said bar, and an adjustable clamping device to secure said arm to said bar and allow it to be adjusted in the direction of its length, substantially as and for the purpose specified.

20. An adjustable shifting-arm for belts, in combination with a shifting-bar arranged to reciprocate in fixed guides, said arm being arranged at right angles to said bar, and an adjustable clamping device to secure said arm to said bar and allow it to be adjusted both in the direction of its length and that of the shifting-bar, substantially as and for the purpose specified.

291,218. STOP-VALVE. CHARLES F. MURDOCK, Detroit, Mich. Filed Apr. 6, 1883. (No model.)

Claim.—1. In a stop-valve, an adjustable valve-gate with inclined faces, made in two parts, which are disconnected from but abut against and support each other upon their rear surfaces, which in one part forms a spherical segment, with a semi-spherical stemway formed therein, and in the other a corresponding socket, substantially as and for the purposes described.

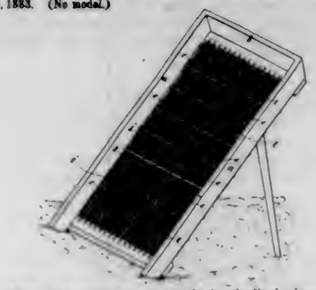


2. In a stop-valve, an adjustable valve-gate, the two parts of which have segmental ball-and-socket abutments upon their backs or meeting faces, central passage-way, I, and corresponding grooves K upon each part, in combination with the winged nut L, all combined and constructed substantially as and for the purposes described.

3. In a stop-valve, an adjustable valve-gate made in two disconnected parts, the abutting faces of which form a ball-and-socket joint, the center bearing portion of which is cut away, substantially as set forth.

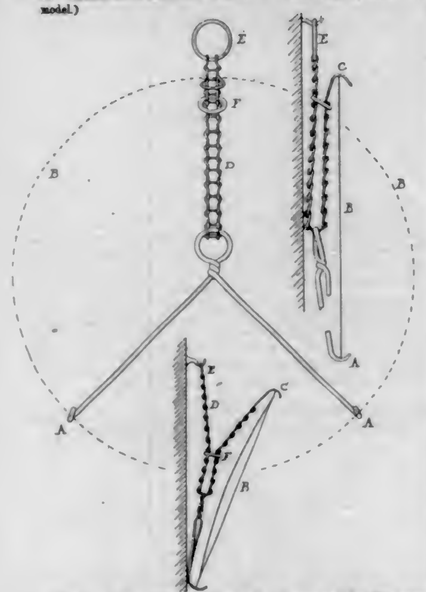
4. In a stop-valve, an adjustable valve-gate made in two parts, the abutting faces of which form a ball-and-socket bearing, through the spherical segment of which bearing is a semi-spherical slotted stemway, in combination with the winged nut provided with means for connecting it to the gate, the parts being constructed to operate substantially as and for the purposes described.

5. In a stop-valve, a gate consisting of two valve-disks provided with a spherical joint, and forming a wedge-shaped gate when closed, in combination with a nut through which the stem is threaded, the body of said nut being outside the body of the valve-gate, said nut being provided with wings or flanged at the lower end thereof, which engage with the grooves in the valve-disks near the top thereof, said grooves being larger than the entering wings, so that in operating the gate the valve-disks are adapted to draw apart upon their lower ends when the gate is raised and adjust themselves to the valve-seats when closed, substantially as and for the purposes set forth.



291,219. DEVICE FOR FASTENING SCHOOL-DESKS. JOHN WEST MYERS, Lincoln, Ind. Filed May 3, 1883. (Model.)

Claim.—1. The combination of the two recessed plates D D', one of which is provided with the projections H, the other with the projections H and stops J, with the legs of a desk or bench, both of which are provided with the lugs C, and the locking device L, secured to one pair of said legs, and which prevents any backward movement of the lugs C, substantially as shown and described.

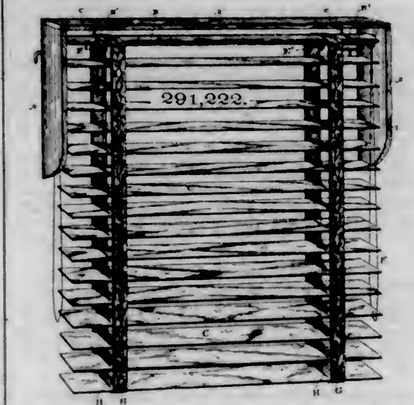


2. The combination of the leg of a desk, seat, or bench provided with the lug or projection C, and recessed to receive a bolt, L, and an operating mechanism, P O, with the recessed plate D, provided with lugs H and J, for catching over the lugs C, substantially as set forth.

291,220. SCREEN. JOSEPH NORWOOD, Brooklyn, N. Y. Filed Oct. 1, 1883. (No model.)

Claim.—The combination, with the longitudinal wires *c c* in a flat screen, of the transverse bars *e e*, grooved for the reception of the wires *c*, and placed at suitable distances apart, the clamping-bars *i*, and the screen-frame *a b*, substantially as set forth.

291,221. SUSPENDING ATTACHMENT FOR PLAQUES, FRAMES, &c. GEORGE R. OSBORN, New York, N. Y. Filed Aug. 11, 1883. (No model.)



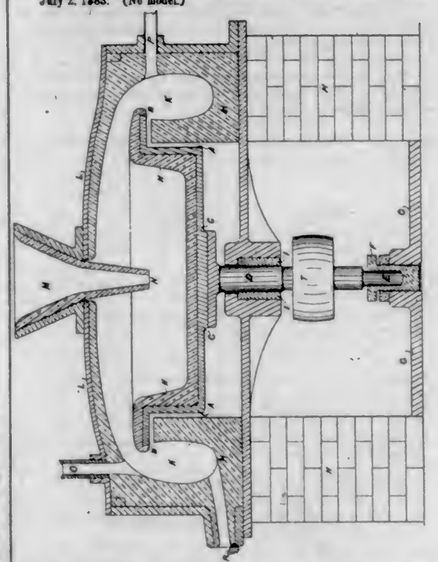
Claim.—1. The suspension device for plaques and the like, composed of a stiff bifurcated hanger, constructed substantially as described, and a chain provided with hooks or loops, as and for the purpose set forth.

2. The combination of the stiff bifurcated hanger, constructed substantially as described, the chain provided with hooks or loops, and the adjustable ring on the chain, substantially as and for the purpose set forth.

291,222. WINDOW-SHADE. JOB E. PHILLIPS, West Ashford, Conn. Filed Dec. 1, 1883. (No model.)

Claim.—1. In a window shade or blind, the broad pivotal upper or end slat, provided with journals removed from its ends, in combination with eyebolts or hooks forming bearings for said journals, substantially as described.

2. In a window-shade or Venetian blind, the broad pivotal upper slat provided with journals removed from its ends, in combination with eyebolts or hooks pendent from the upper horizontal bar, and a detachable frame applicable to the window-frame, for the purpose and substantially as described.



3. The combination, with the upper slat of a Venetian blind, of a journal at one end, and the swiveling-pulley mounted thereon, substantially as and for the purpose specified.

4. The upper broad pivotal slat provided with two journals removed from its ends, in combination with the journal at one end, having the swiveling-block thereon and the grooved pulley fast on its opposite end, and carrying a cord for adjusting the angles of the slats, substantially as described.

5. The upper broad pivotal slat, B, provided with the journals B', B^2, B^3, B^4, and B^5, in combination with the eyebolts *c c'*, swiveling-pulleys E, E', and E^2, fixed pulley D, and the cords D, F, and F", all substantially as and for the purpose set forth.

291,223. PROCESS OF AND APPARATUS FOR THE PRODUCTION OF DENSE METAL CASTINGS. CARL MARIA PIELSTICKER, London, England, and FRIEDRICH C. G. MÜLLER, Brandenburg, Prussia, Germany. Filed July 2, 1883. (No model.)

Claim.—1. The herein-described process of eliminating gases from molten metal, which consists in subjecting the same to centrifugal action in a substantially-closed chamber, and at sufficiently high speed to separate the particles and liberate the gases by throwing the molten metal against the walls thereof.

2. The herein-described process of eliminating gases from molten metal, which consists in subjecting the same to centrifugal action at sufficiently high speed to separate the particles and liberate the gases while

in a substantially-closed chamber by throwing the molten metal against the inner wall thereof, and at the same time maintaining a partial vacuum therein by the action of the centrifuge.

3. A device for atomizing molten metal by centrifugal action, which consists of a centrally-pivoted receiver provided with means for being mechanically rotated, and supported within an air-tight bearing, a chamber inclosing said receiver and formed with an annular circumferential trough having inlet and outlet passages, and a funnel extending from the exterior to the interior of the receiver, as set forth.

4. A device for atomizing molten metal by centrifugal action, which consists of a centrally-pivoted dish-shaped receiver provided with means for being mechanically rotated, and supported within an air-tight bearing, a chamber inclosing said receiver and formed with an annular circumferential trough having inlet and outlet passages, and a funnel extending from the exterior to below the edges of the dish-shaped receiver, as set forth.

5. The herein-described apparatus, consisting in the combination of a rotating shell, A, with the surrounding circular channel K, a cover, L, and the funnel M, resting in the center of said cover, by means of which funnel the molten metal introduced into the shell A is, by means of centrifugal action and under exclusion of air, thrown against the sides of the circular channel K, and thereby atomized and the gases set free, as described.

291,224. SAW-SET. ROBT. E. PONDEXTER, Indianapolis, Ind. Filed June 29, 1883. (No model.)

Claim.—1. A device for setting saws, cast in one piece, formed with sides B, a connecting-web, A, said web being provided in one end with a series of holes, *a'*, extending crosswise thereof, between the sides B, said holes varying in size, whereby they are adapted to be used on different-sized teeth, and the whole set is adapted to be used as a hand-set when desired, substantially as set forth.

2. A device for setting saws, provided with an anvil, A', having an inclined face, and spur projections *a b*, for holding the same in place, and a series of holes, *a'*, adapting it to be used also as a hand-set, substantially as set forth.

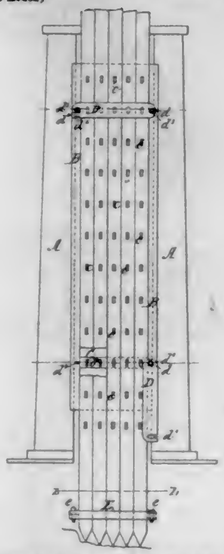
3. A device for setting saws, formed of a single casting, having sides B, a connecting-web, A, wherein are holes *a'*, and on the under side of which is a rib, a^2, an anvil-like portion, A', and projections *a* and *b* upon its lower side, substantially as shown and specified.

4. A device for setting saws, constructed in a single piece and embodying an anvil-set, a hand or wrench set, and a gage, said several parts being constructed and operating substantially as shown and described, and for the purposes specified.

291,225. BUCKLE. THOMAS O. POTTER, Boston, MASS. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a buckle, the combination of the back or body having the ears a^2, from which the pivots a^2 are formed by striking or bending inward the portion of the body of the ear described, with the jaw *b*, having the ears b', through holes in which the pivots a^2 extend, all substantially as and for the purposes specified.

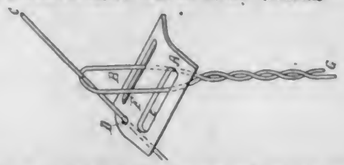
2. The combination, in a buckle, of the jaw *b*, having the ears b', provided with holes b^2, and the body *a*, having the ears a^2, provided with extensions or pivots a^2, formed therefrom, as described, and extended through said holes and then bent or curved downwardly to lock the jaw and back together, all substantially as and for the purposes described.



291,226. SNAP-HOOK. JESSE E. PUMPHREY, Columbus, Ohio. Filed Aug. 9, 1883. (No model.)

Claim.—1. A snap-hook provided with an opening or socket in its base to receive and retain a snap-spring, said socket being formed with an oblique upper side to act as an abutment for the spring, and also with a shoulder constituting a rest for the adjacent end of said spring, whereby the spring is held within the socket by virtue of its resilience alone when the outer end of said spring is in operative contact with the top of the hook.

2. The combination, with a straight snap-spring, of a snap-hook provided with an opening or socket in its base to receive the spring, said socket being formed with an oblique upper side and also with a downwardly-extending rib or base, substantially as and for the purposes described.

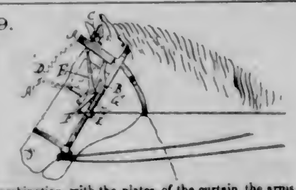


291,227. DEVICE FOR SECURING TOOLS IN STONE-CHANNELING MACHINES. ALBERT H. RAPP, Paris, France, assignor to Allston Gerry, (individually and as Trustee,) New York, N. Y. Filed Feb. 21, 1883. (No model.)

Claim.—1. The combination, with the tool slide or carrier of a stone-channeling machine having fixed pins or projections on its face, and tools having in them holes to receive the said pins, of a clamping-plate attached to the carriage opposite said pins, and a packing-piece which is applied between the carrier and clamping-plate, and through which the said pins or projections pass, substantially as herein described.

2. The combination of the tool slide or carrier B, provided with the fixed pins C, the screw-bolts *d d*, and the elastic or yielding facing-pieces $b\ b^2$, the tools provided at intervals with slots or holes c to receive the said pins C, and the hooked and pivoted clamping-plates D D, and the bolts $d^3\ d^3$ and nuts d^3, substantially as herein described.

291,228. BALE-TIE. ROBERT E. RIALL, Johnstown, Pa., assignor to the Cambria Iron Company. Filed Nov. 14, 1883. (No model.)



Claim.—1. A bale-tie buckle or fastening consisting of the plate A, provided with the slots *e e*, and hole D, substantially as described.

2. The combination, in a bale-tie, of the plate A, provided with the slots *e e*, and having the hole D, adapted to receive one end of the wire, with the wire link B, formed from the other end of the wire, substantially as described, and for the purpose set forth.

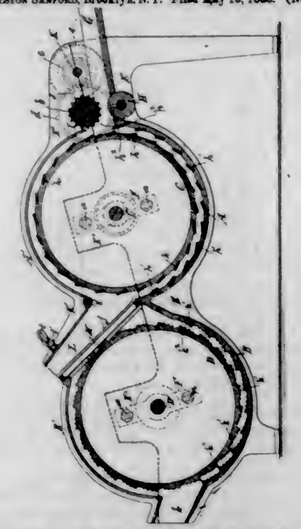
291,229. BLINDER FOR HORSES. BERNARD REIS, Brooklyn, N. Y. Filed May 17, 1883. (No model.)

Claim.—1. A horse-blinder consisting of a bowed plate, having means for securing it to the harness of a horse's head, of a curtain connected to said plate at one end to fold therein, unfolding lever-arms pivoted to the forked supporting-plates, having one end connected to said curtain, and the other end adapted to be connected with cords or reins, and the folding springs on said lever-arms with a tendency to throw the curtain-connected end thereof toward the plate, substantially as shown and described.

291,229.

2. The combination, with the plates, of the curtain, the arms, the levers, the folding-springs attached to the plate-supporting arm B, and the catches I, substantially as and for the purpose described.

291,230. TRUNK-ROLLER AND CORNER-PIECE. ANTHONY V. ROMANA, Wauwatosa, Wis. Filed July 23, 1883. (Model.)



Claim.—1. In a trunk-roller, the plates A and A', the upper plate, A, being perforated to receive the neck or reduced portion of the hub B, while the lower plate, A', is perforated and provided with a shoulder to receive the enlarged lower portion of said hub, in combination with the hub B and roller C, the journal of which is directly below the said hub, which is hollowed out on the under side to receive the said roller, and the upper part of which hub is upset above the upper plate, and the vertical rollers *a a*, journaled in the plates A A', and in contact with the hub B, substantially as set forth.

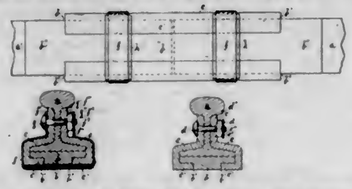
2. In combination with a trunk-body, the plates A and A', and the hub B, hollowed out on its under side to receive the roller C, having its journals located directly under said hub, and secured in the depending portions thereof on each side of the hollowed-out portion, with the rollers *a a* and the corner-piece D, the lower horizontal flange of which extends under the lower plate, A', of the roller proper, and serves to secure it in place on the under side of the trunk-body, hollowed out to receive it, substantially as set forth.

3. In combination with a trunk-body having bottom rail and uprights on the outside of said body, the castings D D', adapted to clamp the bottom rail and uprights securely together, and having inwardly-projecting flanges *d*, that confine the said uprights in place against any tendency to spring laterally, substantially as set forth.

291,231. MACHINE FOR CUTTING AND GRINDING CORNSTALKS, &c. GILSTON SANFORD, Brooklyn, N. Y. Filed May 15, 1883. (No model.)

Claim.—1. The combination of a cylindrical casing and a cylinder capable of rotation therein, both provided with crushing or reducing blades having blunt or non-cutting edges, and a sharp-edged cutting-blade fixed in the casing adjacent to the feed-inlet, substantially as and for the purpose herein described.

2. The combination of the cylindrical casing A A' and rotating cylinder C, both provided with blades A A', having blunt or non-cutting edges, and consisting of bars of rectangular cross-section, secured to the casing and cylinder so that one edge projects from their surfaces, and the sharp-edged cutting-blade A^2, substantially as and for the purpose herein described.



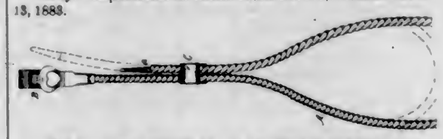
3. The combination, with the cylindrical casing and the rotary cylinder, of the feed trough or chute G, the feed-roller H, having a smooth surface and free to rotate by the passage of material over it, the roughened roller I, the driving-shaft K, the links or arms J, carrying the bearings of the roller I and fulcrumed on the shaft K, and the gear-wheels *c d*, for rotating said roller I from said shaft K, substantially as and for the purpose described.

4. The combination of the two casings A A' B B' and their cylinders C D, of the feed-inlet at the side of the casing A A', the delivery-outlet *k* at the side of the casing B B', and the chute L and grating M between adjacent sides of said casings, all being so organized that the rotation of the cylinder C will produce the passage of material through the chute L and onto the grating M, substantially as described.

5. The combination, with the two casings and their rotary cylinders, of the delivery nozzle or chute L, having a movable side or top, L', and the slideway *j*, and the grating M or shutter N, fitted to said slideway, substantially as described.

291,232. RAILROAD-JOINT AND FASTENING DEVICE. SUMNER SHAW, Boston, Mass. Filed Feb. 3, 1883. (No model.)

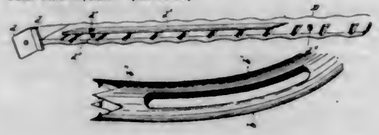
Brief.—A railroad-joint consisting of a base-plate having side recesses and headed ends, and fish-plates with angular flanges adapted to rest in the plate-recesses. An inclosing-strap is placed around the fish-plate and unrecessed portion of the base-plate. An elastic cushion is interposed between the sole and fish plate inclosing strap.



Claim.—1. The herein-described railroad-joint, consisting of the base-plate *b*, with its side recesses, $b'\ b'$, and headed ends $b''\ b'''$, in combination with the fish-plates *c c*, their angular flanges $c'\ c'$, and the fastening bolts and nuts $d\ d'$, as and for the purpose set forth.

2. In combination, the sole-plate *b*, fish-plates *c c*, bolt and nut *g g'*, inclosing-strap $f\ f'\ f''$, and the elastic packing or cushion *h* interposed between said sole and fish plates and the said inclosing-strap, in a manner and for the purpose as described.

291,233. STOCKING-SUPPORTER AND SLEEVE-ADJUSTER. CHRISTOPHER C. SHELBY, New York, N. Y. Filed Oct. 5, 1883. (No model.)



Brief.—Improvement on Letters Patent No. 273,770, dated March 13, 1883.

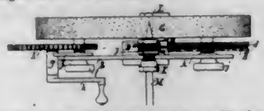
Claim.—1. The combination, with the single piece of cord or webbing having the pendent portion provided with the attaching-clasp, of means, substantially such as shown and described, for enlarging or reducing the size of the loop without varying the length of the pendent portion, substantially as described.

2. The combination, with the single piece of cord or webbing having the attaching-clasp at one end, of the other clasp for clamping both parts of the webbing, including the free ends, substantially as described.

291,234. SHOVEL AND SCOOP. LOUIS H. SHOLDER, Cleveland, Ohio. Filed June 16, 1883. (No model.)

291,234.

Claim.—1. The part B, consisting of a curved tubular socket terminating at its lower end in a skeleton plate, substantially as described, and for the purpose shown.



2. A shovel having a wire bottom and perforated metal sides C, substantially as set forth.

3. A shovel having a wire bottom, perforated metallic sides C, and metal piece D, secured at its opposite ends to the side piece, C.

4. The combination of the parts B, C, and D, constructed substantially as described, and for the purpose specified.

5. The combination, with a handle, of the pawl B, constructed substantially as described, and provided with the elongated socket, the upper end of which is formed with triangular or other suitable projections, each of which is provided with an inwardly-projecting teat to take into the wooden handle, substantially as set forth.

291,235. PENCIL-SHARPENER. WILLARD E. SIBLEY, Weston, Mass. Filed Aug. 1, 1883. (No model.)

Claim.—1. In a device for sharpening pencils, the combination of two pulleys, and a cutting or rasping band extending about the pulleys, with a pencil-holder located in such position as to hold the pencil against some part of the band between the pulleys, substantially as set forth.

2. In a pencil-sharpener, a pencil-holder having a cavity and a rubber or other elastic tube in said cavity, in combination with means for compressing said tube, substantially as set forth.

3. In combination with two pulleys and a cutting or rasping band extending around said pulleys, a plate, L, adapted to be adjusted, inclined, and secured in relation to the band, substantially as and for the purpose set forth.

4. In a pencil-sharpener, the combination of two pulleys, a cutting or rasping band about the pulleys, a pencil-holder, and means for adjusting said pulleys, whereby the required tension may be given to said band, substantially as set forth.

5. In a pencil-sharpener, a pencil-holder adapted to revolve in bearings, and having a pulley joined thereto, in combination with a driving belt and pulley, the latter pulley being adjustable to give the required tension to the belt, substantially as specified.

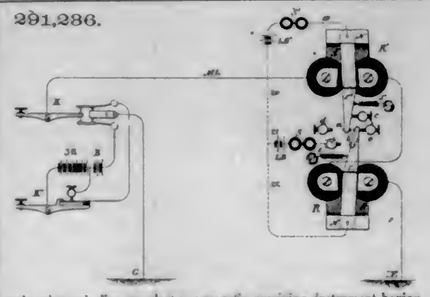
6. The combination, in a pencil-holder for a pencil-sharpening device, of parts *s* and *t*, one to screw on the other, and having a cavity and tapering shoulders, *q*, therein, with a tube, *r*, of rubber or of like elastic material, in said cavity, substantially as and for the purpose set forth.

7. In a pencil-sharpener, the combination of pulleys E and F, band G, and adjustable studs *b* and *c*, substantially as specified.

8. The combination of pulleys E and F, band G, and revolving pencil-holder K, substantially as specified.

9. The combination of pulleys E and F, band G, and plate L, elastic and adjustable, substantially as specified.

10. The combination of two pulleys, E and F, band G, elastic and adjustable plate L, and revolving pencil-holder K, substantially as set forth.



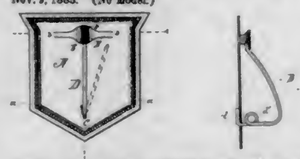
11. In a pencil-sharpener, a cutting or rasping band, the ends of the piece forming the same being butted together and held by means of a binding or re-enforcing piece on the inner surface of the band over the place of juncture of said ends, in combination with a pencil-holder located in such relation to said band that the pencil is held transverse to the band, substantially as and for the purpose set forth.

291,236. QUADRUPLEX TELEGRAPH. GERRITT SMITH, Astoria, N. Y. Filed May 22, 1883. (No model.)

Claim.—1. In a diplex telegraph, means for transmitting two strengths of current and for reversing either strength of current, in combination with a main line, a relay having two armatures adapted to come in contact with each other to form an electrical connection, a stationary electrical contact for one of said armatures, and two local sounders, one of said sounders being operated upon contact of the two armatures, and the other upon contact between one of said armatures and its stationary electrical contact.

2. In a diplex telegraph, the combination of means for transmitting two strengths of current and for reversing either strength of current, a

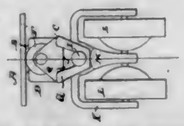
291,236.



main telegraph-line, an electro-magnetic receiving-instrument having two polar magnets, two armatures adapted to come in contact, a stationary electrical connection to form contact with one of said armatures, and two local sounders, one of said sounders being operated by connection of the two armatures, and the other upon contact of one of the armatures and its stationary electrical contact.

3. In a diplex telegraph, the combination of means for transmitting two strengths of current and for reversing either strength of current, a main line, a relay having two polar electro-magnets, and two respective armatures capable of establishing electrical connection with each other, substantially as described.

4. In a relay for a diplex telegraph, the combination of two polar electro-magnets having two respective armatures capable of establishing electrical connection, a stationary electrical contact for one of said armatures, and two local sounders, substantially as described.



5. The combination, in a diplex relay, of two polar electro-magnets having armatures R R', capable of establishing electrical connection with each other, contact-stops *c d e*, electrical contact *f*, retracting-springs *s s'*, and local sounders S S'.

291,237. PAPER-FILE. MARGRET SMITH, New York, N. Y. Filed Nov. 9, 1883. (No model.)

Claim.—A paper-file constructed as described—that is to say, having a sheet, A, with stamped or bulged portion B, with points b' b^2, and leaving a hole, B', in which the nail upon which the file is suspended is received, and having secured to it a pin or spear, D, having coil d' and point d^2, all constructed, combined, and operating as set forth.

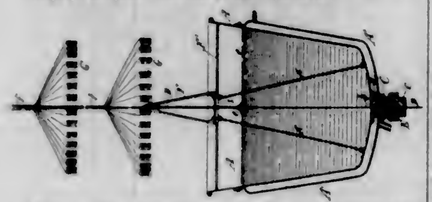
291,238. FURNITURE-CASTER. WM. H. SPONGL, Hamilton, Ohio. Filed Sept. 15, 1883. (Model.)

Claim.—1. In a furniture-caster, the combination of a piece to attach to furniture, a yoke-piece fitted to swivel thereon, and provided at its ends with downward-projecting lugs, a rivet or axle of oscillation carried in said lugs, and a housing fitted to oscillate upon said rivet, substantially as and for the purpose specified.

2. In a furniture-caster, the combination, with the attaching-piece, the oscillating housing, and the rivet or axle of oscillation, of the yoke-piece having bearing-lugs for the rivet recessed, as at Q, substantially as and for the purpose specified.

3. In a furniture-caster, the combination, with a piece to attach to furniture and an oscillating housing, of a yoke fitted to swivel upon the attaching-piece and having recessed lugs, as set forth, the rivet I, and the attaching screw or rivet E, bearing upon said rivet I, substantially as and for the purpose specified.

4. In a furniture-caster, the combination, with a piece to attach to furniture, a yoke-piece swiveled thereto, and a rivet or axle of oscillation held therein, of a housing provided with two bearings for said rivet open at the top and a bearing for said rivet open at the bottom, substantially as and for the purpose specified.



5. In a furniture-caster, the combination, substantially as set forth,

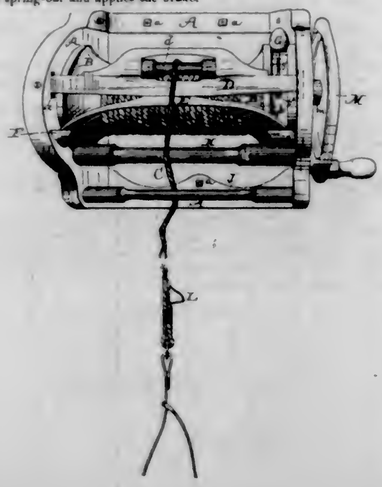
of a piece to attach to furniture, a yoke-piece to swivel thereon, and a housing fitted to oscillate with reference to said yoke, and having journals of oscillations broader than their axle, so as to permit side movement, substantially as and for the purpose specified.

6. In a furniture-caster, the combination, with a piece to attach to furniture, the yoke swiveling thereon, and the rivet or axle of oscillation, of the oscillating housing hung to said rivet, and provided with a convex shoulder, M, arranged to be borne upon by the yoke, substantially as and for the purpose specified.

7. In a furniture-caster, the combination of the piece A, provided with cylindrical stem B, the yoke C, fitting said stem, and provided with the anti-friction wheel F, the rivet I, and the housing K, substantially as and for the purpose specified.

291,239. APPARATUS FOR COVERING ELECTRIC CONDUCTORS. HENRY D. STANLEY, Bridgeport, Conn., assignor to the Bridgeport Brass Company, same place. Filed June 8, 1883. (No model.)

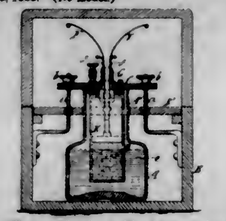
Claim.—1. The combination, with the vat or vessel containing paint or insulating compound, and provided at the bottom with a recess or cavity, of a plug of packing material in said recess or cavity having an aperture for the passage of a conductor, and means accessible from the exterior of the vat or vessel, and preferably consisting of a cap or gland for compressing said plug and causing it to fit tightly around the conductor, substantially as specified.



2. The combination, with a vat or vessel having an aperture in the bottom for the passage of a conductor, of a tube or nozzle at or near the top of the vat or vessel, through which the conductor may pass, and flexible or yielding connections between the said tube or nozzle and the vat or vessel, substantially as and for the purpose specified.

3. The combination, with a vat or vessel having an aperture in the bottom for the passage of a conductor, of a tube or nozzle at or near the top of the vat or vessel, through which the conductor may pass, flexible connections between said tube or nozzle and the vat or vessel, and a cross-bar above which said tube or nozzle is placed, and which prevents its falling into the vat or vessel when not in use, substantially as specified.

4. The combination, with the vat or vessel A, of the tube or nozzle F, the mouth or tip of which is adjustable in size, and flexible connections *d*, between said tube or nozzle and said vat or vessel, substantially as specified.

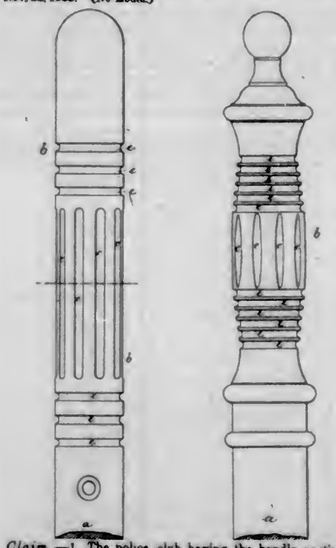


291,240. FIRE-ESCAPE. HENRY C. STOCKMAN and JOHN ADAMS, Germany, Ohio. Filed June 28, 1883. (No model.)

Brief.—A weight applied at the free end of the rope presses down the spring-bar and applies the brake.

Claim.—In friction fire-escapes, the combination of the frame, bolts *a*, slots, drum, groove, rope, stirrup, bolt, bar, roller *d*, spring, bearings, brake, bolt *g*, strap, nut, roller H, roller J, crank-wheel, and axle, substantially as above described, and for the purposes set forth.

291,241. ELECTRIC BATTERY. JAMES L. TOBIN, Newark, N. J. Filed Mar. 8, 1883. (No model.)



Claim.—1. The combination, with a battery plate or element, of an upwardly-extending resilient arm, and an abutment through which said arm moves, and with which it engages with sufficient friction to hold the plate or element in the position to which it is adjusted, substantially as specified.

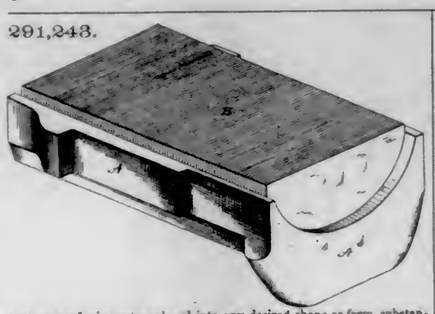
2. The combination, with a battery plate or element, of an upwardly-projecting resilient arm provided with a shoulder or offset, and an abutment through which said arm may move, and with which the shoulder or offset of the arm may engage to hold the plate or element in position, substantially as described.

3. The combination, with a battery plate or element, of two resilient arms connected with said plate or element and diverging upwardly therefrom, and an abutment through which said arms may move, and with which they engage to hold the plate or element in position, substantially as specified.

4. The combination of the plate E, the resilient and diverging arms F, provided with offsets or shoulders *f*, and the abutment G, substantially as described.

291,242. POLICE-CLUB. JOHN J. TOWER, Brooklyn, N. Y. Filed Nov. 22, 1883. (No model.)

Claim.—1. The police-club having the handle portion grooved longitudinally, substantially as specified, the same forming a new article of manufacture.



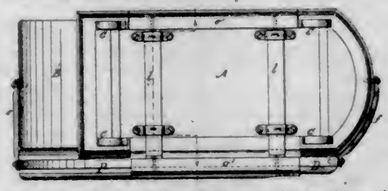
2. The police-club having the handle portion grooved longitudinally and peripherally, as and for the purposes set forth.

291,243. JOURNAL BOX AND BEARING. ROBERT W. TRAYLOR, Richmond, Va., assignor to the Journal Bearing Mica Company, New York, N. Y. Filed June 25, 1883. (No model.)

Claim.—1. The method herein described of making journal boxes or bearings by casting or molding a metallic shell or casing around a com-

4.

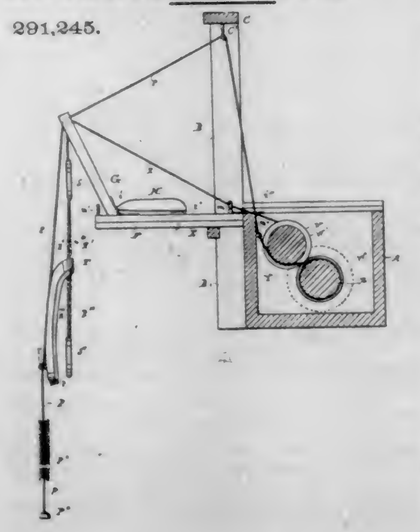
291,243.



pact mass of mica cut or placed into any desired shape or form, substantially as described.

2. A journal box or bearing composed of mica, with a suitable metallic frame or casing cast or molded around it, except on the side for the journal, substantially as described.

3. A journal box or bearing composed of mica combined with plumbago or other suitable substance, with a suitable metallic frame or casing cast or molded around it, except on the side of the journal, substantially as described.

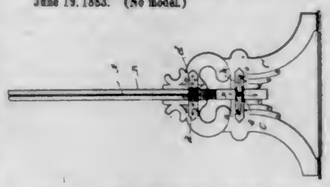


291,244. LOUNGE AND SOFA. LEWIS C. VAN NEST, Plainfield, N. J. Filed Feb. 24, 1883. (No model.)

Claim.—1. The combination, with the sofa or lounge, of a movable back upholstered or finished on both sides, the link *e*, pivoted at one end to the upper part of the arm in the middle of its width and at the other end to the back, the link *f*, pivoted at one end to the bottom part, A, of the lounge and at the other end to the back, the slides *l*, passing across the bottom part of the sofa, and the sections *o o'* upon the ends of such slides and forming supports for the back of the lounge, substantially as set forth.

2. The combination, with the sofa or lounge bottom and arm, of a reversible back, links for the ends of the same, transverse slides, and sections *o o'* on the ends of the same, substantially as set forth.

291,245.



291,245. FIRE-ESCAPE. FREDERICK WILLIAM VOIGT, Hicksville, Ohio. Filed May 19, 1883. (No model.)

Brief.—The guide and lowering ropes are wound in opposite directions upon the reels incased in the box. A coiled spring is secured to the reel-shaft. The guide-rope passes through a ring on the belt, and rings for the limbs of the descending person are secured to the lowering-ropes.

Claim.—1. In a fire-escape, the combination of the box A, having rolls W W', adapted to carry ropes R R and P, with rings S S, belt T, and ring *t*, substantially as described, and for the purposes set forth.

2. In a fire-escape, the combination of box A, gallows-frame B C, cover F, frame G, and brace H, with ropes R R, rings S S, belt T, having ring *t*, and guide-rope P, adapted to be raised and lowered by windlass Z, as described, and for the purposes set forth.

291,246. SCREEN. JOHN E. WAKEFIELD, Worcester, Mass. Filed June 19, 1883. (No model.)

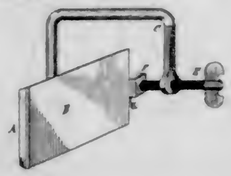
Claim.—1. The combination, with the screen having vertical end pieces, B, of the legs C C' at each side of each end-piece, and the three-part hinges *d e*, connected to said legs and end pieces, whereby the legs are attached to the vertical end piece and rendered capable of folding toward each other, substantially as set forth.

2. The combination, with the screen having vertical end pieces, of legs and three-part hinges, the outer leaves of the hinges being screwed to the legs and the central leaf being attached to the end pieces of the screen, and a turning button secured upon a pivot to the central leaf, substantially as set forth.

3. The combination, with the screen having vertical end pieces and legs, of hinges to connect the legs to the end piece of the screen and allow the legs to be folded toward each other, and a turning button to retain the legs in a distended position, substantially as set forth.

4. The combination, with the screen and legs, of a three-part hinge and a turning button to stiffen the hinge, such turning button being upon a pivot attached to the central part of the hinge, substantially as set forth.

291,247. OILER FOR CAR-AXLE BOXES. GEO. K. WATERHOUSE, Boston, Mass., assignor to himself and James Morse, same place. Filed June 11, 1883. (No model.)



Claim.—1. The combination of a box adapted to contain oil, having bearings for the journal to be lubricated, a longitudinally-fluted roller composed of elastic material, the flutes being open at the ends, and means for retaining said roller in contact with the journal, substantially as described.

2. A roll for lubricators, composed in part of rubber fluted longitudinally and in part of brushes arranged between the rubber parts, substantially as described.

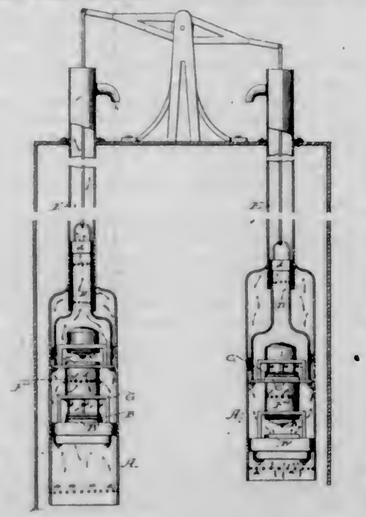
291,248. ROOFING-CLAMP. NATHANIEL W. WEST, Alna, Me. Filed Sept. 5, 1883. (No model.)

Brief.—Consists of a U-shaped clamp-frame, to one end of which is swiveled, by a washer on its outer side, a plate cushioned on its inner side, and having metallic-bound recesses on its outer side, the other end being provided with a thumb-screw, to the inner end of which is swiveled a washer, likewise cushioned.

Claim.—As an improvement in roofing-clamps, the combination of a binding-plate having a cushion or protecting-plate on its inner side, and provided on its outer side with metal-bound recesses, of a clamp swiveled centrally to the outer side of said plate, and having a tightening-screw provided at the end facing the cushioned side of the binding-plate with a swiveled washer, likewise covered with an elastic cushion, substantially as set forth.

291,249. CUT-OFF VALVE AND GEAR. JEROME WHEELOCK, Worcester, Mass. Filed Apr. 23, 1883. (No model.)

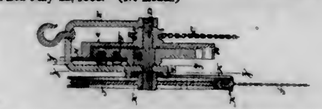
Claim.—1. The combination, substantially as hereinbefore described, of a steam-engine cylinder having induction-passages extending to each end thereof, a steam chest or chamber communicating with both of said passages, an annular valve limited to a rotary movement within said steam-chest, and gearing for continuously revolving said valve at a speed corresponding with that of the engine.



2. The combination, substantially as hereinbefore described, of a steam-engine cylinder, an annular valve for controlling the passage of steam thereto, gearing for revolving the valve, and a governor for advancing or retarding said valve during its rotation.

3. The combination, substantially as hereinbefore described, of a steam-engine cylinder, a valve or valves for directly controlling the induction and eduction of steam to and from the cylinder, an independent annular revolving steam-valve which controls the passage of steam on its way to the induction-valve, and a governor which advances or retards the annular valve and cuts off or varies the supply of steam to the induction-valve and cylinder.

4. The combination, in a steam-engine, of the cylinder having passages alternately serving for induction and eduction of steam, a single valve which operates with both passages for induction and eduction, and an independent annular cut-off valve revolved by gearing connected with the crank-shaft of the engine, substantially as described.



5. In a steam-engine, the combination, substantially as described, with the crank-shaft and cylinder, of an annular revolving valve, an oscillating induction and eduction valve, a revolving valve-shaft driven by the crank-shaft, and geared to both of said valves, for continuously revolving the one and for oscillating the other, and a governor mounted on said valve-shaft, for controlling the annular valve and cutting off or varying the supply of steam to the oscillating valve.

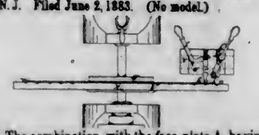
291,250. PUMP. ARCHIBALD WATSON WHITE, San José, Cal. Filed May 11, 1883. (No model.)

Claim.—In a double-acting pump, the supply-cylinders A and hollow pistons D, in combination with the plunger-valves B, provided with the guide-pins *b*, and located within the frames G, and the check-valves C, provided with the guide-pins *c*, and operating within the hollow pistons D, all constructed substantially as and for the purpose set forth.

291,251. HOISTING-MACHINE. JOSEPH J. WHITE, New Lisbon, N. J. Filed July 23, 1883. (No model.)

Claim.—1. A yoke, E, a shaft, D, mounted thereon, having an eccentric, G, a winding-wheel, A, with internal gear, a hoisting-chain, C, a swaying disk, F, with toothed periphery, a hand-wheel, J, and hand chain or rope J', and an arm, H, secured to said disk and engaging with said yoke, the winding-wheel, disk, and hand-wheel being fitted on said shaft D, and the limbs of the yoke supporting the shaft at opposite ends, said parts being constructed and combined as described, and forming an improvement in hoisting-machines.

2. A yoke-shaft with eccentric, winding-wheel with internal gear, a swaying disk with toothed periphery, a hand-wheel, an arm, and guides for the chain or rope of the hand-wheel, combined and operating substantially as and for the purpose set forth.



3. In a hoisting-machine, a driving-wheel, in combination with a yoke having a log or abutment, and two guiding-arms for the chain or rope, independent of each other, substantially as and for the purpose set forth.

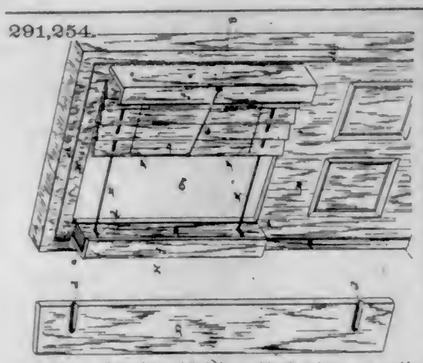
291,252. GARMENT-SUPPORTER. THOMAS WHITE, Cleveland, Ohio, assignor of one-half to Edward H. Campbell, Chicago, Ill. Filed Sept. 26, 1883. (No model.)

Claim.—A metallic garment-supporter, made of any suitable shape, having the opening B and the projecting or depending nose N, bent or curved outwardly, as shown and described, to securely and firmly hold the garment after a small portion of it has been drawn up through the opening and looped over the nose.

291,253. MACHINE FOR SPINNING METALS. FREDK. C. WILLIAMS, Arlington, N. J. Filed June 2, 1883. (No model.)

Claim.—1. The combination, with the face-plate A, having a groove, *a*, and suitable chucking means, of the duck-bill *g*, and suitable means for guiding and presenting it to spin the metal into the groove, substantially as herein specified.

2. The lever J and roller *j*, capable of turning on a pivot, *k*, carried on a slide, H, in combination with the face-plate A, having the groove *a*, and with the duck-bill *g*, and means for operating it, as herein specified.



3. The dog K and its actuating-spring *e*, in combination with the slide D, having the two holes *d d'*, and with the duck-bill *g* and its operating means, face-plate A and chucking means, and the roller *j* and its operating means, arranged for joint operation, as herein specified.

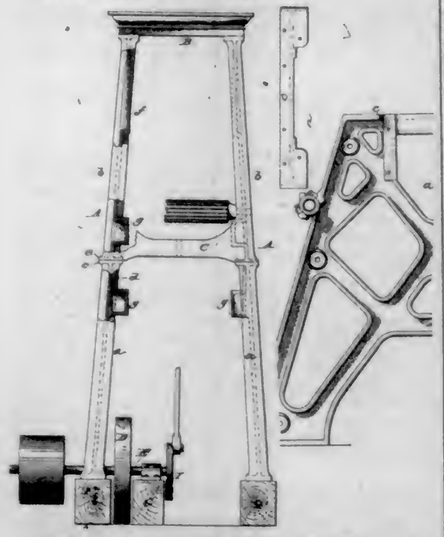
4. The roller *j* and means for holding and operating it, in combination with a duck-bill, *g*, and means for holding and operating it, and with a face-plate, A, and means for operating it, combined and arranged to serve relatively to each other and to a circular sheet of metal having a previously-prepared edge, so as to form the bead and fold inward the corrugated edge and sink it into such bead, all substantially as and for the purpose herein specified.

291,254. WINDOW-BLIND. JOSEPH WILLIAMS, San José, Cal. Filed Sept. 18, 1883. (No model.)

Brief.—A shutter consisting of slats grooved or bored diagonally from edge to edge, through which passes a rod for holding or keeping them in place. The slats can turn from a position edgewise to a position very nearly flat, and a cord connects the slats with the frame. Rods secured to the innermost slats and engaging with a staple on the frame keep the blind-sections extended.

291,254.

Claim.—1. In a window-blind, the combination of transverse guides with a series of independent slats mounted thereon in such a manner as to turn from one position to a position at right angles, and a flexible connection between said slats, whereby they may act in unison as a blind, substantially as herein described.



2. In a window-blind, the guide-rods E, in combination with the slats D, having inclined sockets and grooves *d*, through which said rods pass, whereby said slats may turn from one position to a position at right angles, substantially as herein described.

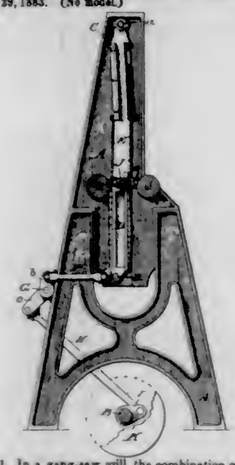
3. In a window-blind, the guide-rods E, in combination with the slats D, pivoted to slide thereon and to turn from one position to a position at right angles, as shown, and the cord or chain F, secured to the main frame and to each slat, whereby said slats are limited in their sliding movement and caused to act in unison as a blind, substantially as herein described.

4. In a window-blind, the guide-rods E, in combination with the pivoted sliding slats D thereon, as described, and the catch G, secured to the leading slat, and adapted to engage with an eye on the main frame, substantially as herein described.

5. In a window-blind, the casings H, formed on the frame, and the guide-rods E, in combination with the connected slats D, mounted on said rods and adapted to slide back and forth thereon, and turn from one position to a position at right angles, whereby they may, when drawn back, be fitted within said casings, substantially as herein described.

291,255. GANG-SAW-MILL FRAME. THEODORE S. WILKIN, Milwaukee, Wis. Filed Nov. 15, 1883. (No model.)

Claim.—1. A gang-saw frame consisting of two side frames, A A, connected by cross-ties or braces, and having a regular and continuous spread from top to bottom, substantially as shown, whereby strains are transmitted directly to the sills and lateral strains are avoided.



2. In a saw-mill frame, a side frame consisting of base-section *a*, having recessed upper end and continuous flange or bearing-face *c*, and upper section, *b*, formed with depending portion *d*, and bearing face or flange *e*, said parts being bolted or fastened together, substantially as shown and described.

3. In combination with a gang-saw frame, composed of inclined sides A A and cross-ties or braces, a driving-shaft having the crank-pin of its crank-wheel I exactly midway between the side frames, a pillow-block supporting the inner end of said shaft, sills supporting the sides A A, and fly-wheel D, mounted upon the shaft within the frame at a point between the pillow-block and sill, as shown and described.

4. A gang-saw frame having its side frames spread farther apart at the base than at the top, and extending in straight lines from top to bottom.

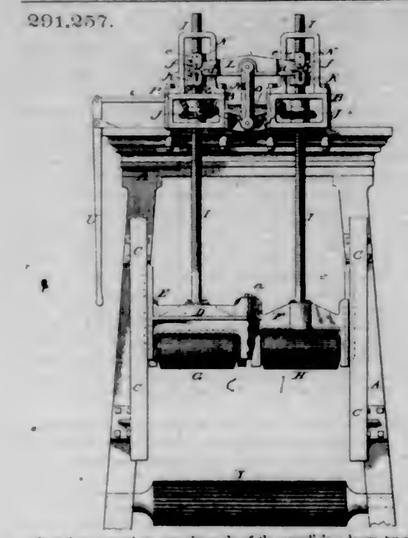
5. In a gang-saw-mill frame, side frames, A, inclined outward from top to bottom, and provided with vertical bearing-faces on their inner sides, for the purpose explained.

291,256. GANG-SAW MILL. THEODORE S. WILKIN, Milwaukee, Wis. Filed Aug. 29, 1883. (No model.)

Claim.—1. In a gang-saw mill, the combination of a frame and oscillating mechanism, consisting of a pendulous bar carrying the upper guide, a lower guide pivoted at its lower end to said bar, and supported at its upper end by a link pivoted to the frame, a driving-shaft, a crank upon said shaft, and intermediate mechanism, substantially such as described and shown, connecting the pendulous bar and the crank, and adapted to impart a swinging motion thereto.

2. In a gang-saw mill, the combination of a pendulous bar, an upper guide carried thereby, a lower guide pivoted to the pendulous bar, and connected by a link to the frame of the machine, and means, substantially such as shown and described, for imparting a swinging motion to the pendulous bar, for the purpose set forth.

3. In a gang-saw mill, oscillating mechanism consisting of pendulous bar E, carrying guide C, lower guide, D, pivoted to said bar, and connected by a link, J, with the main frame, pitman F, crank-arms *b c*, pitman H, and crank I, all constructed and arranged to operate substantially as shown and described.



291,257. GANG-SAW MILL. THEODORE S. WILKIN, Milwaukee, Wis. Filed Aug. 29, 1883. (No model.)

Claim.—1. In a gang-saw mill, the combination of a main frame provided with guides C, a sliding frame, D, mounted in said guides, pressure-rolls G H, mounted in frames E F, arranged to slide independently in frame D, means, substantially such as shown and described, for raising and lowering frames E F, and cap-plate *a*, overhanging the proximate ends of frames E F, and secured to frame D, whereby said frame D is sustained by the uppermost of the frames E F.

2. The combination, in a gang-saw mill, of a main frame, vertically-moving frames E F, provided with independent pressure-rolls G H, screw-rods I I, for raising and lowering the pressure-roll frames, nuts K K, encircling the screw-rods, and springs *f*, above the nuts, adapted to hold said nuts normally in a fixed position, but to yield and allow the nuts and screw-rods to rise when the pressure-rolls are raised, substantially as set forth.

3. In a gang-saw mill, the combination of a main frame, two vertical screw-rods carrying independent pressure-rolls to bear upon the casts or logs, an equalizing-beam pivoted between said rods, collars attached to the arms of said beam and passing round the rods, nuts encircling the

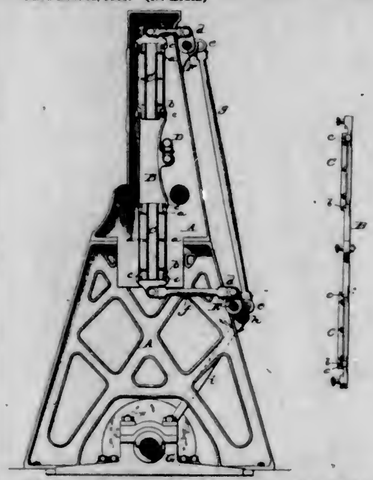
291,257.

rods and connected to opposite ends of the equalizing-beam by slotted links, and springs interposed between the collars and the nuts, all substantially as shown and described, whereby the screw-rods are permitted to rise and fall through their rotation within the nuts, to simultaneously adjust themselves and their rollers to logs or casts of unequal thickness through the tipping of the equalizing-beam, and to independently rise and fall in passing over the irregularities of the said casts or logs.

4. In a gang-saw mill, the combination of two vertical screw-rods, I I, carrying independent pressure-rolls, and with means, substantially such as described and shown, for rotating them, equalizing-beam L, pivoted between said rods, collars N N, carried by opposite ends of said beam, nuts K K, connected with the beam on opposite sides of its pivot by slotted links *d d*, and encircling the screw-rods, and springs *f f*, interposed between the collars and nuts, for the purpose explained.

5. In a gang-saw mill, the combination of a main frame, a vertical longitudinally-grooved screw-rod, I, carrying a pressure-roll, pinion J, encircling said rod and having a lug fitting into its groove, driving-shaft X, provided with wheels V W, and swinging shaft Q, provided at opposite ends with pinions or wheels P and R, the former in constant engagement with pinion J, and the latter adapted to be thrown into engagement with either of the wheels V W, to effect the raising or lowering of the screw-rod and its roll.

6. In a saw-mill substantially such as described, the combination of a shaft, X, carrying wheels V W, screw-rod I, carrying a pressure-roll, pinion or friction-wheel J, adapted to impart rotation to the rod, and shaft Q, provided with pinions or friction-wheels P R, the latter arranged, substantially as shown and described, to be thrown into engagement with either of the pinions or wheels V W, whereby the screw-rods may be caused to turn in either direction at will, and to elevate or depress the pressure-roll.



7. In combination with pressure-rolls G H and their carrying-frames E F supporting screw-rods I I, nuts K K, and equalizing-beam L, carrying said nuts at opposite ends, substantially as and for the purpose explained.

8. The combination, substantially as shown and described, of vertical screw-rods I I, carrying independent pressure-rolls, and wheels J J, at front and rear of the frame, adapted to rotate said rods, divided shaft Q, wheels P P, R, and S, shaft X, provided with wheels V and W, and means, substantially such as shown and described, for moving the sections of shaft Q, whereby either the front or rear set of pressure-rolls may be controlled and made to rise or fall at will.

9. In combination with screw-rods I I, carrying pressure-rolls G H, nuts K K, encircling the rods, and wheels J J, at front and rear of frame A, serving to rotate the screw-rods, shaft X, carrying wheels V W, divided shaft Q, having its two sections arranged, substantially as shown and described, to swing about the respective screw-rods I, and provided at their inner and outer ends with wheels to engage, respectively, with wheels J J, V, and W, and the levers U U, connected with the respective sections of shaft Q, substantially as and for the purpose explained.

10. In a saw-mill, the combination of two independent pressure-rolls adapted to act simultaneously upon casts or logs of unequal thickness, carrying-frames for said rolls, an intermediate equalizing-bar, and elastic or yielding connections, substantially as described between the equalizing-bar and the carrying-frames, whereby the rolls are permitted to yield independently and without movement of the equalizing-bar in passing over uneven places.

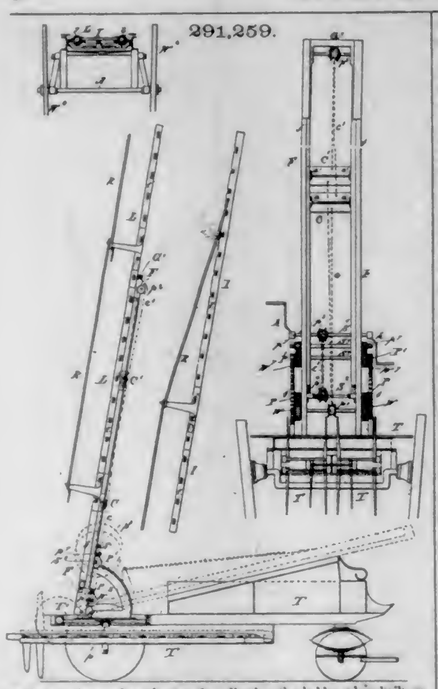
291,258. GANG-SAW MILL. THEODORE S. WILKIN, Milwaukee, Wis. Filed Nov. 22, 1883. (No model.)

Claim.—1. In combination with a supporting-frame of a gang-saw mill, upright beams carrying the sash-guides, and adapted to move bodily backward and forward equally at their upper and lower ends, and means, substantially such as shown and described, for imparting such motion to the beams.

2. In combination with a supporting-frame, beams B, each carrying upper and lower guides, C, supporting-links D, pivoted to the main frame, and to the beams at a point between the upper and lower ends of the latter, main shaft G, crank *j*, shafts E F, provided with arms *d e*, the former connected with the upper and lower ends of the beams and the latter connected with each other, and arm *h*, secured upon one of the shafts E F and connected with crank *j*, all substantially as shown and described.

3. The herein-described sash-oscillating mechanism for gang-saw mills, consisting of beams B, supporting-links D, pivoted to the main frame and to the beams between the upper and lower ends of the latter, horizontal shafts E F, arms *d*, secured upon said shafts and connected by pitmen *f* with the upper and lower ends of beams B, arms *e*, secured upon said shafts and connected by pitman *g* with each other, shaft G, provided with crank *j*, arm *h*, secured upon shaft E, and pitman *i*, connecting arm *h* and crank *j*, substantially as set forth.

4. In combination with guides C and beam B, one provided with elongated holes *a*, fastening-bolts passing through said holes and binding the parts together, and screw-stems C, bearing against one of said parts and screwing into the other, as shown, to adjust the guides upon the beams and to hold them where adjusted.



291,259. EXTENSION FIRE-LADDER. GUSTAV WITTE and OTTO GRIEBEL, Berlin, Germany. Filed July 14, 1882. (No model.) Patented in Germany Aug. 16, 1879, No. 9,906, and June 9, 1885, No. 21,092, and in Austria-Hungary Oct. 31, 1882.

Brief.—A folding frame is pivoted to the truck, upon which frame two reciprocating carriages are arranged. The ladder-section is laid upon the carriages and raised to the top of the frame and held until another section is connected thereto by a socket-joint. By a segmental rack and pinion, or by pivoted braces and their operating mechanism, the frame is raised and its angle of inclination adjusted.

Claim.—1. In an extension fire-ladder, the combination, with a series of ladder-sections constructed to be connected one with the other by socket-joints on their side bars, of a frame, F, two reciprocating carriages, C C', and means, substantially as described, for imparting motion to said carriages and holding the ladder-sections in position when raised, whereby a ladder-section is raised and held for connection with another section to build the ladder from top downward and raise the ladder as it is built up, substantially as described.

2. In an extension fire-ladder, the combination, with ladder-sections adapted to be connected by socket-joints, of a frame and two reciprocating carriages supported thereon, and constructed to serve as a guide for said carriages and for the ladder-sections when placed thereon, mechanism for moving the carriages in opposite directions to raise a ladder-section, devices to hold said section in position for connection from below with

291,259.

another section, and mechanism for adjusting the ladder when built up into proper position and giving it the proper inclination, substantially as described.

3. In an extension fire-ladder, the combination, with ladder-sections constructed to be connected by socket-joints, of a frame and mechanism for raising the ladder-sections one after another, appliances for rotating the frame and giving it the proper inclination, and mechanism for rigidly holding the ladder and frame in the position given thereto, substantially as set forth.

4. In an extension fire-ladder, the combination, with a two-wheel truck, of the hinged or folding frame F, supported at one end of its base by guide-wheels and at the opposite end from the truck-wheel axle, and mechanism for elevating the frame and adjusting the same to the desired inclination, as described, for the purpose specified.

5. The frame F, composed of side pieces, *f f*, brace-rods E E′, and cross-girts G G′, all constructed for operation in combination with a truck or carriage, substantially as shown and described, for the purpose specified.

6. In an extension fire-ladder, the frame F, composed of side pieces, *f f*, brace-rods E E′, cross-girts G G′, and the guide-wheels W², in combination with the axle of a truck, upon which said ladder is adapted to be folded, as described, for the purpose specified.

7. In an extension fire-ladder, the frame F, composed of side pieces, *f f*, brace-rods E E′, cross-girts G G′, and guide-wheels W², in combination with the carriage C², mechanism for moving the same along the side pieces, *f*, and the axle of a truck, upon which said frame is adapted to be folded, as described, for the purpose specified.

8. The combination, with two sections of tubing and the coupling O, constructed as shown and described, of a ring or sleeve carrying an operating-lever and constructed to be fitted upon the sleeve O, for rotating the same, substantially as and for the purpose specified.

9. The combination, with the sleeve O, having shoulder o^2 and a recess, o^3, of the ring *q*, its tubular arm *q′*, and the eyebolt q^2, all constructed for operation substantially as described.

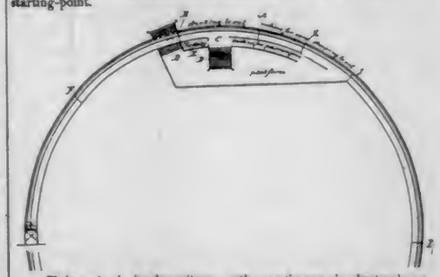
291,260. PROCESS OF MANUFACTURING PLANISHED SHEET-IRON. W. DEWEES WOOD, Pittsburg, Pa. Filed June 2, 1883. (No specimens.)

Claim.—1. In the manufacture of planished sheet-iron, the improved method of preparing broken-down iron sheets for subsequent working, which consists in coating the same with a wash of red oxide of iron, carbon, and water, or other suitable liquid, substantially as set forth.

2. In the manufacture of planished sheet-iron, the improved method of preparing the broken-down iron sheets for subsequent working, which consists in rubbing up the red oxide formed on the sheets while being rolled and simultaneously applying and rubbing in an artificial wash of red oxide, carbon, and suitable liquid, substantially as set forth.

3. In the manufacture of planished sheet-iron, the improved method of preparing the sheets for treatment in a closed retort or chamber, which consists in coating the same with artificially-applied red oxide and pulverized carbon, substantially as set forth.

4. In the manufacture of planished sheet-iron, the improved method of treating the hot sheets as they come from the retort, which consists in quickly removing the waste material therein, reoxidizing the revived or nascent surface while still hot, and immediately cooling the sheet by artificial means, substantially as set forth.

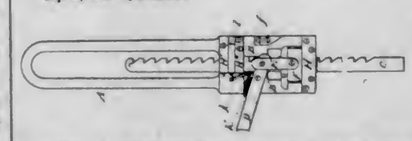


5. The improved method of cleaning and simultaneously reoxidizing the revived or nascent surface of a sheet previously coated with an oxide and deoxidized in a closed retort or chamber, which consists in causing a series of jets of superheated steam under high pressure to discharge or blow on and along the exposed surface of such sheet while still hot from the retort or chamber, substantially as set forth.

6. In the manufacture of planished sheet-iron, the improved method of treatment embracing the following steps: first, subjecting the unscaled sheets in packs, with intervening layers or coatings of carbon, to the action of a high heat in a close chamber or retort; second, causing a series of steam-jets to discharge or blow on and along the exposed surface of each sheet while still hot from the retort or chamber; and, third, arresting further chemical action by artificial means, substantially as set forth.

7. The improvement in the process of making planished sheet-iron, which consists in artificially promoting thereon, substantially as described, the formation of an oxide surface, reviving such oxide surface, reoxidizing such revived or nascent surface and fixing the oxide so formed, with intermediate heating and rolling and final heating and planishing, substantially as hereinbefore set forth.

291,261. CIRCULAR GRAVITY-RAILWAY. ALANSON WOOD, Toledo, Ohio, assignor of one-half to James A. Cohoon, same place. Filed Aug. 8, 1883. (No model.)



Brief.—A circular railway on which from the start the cars travel at an increasing rate of speed down the different inclines or grades of the track, acquiring sufficient momentum to carry them up a rise in the track to a stopping-level, from which level they are forced up an incline to the starting-point. A suitable platform and ticket-box are provided at the starting-point.

Claim.—1. A circular railway, with a continuous circular track provided with a rapid decline at the starting-point, for part of its way, and with a gradual decline for another part of the way, and then with a steep decline for another, so arranged that a car traveling on said track will acquire a great velocity to carry it up a rise in the track to a level, where it will stop, substantially as herein shown and described.

2. In combination with a circular track, provided with the grades herein described, the platforms C L, inclined way M, stairs D, and ticket-station, substantially as and for the purposes set forth.

291,262. STUMP-PULLER. PETER ZUBER, Ashburnham, Mass. Filed Sept. 8, 1883. (No model.)

Claim.—1. The combination of a ratchet-bar, C, sliding in the cheeks B of a frame, A, with the ways B′ and cross-head F, adapted to be automatically engaged with and disengaged from ratchet-bar C, substantially as described.

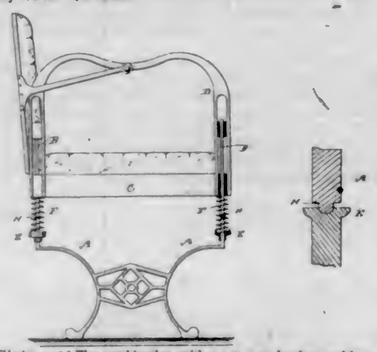
2. The combination of the reciprocating cross-head F with the transversely-acting spring-pawl G, adapted to automatically engage the notches of the ratchet-bar C, substantially as described.

3. The combination of the ratchet-bar C, cross-head F, reciprocated parallel to the longitudinal axis of the ratchet-bar C, and reversible spring-pawl G, substantially as described.

4. The combination of the ratchet-bar C, reciprocating cross-head F, spring-pawl G, adjusted to be disengaged by its spring, with the wedge-cam *f*, substantially as described.

5. The combination of the ratchet-bar C, reciprocating cross-head F, actuating-pawl G, and spring retaining-pawl I, substantially as described.

6. The combination of the ratchet-bar C, cross-head F, spring-pawl G, wedge-cam *f*, spring-pawl I, and displacing-linkage *k*, substantially as described.



7. In combination with the pawl I, the two opposing springs *i* and *i′*, the spring *i* acting constantly, and the spring *i′* at intervals only, substantially as described.

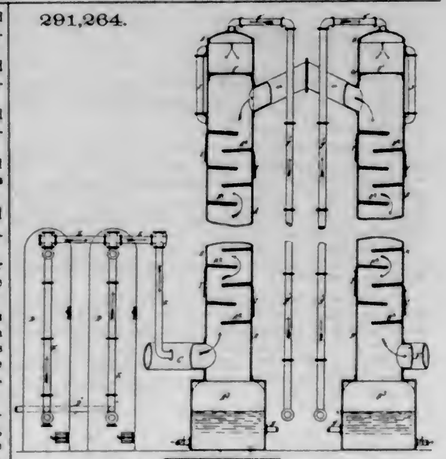
8. The combination of pawl G, provided with reversing notches or bearings *e e′*, with the reversible spring *d*, substantially as and for the purpose described.

9. The combination of the frame A, provided with guiding-cheeks B and ways B′, the reciprocating ratchet-bar C, the retaining-pawl I in fixed vertical relation with the frame, the movable cross-head F, the spring-pawl G in fixed vertical relation with said cross-head F, and the lever D and link E, for actuating said cross-head, substantially as described.

10. As a machine for the raising and lowering of weights, the organization of a ratchet-bar capable of vertical intermittent reciprocation, a vertically-reciprocated cross-head provided with a spring-pawl capable of adjustment to engage with or disengage from the teeth of the ratchet-bar by the action of its spring, and means to positively engage said pawl with said teeth in opposition to its spring, and a spring retaining-pawl adapted to be automatically disengaged from the teeth of said ratchet-bar by the downward stroke of the actuating-lever in the lower half of its throw, substantially as described.

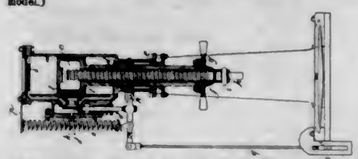
291,263. CAR-SEAT. WILLIAM A. ACKLEY, Hackettstown, N.J. Filed July 7, 1883. (No model.)

Claim.—1. The combination, with a car-seat having cavities or openings in the standards of the arm-rests, of the seat-legs, having extensions projecting into the said cavities in the standards of the arm-rests, and of spiral springs surrounding the upper parts of the legs and supporting the seat, substantially as herein shown and described, and for the purpose set forth.



2. The combination, with the car-seat C and the legs A, having extensions B projecting into cavities in the standards of the arm-rests of the seat, of cup-shaped collars secured to the extensions B of the legs, and spiral springs F surrounding said extensions, substantially as herein shown and described.

3. The combination, with a car-seat having cavities or openings in the standards of the arm-rests, of the seat-legs having jointed extensions projecting into the said cavities in the standards of the arm-rests, and spiral springs surrounding the upper parts of the legs and supporting the seat, substantially as herein shown and described, and for the purpose set forth.

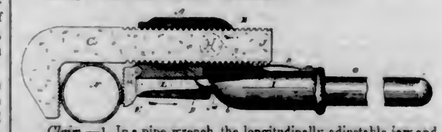


291,264. PROCESS OF OBTAINING AMMONIA FROM FURNACE-GASES. JOHN ADDIE and JAMES ADDIE, Glasgow, Scotland. Filed May 11, 1883. (No model.) Patented in England Oct. 6, 1882, No. 4,758; in France Apr. 3, 1883, No. 154,644, and in Belgium Apr. 6, 1883, No. 60,995.

Claim.—The mode herein described of utilizing the gases from blast and other furnaces to recover the ammonia therefrom, said mode consisting in first fixing the ammonia in such gases after they leave the furnace by mixing therewith sulphurous acid or sulphuric acid in the form of gas or vapor, and then condensing or dissolving and recovering the salts or compounds thereby formed, substantially as set forth.

291,264.

291,265. PRESS FOR MOLDING GLASS. ADRIEN ANTOINE APPERT and LEON ALFRED APPERT, Paris, France. Filed Oct. 13, 1883. (No model.)

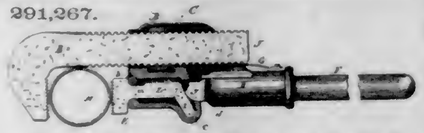


Claim.—1. In a press for molding glass, the combination, with an air-cylinder and its piston carrying a core or mold, of a valve for controlling admission of air to the cylinder, operated by a lever for moving it in one direction, and by the recoil of a spring for moving it in the other, substantially as herein shown and described.

2. In a press for molding glass, the combination, with a motor-cylinder, of a slide-valve provided with a retracting-spring, the movements of which the workmen can control by hand, and an adjusting arrangement for regulating by hand the variable distance between the core and the mold, an arrangement that includes a screw-threaded rod, *f*, moving longitudinally in the socket-piece or hollow rod *d* of the piston by means of a thumb-nut, *g*, that turns upon the end of the rod *d*, all substantially as above described, and represented in the annexed drawings, and for the purposes set forth.

3. In a press for molding glass, the combination, with an air-cylinder provided with ports *l*, and its piston carrying a core or mold, of the slide-valve *j*, the levers *m r*, the connecting-rod *q*, and the spring *o*, secured to the lever *m* and to a projection on the upper end of the cylinder, substantially as herein shown and described.

291,266. PIPE-WRENCH. FRANK ARMSTRONG and NATHANIEL W. VANDERGRIFT, Bridgeport, Conn.; said Vandegrift assignor to said Armstrong. Filed June 21, 1883. (No model.)



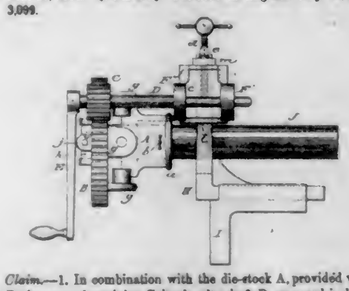
Claim.—1. In a pipe-wrench, the longitudinally-adjustable jaw and shank C J, arranged within the frame A, in combination with the pivoted lower jaw, E, having a tail or shank, L, beveled at the rear end, as described, and the vibratory handle-casting I, provided at the front end with the nose M, substantially as and for the purpose set forth.

2. The combination and arrangement of the frame A, jaws C E, and handle-casting I, pivotally connected to the frame A, and provided with nose M and curve *b*, substantially as shown and described.

3. The frame A, provided with shank-channels B and D and transverse nut-opening, and formed with circular trunnion-seats to receive the bearings H, substantially as hereinbefore set forth.

291,267. PIPE-WRENCH. FRANK ARMSTRONG and NATHANIEL W. VANDERGRIFT, Bridgeport, Conn.; said Vandegrift assignor to said Armstrong. Filed June 21, 1883. (No model.)

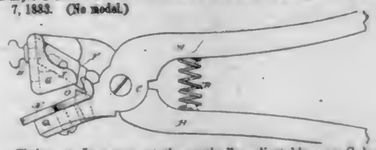
291,267.



Claim.—1. In a pipe-wrench of the type herein shown, the lower jaw, E, provided with a shank, L, in combination with a toggle-arm, I, case A, provided with a seat, *c*, and a handle-socket, D, provided with a nose or projection, J, whereby the jaw is caused to move outwardly in a longitudinal direction by the action of the nose J upon the inclined toggle-arm I, as hereinbefore set forth.

2. The lower jaw, E, provided with a recess, *a*, in combination with the case A, pin *b*, and means for moving said jaw longitudinally, as hereinbefore set forth.

3. The case A, adapted to receive in operative relation the moving parts of the wrench, and provided with a seat, *c*, for the reception of one end of the toggle-arm E, substantially as shown and described.



291,268. DIE-STOCK. FRANK ARMSTRONG, Bridgeport, Conn. Filed June 27, 1881. (No model.) Patented in England July 15, 1881, No. 3,099.

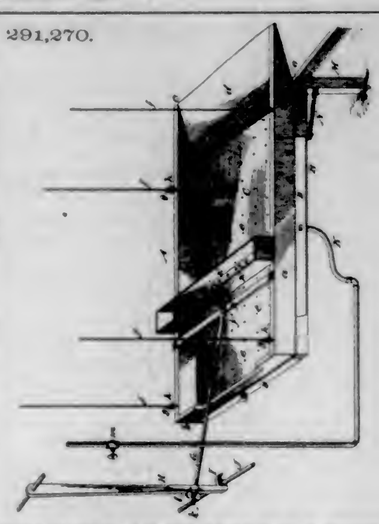
Claim.—1. In combination with the die-stock A, provided with the gear B, the operating-pinion C, having its shaft D arranged in bearings F F' upon a vertically-movable gate, *c*, and adapted to slide longitudinally therein, substantially as and for the purpose set forth.

2. The die-stock A, provided with a gear, B, adapted to be operated by a pinion, and also provided with handle-sockets *g*, substantially as and for the purpose set forth.

291,269. SAW-SET. FORTUNE L. BAILEY, Freeport, Ind. Filed Aug. 7, 1883. (No model.)

Claim.—1. In a saw-set, the vertically-adjustable gage G, having the wide flange J formed on one edge, and which extends inward toward the anvil, so as to catch upon the tops of narrow saws, the gage being secured directly upon the end of the jaw by means of a set-screw, H, substantially as shown.

2. The improved saw-set consisting of the pivoted parts A B, forming the handles and jaws, a reversible die, F, made adjustable upon one of said jaws by means of a slot and set-screw, an adjustable flanged gage, G, adapted to bear upon the side of a saw and limit the extent of set of the teeth, the adjustable plate N, provided with points V, for limiting the depth of set, and the anvil, substantially as set forth.



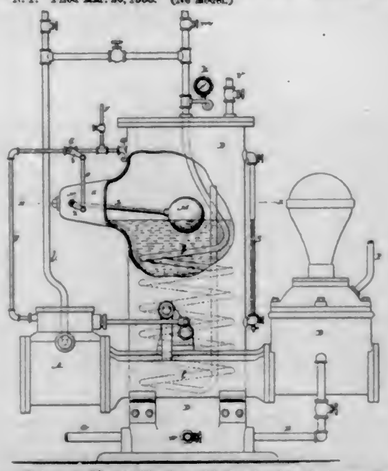
291,270. ORE-CONCENTRATING MACHINE. JOHN W. BAILEY, Denver, and SUMNER B. WARFIELD, Holy Cross, Colo. Filed Sept. 3, 1883. (No model.)

Claim.—1. The combination, in an ore-concentrator, of a box or receptacle containing a perforated diaphragm, a water-pipe communicating with the box below the diaphragm, and devices for imparting a concussive blow to the box, substantially as set forth.

2. The combination, in an ore-concentrator, of a pendent box or receptacle containing a perforated diaphragm, a water-pipe communicating with the box below the diaphragm, a feed-hopper having a perforated bottom, and devices for imparting a concussive blow to the said pendent box, substantially as set forth.

3. The combination, in an ore-concentrator, of a pendent box or receptacle containing a perforated diaphragm, a water-pipe communicating with the said box below said diaphragm, devices for imparting to the box a concussive blow, and means for regulating the violence of said blow, substantially as set forth.

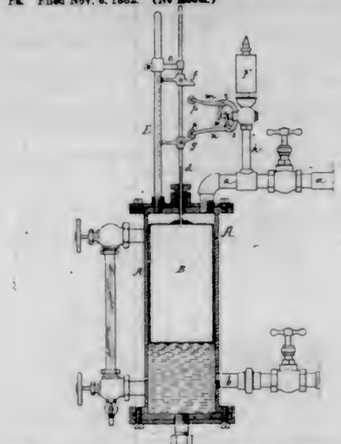
291,270.



4. The combination, in an ore-concentrator, of a pendent box or receptacle containing a perforated diaphragm having one end inclined, a water-pipe communicating with the pendent box below the diaphragm, and devices for imparting a concussive blow to the said box or receptacle, substantially as set forth.

5. The combination, in an ore-concentrator, of a pendent box or receptacle containing a perforated diaphragm having one end inclined, a water-pipe communicating with the pendent box below the diaphragm, a removable drawer or tray, O, and devices for imparting a concussive blow to said pendent box, substantially as set forth.

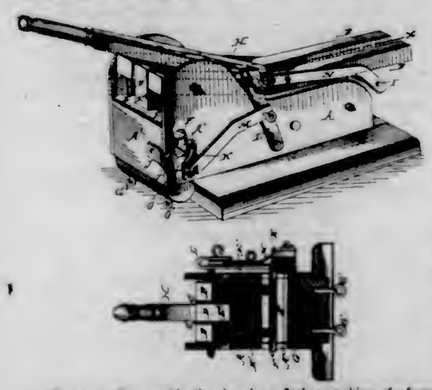
6. The combination, in an ore-concentrator, of box A, having a diaphragm, C, pendent bar H, cam I, rod G, post M, and contracting-springs N, substantially as and for the purpose described.



291,271. PUMP-REGULATING DEVICE. JAS. H. BAKER, New York, N. Y. Filed Mar. 26, 1883. (No model.)

Claim.—1. The combination, with the closed vertical vessel D and the pipe for supplying the water of condensation to the same, of a horizontal steam-pump, the frame of which is bolted to the side of the water-vessel, a pipe from the water-vessel to the pump, and a pipe from the pump to the boiler, a steam-pipe from the boiler to the engine, and a cock in the same, a float within the closed water-vessel D, a lever and a rock-shaft passing through a stuffing-box upon the water-vessel, and a lever and link from the rock-shaft to the steam-valve, substantially as set forth, whereby the water of condensation within the closed water-vessel is made to operate the steam-valve, substantially as set forth.

2. The combination, with the steam-pump and the closed water-vessel D, of the steam-valve G, a float and lever within the vessel, and a connection to the valve to open and close the same, the coil *t* within the water-space of the vessel D, and the exhaust-pipe and cocks, to cause the steam from the engine to pass into said coil or to escape to the atmosphere, substantially as set forth.

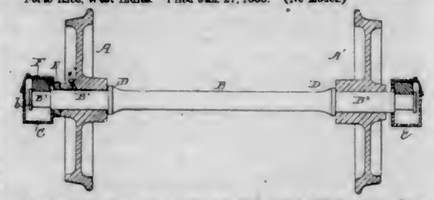


291,272. LOW-WATER ALARM. WILLIAM T. BATE, Conshohocken, Pa. Filed Nov. 6, 1882. (No model.)

Claim.—1. The combination of the vessel A, communicating with the steam and water spaces of the boiler, the float B, having a stem, *d*, with an adjustable tappet, *f*, and alarm-whistle and its valve, and a lever, *m*, adapted to act directly upon the stem of the valve, and projecting into the path of the tappet *f*, as set forth.

2. The combination of the whistle-valve having a stem, *w*, two levers, *m* and *n*, both adapted to act directly upon said stem, the vessel A, and a float, B, having a stem, *d*, with tappet or tappets for actuating the levers *m* and *n*, as set forth.

291,273. HOOP-FLARING MACHINE. JOHN BAUMLE, Milwaukee, Wis. Filed Oct. 26, 1883. (No model.)

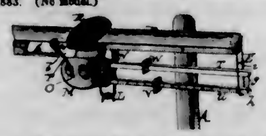


Claim.—1. The combination, in a hoop-flaring machine, of a frame provided at its head or forward end with a transverse slot or opening through which the hoops are passed, a bed-plate adjustably secured in the bottom of the said slot or opening, adjusting-screws by which the said plate is vertically adjusted, a flaring-block working in the upper part of the transverse slot or opening, and provided with flanges upon either edge of its lower curved face, and means or mechanism by which the said block is operated.

2. The combination, in a hoop-flaring machine, of a frame provided at its head or forward end with a transverse slot or opening through which the hoops are passed, a bed-plate adjustably secured in the bottom of the said opening, adjusting-screws by which the said plate is vertically adjusted, a flaring-block working in the upper part of the transverse slot or opening, and provided with flanges upon either edge of its lower curved face, two vertical sliding posts having their lower ends rigidly secured to the upper side of the flaring block at an equal distance from either end, and having their upper ends pivotally connected by means of a movable metal block to the forward end of two pivoted weighted arms, a metal block pivotally connecting the vertical posts and the forward ends of the two pivoted weighted arms, two pivoted weighted arms having their forward ends connected to the upper ends of the vertical sliding posts, and a pivoted operating-lever by which the free ends of the said arms are operated, all constructed and combined to operate substantially in the manner and for the purpose shown and set forth.

3. The combination, with a hoop-flaring machine of the described construction, of a metal block provided with a curved side, and rigidly secured upon one side of the frame of the machine immediately in advance of one end of the transverse slot or opening through which the hoops pass, a curved metal plate hinged at one end to the rear side of one end of the transverse slot or opening, and a pivoted lever and suitable pitmen for connecting the said hinged plate to the end of the main operating-lever, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

291,274. CAR WHEEL AND AXLE. JOSEPH BAUTIER, San Juan, Porto Rico, West Indies. Filed Jan. 27, 1883. (No model.)

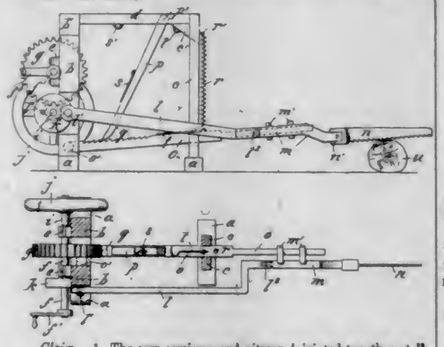


Claim.—The combination of the axle provided with the collar D at each end, a journal, B', for one of the wheels, of slightly less diameter than the bearing B^3 for the other wheel, and a collar, E, for retaining the loose wheel in position upon the axle, with journal-box C and wheels A A', constructed alike, substantially as and for the purpose described.

291,275. BUCKLE. FRANK S. BELCHER and JOHN B. BELCHER, Charlotte, Mich. Filed Aug. 2, 1883. (No model.)

Claim.—In a buckle, the combination of the end bars, F and G, frame-bar D, elevated cross-bars A and A', and half-bars B and B', substantially as shown, and for the purpose described.

291,276. PLATFORM-SCALE. ENOS BELL, Minneapolis, Minn. Filed Sept. 1, 1883. (No model.)

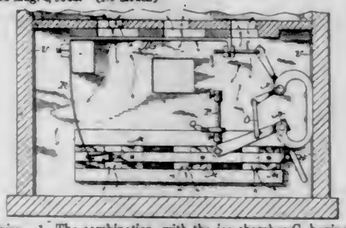


Claim.—1. The combination, in a platform-scale, of a platform, a scale-beam or steelyard having a heel or counter-balance, means, substantially as described, for connecting the beam and platform, a pin or trigger attached to said counter-balance, a gong or alarm, and a hammer or striker having a tail adapted to engage said pin or trigger, and upon the tilting of said beam to be released from the said trigger and cause the hammer to strike the gong, substantially as and for the purpose set forth.

2. In a platform-scale, the combination, with the platform, and a scale-beam having a pin or trigger projecting therefrom, of a pivotal striker having a tail adapted to engage with said trigger, a spring adapted to engage and actuate said striker, as explained, and a gong or other suitable alarm, substantially as and for the purpose set forth.

3. A platform-scale having a platform capable of vertical and swinging movement, a steelyard having scale and tare beams, permanent and removable weights, a spring-held tare-pea or weight, and a suitable pin or trigger, a pivoted spring-actuated striker adapted at its lower end to engage with said pin or trigger, and at its upper end to strike a gong or alarm, substantially as and for the purpose set forth.

291,277. DRAG-SAW. WM. A. BENNETT, Dallas, Tex. Filed Sept. 10, 1883. (No model.)



Claim.—1. The saw-carrier *m* and pitman *l*, jointed together at l^3, in combination with a rod, *o*, pivoted to rear posts, *b*, passing through yoke-plates *m'* on the saw-carrier, and laterally secured against posts *c c*, whereby the saw may be prevented from a lateral movement, but permitted a free downward movement, as described.

2. The combination, with the pivoted bar *o*, having a rack thereon and connected with the saw-carrier by yoke-plates *m'*, of the pawl *p*, pivoted at *p'*, whereby the saw may be held down to its work, as described.

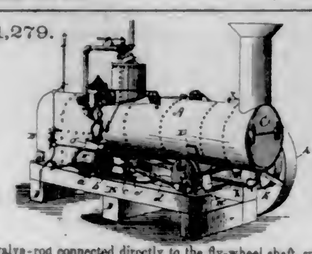
3. The combination, with a pivoted saw-carrier, of the pivoted rack-bar *o*, connected therewith by yoke-plates *m'*, and the spiral spring *r*, the latter attached to said rack-bar and to the upper part of the frame, as shown and described.

4. The combination, in a sawing-machine, of the saw-frame, shafts *f i*, balance-wheel *j*, crank-disk *k*, pitman *l*, saw-rod *m*, having guide-eyes *m'*, pivoted bar *o*, having rack *q*, the gravity-pawl *p*, and the balancing-spring *r*, substantially as shown and described.

291,278. REFRIGERATOR. CHARLES J. BERENS, Washington, Ind. Filed Aug. 2, 1883. (No model.)

Claim.—1. The combination, with the ice-chamber C, having air-passages D in or about its bottom, of the slides E, pivoted arms F, and rod G, projecting outside the refrigerator, substantially as shown and described.

2. The combination, with the ice-chamber C, having air-passages D in or about its bottom, of the slides E, pivoted arms F, adjustable supports F', and the graduated rod G, arranged to project without the refrigerator, substantially as shown and described, whereby the quantity of cold air admitted to the refrigerating-chambers may be regulated, as specified.

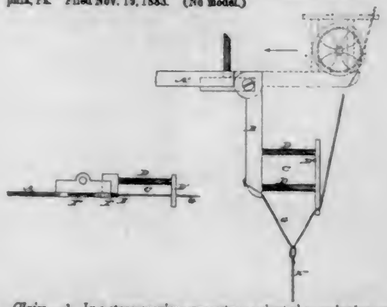


3. The removable walls K L, having openings therein, in combination with the weight or spring actuated slides M, having slotted arms V, and the rock shaft or shafts N, having arms with which said slotted arms engage when said walls are being placed in position, substantially as shown and described.

4. The combination of the weight or spring actuated slides M, the rock-shafts N, having arms engaged with said slides, the vertical arm P, pivoted to an arm on one of the rock-shafts, and the window-sash having an arm, Q, sliding on the arm P to adapt the window to set on the slides only at the beginning of its movement when being lifted and at the end of its movement when being let down.

291,279. PORTABLE STEAM-ENGINE. ROBERT M. RIGGS, Hughesville, Pa. Filed June 1, 1883. (No model.)

Claim.—1. The combination, in a portable engine, of a horizontal steam-cylinder mounted on a base-frame, a steam-boiler mounted on the same frame independently of the said cylinder, a transverse fly-wheel shaft below the boiler-shell, a steam-chest having an inclined valve-seat,



291,279.

and a valve-rod connected directly to the fly-wheel shaft, substantially as described.

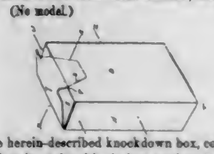
2. The combination, in a portable engine, of a horizontal steam-cylinder, a fly-wheel shaft arranged in the same horizontal plane as the said cylinder, a steam-chest having an inclined valve-seat, and a valve-rod connected directly to the fly-wheel shaft, substantially as described.

291,280. STORE-SERVICE APPARATUS. ISIDORE BERGE, Philadelphia, Pa. Filed Nov. 19, 1883. (No model.)

Claim.—1. In a store-service apparatus, a pivoted or swinging arm, provided with a cord adapted to yield and form a loop for supporting the carrier to be raised or lowered, substantially as and for the purpose set forth.

2. An elevating device for store-service apparatus, consisting of a pivoted or swinging arm, a guard, and cord, substantially as and for the purpose set forth.

3. A lowering device for store-service apparatus, consisting of a pivoted or swinging arm, a guard and cord, and stops on said arm, substantially as and for the purpose set forth.



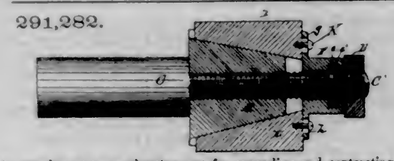
4. In store-service apparatus, a pivoted or swinging arm provided with a stop, F, for preventing descent of the carrier from the rail, and a pivoted stop, E, for preventing return of said carrier from said arm to the rail, substantially as and for the purpose set forth.

5. In store-service apparatus, a switch consisting of a frame connecting the ends of rails of different elevations, and a descending arm adapted for directing a carrier from a branch to the main rail, substantially as and for the purpose set forth.

6. A gravitating arm or switch-rail, an arched frame, the main rail, and branch rail, combined and operating substantially as and for the purpose set forth.

7. Main and branch rails and a switch-rail, in combination with a bridge supporting the main and branch rails at the switch ends, and permitting the passage of the carrier thereunder, as stated.

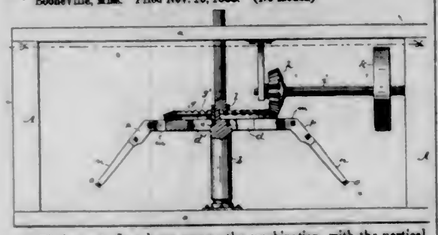
291,281. KNOCKDOWN BOX. JOHN BLAKELY, Brooklyn, N. Y. Filed Nov. 16, 1883. (No model.)



Claim.—The herein-described knockdown box, consisting of a tabular body provided at its ends with closing portions 5 6 7 8, one of said portions being provided with a locking-tongue, as 3, and the opposite portion with a cut, as *r*, located upon the fold-line between said portion and the body of the box, substantially as described.

291,282. LATHE-MANDREL. WILLIAM H. BLEE, Grafton, W. Va. Filed July 27, 1883. (No model.)

Claim.—1. In combination with the shank C, having a reduced screw-threaded portion, C', integral therewith, and the tapered head A with grooves *b* formed therein, the tapered jaws I, provided with means



291,282.

for attachment to an adjusting-nut for expanding and contracting the jaws, substantially as set forth.

2. In combination with the shank C, provided with a reduced screw-threaded portion, C', forming an attaching means for the grooved head A, the jaws I, secured within said grooved head and connected to a slotted flange, *g*, having an outwardly-extended portion, F, adapted to embrace the flanged and grooved nut D, the parts being organized substantially as shown, and for the purpose set forth.

291,283. HORSE-POWER. CHARLES B. BOREN and JOHN S. BOREN, Booneville, Miss. Filed Nov. 10, 1883. (No model.)

Claim.—1. In a horse-power, the combination, with the vertical shaft *b*, provided with an elevated shoulder, *c*, and a reduced diameter above said shoulder, of the master cog-wheel *g*, having radial arms *g'*, ferrule *l*, ring *d*, and elbow-levers *m n*, substantially as shown and described.

2. In a horse-power, the combination, with the frame A and vertical shaft *b*, provided with an elevated shoulder, *c*, and a reduced diameter above said shoulder, of the horizontal master cog-wheel *g*, having radial arms *g'*, and ferrule *l*, ring *d*, elbow-levers *m n*, having straps *p*, secured to said ring, horizontal shaft *i*, carrying cog-wheel *h* on one end and band-pulley *k* on its opposite end, substantially as described, and for the purpose set forth.

291,284. COMPOSITION OF MATTER FOR MOLDING FRUITS, FANCY-TOPPED TABLES, BIRDS, &c. ELMINA BRADY, Portlandville, N. Y. Filed June 18, 1883. (No specimens.)

Claim.—The herein-described composition of matter from which to mold articles of ornament and utility, consisting of hard stone, common sand, slate stone, white sand, clam-shells, common brick, charcoal, blue clay, water, and linseed-oil in the proportions substantially as herein specified.

291,285. FLOATING FILTER. JOHN H. BREHM, Davenport, Iowa. Filed July 23, 1883. (No model.)

Claim.—1. The combination of a cistern, well, or reservoir, a pump, a suction-pipe connecting said reservoir and pump, a floating filter consisting of an air-chamber and two concentric cylinders of different diameters, the outer cylinder being perforated throughout its circumference, and the space between the cylinders containing filtering material, and a flexible pipe connecting said filter and suction-pipe, substantially as described.

2. A floating filter consisting of an air-chamber and two concentric cylinders of different diameters, the outer cylinder being perforated throughout its circumference, and the inner cylinder divided by a wire-gauze diaphragm into two chambers, one of which is perforated, the said chambers and the annular space between the cylinders being filled with filtering material of different kinds, substantially as described.

3. A filter-casing consisting of a cylinder of perforated metal having a lining of wire-gauze, the meeting edges of said cylinder being turned outward and overlapped by the wire-gauze lining, and united by means of solder, which enters the meshes of the outturned wire-gauze lining substantially as described.

291,286. ZINC FOR BATTERIES. HORATIO J. BREWER, New York, N. Y. Filed Mar. 31, 1883. (No model.)

Claim.—The combination of the zinc A, the thread B, permanently cast in the zinc A, and the zinc nut C, screwing upon the thread B, substantially as described.

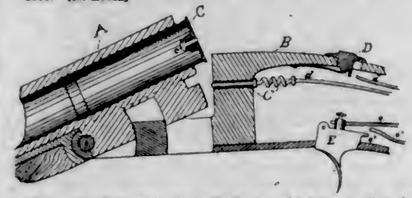
291,287. FLYING TARGET. J. SMITH BRIGGS, Kankakee, Ill. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination, with a hollow perforable flying target containing dust, of means upon the target, constructed to give a rotary motion thereto during its passage through the air, substantially as described.

2. The combination, with a hollow perforable flying target containing dust, of wings upon said target, constructed to give a rotary motion thereto in its passage through the air, substantially as described.

3. The combination, with the hollow flying target, composed of paper or similar perforable material, containing dust, of wings upon said target, constructed to give a rotary motion thereto in its passage through the air, substantially as described.

4. A hollow perforable flying target containing dust and provided with spiral wings in front, and a tail, substantially as described.



5. A hollow dust-filled flying target, composed of a paper tube flattened at its ends, so as to form deflecting-surfaces, constructed to give a rotary motion thereto in its passage through the air, substantially as described.

6. A flying target composed of a paper tube flattened at its ends in intersecting planes and containing dust, substantially as and for the purpose set forth.

7. A flying target composed of a paper tube flattened at its ends in transverse planes, and having its flattened portion at its front end bent to form wings a', and its flattened rear portion extended to form a tail, a^2, substantially as described.

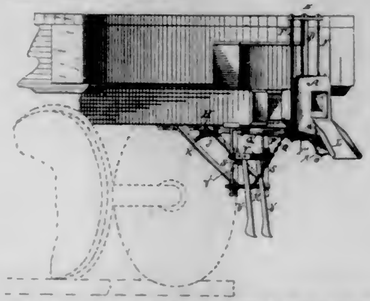
8. A hollow perforable flying target containing dust, and provided with an inwardly-opening valve, a^4, in its front portion, substantially as and for the purpose set forth.

291,288. ELECTRIC FIRE-ARM. ALEXANDER T. BROWN, Syracuse, N. Y., assignor of one-half to Lyman C. Smith, same place. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination, with the breech of a gun, of an induction-coil, a trigger, and metallic connections from the primary circuit of the coil to the trigger, as set forth.

2. The combination, with the breech of a gun, of an induction-coil, a metallic connection from the primary circuit of the coil to the trigger, a metallic connection from said primary circuit to the neighborhood of the trigger, and a trigger pivoted as described, so that when pulled it may come in contact with said last-mentioned metallic connection.

3. The combination, with the breech of a gun, of the induction-coil, the wire *d*, passing through the breech-block, but insulated therefrom, the wire *d'*, connected to the frame of the gun, and the primary circuit-wires *e f* in electrical circuit with the coil by means of the trigger, all substantially as described.



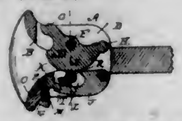
4. The combination, with the stock of a gun and with the conducting-wire, of an electrical firing device contained therein, and of a safety device, substantially such as described, whereby the connection may be broken, substantially as set forth.

5. The combination, with the stock of a gun, of wires, as *d d'*, connecting the frame with the battery or coil, a safety-button, as D, to break the connection or close the same, and a firing-trigger independent of said safety device, constructed to close the circuit, substantially as described.

6. The combination, with the stock of a gun, of an electric battery or coil, a wire or metallic connection insulated from the frame and leading to the cartridge-chamber from said battery or coil, a metallic connection from said battery or coil leading to the metallic frame of the arm,

and a push-button by which the continuity of the last-mentioned metallic connection may be broken, substantially as described.

291,289. CAR-COUPLING. JOHN C. BRYAN, Holly Springs, Ark. Filed Oct. 17, 1883. (No model.)



Claim.—1. The combination of the frame E, having cross-bar F, the apron L, having adjustable arms hinged on said bar, the spring or lever O, loosely mounted on said bar, and the chain Q, for holding one end of the spring or lever, substantially as shown and described.

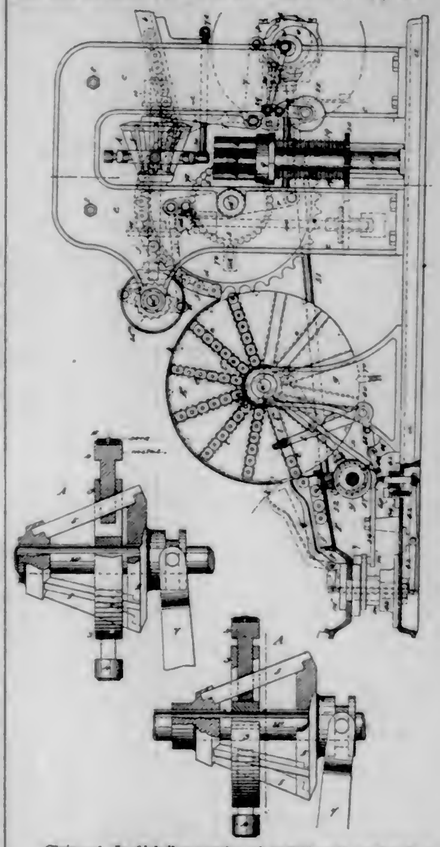
2. The combination of the frame E, the apron L, the spring O, the chain Q, the hangers S, the forked and slotted bar G, and clip H, substantially as shown and described.

3. The combination of the frame E, carrying the pin D, the spring-actuated plate C, for supporting the pin, and the swinging arms U and hangers S, substantially as shown and described.

291,290. CAR-COUPLING. GEORGE W. BUTLER, Knoxville, Tenn. Filed Oct. 31, 1883. (No model.)

Claim.—1. In a car-coupling, the herein-described draw-head, having interiorly-located central longitudinal ribs on its upper and under sides, and provided with a central longitudinal slot extending through the said ribs, in combination with a coupling-hook pivoted in the said slot in the upper part of the draw-head, and a latch pivoted in the said slot in the lower part of the draw-head, substantially as set forth.

2. The combination of the longitudinally-slotted draw-head, the coupling-hook pivoted in the upper part of the same, and consisting of a plate having a downwardly-extending curved pin or hook, an upwardly-extending handle, and a rearward bulging extension overbalancing the front part of the plate, a latch pivoted in the lower part of the draw-head, adapted to engage the pin or hook of the coupling-plate, and means for operating the said latch, substantially as set forth.



3. The combination of the longitudinally-slotted draw-head, the coupling-plate pivoted in the upper part of the same, the latch-plate J, having latch K, recess L, and stud M, the spring N, supported upon a lug, O, extending from the draw-head, and the transverse shaft R, having crank S and tongue T, substantially as set forth.

4. In a car-coupling, the combination, with the draw-head, of a transverse shaft having loosely-mounted arms provided with laterally-projecting shoulders and fixedly-secured disks adjoining the said arms, and provided with teeth adapted to engage the under sides of the shoulders of the latter, substantially as and for the purpose set forth.

5. As an improvement in car-couplings, the combination of the draw-head having the interior longitudinal ribs and a central longitudinal slot, the coupling-plate E, pivoted in the upper part of the draw-head, the latch J, pivoted in the lower part of the draw-head, the transverse shaft R, the tongue T, mounted upon the same in the central slot, the arms U, mounted loosely upon shaft R adjoining the central rib, and having laterally-projecting shoulders, disks mounted securely upon shaft R adjoining the arms U, and having teeth engaging the shoulders of the latter, and mechanism for operating the shaft R, substantially as set forth

291,291. MACHINE FOR LABELING SPOOLS. SØREN A. CALMAR and HENRY W. CARR, Arlington, N. J. Filed Dec. 1, 1882. (No model.)

Brief.—The spools are first fed into a hopper, which conveys them into the peripheral notches or recesses of a drum revolving step by step the extent of one such recess at each step. By this wheel they are carried between two of two radial series of stampers, which are by suitable mechanism rotated in steps synchronously with the drum, and also reciprocated radially at the end of each step, to remove the labels from an automatically-rising receptacle, moisten their gummed sides, and attach them to the spools, held as above stated. The spools are then carried forward to be dropped successively into two parallel chutes, a number of which are disposed radially in an intermittently-rotary drum, which is shifted laterally to enable both of its parallel series of chutes to be filled. The spools are finally delivered in a stated number into boxes located on a horizontally and intermittently rotating table, whence the filled boxes are removed by the operator and replaced by empty ones.

Claim.—1. In a labeling-machine substantially such as set forth, a rotary stamping device provided with a radial series of stampers, in combination with means for advancing the spools step by step and for revolving the series of stampers in coincident steps, and means, substantially as described, to diverge the series at the pause between the steps and to retract the same at the next step, substantially as herein set forth.

2. In a labeling-machine such as set forth, the combination, with means to advance the spools one by one with intervening pauses, of an intermittent rotary stamping device provided with a radial series of stampers operating in relation with the spools, together with a reservoir of labels and a moistening-pad arranged in relation with two of said stampers, so arranged that three of said stampers act at the same time—one picking up a label, another moistening the previous label, and a third sticking the label previously moistened onto the spool-head—substantially as herein shown and described.

3. In a labeling-machine of the kind set forth, the combination, with an intermittent rotary label-stamping device provided with a radial series of reciprocating plungers or pickers, of a label-holding tube or reservoir arranged in line with said stampers, with a feeding-piston to force the column of labels toward the stampers, and means, substantially as described, for propelling said piston to advance the labels in correspondence with the strokes of the stamper, substantially as herein set forth.

4. In a labeling-machine of the kind set forth, the combination, with a label picking and stamping device, of a series of label-holding tubes or

reservoirs mounted on a rotary or movable support arranged to present one of the reservoirs in line with the picker, with a retaining-catch to hold the same in said position, and with means tending to move said support so as to remove one reservoir from under the picker and present another one in its place, and with a tripping device arranged to release said catch and thus cause the change in the position of the reservoirs when the one in action becomes exhausted, substantially as herein shown and described.

5. The combination, in a labeling-machine of the described kind, with an intermittent rotary spool-wheel, *d*, of the intermediate rotary stamper or stampers, A, relatively arranged substantially as shown, with a ratchet-feeding device for revolving said wheel step by step, and a distinct ratchet-feed device for revolving said stamper or stampers step by step, and an operative connection between the two feeds and a single reciprocating motive device, substantially as described, actuating one of said ratchet-feeds, whereby both wheel and stampers are moved in coincident steps by the same motive impulses, substantially as herein set forth.

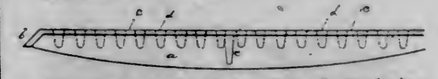
6. In a labeling-machine substantially such as set forth, the label-feeding mechanism, consisting of a label-reservoir, 8, propelling-piston 19, formed as a rack, a pinion engaging therewith and operated through connections, substantially as described, by the worm 25, and a ratchet-feeding device for revolving said gearing step by step and thus moving said piston in steps corresponding to the thickness of the labels, or nearly so, substantially as herein set forth.

7. In a labeling or branding machine, such as set forth, the stamping device A, consisting of an intermittently-rotary disk, 3, provided with a radially sliding series of projecting stampers, 4, with the axially-sliding cone 5, engaged with said stampers, whereby the latter are reciprocated as the cone is slid to and fro, substantially as and for the purpose set forth.

8. In a labeling-machine such as set forth, a label picking and applying device, faced with a solid or semi-solid adherent composition adapted to temporarily adhere to the label without giving off any appreciable amount of its substance thereon when subsequently detached, substantially as herein shown and described.

9. In a spool labeling and packing machine such as described, the combination, with a device for arranging and delivering the spools in regular groups, of the intermittently-movable packing-table F, adapted to hold a series of boxes for receiving said groups successively, with means, substantially as described, for moving said table in steps corresponding to its boxes and coincident with the delivery of each group of spools from the arranging device, substantially as herein shown and described.

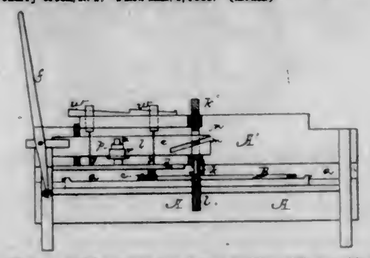
10. The combination, in a labeling or branding machine substantially such as set forth, with means, substantially as described, for advancing the labeled spools one after the other, of the receiving and arranging drum E, having a series of radial chutes adapted to receive said spools in regular groups, an intermittently-movable table placed in conjunction with the delivery-point of said drum, and adapted to hold boxes for receiving said groups, and means for rotating said drum and table in steps corresponding to the receipt of each group of spools, and for depositing each group successively in the boxes of said table, substantially as herein set forth.



11. In a labeling and packing machine substantially such as set forth, the combination, with the rotary arranging-drum E, having a series of radial arranging-chutes, of the rotary packing-table F, provided with radial sockets for packing boxes, and revolving in a plane at right angles to the plane of the drum, or nearly so, with feed mechanism for rotating the drum in steps corresponding to its chutes, and a feed mechanism for rotating the table in steps corresponding to its boxes, together with operative connections between the two, whereby a box on the table and a chute in the drum are brought into coincidence at each step, all substantially as described, and for the purpose set forth.

12. In a labeling or branding machine substantially such as set forth, adapted to advance a single line of labeled spools, the arranging-drum E, provided with a radial series of chutes of twice the width of said spools, arranged to receive the labeled spools from the advancing device, with means for revolving said drum in intermittent steps corresponding to its chutes, and means for shifting said drum from side to side during the pause between each step, so as to receive a parallel group or line of spools in each side of its chute, all substantially as described, and for the purpose set forth.

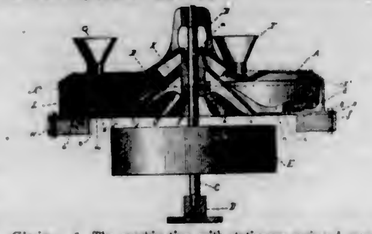
13. In a spool labeling and packing machine such as described, the combination, with a device for arranging and delivering the spools in regular groups, with the packing-table F, adapted to support boxes to receive said groups in succession, and with the swinging lid *q*, arranged to cover said boxes and act to guide the spools therein at the moment of delivery, of means, substantially as described, for operating said lid in relation with the movements of its co-operating parts, as herein shown and described.



14. The combination, with the drum E and table F, formed and arranged relative to each other, substantially as described, of the discharging device *l l*, and means for operating the same in relation with the motions of said drum and table, substantially as and for the purpose set forth.

291,292. GRATE-BAR. WILLIAM H. CANBY, East Saginaw, Mich. Filed June 23, 1883. (No model.)

Claim.—As an improved article of manufacture, the grate-bar herein described, consisting of the vertical longitudinal side flanges, *a*, having convex lower edges and tapering toward each end, the transverse end connections having sloping portions *b*, extending from side flange to side flange, and to the lower edges of the side flanges, the series of oblique transverse bars *d*, alternating with oblique slots, and extending from side flange to side flange, and the vertical transverse central brace, *e*, connecting the side flanges and extending nearly to the convex edges thereof, the whole formed entire and without marginal projections or lugs, as shown and described.



291,293. PAPER-PERFORATING MACHINE. ISRAEL C. CARPENTER, Cherry Creek, N. Y. Filed Mar. 5, 1883. (Model.)

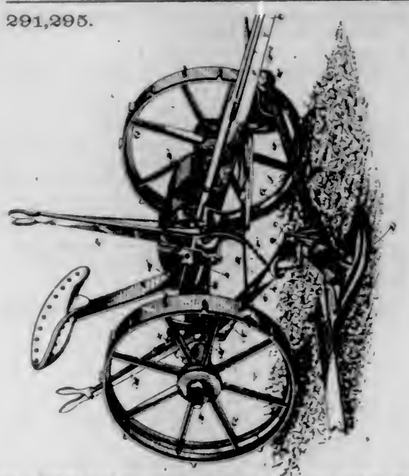
Claim.—1. The combination, in one machine, of the punching devices *s k k' w n*, the carriage B, having the rack *c*, the ratchet-bar *d d'*, and the guide *p r s u*, all operated by the lever *f*, substantially as and for the purpose specified.

2. In combination with the punching devices *f e k k'* and carriage B, the ratchet-wheel *g*, grooved wheel *g'*, ratchet *i*, lever *j*, and rope *h h*, for drawing said carriage forward, all arranged and operating substantially as and for the purpose specified.

291,294. ORE-REDUCING APPARATUS. NELSON CLEMENT, Chicago, Ill. Filed July 24, 1883. (No model.)

Claim.—1. The combination, with stationary casing A, provided with an inlet-spout, F, and ribs *d*, of shaft C, and cone J, provided with ribs *m*, the parts constructed to bring two bodies of ore in contact and reduce the same by attrition, as described and shown.

2. The stationary casing A, provided with inlet-spout F, outlet-spout G, and ribs *d*, in combination with revolving cone J, provided with ribs *m*, and the fans K, as described and shown.



291,295. HARVESTER. SAMUEL C. COBB and NELSON A. WHEELER, Janesville, Wis., assignors to the Janesville Machine Company, same place. Filed July 9, 1883. (No model.)

Claim.—1. In a harvester, the combination, with the main axle, a cam or eccentric shaft, and pinions on said axle and eccentric-shaft, of a handle secured to the cam or eccentric shaft, a catch, *d'*, pivoted to the handle and provided with an arm, *f*, adapted to engage a projection on the frame and retain the pinions in engagement, substantially as set forth.

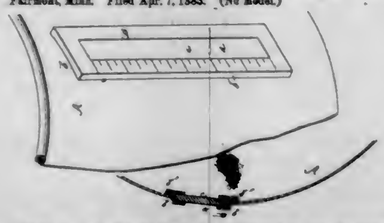
2. In a harvester, the combination, with the main axle, a cam or eccentric shaft, and pinions on said axle and cam-shaft, of a catch pivoted to the handle, said catch having an arm adapted to engage the under side of a projection on the shell or frame, and a spring interposed between the handle and catch for preventing the accidental displacement of the latter, substantially as set forth.

3. The combination, with the main frame having a hemispherical bearing formed in its outer end, of the connecting-bar having a spheroidal

291,295.

end, a hemispherical cap, and a bolt for securing the parts together, substantially as set forth.

4. The combination, with the main frame, a straight connecting-bar connected at one end to the main frame, substantially as described, so as to have a vertical and rocking movement, and a thrust-bar pivotally secured at one end to the main frame, and at its other end provided with a collar, in which is supported and allowed to rotate the free end of the connecting-bar, of a shoe hinged to the free end of the connecting-bar at a point in advance of the cutter-bar, and an arm, connecting-rod, and hand-lever for imparting rotary adjustment to the connecting-bar, substantially as set forth.



5. The combination, with the connecting-bar, hinged shoe, and thrust-bar provided with a collar at its forward end, in which is supported and allowed to rotate the outer end of the connecting-bar, of a gag-iron for tilting the shoe, a hand-lever, and a chain connecting the gag-iron and thrust-bar with said handle, substantially as set forth.

6. The combination, with the hinged shoe, of a combined rotary and reciprocating gag-iron, a hand-lever, and a chain connecting the hand-lever and gag-iron, substantially as set forth.

7. The combination, with a hinged shoe, an elongated bearing having a spiral slot connected with the hinge-section, and a gag-iron provided with a lug that engages said spiral slot, and with an arm at its upper end, of a hand-lever and a chain connecting the hand-lever and the arm on the gag-iron, substantially as set forth.

8. The combination, with the connecting-bar, the vertical box or bearing having a spiral slot therein, the shoe having a finger which rests under the box, and the thrust-bar, of an L-shaped bolt having a laterally-projecting lug which moves in the spiral slot of the box or bearing, and device for turning the bolt.

291,296. CREAM-GAGE FOR MILK-CANS. CLARENCE L. COLBY, Fairmont, Minn. Filed Apr. 7, 1883. (No model.)

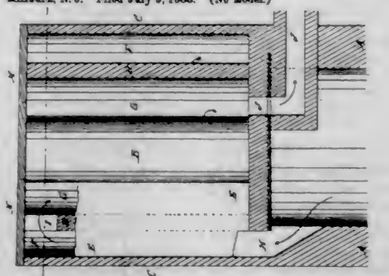
Claim.—1. In a cream-gage, the combination of the can formed with an opening in its side, of the blank or frame B, stamped from a single piece of metal, with the usual gage-marks, the flange *b*, opening *a*, and wings *b'*, and glass panel *c*, the said wings being bent over backward upon themselves at a point so as to leave a narrow projecting double flange or wings *b'*, extending and overlapping the glass panel *c*, substantially as and for the purpose set forth.

2. In a cream-gage, the combination, with a transparent frame, of a sheet-metal frame formed with the opening *a* and flanges *b*, said flanges being bent outward and then back upon themselves, and overlapping the panel, thus forming wings *b'*, adapted to be secured to the sides of the can, substantially as and for the purpose set forth.

291,297. PENCIL. RICHARD M. COLLARD, New York, N. Y., assignor to Leroy W. Fairchild, same place. Filed July 2, 1883. (No model.)

Brief.—A holder and a presser tube, with a spring located in the former, are constructed and arranged in such relation to each other that a stub of lead may be conveniently ejected from its carrier.

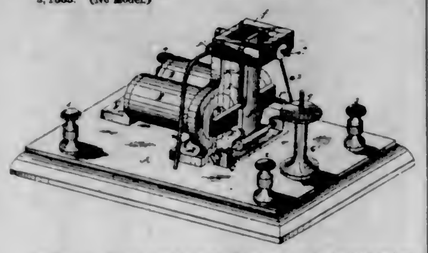
Claim.—1. The combination, with the holder and presser tubes, movable with relation to one another for the purpose of clamping and releasing the pencil-lead, of an ejecting-spring located in the holder-tube in position to be compressed by the lead inserted in said tube, substantially as and for the purposes hereinbefore set forth.



2. The combination, with the holder and presser tubes, movable relatively to one another for the purpose of clamping and releasing the pencil-lead, of an ejecting-spring located in the holder-tube in position to be compressed by the lead inserted in said tube, and a retracting-spring which normally holds said tubes in a position in which they clamp and hold the pencil-lead in place against the stress of the compressed ejecting-spring, substantially as hereinbefore set forth.

3. The combination, with a pencil-case or sheath, a lead-carrier longitudinally movable therein, having a lead-holding socket composed of holder and presser tubes longitudinally movable with respect to one another, and an ejecting-spring in the holder-tube, as described, and means for propelling said carrier in said case, of a stop by which the forward motion of the outer or presser tube is limited, substantially as and for the purposes hereinbefore set forth.

4. The lead-carrier consisting of the presser and holder tubes, combined with ejecting and retracting springs, substantially as hereinbefore described, in combination with the pencil-case, in which the carrier is movable longitudinally, means for propelling said carrier therein, and a stop to limit the forward movement of the presser-tube, these instrumentalities being combined and adapted to co-operate substantially in the manner and for the purposes hereinbefore set forth.



5. The straight-slotted guide-tube, the spirally-slotted rotary propelling-sleeve, and the lead-carrier longitudinally movable in said guide-tube, and composed of the presser and holder tubes, combined with ejecting and retracting springs, substantially in the manner hereinbefore described, in combination with a pin or projection on said holder-tube, which extends through the straight slot of the guide-tube into the spiral slot of the propelling-sleeve, and a stop arranged and operating to arrest the forward movement of the presser-tube at a predetermined point, substantially as and for the purposes hereinbefore set forth.

291,298. RETORT DEOXIDIZING-FURNACE. ISRAEL D. CONDIT, JR., Millburn, N. J. Filed July 5, 1883. (No model.)

Claim.—The deoxidizing-furnace having the inner and outer chambers, F G, the central retort, B, the inner wall, D, having the series of concentrically-arranged retorts B, and the partition E, extending from the central retort, B, through the outer chamber, F, the bottom of the latter having the inlet-opening H on one side of the partition E, while the inner wall, D, has an opening or passage, I, at its upper end on the opposite side of the partition, the bottom of the inner chamber having an outlet-opening, J, substantially as and for the purpose set forth.

291,299. PROTECTOR FOR TELEPHONIC AND TELEGRAPHIC INSTRUMENTS. ANTHONY A. CONNOLLY, Washington, D. C. Filed Apr. 3, 1883. (No model.)

Claim.—1. A protector of electrical instruments from abnormal currents, comprising an electro-magnet adjusted to respond only to abnormal currents, a normally-open earth-circuit, and suitable contacts and connections, whereby an abnormal current crossing either the incoming or outgoing line of the protected instrument will pass through said magnet and direct the current to ground, the abnormal current from either direction being made to follow the same path through the magnet to ground, substantially as described.

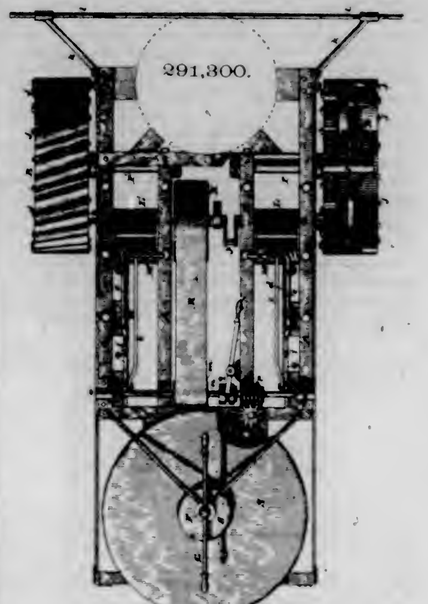
2. A protector for electrical instruments, comprising an electro-magnet adapted to respond to only abnormal currents, a normally-open earth-circuit, and suitable contacts and connections, whereby an abnormal current crossing the outgoing line will energize the magnet, and by the movement of its armature be provided with a circuit to the incoming line and thence through the magnet to ground, the instrument to be protected being by the movement of said armature cut out of the circuit, substantially as described.

3. In an electro-magnetic device for the protection of electrical instruments from abnormal currents, the combination, with an electro-magnet and its armature for short-circuiting or diverting the abnormal currents to earth, and a normally-open earth-circuit, of contact-points on either side of said armature, and diverted circuits leading therefrom, substantially as described, whereby an abnormal current crossing the main line on either side of the protected instrument will pass through the coils of the magnet in the one and the same direction and reach earth by the one path.

4. In an instrument for protecting electrical apparatus from abnormal currents, the combination, with an electro-magnet adapted to respond to only such abnormal currents, and wound in single continuous helical form, of a conducting-armature, a normally-open earth-circuit and back stop normally in circuit with the protected instrument, and suitable contacts and shunt or diverted circuits, substantially as described, whereby an abnormal current crossing the main line on either side of the protected instrument will be caused to energize said magnet, and through the same effect a diversion, short circuit, or shunt to earth.

5. In an automatic electrical protecting-switch, the combination, with the electro magnet or magnets B, conducting-armature F, and back stop, c^2, arranged and adapted to be in normal circuit with the main line, of the diverted line circuits or shunts *l m*, short earth-circuit *d''*, and contacts *d f f'*, substantially as and for the purpose described.

291,300. TRACTION-ENGINE. HAMILTON M. CORBACK, Malden, Mass. Filed Sept. 11, 1883. (No model.)



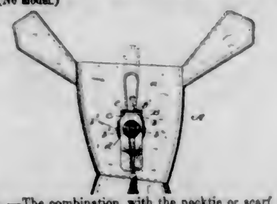
Claim.—1. In a traction-engine, a reversing-gear consisting of a wheel mounted upon a fixed axis, and provided with both an internal and an external gear, and a pinion mounted upon a movable axis, and provided with means for revolving the same, and adapted to be moved from one gear to the other without stopping the engine.

2. In a traction-engine, the combination of a wheel provided with both an internal gear and an external gear, a pinion adapted to engage with either of said gears, a pair of friction-gears for driving said pinion, and mechanism adapted to move said pinion from a position in contact with one of said gears to a position in contact with the other, and at the same time to throw the friction-gears out of and into contact with each other, substantially as and for the purposes described.

3. In a traction-engine, the combination of the wheel B, provided with the external gear, *h*, and internal gear, *i*, the pinion *g*, secured to the friction-gear O, and both mounted in the swinging frame M, the friction-gear L and means of imparting motion thereto, the connecting-rod *c*, and the lever *d*, provided with means for holding it in any required position, all substantially as and for the purposes described.

4. In a traction-engine, a traction-wheel provided with a tire made of thin corrugated sheet metal, secured to the rim of said wheel by any suitable means, substantially as and for the purposes described.

5. In a traction-engine, a traction-wheel provided with a tire made of thin diagonally-corrugated sheet metal, secured to the rim of said wheel by means of suitable rods, which pass through the corrugations, and are



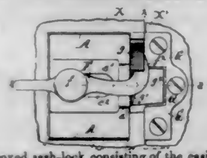
firmly secured at their ends to the opposite sides of the rim of the wheel, substantially as and for the purposes described.

6. In a traction-engine, the combination of the two-speeded drum S, provided with the gear *s*, the worm-gear *p*, shaft *n*, pulley *m*, belt R, pulley K, shaft *a*, and means of rotating the same, all substantially as and for the purposes described.

7. In a traction-engine, the combination of the geared drum S, mounted upon the steering-shaft of the carriage, and suitable means for revolving said drum, substantially as and for the purposes described.

291,301. NECKTIE. WILLIAM C. CROSS, Boston, Mass. Filed Oct. 20, 1883. (No model.)

Claim.—The combination, with the necktie or scarf, of a spring-closed nipper provided with guide grooves or slots, and a collar-button loop-cord, the ends of which pass each through one of said slots and thence out from the nipper, substantially as and for the purposes set forth.

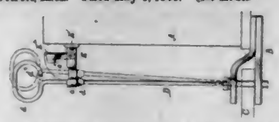


291,302. PREPARATION OF GLUE-STOCK FROM BONES, HORN-PITHS, &c. EDWARD F. CRUSE, Newark, N. J. Filed Nov. 1, 1883. (No specimens.)

Claim.—The process herein described of treating the mother-liquid resulting from the treatment of bones, &c., with hydrochloric acid in the manufacture of glue, the same consisting in adding to said liquid calcic carbonate until the liquid is neutralized; then adding calcic hydrate to precipitate organic matter; then separating the clear calcic chloride from the precipitated impurities; then decomposing the pure calcic chloride by means of sulphuric acid; and, finally, separating the precipitated calcic sulphate and the free hydrochloric acid, by filtration, for use, substantially as specified.

291,303. FASTENER FOR THE MEETING-RAILS OF SASHES. GEORGE W. CURRY, St. Louis, Mo. Filed Jan. 29, 1883. (Model.)

Claim.—1. The improved sash-lock consisting, essentially, of the casing A, having spindle *b*, the arm-connections D D' to bolt *c*, forming part of which is the bearing-plate *c'*, having slot c^2, the spring E, the catch G, having socket g^2, to operate as and for the purposes set forth.

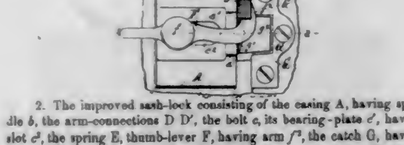


291,303.

2. The improved sash-lock consisting of the casing A, having spindle *b*, the arm-connections D D', the bolt *c*, its bearing-plate *c'*, having slot c^2, the spring E, thumb-lever F, having arm f^2, the catch G, having socket g^2, mortise at *g'*, and bevel-face at g_1 by means whereof both the bolt and the thumb-lever can be secured in the manner and for the purposes set forth.

3. In a sash-lock, the combination with a pivoted thumb-lever, F, having the arms *f''* f^2, the latter provided with lug f^3, the catch G, having mortise *g'* and shoulder at g^2, by means whereof the said lateral arm f^2, engaging the mortise of the catch at same time, brings in engagement the lug f^3 with the shoulder on the catch, substantially as and for the purposes set forth.

291,304. FASTENING DEVICE FOR DRAFT-PINS. JOSEPH W. DAILEY, Detroit, Mich. Filed May 3, 1883. (No model.)

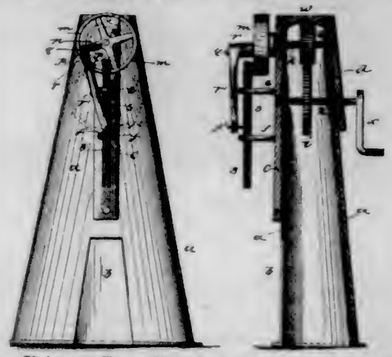


Claim.—1. A fastening for securing draft-pins firmly in place, consisting of suitable embracing-jaws adapted to be secured to the dash-board, and provided with the orifice c^2, communicating with the expanded orifice *c'*, and, in combination therewith, a latch pivoted between said jaws, and adapted, when closed, to hold the draft-pin firmly in the orifice c^2, substantially as described.

2. A fastening for holding a draft-pin firmly in place, consisting of suitable jaws provided with the orifice c^2, communicating with the expanded orifice *c'*, and, in combination therewith, a latch pivoted between said jaws, and provided with a stopper adapted to close into the orifice c^2, the construction being such that when the latch is closed the draft-pin will be held firmly in the orifice c^2, substantially as described.

3. The combination, with a dash-board and draft-pin provided with shoulders *b*, of a fastening consisting of embracing-jaws provided with the orifice c^2 and expanded orifice *c'*, and, in connection therewith, a latch suitably pivoted between said jaws, the construction being such that when the latch is closed the pin will be held firmly in the orifice c^2, and in that position be prevented from displacement by the shoulders *b* beneath the fastening, and by raising the latch the pin may be drawn upward through the orifice *c'*, substantially as described.

291,305. MACHINE FOR CUTTING VEGETABLES. PETER J. DANIS, St. Louis, Mo. Filed July 19, 1883. (No model.)

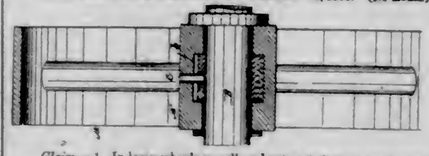


Claim.—1. In a vegetable-cutter, the knives having pintles extending from their rear corners, in combination with a frame having set-screws, the pintles having bearing in the frame to hinge the knives thereto, and the set-screws bearing against the upper and under sides of the knives, the upper set-screws working over the under set-screws.

2. In a vegetable-cutter, the J-bar formed at top with scoring-knives and at bottom with a flange, thumb-screws working through said flange, and a slotted plate for the knives to work through, and in which the thumb-screws work, in combination with a board through which the knife-bar is adjusted, to conceal, and also fully or partly expose, the knives, as set forth.

3. In a vegetable-cutter, the combination of the hinged and adjustable slicing-knives and the J-bar having vertical knives adjustable vertically in relation to the slicing-knives for scoring, or to cut strips, as set forth.

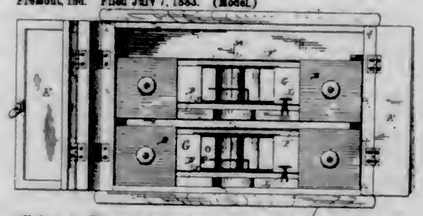
4. The combination, in a vegetable-cutter, of the slicing-knives F, having pintles at their rear corners hinged to the frame, set-screws G H, bearing against opposite sides of the knives, the bar L, having vertical scoring-knives *l*, and horizontal flange L', and the thumb-screws M, to adjust the scoring-knives in front of or beneath the slicing-knives, as set forth.



291,306. CHURN. JAMES HOPKINS DANIELL, Prescott, Ark. Filed July 12, 1883. (No model.)

Claim.—1. The combination, with the conical frame *a*, of sheet-iron, made flat on one side and cut away in said flat side near its base, as at *b*, to receive the churn, of the bearing-irons *c d* near its top, for the journals of the shafts *h* and *k*, the spur-gear *i*, pinion *l*, fly-wheel *m*, having the spoke *n*, provided with a plurality of perforations, and pitman *r'*, connected to the plunger-rod working in guide-arms extending from the bearing-iron *c*, and the said rod adapted to connect with the dasher-rod, substantially as specified.

2. In a churning-machine, the conical frame *a*, made of sheet-iron, and having one flat side cut out at *b* near its base to receive the body of a churn, to bring it centrally under the operating-plunger, substantially as specified.

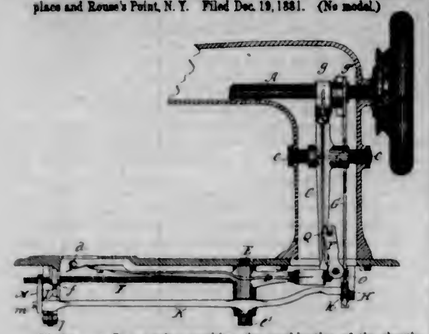


291,307. DEVICE FOR LUBRICATING WHEELS AND PULLEYS. WILLIAM P. DANIELL, Girardville, Pa. Filed Nov. 12, 1883. (No model.)

Claim.—1. In loose wheels or pulleys having their hubs constructed with an interior oil recess or chamber in open communication with the bore of the hub, the combination, with the hub, of an oiling-tube in open communication with the exterior of the hub and arranged to project within said chamber to the full extent of the depth thereof, or thereabout, substantially as specified.

2. The combination, with the hub A' of a loose wheel or pulley having an oil recess or chamber, *b*, arranged to extend around the interior of the hub, of the oiling-tube C, arranged to project within said chamber and so that its inner end is in line, or thereabout, with the bore of the hub, essentially as shown and described.

291,308. CABINET FOR WATCH-CRYSTALS. ORRY H. DAUGHERTY, Fremont, Ind. Filed July 7, 1883. (Model.)



Claim.—1. The combination, in a cabinet, of a number of drawers, and each drawer provided with a wheel or revolving part which has recesses formed in its edge for the purpose of holding watch glasses or crystals, substantially as shown.

2. The combination of a drawer provided with cross-pieces with a revolving wheel having recesses in its edge to receive articles of different sizes, substantially as described.

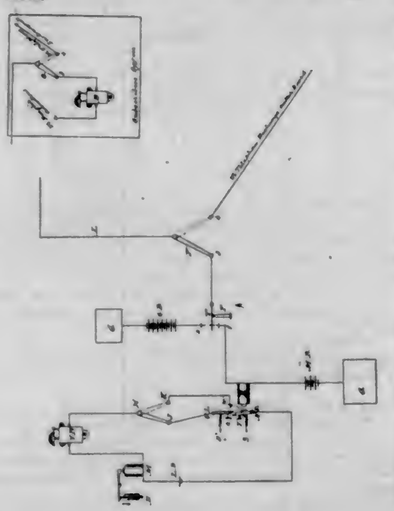
3. The combination of a drawer provided with cross-pieces with a revolving wheel provided with recesses in its edge, and a spring-snap for holding the wheel in position, substantially as set forth.

4. The combination of a drawer with a revolving wheel having recesses of different sizes made in its edges, with a second smaller wheel which is placed in the middle of the larger wheel, the smaller wheel also having recesses formed in its edges, substantially as specified.

291,309. SEWING-MACHINE. CHARLES W. DAVIS, Montreal, Quebec, Canada, assignor to the C. W. Williams Manufacturing Company, same place and Rouse's Point, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. In a sewing-machine, the combination of the shuttle-lever and push-rod and the pivoted lever K, operated independently from the driving-shaft and connected to the push-rod.

2. The combination of the driving-shaft and the pendent lever G with the incline H and the sliding bar O.

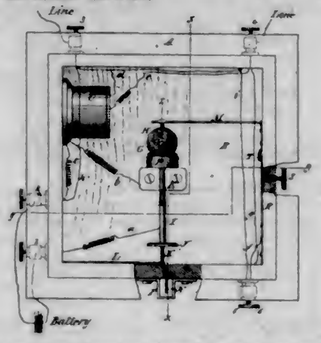


3. The combination of the pendent lever, the incline H, having the pin, the bar O, the arm P, and screw Q.

4. The combination, with the lever K, and with the pendent lever and connecting devices for giving said lever a horizontal oscillating movement, of the slotted link M, the set-screw, and the push-rod F.

5. The combination, in a sewing-machine, of the vertical reciprocating lever G, operated from the driving-shaft, and provided at its lower end with roller g^2, working on inclined plane H, with the horizontal vibrating lever K, mounted on the same axis as shuttle-lever D, provided with grooved roller *k*, impinging on vertical lever G at back end, and attached to link M, connected with feed devices at front end, said lever K being controlled by roller-support L, and acted upon by push-spring *n*, the whole being capable of adjustment to regulate the length of stitch by means of bar O, operated through arm P by regulating-screw Q, substantially as described.

6. The combination of the plate R', having the curved offset R', and the free end foot R^2, elevated above the face-plate, with the take-up lever S, substantially as described.



291,310. COMBINED BURGLAR-ALARM AND TELEPHONE SYSTEM. BENJAMIN F. DILLON, Savannah, Ga. Filed May 23, 1883. (No model.)

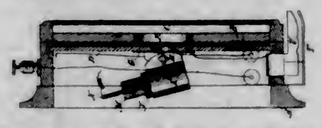
Claim.—1. A combined telephone system and burglar-alarm, consisting of a telephone-line, burglar-connections at the subscriber's office, a subscriber's telephone, a two-point switch connecting alternately with the subscriber's telephone-instrument or his burglar-connections, and a central office having a telephone switch-board and local battery with burglar-alarm circuit worked by relay, as described, and a two-point switch connecting the line alternately with the telephone switch-board and the relay of the burglar-alarm circuit, substantially as set forth.

2. The combination, with the relay R, operated by the main battery and adapted to be influenced by the surreptitious grounding or breaking of the main circuit in one of the subscribers' offices, of the vibrating bell and local-battery circuit, the electrically-connected contact-points V W K, the armature-lever A L, forming one of the terminals of the local-battery circuit, the switch-lever H, forming the other terminal, and the lever U L, electrically connected to point J, and provided with spring S', and arranged, as described, to be struck and deflected by the armature-lever A L, as and for the purpose described.

291,311. TELEPHONE-TRANSMITTER. DANI. DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Mar. 24, 1883. (No model.)

Claim.—1. In a telephone, the combination of two electrodes of low conducting material, respectively in the shape of an annular cup or socket, and of a ball adapted to be received in said cup or socket, and means for raising and holding said ball out of contact with said cup, substantially as described.

2. In a telephone, the combination of a diaphragm, an annular cup or socket of low conducting material, supported by or upon said diaphragm, a ball of low conducting material adapted to be received in said cup, and a metallic rod fastened to said ball and passing through the aperture in said cup, substantially as described.



3. In a telephone, the combination of a non-conducting diaphragm, a conducting-support attached thereto, an annular cup or socket of low conducting material held in said support, a ball of low conducting material adapted to be received in said cup, and a metallic rod fastened to said ball and passing through the aperture in said cup, substantially as described.

4. In a telephone, the combination of a non-conducting diaphragm, a conducting-support attached thereto, an annular cup or socket of low conducting material, a ball of low conducting material adapted to be received in said cup, a rod attached to said ball and extending downward through the aperture in said cup, and a vertically-movable support arranged beneath the lower end of said rod and capable of being elevated to meet said rod and lift or sustain the same, substantially as described.

5. The combination, in a telephone, of the ball H, annular cup-shaped carbon G, the support E F, rod I, plate J, spring L, and hook or bracket P, connected in circuit, substantially as described.

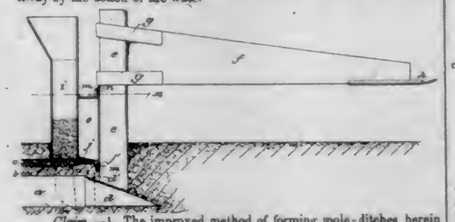
6. The combination, in a telephone, of the rod I, support E F, spring M, button S, and spring R, connected in circuit, substantially as described.

291,312. TELEPHONE-TRANSMITTER. DANI. DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Mar. 24, 1883. (No model.)

Claim.—1. In a telephone-transmitter, the combination of two electrodes of low conducting material, one loose and the other annular in form, attached to and upon a movable support and surrounding the first

electrode, and means for varying the inclination of the second electrode and support, so that said second electrode may sustain more or less of the weight of the first electrode, substantially as described.

2. In a telephone-transmitter, the combination of an electrode of low conducting material in the form of a hollow cylinder, vertically disposed, having a piece of insulating material inserted in its lower end and sustained by a support, and a second electrode of low conducting material in the form of a solid cylinder, adapted to fit loosely in the first electrode and to rest on said inserted piece of insulating material, and means for adjusting said first electrode and support at a desired inclination, so as to vary the proportion of weight of the second electrode respectively sustained by the first electrode, substantially as described.



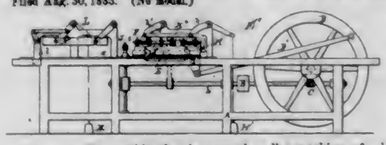
3. In a telephone-transmitter, the combination of a diaphragm, a hollow cylinder of low conducting material held in a support hinged or pivoted to said diaphragm, a solid cylinder of low conducting material loosely fitting in said hollow cylinder, and a means for turning said hollow cylinder on its pivot or hinge, substantially as described.

4. In a telephone-transmitter, a diaphragm of non-conducting material, a metal cup pivoted to said diaphragm, a hollow cylinder of low conducting material contained in said cup, a solid cylinder of low conducting material loosely fitting in said hollow cylinder, a piece of insulating material arranged between the lower end of said solid cylinder and the cup, and means for turning said cup on its pivot or hinge, substantially as described.

5. In a telephone-transmitter, the combination of a diaphragm of non-conducting material, bracket G, cup I, carbon J, carbon M, rod O, and lever P, substantially as described.

291,313. METHOD OF AND MEANS FOR MAKING MOLE-DITCHES. MILTON HERBERT EATON, Wilton Junction, Iowa. Filed Aug. 13, 1883. (No model.)

Brief.—The cement-tube connects to a second or crown cutter above the mole, the object being to leave a thin roof of packed earth to support the cement while hardening, and which will afterward be washed away by the action of the water



Claim.—1. The improved method of forming mole-ditches herein shown and described, consisting in lining the ditch proper, *a*, with a layer of cement, *c*, supported while hardening on the earth lining or shell *b* formed over the ditch *a*, substantially as specified.

2. The combination, with the mole-ditcher *d e*, of the cement-feed hopper or tube *i* and a cutter, *j*, for forming the cement-lining cavity, said cutter *j* being spaced from the ditcher-plow *d*, between the ditch proper and the cement-cavity, substantially as shown and described.

3. The combination, with the mole-ditcher *d e*, of the hopper *i* and cutter *j*, said cutter *j* overlapping the rear end of the ditcher-plow *d*, and the cutter *j* and plow *d* having reversely-inclined opposite faces *j' d'*, substantially as shown and described.

4. The combination, with the mole-ditch plow *d e*, of the cement-hopper *i* and cutter *j*, detachably connected to the ditcher-standard *e*, substantially as shown and described.

291,314. MATCH-SPLINT MACHINE. WILLIAM I. ELY, Detroit, Mich. Filed Aug. 30, 1883. (No model.)

Claim.—1. The combination, in a match-splint machine, of a bed for carrying the block to be cut, a rising and falling arbor, F, having cutters to form the block into lengths for the splints, a cutter, J, for cutting the block into suitable widths for the splints, a cutter, K, for shearing off the splints, and mechanism for operating all the cutters, substantially as described.

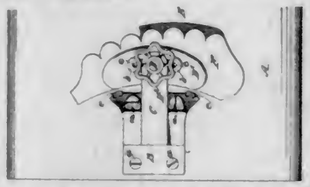
2. In a match-splint machine, the combination of a reciprocating bed, E, for carrying the block to be cut, an arbor, F, having cutters for forming the block into lengths for the splints, a cutter, J, for forming the block into suitable widths for the splints, a cutter, K, for shearing off the splints, and means for raising and lowering the arbor and operating all the cutters, substantially as described.

3. The combination, with the cutters J and K, arranged one in advance of the other, and means for operating the cutters, of a bed, E, for carrying the block to be cut, and mechanism for reciprocating the bed to present the block first to the cutter J to form the width of match-splints, and subsequently to the cutter K for shearing off the splints, substantially as described.

4. The combination, in a match-splint machine, of an arbor, F, carrying cutters, devices for supporting the arbor and permitting it to rise and fall, a reciprocating bed for carrying the block, means for lowering and raising the arbor to cut the block into lengths for the splints, a cutter, J, for cutting the block into the width for the splints, and a cutter, K, for shearing off the splints, substantially as described.

5. In a match-splint machine, the combination of a sliding bed, E, and arbor F, provided with a series of cutters, suspended levers A A', supporting the arbor, a bar, H^2, connecting said levers, a stop on the sliding bed, arranged to act on the bar connecting the levers to lower the arbor and bring the cutters into action on the material, and means for elevating the arbor away from the material, substantially as described.

6. The combination, in a match-splint machine, of the sliding bed and the cutters for forming the splints, with a slide, Q, on the bed, a rack, N, a retracting-spring, *n*, connected with the rack, an arm, O, having a cam, *o*, and a stationary stop, P, for acting on the arm and causing its cam to advance the rack and slide to feed the material to the cutters, substantially as described.



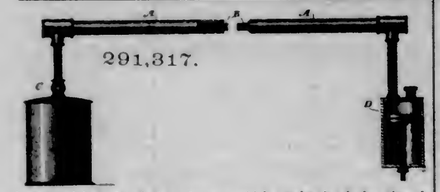
7. In a match-splint machine, the combination of a work-carrying bed, an arbor having a series of cutters to cut the material into lengths for the splints, cutters arranged to cut at right angles to those on the arbor, for cutting the material into widths for the splints, a cutter for shearing off the splints, and mechanism for operating all the cutters, substantially as described.

291,315. THILL-HOLDER. JOHN WESLEY EVANS and ALBERT H. VERMAY, Baltimore, Md. Filed Oct. 22, 1883. (No model.)

Claim.—The combination of a metallic thill-loop covered inside and outside with leather and suspended in the usual manner, a threaded bolt passing through the sides of the loop near its lower end, and provided with washers inside the sides of the loop, and a roller journaled upon the bolt and having a metallic covering upon its surface, as and for the purpose shown and set forth.

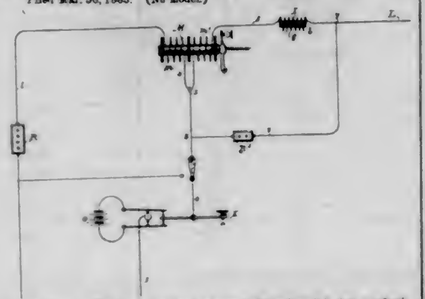
291,316. BUTTON-FLY CLAMP. ISIDOR FELBER, Nyack, N. Y. Filed Nov. 6, 1883. (No model.)

Claim.—1. In a button-fly clamp, the casting B, having the arm C, provided with the apertured side projections, *b c*, in combination with the screw D, working in said casting, and having the swiveled plate D', provided with the pins *d*, fitting into the apertures of the casting projections *b*, substantially as and for the purpose set forth.



2. In a button-fly clamp, the plate D', swiveled to the operating-screw, and provided with pins *d* for guiding the plate, substantially as described.

3. The casting B of a button-fly clamp, provided at its forward edge with the cushions *e e* for protecting the pattern F, substantially as and for the purposes set forth.

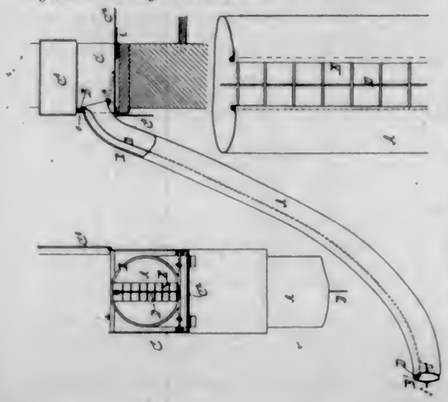


291,317. UNDERGROUND TELEGRAPH SYSTEM. STEPHEN D. FIELD, New York, N. Y. Filed May 5, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the insulated electrical conductors, the sealed conduit, within which said conductors are disposed, and the dry carbonic-acid gas therein maintained.

2. The mode described of preventing the combustion of the insulating material of electrical conductors, which consists in placing them in conduits within which dry carbonic-acid gas is maintained.

291,318. DUPLEX TELEGRAPH. STEPHEN D. FIELD, New York, N. Y. Filed Mar. 30, 1883. (No model.)

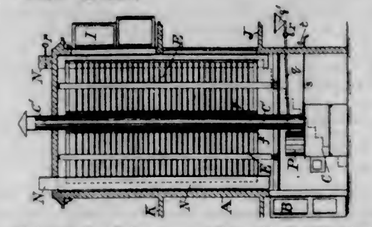


Claim.—1. The combination, substantially as hereinbefore set forth, with a main and an artificial line, a battery, and means for transmitting impulses therefrom upon said main and artificial line, of a differential electro-magnet having one of its coils included in the circuit of said artificial line and its remaining coil included in the circuit of said main line, an electro-magnetic inductor included in the last-named circuit, and a conductor constituting a permanent shunt-circuit around said inductor and the coil connected with said main line.

2. The combination, substantially as hereinbefore set forth, with a main and an artificial line, a battery, and a transmitting device for simultaneously sending currents or impulses therefrom to said main and artificial lines, of a differential electro-magnet having a corresponding terminal of each of its coils connected with said transmitting device, and the remaining terminals connected, respectively, with said main and artificial lines, an electro-magnetic inductor included in the circuit of said main line, a branch or shunt circuit connecting said transmitting device with said main line independently of said differential electro-magnet and electro-magnetic inductor, and an artificial resistance included in said branch or shunt circuit.

291,319. FIRE-ESCAPE. ADOLPH FISCHER, Ravenswood, assignor to himself, and Louis Franke, New York, N. Y. Filed Feb. 17, 1883. (No model.)

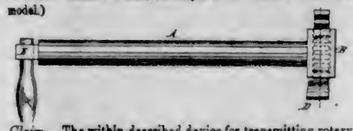
Brief.—The upper supporting-ring of the chute is provided with pivots which are journaled in the sides of the inclosing-casing, which casing is made with hinged sides and cover.



Claim.—1. The combination, in a fire-escape, of the inclosing-casing C, adapted to be secured to a building, with the chute A, having a ring at each end, one of the rings being secured within the casing, said chute being capable of folding into the inclosing-casing, substantially as described.

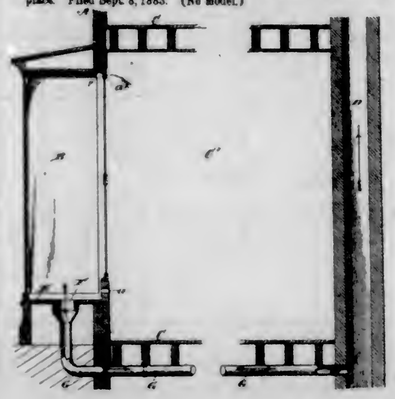
2. The combination, in a fire-escape, of an inclosing-casing, C, having hinged sides $C' C^2$ and hinged top C^3, with the chute A, having a ring at each end, one of the rings being secured within the casing, said chute being capable of folding into and being concealed by the casing, substantially as described.

3. The combination, in a fire-escape, of the casing C, provided with a cross-bar, *c*, with the chute A, having the ring B, provided with pivots *s*, supported within the casing, said ring being capable of swinging to rest against the cross-bar of the casing, substantially as described.



291,320. FRUIT-DRIER. HARRISON FITTS, Rollin, Mich. Filed May 28, 1881. (No model.)

Claim.—1. In a fruit-evaporator, the combination of an inclosure whose walls and roof are practically air-tight, fruit-trays, a furnace within the said air-tight inclosure, a smoke-flue, C', extending up through the inclosure and projecting from the roof, and one or more vertical vapor-flues, N, open only at the top and bottom, and having its lower open end below the fruit-trays and its upper end through the inclosure at the top, as set forth.

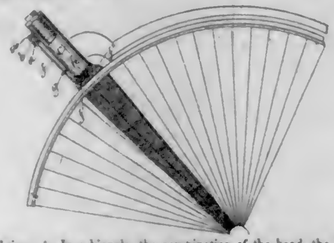


2. A fruit-evaporator having rotatable fruit-tray reels, a furnace below the reels, a smoke-flue, C', passing from the furnace to the roof between the reels, and a vapor-flue, N, open only at the ends, and having its lower end below the reels and its upper end above the reels, as set forth.

291,321. DEVICE FOR TRANSMITTING ROTARY MOTION AND POWER. GUSTAV FOCKE, Brooklyn, N. Y. Filed Oct. 11, 1883. (No model.)

Claim.—The within-described device for transmitting rotary motion and power, consisting of the combination of the socketed tube or sleeve A, operating-rod E, provided with the pinion or ratchet C at one end and handle H at the other, the pawl or tool D, secured in position and held adjustably by set-screw F, substantially as and for the purpose set forth.

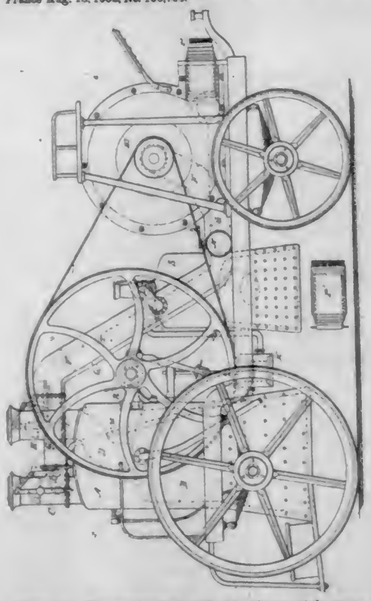
291,322. MEANS FOR VENTILATING BOW-WINDOWS. CHAS S. POOS, Baltimore, Md., assignor of one-half to William H. Clifford, same place. Filed Sept. 8, 1883. (No model.)



Claim.—1. The combination, with a show-window, of means for admitting thereto a warm stratum of air, and an exit in the lower portion of the window for the escape of air, a circulation being thus created through the window, substantially as and for the purpose set forth.

2. The combination, with a show-window, of an air-escape pipe entering the bottom or sill of said window and leading to a flue or air-escape, which communicates with the open air at or near the top of the building, substantially as described.

3. The combination, with the show-window A, of the ventilating-funnel F, entering the sill of the window, the air-pipe G, and an air-conduit, D, substantially as described.



291,323. BICYCLE. GEORGE D. FOOTE, Pittsfield, Mass. Filed Nov. 13, 1883. (No model.)

Claim.—1. In a bicycle, the combination of the head, the handle-bar applied to the front side of the head, a locking device or bolt normally securing the handle to the head, and means for automatically retracting said bolt, as set forth.

2. The combination of the head having a projection, *b*, the handle-bar formed to bear only against the front side of said head, and slotted to receive the projection *b*, the locking-bolt *f*, normally connecting said handle-bar and projection, and the pivoted lever *f'* and dog *f²*, adapted to be operated by the wheel, or its equivalent, to retract the bolt *f*, as set forth.

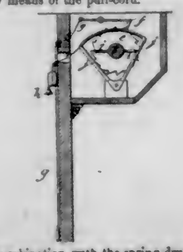
291,324. APPARATUS FOR EXTINGUISHING FIRES. JOHN KERSACK JOSHUA FOSTER, Bolton, County of Lancaster, England. Filed Apr. 13, 1883. (No model.) Patented in England Feb. 13, 1882, No. 803, and in France Aug. 13, 1882, No. 150,706.

Claim.—1. The combination, with a fan-blower, of the steam-boiler S, pipe L, connected throttle-valves L' L², pipe F, throttle-valves H H', uptake D, and furnace B, as shown and described.

2. The combination of a fire-box and boiler provided with separate uptakes, pipes connected to said uptakes for the conveyance of vitiated air and steam, respectively, a fan-blower or pump connected to said pipes, throttle-valves to control the thoroughfare through the pipes, and a boiler and steam-engine for driving the fan-blower or pump, substantially as herein described, and shown in the drawings, for the purpose specified.

3. The combination of the boiler A, fire-box B, uptakes C and D, pipes F and G, fan-blower or pump E, coupled pairs of throttle-valves H H' I I', steam-engine K, and high-pressure steam-boiler S, substantially as shown and described, for the purpose specified.

291,325. HAME. FRED FRAZER, Syracuse, N. Y. Filed Nov. 14, 1883. (No model.)

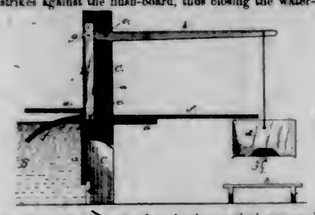


Claim.—1. A hollow metal hame composed of two sections fitted together by an overlapping joint and the auxiliary fastenings, substantially as shown and described.

2. The combination, with the hame-sections *a g*, of the lap-jointed edges *b h*, the rivet *j*, for securing their lower ends, and the knob or tip *f*, for securing their upper ends, substantially as shown and described.

3. The combination, with the hame-sections *a g*, having overlapped edges *b h* and end fastenings, of the terret and top strap loop fastenings, and tug-loop passed through both said sections and aiding in securing them together, substantially as shown and described.

291,326. FIRE-ESCAPE AND ALARM. WILLIAM S. FRENCH, Jackson, Mich. Filed Mar. 26, 1883. (No model.)

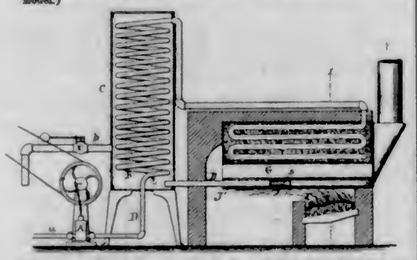


Brief.—Tappets on the shaft of the spring ladder-drum strike a pivoted yoke having attached to it a bell-cord and bell, as the reel turns, having been released by lifting the pawl-lever from the ratchet-wheel on the same shaft by means of the pull-cord.

Claim.—The combination, with the spring-drum *a*, carrying a flexible fire-escape ladder, tappets *i*, and ratchet-wheel *e*, of the pawl-lever *f*, provided with the pull-cord *g*, the pivoted yoke *j*, and a bell, *k*, connected by a cord, wire, or chain with the yoke, whereby on pulling the pawl-cord the drum will open out the escape-ladder and ring the alarm, as described.

291,327. FLOOD-GATE. JAMES ALEXANDER GALLOWAY, Spring Hill, assignor of one-half to Edward James Rambert, Rambert's, S. C. Filed Mar. 12, 1883. (No model.)

Brief.—At high water the bucket fills and, overbalancing the gate-carrying frame, descends, and the frame rises until the gate is disengaged from the flush-board, when the gate rotates, giving way to the water. When the water falls below the level of the spout, the bucket, which is self-discharging, empties, and the gate descends till, as it rotates, one of its arms strikes against the flush-board, thus closing the water-way.



Claim.—The side posts of a dam, having vertical grooves in them, and a flush-board connecting the posts, in combination with a lever pivoted to said posts, a bucket hung to one arm of said lever below high-water level, and means, substantially as described, for permitting water to escape from the bucket, a frame hung to the other arm of said lever, to slide in said vertical grooves, a gate having arms like a water-wheel, pivoted to revolve in said frame, and a spout passing through the dam at high-water level, whereby water may be carried from the forebay into the bucket and the gate freed from the flush-board, as and for the purpose described.

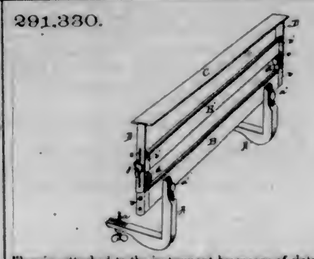
291,328. LOCK-NUT. OWEN F. GARVEY, Pawtucket, R. I. Filed Apr. 7, 1883. (No model.)

Claim.—A nut provided with a screw-threaded opening set at an oblique angle to one or both faces of the nut, and having an enlargement, H, at the base of said screw-threaded opening, as set forth.

291,329. MANUFACTURE OF SOAP. WILLIAM E. GIBBS, Elizabeth, N. J., and CHARLES G. OTIS, Brooklyn, N. Y. Filed May 16, 1883. (No model.)

Claim.—1. As an improvement in the art of soap-making, passing the mixture of alkali and fat forcibly through a heated channel filled with small particles of iron or other substance, substantially as set forth.

2. Subjecting the material to the action of heat while passing through a mass of small particles and after being partially heated, substantially as set forth.



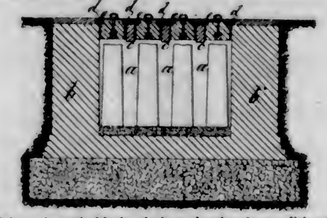
3. The combination, in a soap-machine, of a pipe or channel filled with scrap-iron or its equivalent, a heater, and a pump, whereby the material is forced through said channel between the particles of scrap, substantially as set forth.

4. The combination of the tube or channel in which the material is heated, with tubes and casings, substantially as set forth, whereby the hot material passing from said tube is caused to impart its heat to the new supply entering said tube, substantially as specified.

5. The combination of the boiler, tube, vessel C, coil B, heater, and pump, substantially as specified.

291,330. ARM AND FINGER GUIDE FOR PIANOS AND ORGANS. THOMAS GIDDINGS, Williamsport, Pa. Filed Apr. 11, 1883. (No model.)

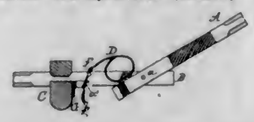
Claim.—1. An arm and finger guide for pianos and organs, such guide having its constituent parts adjustably connected together, and



likewise attached to the instrument by means of slots and thumb-screws, with which the several parts are provided, substantially as described.

2. An arm-guide for pianos and organs, consisting of two rails, arranged one above the other and adjustably connected together, and likewise attached to and supported by a pair of brackets attached to the instrument, and adapted to be adjusted horizontally toward or away from the key-board by means of slots and thumb-screws, with which the several parts are provided, substantially as and for the purpose set forth.

3. The combination, with the arm-guide, as described, of a finger-guide adapted to be used simultaneously therewith, and consisting of a rail attached to the rails constituting the arm-guide, and adapted to be horizontally adjusted over the key-board and to be swung vertically above the arm-guide by means of slots and thumb-screws, with which the several parts are provided, substantially as and for the purpose set forth.

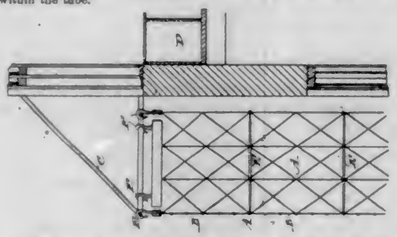


4. In a device of the character described, the combination, with the brackets A A and the arm-guide, constructed, arranged, and attached to the piano or organ as described, of the finger-guide consisting of the strip C and plates D D, constructed, attached, and made adjustable upon the arm-guide, substantially as described and shown.

291,331. APPARATUS FOR EQUALIZING THE TEMPERATURE OF STEEL INGOTS. JOHN GJERS, Middlesbrough, in the North Riding, County of York, England. Filed Mar. 23, 1883. Renewed Dec. 12, 1883. (No model.) Patented in Belgium Apr. 13, 1883, No. 61,080, and in Luxemburg Oct. 30, 1883, No. 317.

Claim.—A vertical inclosed pit or chamber for equalizing the temperature of steel ingots, constructed to contain several ingots at a time in a vertical position, and having in its top a number of openings corresponding to the number and positions of the ingots to be treated at a time, each of said openings being provided with a separate removable cover of non-conducting material, substantially as described, for the purpose specified.

291,332. WAGON-TONGUE SUPPORT. ALBERT HARVEY GILKASON, Wabash, Ind. Filed Sept. 27, 1883. (No model.)



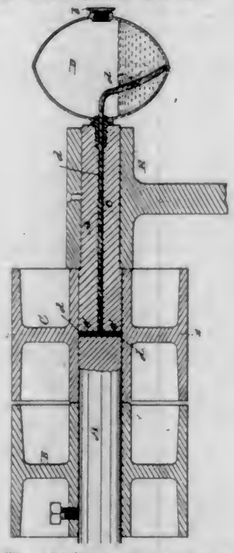
Claim.—1. In a wagon-tongue pivoted to swing vertically between the hounds, a spring secured upon the rear end of the tongue, and two hooks secured to said spring at different heights, in combination with a block secured to the axle, having one or more studs adapted to engage said hooks, as shown and described.

2. The combination, with a flat coiled spring having two pairs of hooks projecting from its sides, as described, secured to a wagon-tongue, of a block secured to the axle, having two forward projections farther apart than the width of a pair of hooks, carrying two inwardly-projecting studs far enough apart to permit said spring to pass between them, and adapted to engage the hooks at the sides of the spring, as shown and described.

3. The combination, with a block having the forward-projecting sides and inwardly-projecting studs described, secured to a wagon-axle, of a spring secured to the tongue, and two pairs of hooks secured to the spring, adapted to engage said studs, each pair of hooks being provided with noses adapted to guide the hooks past the studs, as described.

291,338. FIRE-ESCAPE. WILLIAM H. GLENN, Kirksville, Mo. Filed June 1, 1883. (No model.)

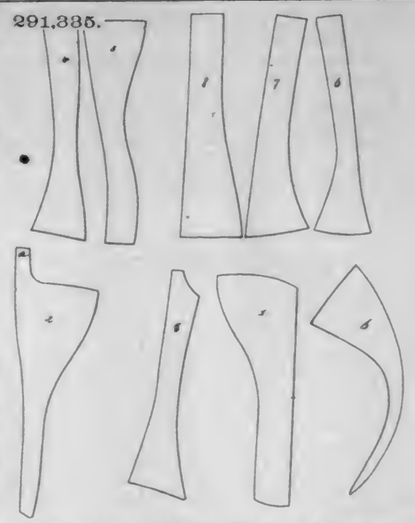
Brief.—A fire-escape consisting of a tube made of ropes tied at their points of intersection and suspended by hooks from a frame, and having a ladder secured thereto, so that persons descending pass down within the tube.



Claim.—1. A fire-escape sack formed of perpendicular ropes, and ropes crossing these obliquely, said ropes being tied together at their points of crossing, all substantially as shown and described.

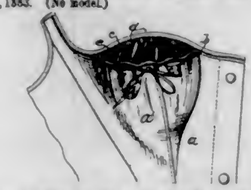
2. The combination, with a fire-escape sack having hooks at the rim of the upper end, of a projecting frame, C, arranged to hold the sides of the sack perpendicularly, as shown and described.

3. The combination, with the sack or tube A, made of ropes, of the hooks F and the ladder B, secured in the sack, substantially as herein shown and described, and for the purposes set forth.



291,384. OILER FOR LOOSE PULLEYS. WILLIAM D. GRAVES, Jr., Presque Isle, Me. Filed Oct. 10, 1883. (No model.)

Claim.—In oiling or lubricating devices for loose pulleys, the combination, with the shaft A, constructed with a longitudinal aperture, *c*, extending from one end thereof to a transverse aperture, *c'*, arranged at about a point in a central plane with the pulley of said shaft, of an oil or lubricant cup or vessel, D, having a screw-threaded attaching tube and wicking, *d*, substantially as shown and described, and for the purpose set forth.



291,385. CORSET. CATHARINE A. GRISWOLD, New York, N. Y. Filed Mar. 21, 1883. (No model.)

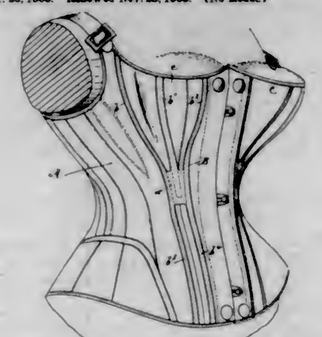
291,385.

Claim.—A corset each half of which, having the configurations shown and described, is composed of the pieces 1 to 8, inclusive, having, respectively, the form shown in said figures.

291,386. CORSET. CATHARINE A. GRISWOLD, New York, N. Y. Filed Mar. 21, 1883. (No model.)

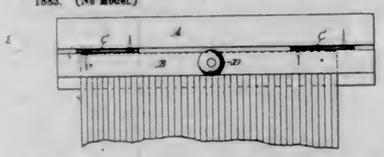
Claim.—A corset having breast-pockets adapted to hold pads in place by means of eyelets and lacings at the top, extending from the back to the front portions of the pockets, as shown and described.

291,387. CORSET-CLASP. CATHARINE A. GRISWOLD, New York, N. Y. Filed Mar. 23, 1883. (No model.)



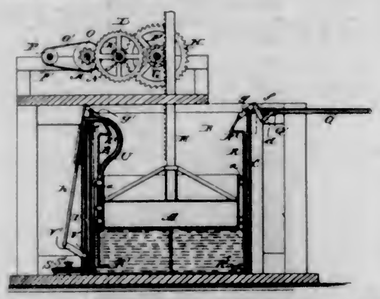
Claim.—1. The combination, in a corset, with a busk, *a*, inclosed in a pocket therein having the outer edge open, of the clamp-shield *b*, secured to the said busk and corset by a detachable stud that passes through both, as and for the purpose described.

2. In a corset, the combination, with the end of the busk *a*, inclosed in a pocket in the corset, of the clamp-shield *b'*, provided with the lip *e*, and secured to the corset by a stud or eyelet that passes through the sides of the pocket and the shield, as and for the purpose described.



3. In a corset, the combination, with a busk, *a*, in the pocket therein, of a shield, *b'*, placed at the end of the busk, so that the end enters the shield, the latter being secured to the corset by a stud or eyelet that passes only through the sides of the pocket and the shield, as and for the purpose described.

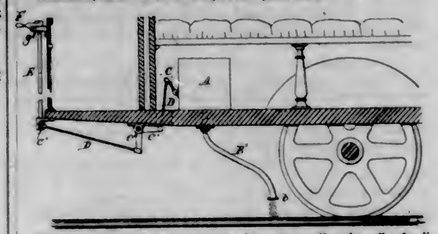
291,338. CORSET. CATHARINE A. GRISWOLD, New York, N. Y. Filed Mar. 23, 1883. Renewed Nov. 23, 1883. (No model.)



Claim.—The combination, with a corset, A, of the described stay-piece B, composed of the integral body *a* and the several described branches, and attached to the corset so that said body *a* is at the waist-line immediately below the breast-swell *c*, and so as to form pockets for steels or bones extending continuously from the top of the corset across the said integral body *a*, under said branches, for the purpose described.

291,339. BILL-HOLDER. PETER HAND, Glen, N. Y. Filed Nov. 5, 1883. (No model.)

Claim.—A bill-holder consisting of the rabbeted strip A, provided with the pins E and with the horizontally-moving links C, pivoted to the under side of the rabbet, and also pivoted at their outer ends to the apertured strip B, whereby the strip B may be folded back upon the strip A under its rabbet and the pins and apertures made to register, substantially as described.



291,340. WATER-MOTOR. ALVET CURTIS HARVEY, Lone Pine, Cal. Filed Mar. 8, 1883. (No model.)

Claim.—1. The buoy A, carrying journals with rollers *a* and a rack, E, in its center, in combination with a cistern, B, having the vertical guide-tracks C, whereby said rack will rotate a pinion and operate a train of mechanism, as described.

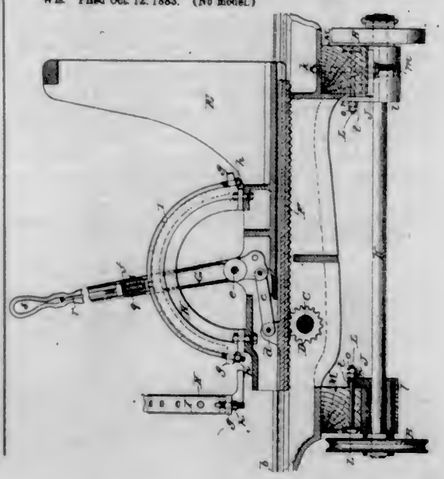
2. The combination, with the buoy A and cistern B, of an inlet-pipe having cock Q', with arm *d*, the rod *f*, the lever *g*, the outlet-pipe V, with arm V', the rod A, the lever *g'*, and the rods R, bent at R' R², whereby the buoy will automatically open and close the inlet and outlet cocks, as described.

291,341. SAND-BOX FOR STREET-CARS. GEORGE H. HATHAWAY, Fairhaven, Mass. Filed Nov. 16, 1883. (No model.)

Claim.—The within-described sand-box for sanding the rails of railroads, constructed with gate, hopper, and tunnel, as herein shown, located under the seats, between or before the wheels, over the rails, with other devices for operating it, all combined and operating as and for the purpose set forth and described.

291,342. CROSS-CLIP FOR METALLIC SKYLIGHTS AND GLAZED ROOFS. GEO. HAYES, New York, N. Y. Filed Mar. 26, 1883. (No model.)

Brief.—Provides a sheet-metal cross-clip of one or more pieces for abutting panes of glass, bent to form a ledge for the lower edge of the upper sheet of glass, and a groove to receive and support the upper edge of the lower sheet of glass, and beneath said ledge and groove bent backward from the upper edge of the ledge, and then curved to form a gutter located entirely beneath the glass-supporting parts of the clip.



Claim.—The sheet-metal cross-clip C, for abutting panes of glass in skylight and glazed roofs, composed of one or more pieces, so bent that a rabbet or ledge, *a*, is formed to support the lower edge of the upper sheet of glass, and a groove, *b*, to receive and support the upper edge of the lower sheet of glass, and beneath the said ledge *a* and groove *b* the metal bent backward from the upper edge of the ledge *a*, and then curved to constitute a gutter, *d*, located entirely beneath the glass-supporting parts of the clip C, so as not to obstruct light entering through the glass panes, essentially as shown and described.

291,343. MINER'S SQUIB. GEORGE HAYES, Girardville, Pa. Filed Nov. 17, 1883. (No model.)

Claim.—An improved miner's squib, consisting of the tube A, having an inner integral match, *a*, coated or saturated with some rapidly-burning substance, and an outer match, B, secured to the tube over the match, substantially as herein shown and described.

291,344. SAW-MILL SET-WORKS. GEORGE M. HINKLEY, Milwaukee, Wis. Filed Oct. 12, 1883. (No model.)

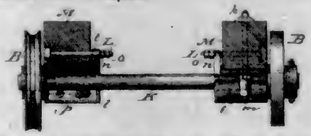
Claim.—1. The combination, in a saw-mill carriage, of a head-block, a knee sliding therein, a rack-bar sliding in said knee, a pinion secured upon the feed-shaft and meshing with the rack, a lever fulcrumed in the sliding knee, and a link connecting the lever and the rack, substantially as shown.

2. In combination with a saw-mill head-block and a knee arranged to slide therein, a rack meshing with a feed-pinion and separate from the knee, a lever to move said knee independently of the rack, provided with a locking device, and a rack to receive said locking device, said rack being adjustable, substantially as described, to permit it to be brought into proper relation to the locking device.

3. In combination with a saw-mill head-block, a knee movable thereon, a lever connected with said knee and adapted to move the same, a locking-bolt to hold said lever at any desired adjustment, and a rack to receive the locking-bolt, said rack being adjustable, substantially in the manner and for the purpose explained.

4. In combination with a sliding knee, E, provided with arc H, adjusting-lever G, provided with a locking-bolt, F, and a recessed strap, I, applied to and adjustable upon the arc, substantially as and for the purpose explained.

5. The combination, substantially as shown and described, of a head-block, a knee, E, movable thereon, a rack, F, movable independently of the knee, a hand-lever, G, pivoted to the knee and provided with a locking-bolt, *f*, a link, *e*, connecting the hand-lever and the rack F, an arc, H, upon the knee provided with ears *g*, and a strap, I, adapted to receive the locking-bolt *f*, having its ends passed through the ears *g*, and provided with nuts *h*.



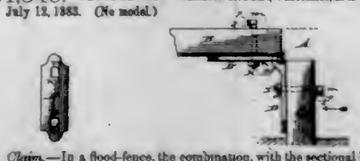
6. The herein-described method of aligning knees upon a saw-mill carriage and adjusting their locking devices to maintain such alignment, which consists in bringing one knee to a given line, then adjusting each succeeding knee to the same line, moving the rack with which its locking-bolt engages to proper position to receive said locking-bolt while the knee is in such adjusted position, and making the rack fast at such point.

7. In combination with a saw-mill carriage, a head-block mounted thereon and having the side faces of its forward end or nose beveled from the sides inward toward the center, the narrowest portion being at the extreme front end, substantially as and for the purpose explained.

8. In combination with a traveling saw-mill carriage, a head-block having its nose or forward end narrowed and provided with inclined faces connecting the narrow ends and the sides, as and for the purpose explained.

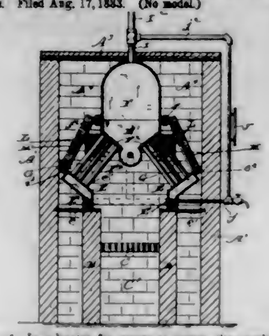
9. A saw-mill head-block narrower at its extreme forward end than in rear thereof, and having its narrow end and its sides connected by inclined faces, as shown, whereby it is adapted to deflect obstructions.

291,345. TRUCK-BOX FOR SAW-MILL CARRIAGES. GEORGE M. HINKLEY, Milwaukee, Wis., assignor to Edward P. Allis & Co., same place. Filed Nov. 19, 1883. (No model.)



Claim.—1. In combination with a saw-mill carriage, its truck-wheels, and their shaft, a box for said shaft, longitudinally adjustable, substantially in the manner and for the purposes set forth.

2. In combination with a saw-mill carriage and its truck-axle K, a box for said axle, having plate J, provided with slots *j* and ear *t*, vertical bolts *k*, and horizontal bolt L, passing through the sill of the carriage and through ear *t*, and serving to draw the box outward against the hub of the truck, substantially as described and shown.

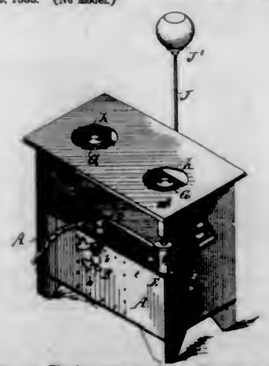


3. In combination with a saw-mill carriage, axle K, wheels B, secured thereon, and an adjustable block bearing against the hub of one of said wheels, substantially as and for the purpose explained.

291,346. FLOOD-FENCE. WILLIAM HODGIN, Vincennes, Ind. Filed July 12, 1883. (No model.)

Claim.—In a flood-fence, the combination, with the sectional hinged posts, of the key-bolts having eccentric enlargements next their heads, and the brace-plates F, on the sides of the post opposite the hinges, having key-slots *k* and *l*, adapted to engage the eccentric enlargements of the key-bolts, substantially as specified.

291,347. HEATER FOR STEAM AND WATER. ALDEN HOLT, Boston, Mass. Filed Aug. 17, 1883. (No model.)



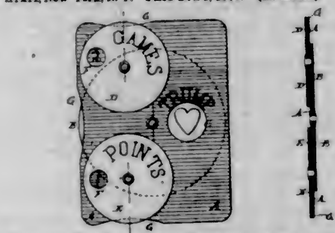
Claim.—1. In a heater for steam or water, the combination of an upper receptacle for water and steam, having the steam-dome portion F and the lower portion, F', cast with downwardly-converging plates or walls F², having longitudinal series of tube-apertures, said portions F and F' being cast separately and bolted together, the lower receptacles, E E, each having the tight lower portion, E', cast integrally with the part E, both extending from one end to the other of the heater, and each part E having a wall or plate, *e'*, parallel with one of the walls F², and the tubes G, having their ends secured in said parallel plates or walls, substantialy as set forth.

2. In a heater for steam or water, the combination of the upper receptacle, F F', two sets of inclined downwardly-converging steam-tubes, both sets communicating with said receptacle F F', the receptacles E E' at lower points, each connecting all of the tubes of one set, the outer masonry casing around the heater, the smoke-flue communicating with the heating-chamber at or near the upper horizontal plane of the heating-tubes, and the interior supplemental masonry walls, M, above the smoke-flue, and extending from the upper receptacle, F F', to the lower receptacles, respectively, whereby the products of combustion are prevented from rising above said tubes, and dead-air chambers are formed around the upper portion of the heater, substantially as set forth.

3. The combination of the lower receptacles, E E, having the flat upwardly-inclined plates *e'* extending from end to end of the heater, the inclined tubes G, fitting into the receptacles E, and the upper receptacle for water and steam, having the lower part, F', cast with the walls F², inclined to be parallel with the walls *e'*, and the steam-dome F, cast separately from and bolted to the lower part, F', substantially as described and shown, and the outer casing which surrounds the aforesaid parts, substantially as set forth.

4. The combination of the upper receptacle for steam and water, the lower receptacles, E E', each having an upwardly-extended flange, *e²*, inclined tubes arranged in two upwardly-converging sets, and the bricks or masonry M, resting at the bottom on the flanges *e²* and at the top against the upper receptacle, substantially as set forth.

291,348. GASOLINE-STOVE. CHARLES H. HUNTLEY, St. Louis, Mo., assignor of one-half to the Fay Gas Fixture Company, same place. Filed July 16, 1883. (No model.)



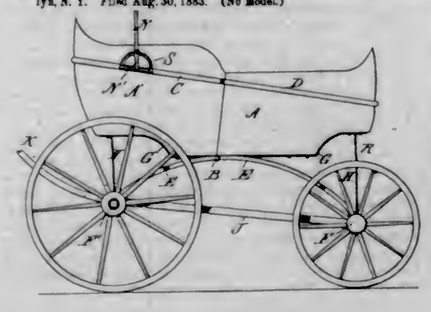
Claim.—1. The improvement in gasoline-stoves, &c., essentially consisting of an air-chamber, A, inclosing the reservoir B, to contain the gasoline, the latter reservoir being closed on all sides, as shown, the curved pipe *c*, the stand-pipe *f*, and distributing-pipes with burners, and the air-pump E, or its equivalent, by means whereof the gasoline by compressed air can be pumped or elevated to reach and be distributed to the burners, as and for the purposes set forth.

2. In combination with the air-chamber A, inclosing the gasoline-tank B, which is closed on all its sides, having inlet-cock *b'*, the air-pump or its equivalent, the pipe *c*, curved to have one end communicating with the air-chamber, the other end top of the gasoline-tank, the stand-pipe *f*, the distributing-pipes and their burners, as shown, the cock or faucet i, by means whereof a reflow of the unused gasoline to its reservoir is had, as and for the purposes set forth.

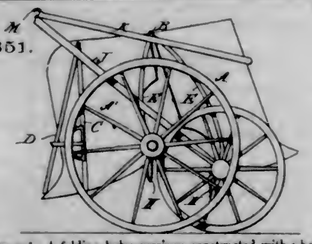
3. The improved gasoline-stove consisting of the main tank or air-chamber A, having within it the gasoline-reservoir B, closed on all its sides, the cup, cock, and inlet-pipe leading to said reservoir B, the curved pipe *c*, the air-pump to compress the air, the stand-pipe *f*, the main pipe and its branches carrying the burners, the top of the stove having pot-holes, all said parts combined to operate in the manner and for the purpose set forth.

291,349. GAME-REGISTER AND TRUMP-INDICATOR. GEORGE W. HYATT, New York, N. Y. Filed Dec. 1, 1883. (No model.)

Claim.—1. A game-register and trump-indicator constructed substantially as herein shown and described, and consisting of the central plate, A, having aperture C, and provided with recesses G in its edges and with two circles of numerals upon its face, the pivoted disk B, having the four card-characters upon its face, and the pivoted disks D E, having apertures F, as set forth.



2. In a game-register and trump-indicator, the combination, with the central plate, A, having aperture C, edge recesses G, and two circles of numerals, of the pivoted disk B, carrying the card-characters, and the disks D E, having apertures F, substantially as herein shown and described, whereby the trump can be indicated and a registry made of the points made in a game and the number of games played, as set forth.



291,350. STRAW-STACKER CARRIAGE. JOHN W. IMLER and DANIEL W. SNOWDEN, Imlertown, Pa. Filed Oct. 30, 1883. (No model.)

Claim.—In a straw-stacker carriage, the combination of the bed-plate, the revolving frame pivoted thereon, a sliding top plate, guide-clamp connecting it to the bed-plate and formed with a shaft-bearing, a grooved sliding shaft, a bevel-pinion on said shaft, the bevel-gear wheel *m*, and pivot-shaft *t*, whereby the sliding top plate may be shifted to move the straw-carrier on said sliding top plate without disengaging the gearing, substantially as specified.

291,351. FOLDING BABY-CARRIAGE. HENRY A. JACKSON, Brooklyn, N. Y. Filed Aug. 30, 1883. (No model.)

Claim.—1. A folding baby-carriage constructed with a box formed of two sections hinged to each other at the bottom, and with springs secured to the bottoms of the sections, for swinging the bottoms of the said sections toward each other, substantially as herein shown and described.

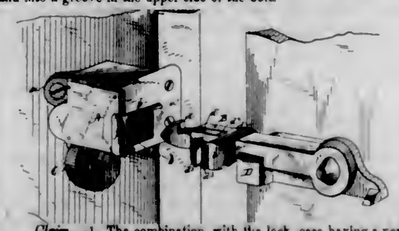
2. A folding baby-carriage constructed with a box formed of two sections hinged to each other at the bottom, with hinged supporting-springs jointed at the joint of the box, and with reaches secured to the front axles, and adapted to fit against the rear axle, substantially as herein shown and described.

3. A folding baby-carriage constructed with a box formed of two sections hinged to each other at the bottom, with hinged supporting-springs jointed at the joint of the box, with reaches secured to the front axle and fitting against the rear axle, and with handles hinged to the free ends of the side bars, substantially as herein shown and described.

4. In a folding baby-carriage, the combination, with the hinged body A A', of the hinged supporting-springs E, the reaches J, secured to the front axle, F, and fitting against the rear axle, F', and the handles K, hinged to the free ends of the bars J, and provided with curved prongs M, substantially as herein shown and described.

5. In a folding baby-carriage, the combination, with the axles F F', of the hinged body or box A A', the springs E, jointed at the joint of the box, and the U-shaped frame D or bail hinged to the rear section, A', substantially as herein shown and described.

6. The combination, with a baby-carriage, of a bow having a longitudinal slot in its curved top, and of a canopy or parasol having its ferrule passed through the said slot, substantially as herein shown and described.



7. The combination, with a baby-carriage, of the slotted bow N, the canopy or parasol P, the rod Q, and the rod R, provided with an eye, R', mounted on one of the standards of the bow, substantially as herein shown and described.

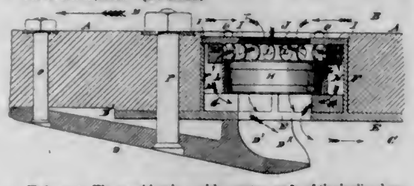
8. The combination, with a baby-carriage, of the slotted and toothed bow N, the canopy or parasol P, the rod Q, and the rod R, provided with an eye, R', substantially as herein shown and described.

9. The combination, in a baby-carriage, of the pivoted bow N, having the end of one shank forked and provided with a slot, *g*, with the notched or toothed semicircular frame S and the pintle T, substantially as herein shown and described.

291,352. SEAL-LOCK. CHARLES A. JEWETT, Marshalltown, Iowa. Filed Sept. 19, 1883. (Model.)

Brief.—The neck of the seal is placed between the vertical jaws on the bolt, the perforated end bent over and held in place by a gravity-catch in the case, the end of said catch passing through the perforation and into a groove in the upper side of the bolt.

Claim.—1. The combination, with the lock-case having a vertical opening through its bottom and a horizontal hole through one end, of a hooked-nose bolt, B, and a gravitating latch, C, having a horizontal notch, a beveled nose, and a lower perforated extension, the upper portion of said latch being wholly inclosed in the lock-case, substantially as described.



2. A bolt, B, grooved at *d'*, and having a hooked engaging end and jaws *d²*, the latter forming a vertical groove for the neck of the seal, in combination with the drop-catch E, substantially as described.

3. The combination of the box A, the latch C, the hasp-bolt B, having jaws *d³*, which form a groove to receive the neck of the seal, and the drop-catch E, substantially as described.

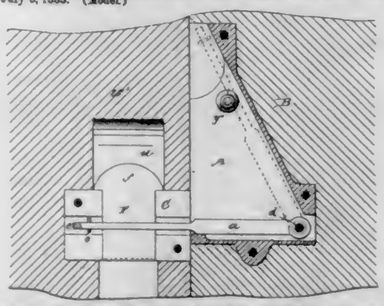
4. In a seal-lock case having a lip, *p*, undercut, a hooked bolt having a shoulder, d^3, a drop-catch, C, and a gravitating latch, E, substantially as described.

5. The combination of a lock-case, a beveled latch, E, a bolt grooved at *d'*, and provided with jaws d^3, forming a vertical groove, and a bent tag having a perforation through its head, substantially as described.

291,353. AUTOMATIC BILGE-PUMP. JOS. R. JOHN, St. Louis, Mo. Filed Mar. 12, 1883. (No model.)

Claim.—1. The combination, with a water-craft, of the inclined projection or bustle on the outside of the side or bottom of the hull, and an aperture at the rear of the salient rear end of the bustle, extending from outside to inside of the hull and provided with an inwardly-closing valve.

2. The combination of metal bustle D, secured to the bottom of a water-craft, with recess at the rear end of the bustle and orifice in the bottom of the craft in communication with said recess, and valve H, closing inwardly against its seat, to close the orifice against entering water.



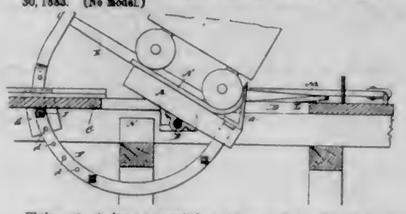
3. The combination, with the bottom of a water-craft, of bustle D, orifice through the bottom, in connection therewith inwardly-closing valve H, and screw-cap K, for the purpose set forth.

4. A bilge-pump consisting of a lower plate, E, having an orifice, E', a cylindrical outer shell, F, and radial wings G, an upper plate, I, having an orifice, J, a cylindrical inner shell beneath said upper plate, having suitable orifices, L', and concentric with the outer shell, and a float-valve within the inner shell and adapted to be supported by the wings, as set forth.

5. In combination with a bilge-pump having lower plate, E, and orifice E', the bustle D, gently inclined downwardly from its forward end to its rear end, D', having cup D^2, open at rear and at top, beneath the orifice of the plate, and corners D^2, to bear against the front edge of the plate, as set forth.

6. The combination of a suitable bustle to cause a vacuum, a lower plate, E, formed with orifice E', a cylindrical shell, F, surrounding the orifice, radial wings G between the orifice and shell, upper plate, I, formed with orifice J, a cylindrical shell, L, within the outer shell, having openings L', wings M between the shells, and a float, H, to rest on the radial wings when in operation, as set forth.

291,354. SEAL-LOCK. JESSE JORDAN and ABNER P. POWERS, Macon, Ga., assignors of one-fourth to Smith Murray Hillard, same place. Filed July 5, 1883. (Model.)



Claim.—1. In a car-door seal, the combination, with a spring-bolt carrying a knife on its free end, and pivoted to a car-door, of a card-carrying casing secured to another door or car-frame, and provided with guide-ridges for guiding the bolt into the casing away from the card and permitting it to drop down behind the said card, whereby the card will be cut on the withdrawal of the bolt, as set forth.

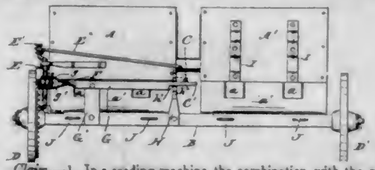
2. The combination, with the casing A, of the spring-bolt *a*, pivoted at its lower end in said casing, and the stud *y'*, projecting from the wall of the casing, substantially as herein shown and described, whereby provision is made for retaining the bolt in the casing when not in use, as set forth.

3. In a car-door seal, the combination, with the casing A, containing the pivoted spring-bolt *a*, carrying a knife, *c*, and a cross-pintle, *e*, of the casing C, provided with two grooves, *m n*, for guiding the spring-bolt, and with a device for holding a seal-card, substantially as herein shown and described.

4. In a car-door seal, the combination, with the casing A, containing a pivoted spring-bolt, *a*, carrying a knife, *c*, and a cross-pintle, *e*, of the casing C, provided with grooves *m* and *n*, separated by ridges *o*, having beveled ends, which casing C is provided with slots for receiving a seal-card, substantially as herein shown and described.

291,355. DUMPER. SAMUEL M. KEEBLER, Saltsburg, Pa. Filed Oct. 30, 1883. (No model.)

Claim.—1. A dumper consisting of a pivoted platform, to the bottom of which two curved bars or plates are fastened, between which a weight is held adjustably, substantially as herein shown and described.



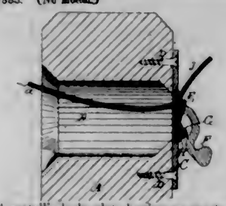
2. In a dumper, the combination, with the platform A, mounted at its middle on a shaft, B, of the bar E, projecting from the rear end of the platform, and of the curved bars or plates F, secured to the front end of the platform and to the end of the bar E, and of the weight G, held between the bars or plates F, substantially as herein shown and described.

3. In a dumper, the combination, with a platform rigidly mounted on a journaled shaft, of a brake-pulley rigidly mounted on the shaft, a brake-band passed around the pulley, and of a pivoted lever to which the ends of the band are secured, substantially as herein shown and described.

4. In a dumper, the combination, with the platform A, mounted rigidly on a journaled shaft, B, of the brake-pulley H, mounted on the shaft, the brake-band K, passed around the pulley and having its ends secured to a pivoted lever, L, and a pivoted lever, M, resting on the free end of the lever L, substantially as herein shown and described.

5. In a dumper, the combination, with platform mounted rigidly on a journaled shaft, of curved bars or plates secured to the bottom of the platform eccentrically in relation to the shaft, and of a weight held adjustably between the said bars or plates, substantially as herein shown and described.

291,356. OAT-DRILL. HENRY KEHL, Mason City, Ill. Filed Aug. 4, 1883. (No model.)

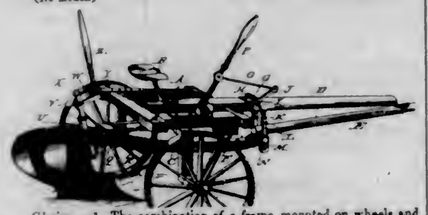


Claim.—1. In a seeding-machine, the combination, with the grain-boxes A A', set slightly apart, and the dropping-slides operating therein, and extended within the space between the boxes, of the drive-wheel provided with a rack-gear, the shaft meshed with said gear and provided with a crank and arranged in rear of the grain-boxes, and the pitman having one end connected with the crank and its opposite end bent at right angles and extended into the space between the grain-boxes and connected to the dropping-slides, substantially as set forth.

2. The combination, in a seeding-machine, of the grain-boxes A A', the loops I I, secured thereon, the dropping-slides, the axle B, the drive-wheel having a rack-gear, the shaft E, provided with a crank, E', the pitman E^2, connecting said crank and the dropping-slides, the pinion F, placed on shaft E, the lug G', and rack H, mounted on the axle, and the lever G, pivoted on lug G', and having one end bifurcated and embracing the pinion F, and its other end arranged in position to engage the rack H, substantially as described, and for the purposes specified.

3. The broadcast-seeder, substantially as specified, composed of the axle B, having wheels D D', the grain-boxes A A', mounted thereon and provided with suitable openings and dropping-slide, loops I, secured on the boxes, whereby to couple cultivators, harrow-connecting eyes J, secured on the axle B, a gear formed on the wheel D, vertical shaft E, having crank E', pitman E^2, connecting crank E' and the dropping-slide, pinion F, keyed on shaft E, rack-bar H, mounted on the axle, and the pivoted lever G, having one end bifurcated and embracing the pinion F, and its opposite end arranged to engage and be held by rack-bar H, all arranged and operating substantially as specified.

291,357. HITCHING DEVICE. JAMES L. KENNEDY, Sioux City, Iowa. Filed Sept. 29, 1883. (No model.)



Claim.—1. A metallic body-plate having an aperture through it, in combination with another plate hinged to swing into said aperture freely past the edges thereof, a spring acting between the body and the hinged piece to close the latter, and a handle thereon, substantially as described, whereby a strap may be held between the adjacent edges of the two plates.

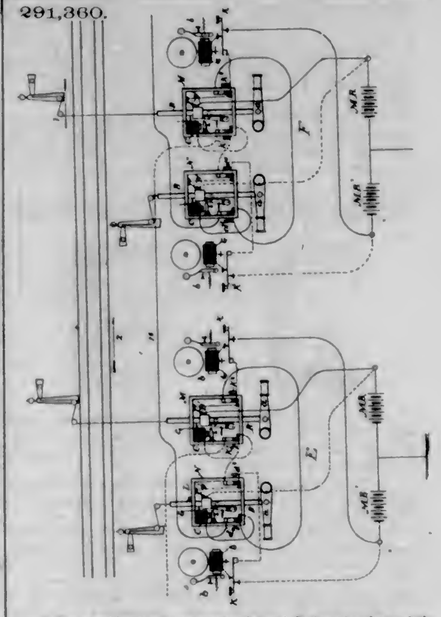
2. The combination, with a hitching-post having a hole through it, of a perforated metallic plate secured to the post over the hole therein, another plate hinged to swing on the first plate, a spring for closing the same, and a handle thereon, as shown and described.

291,358. PROCESS OF ANNEALING WIRE. HUGH KERR, New York, N. Y. Filed Oct. 8, 1883. (No specimens.)

Claim.—The herein-described process of annealing wire, consisting in first placing the wire in a bundle of wet hay or straw and leaving it therein for twenty-four hours or more, then removing the wire and passing it over a bass-wood fire until it attains a heat equal to 550° Fahrenheit, then in allowing it to cool quickly, the whole process being conducted in a dark room, all substantially as specified.

291,359. PLOW. JOHN A. KNEDLER, Grant, Pa. Filed Sept. 4, 1883. (No model.)

Claim.—1. The combination of a frame mounted on wheels and having a short rigid tongue at its forward end, a tongue hinged a distance from its rear end to the outer end of the rigid tongue, a plow supported from the frame and hinged with the forward end of its beam to the rear end of the hinged tongue, and means for raising and lowering the rear end of the hinged tongue, as and for the purpose shown and set forth.



2. The combination of a wheel-supported frame having a rigid tongue at its forward end, a tongue hinged a distance from its rear end to the end of the rigid tongue, a plow supported adjustably from the frame and having the forward end of its beam hinged to the rear end of the hinged tongue, flat bars having longitudinal slots at their lower ends sliding upon bolts at the forward end of the plow-beam, and having perforations at their upper ends, a shaft rocking in bearings upon the rigid tongue forming cranks upon its ends pivoted in the said perforations, and having an arm at one end, a connecting-rod hinged to said arm, and a lever pivoted at one end upon the frame and having the connecting-rod hinged to it, as and for the purpose shown and set forth.

291,360. RAILWAY BLOCK SIGNAL. JOHN K. KNIGHT, New York, N. Y., assignor to William H. Baker. Filed July 24, 1882. (No model.)

Brief.—Manually-operated signals normally at "danger." Unlocking-magnets are in open circuit, which can only be closed by simultaneous co-operation of operators at two stations. Currents of two polarities used—one for signaling and the other for unlocking.

Claim.—1. The combination, with the operating-rod for a railroad-signal, switch, or draw-bridge lock, of a pivoted locking-catch engaging with said rod, a retractor tending to withdraw said catch, and a detaining-armature engaging directly with the catch.

2. The combination, with a reciprocating operating-rod for a signal, switch, or draw-bridge, of a locking-catch provided with a retractor and normally locking said rod from movement in one direction, a detaining-armature arranged, when operated, to release the catch, and means upon said reciprocating rod for engaging with said catch upon a movement of the rod in the opposite direction, and moving said catch into normal locking position with relation to the rod.

3. The combination, with a connecting-rod, B, for a signal or switch mechanism, of a collar or shoulder, B', a pivoted catch for engaging with the same, a retractor constantly tending to disengage the catch, and an armature, C, detaining the catch.

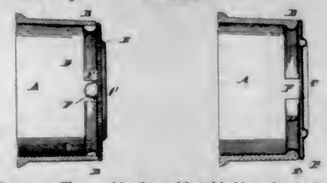
4. The combination of the connecting-rod B, having collar or shoulder B', of a pivoted catch, A, and its retractor, a spring, A'', mounted upon the catch, and a pin or projection carried by the rod for engaging with the spring A'' and restoring the catch to a locking position.

5. The combination of rod and collar B B', swinging catch A and its retractor, detaining-armature C', and mechanism upon the rod for engaging with the catch and restoring it to a locking position.

6. The combination of a semaphore biased to indicate "danger," mechanism for withdrawing the same against its biasing device, so as to cause it to indicate "safety," a lock or catch for locking said mechanism against such movement, an electro-magnet controlling the catch, two keys or switches in the same circuit with said electro-magnet, one at the home station and the other at the next station in advance, and at the latter station a circuit-closer in said controlled circuit, operated by the semaphore mechanism at said station, and arranged to be closed only when said semaphore is at "danger."

7. The combination, in a block signal apparatus, of a series of stations connected by a single line, semaphore mechanism at each station, an electro-magnet for controlling the same, polarized to respond to a current of one kind of polarity, a signal-bell or other receiving apparatus arranged to respond to currents of an opposite polarity or kind, and two manual signaling-keys and a battery at each station, for sending currents of the proper polarity to operate the semaphore-magnet or the signal-bell at the next station.

8. The combination, in a block signal apparatus, of a biased semaphore normally indicating "danger," mechanism for operating the same to cause it to show "safety," a catch for engaging with said mechanism, a retractor applied to the catch for causing its disengagement, a restraining electro-magnet, a switch for connecting said electro-magnet with the line running to the station in the rear, and at the latter station a key or switch and a battery, whereby the detaining electro-magnet at the station in advance may be operated only when both keys are actuated together.



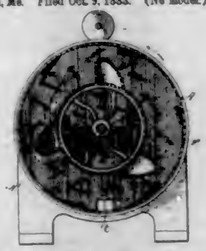
9. The combination, in a block signaling system, of a biased semaphore normally indicating "danger," an electro-magnet and locking device for controlling the position of the same, said magnet being constructed to respond to currents of one kind or polarity, a signal-bell at the same station constructed to respond to a current of the opposite kind or polarity, and two keys, one at the same station with the semaphore-magnet and the other at the next station in advance, with circuit-connections, as described, whereby the closing of both keys is necessary in order to complete the circuit of and energize the semaphore-magnet.

10. The combination, with two semaphore mechanisms at the same

station, one for the up and the other for the down track, of a releasing-key, *k'*, for one mechanism, and a battery-key, d^2, connected in the circuit to one side of the station, a corresponding releasing-key, *d'*, and battery-key connected in the circuit to the other side of the station, said battery-keys being suitably connected to batteries, so as to send a current of one kind or polarity, and signaling-keys—one in each circuit—connected so as to send a current of the opposite kind or polarity.

11. The combination of the biased semaphore, the operating-rod B, the circuit-closer D″, battery M B, the key controlling the common circuit of D″, and the battery-connections from the key to the station in the rear, and a releasing electro-magnet, C, at the latter station.

291,361. CAP FOR WHEEL-HUBS. FRIEDRICH KRAMER, St. Louis, Mo. Filed Aug. 22, 1883. (No model.)



Claim.—1. The combination, with a thimble or band of a vehicle-wheel provided with one or more teats or lugs, of the dust-cap having a spring grooved flange in which the teats of the thimble fit, substantially as and for the purpose set forth.

2. The combination of thimble A, having teats B, and dust-cap C, having spring-flange D, with groove E and notches F, substantially as shown and described, for the purpose set forth.

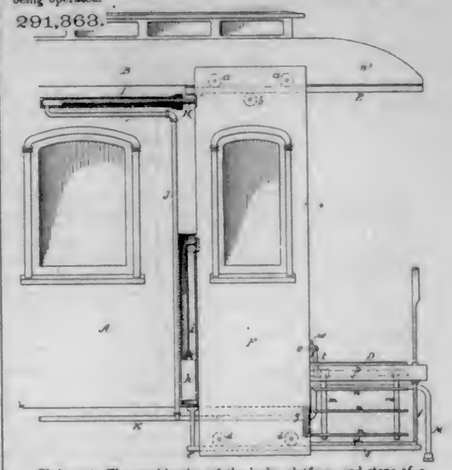
3. The combination of thimble A, having teats B, and cap C, having spring-flange D, with groove E, notches F, and stops E′, substantially as shown and described, for the purpose set forth.

291,362. RICE HULLING AND CLEANING MACHINE. JOHN W. LANE, Portland, Me. Filed Oct. 9, 1883. (No model.)

Claim.—1. In a rice hulling and cleaning machine, the combination of the rotary imperforate cylinder A, having a discharge-passage, T, and internal beveled ribs, *a*, the perforate rotary cylinder B, provided with external wipers, *a'*, beveled and perforated, a feed-passage for the rice, and a suction-fan, communicating with the space between the two cylinders, substantially as described.

2. In a rice hulling and cleaning machine, the combination of the internal perforate rotating cylinder having the perforated and beveled wipers, the external imperforate rotating cylinder having internal beveled ribs, the stationary heads for both cylinders, provided with feed and discharge passages for the rice, and an air-exhausting device, substantially as described.

3. The combination of an exterior cylinder having a positive rotation, and an interior perforate cylinder geared thereto, and having perforated beveled wipers on the exterior thereof, substantially as described.



4. The combination of a rotary external imperforate cylinder having ribs on the interior thereof, a rotary perforate cylinder having perforated and beveled wipers on the exterior thereof, fixed heads A′ A², provided with air-inlets and feed and discharge passages for the rice, and means for inducing blasts of air through the cylinders, substantially as described.

5. The combination of the external rotary cylinder, A, provided with bands, the grooved wheels, and stationary heads, with the internal perforate cylinder, B, provided with perforate wipers *a'*, the spiders and main shaft, gears for driving both cylinders from said shaft, and means for inducing a blast of air through the cylinders, substantially as described.

291,363. SAFETY-DOOR FOR RAILROAD-CAR PLATFORMS. FRANK LAPPIN, Baltimore, Md., assignor of one-half to Virgil Walker, Philadelphia, Pa. Filed Nov. 7, 1883. (No model.)

Brief.—A counterweighted sliding door actuated from the engine through steam or air under pressure closes access to the car-steps. When the steps are being used, a bolt actuated thereby prevents the door being operated.

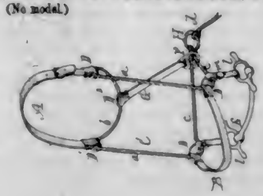
291,363.

Claim.—1. The combination of the body, platform, and steps of a car with a sliding door, F, constructed to be moved to a position in front of or away from the steps, substantially as set forth.

2. The combination of the body, platform, and steps of a car, and the counterbalanced sliding door F, with a plunger, H, and cylinder I, and with pipes through which air or water under pressure may be introduced into the cylinder, all substantially as specified.

3. The combination of the body and platform of a car, and the sliding door F and bolt *v*, with yielding steps G and mechanism whereby the movement of the steps is imparted to the bolt, substantially as described.

291,364. SYRINGE. PHILIP B. LASKEY, Marblehead, Mass. Filed Oct. 3, 1883. (Model.)



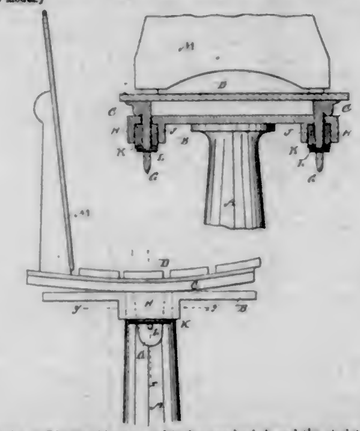
Claim.—1. In a syringe, a delivery-tube provided with a single opening, in combination with a sleeve or cap provided with two openings of different sizes, which are adapted to be brought alternately in conjunction with said opening in the delivery-tube, substantially as and for the purposes described.

2. In a syringe, the combination of a delivery-tube provided with a single opening, a sleeve or cap provided with two openings of different sizes, which are adapted to be brought alternately in conjunction with said opening in the delivery-tube, a screw set in said cap or sleeve, and two shoulders adapted to come in contact with said set-screw, to limit the movement of said cap or sleeve in either direction, substantially as and for the purposes described.

3. In a syringe, the combination of the tube A, to which is tightly fitted the thimble C, provided with the opening *a*, the cap B, provided with the openings *b* and *d*, and the set-screw *f*, the shoulders *g* and *h*, and the friction-surface *k*, all adapted to operate substantially as and for the purposes described.

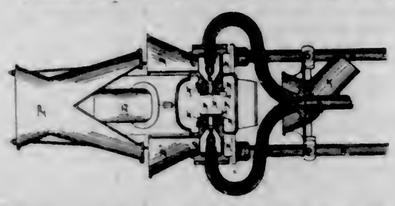
4. In a syringe, the combination of a delivery-tube, A, provided with the flange *l* and a suitable screw-thread, upon which is mounted the thumb-nut *m*, and the ball or bulb D, all adapted to operate substantially as and for the purposes described.

291,365. HALTER. JOHN C. LIGHTHOUSE, Rochester, N. Y. Filed June 18, 1883. (No model.)



Claim.—1. In a halter, the clamp D, made in two parts, constructed with the two sockets *g h*, standing at right angles to each other for receiving the rope, and provided at the bottom with a loop, *k*, to receive the strap of the removable bit, as herein shown and described.

2. In a halter, the combination of the clamps D D, attached to the nose-piece, provided with sockets *g h*, to receive the rope, and with loops *k k*, to receive a bit, and the bit E, provided with buckle-straps *m m*, to buckle into the loops of the clamp, as herein shown and described.



3. In a halter, the combination of the head-piece, A, the nose-piece B, the rope-body C, attached permanently to the nose-piece, passing thence up loosely through loops of the head-piece extending across, forming a throat-latch, which adjusts itself to the throat, the billet G, consisting of a single strap hanging from the throat-latch, having a ring, *p*, at its lower end, and two stale ends, *e e*, proceeding from the nose-strap, passing through the ring of the billet, and attached to a ring, H, outside, to which the hitch-strap *d* is also attached, as herein shown and described.

291,366. CHAIR. JAMES R. LINN, Toledo, Ohio. Filed May 5, 1883. (No model.)

Claim.—The combination, with the standard A and the skeleton frame B, having pockets H, of the rockers C, carrying seat D, and having downwardly-projecting lugs G, located within the pockets, and the rubber tube J, surrounding said lugs and in contact with the lugs and sides of said pockets, substantially as and for the purpose specified.

291,367. APPARATUS FOR PULVERIZING ORES, &c. FREDERIC A. LOCKENBACH, New York, N. Y. Filed June 15, 1883. (No model.)

Claim.—1. The combination, in a pulverizer, of the chamber D, nozzle O, and wearing-pipe E, having flange E′, constructed and arranged substantially as described.

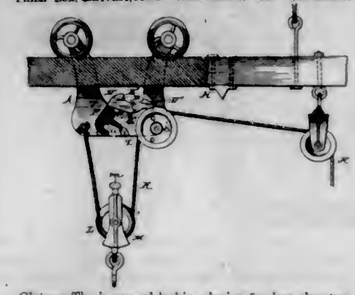
2. The combination, in a pulverizer, of the chamber D, nozzle O, wearing-pipe E, and bushing H, substantially as described.

3. The combination, in a pulverizer, of the chamber F, chambers D, nozzles O, wearing-pipes E E, and bushings H H, substantially as described.

4. The combination, in a pulverizer, of the chamber F, wearing-pipes E E, having flanges E′, and chambers D D, substantially as described.

5. The combination, in a pulverizer, of the chamber F, wearing-tubes E E, chambers D D, and adjustable steam-nozzles O O, substantially as described.

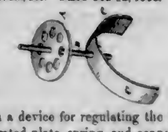
6. The combination, in a pulverizer, of the chambers D and F, communicating with each other, and an adjustable steam-nozzle, O, substantially as described.



7. The combination, in a pulverizer, of the steam-nozzle O, with removable reduced opening G, the tapering chamber D, and pulverizing-chamber F, substantially as described.

8. The combination, in a pulverizer, of the chamber D, steam-pipe A, and adjustable steam-nozzle O, substantially as described.

9. In a pulverizer, and in combination with the pulverizing-chamber F, the chamber D, the steam-nozzle O, and the jet-exhaust apparatus constructed and arranged to draw the pulverized material, exhaust-steam, &c., from said chamber, substantially as described.

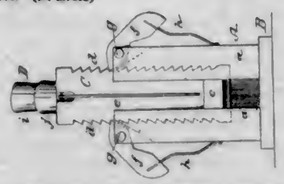


10. The combination, in a pulverizer, of the removable bushings H H and wearing-pipes E E, substantially as described.

291,368. HAY ELEVATOR AND CARRIER. JOHN H. LUX and PHILIP LUX, Earlville, Iowa. Filed Nov. 5, 1883. (No model.)

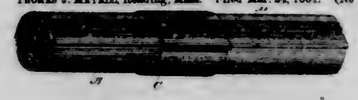
Claim.—The improved locking device for hay elevators and carriers of the described class herein shown and described, consisting of the pivoted catch F, having shoulder F′, and the pivoted lever D, having long arm D′, provided with a step or shoulder, E′, and having the upper side of its extremity beveled or partially rounded, and short arm D″, having the upper side of its extremity beveled or rounded, as and for the purpose shown and set forth.

291,369. DEVICE FOR CHECKING THE FLOW OF GAS. EMIL E. MALAM, St. Louis, Mo. Filed Oct. 12, 1883. (No model.)



Claim.—1. In a device for regulating the flow of gas, the combination of the perforated plate, spring, and connecting rod or stem, made and operating substantially as set forth.

2. In a device for regulating the flow of gas, the combination of the perforated plate, spring, and connecting rod or stem, the spring consisting of a bent plate, as shown and described.

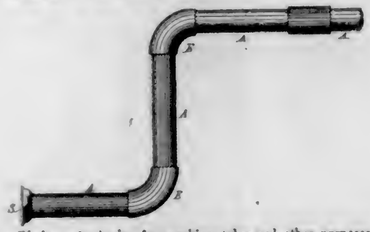


3. In a device for regulating the flow of gas, the combination of the perforated plate, spring, and rod or stem, the ends of the rod or stem extending beyond the plate and spring, substantially as and for the purpose set forth.

291,370. POWER-JACK. JOHN WASHINGTON MANSEY, Gholson, assignor of one-half to Madison Edwards, Noxubee County, Miss. Filed May 29, 1883. (No model.)

Claim.—The casing A, having side ways, *a a*, and formed with projections *m m*, having inclined slots *l l*, in combination with the rack-bar C, spring-pawls *f f*, and lever D, having the circular toothed head *f'*, substantially as and for the purposes set forth.

291,371. BOX FOR LAYING LINES OF TELEGRAPH-WIRE. THOMAS J. MAYALL, Reading, Mass. Filed Mar. 24, 1881. (No model.)



Claim.—1. A box for containing electrical conductors, formed of a composition of vulcanized rubber and graphite in the proportions substantially as described, the graphite being in excess of the rubber, as set forth.

2. A box of rubber and graphite composition, for containing electrical conductors, the same comprising a trough and cover, and having the joints cemented with rubber cement, substantially as described.

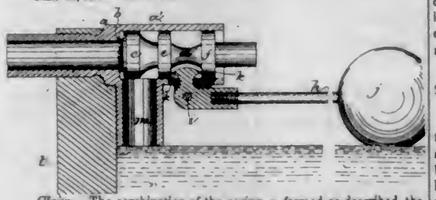
3. A box for containing electrical conductors, having the joints between the sections cemented and enveloped in a sheet of rubber composition, substantially as described.

291,372. PAPER PIPING. JOHN MCCAUSLAND, Providence, R. I. Filed Sept. 13, 1883. (No model.)

Claim.—1. A pipe for speaking-tubes and other purposes, constructed of paper tubes A, connected together by elbows E, of metal, rubber, or other suitable material, and paper couplings *c'*, as shown and described.

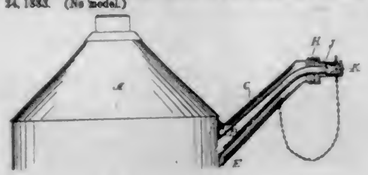
2. A pipe for speaking-tubes, and air and water conductors, constructed of alternated layers of paper *a* and textile fabric *b*, as shown and described.

291,373. FINGER-RING GAGE. FRANK D. MCDOWELL, Salem, Oreg. Filed June 20, 1883. (Model.)



Brief.—Shows the difference in circumference of rings of different sizes.

Claim.—1. A ring-gage of tapering form provided with lines indicating the sizes, and with intersecting lines that indicate the differences in the circumferences of the different sizes, as shown and described.

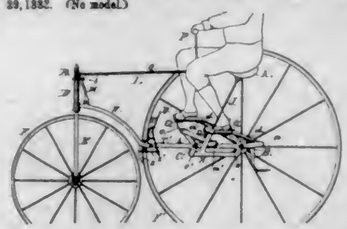


2. In ring-gages, the inclined or spiral lines *b*, combined with the transverse size-lines and the longitudinal marking-line *a*, as and for the purposes set forth.

291,374. BALL-COCK. TIMOTHY MCHUGH, Cambridge, Mass. Filed June 14, 1883. (No model.)

Claim.—The combination of the casing *a*, formed as described, the float-lever A, pivoted to said casing and having a shorter arm projecting into said casing, and the valve provided with the stem *d* and circular flanges *e f*, separated by an annular groove or space receiving the shorter arm of the lever A, whereby the valve is adapted to be rotated by the action of water flowing through the casing when the valve is opened, as set forth.

291,375. CAN-NOZZLE. ISAAC T. MEE, Cedartown, Ga. Filed Aug. 24, 1883. (No model.)



Claim.—1. A can-nozzle having a re-enforcing case or jacket surrounding it, the outer end or head provided with a thread, substantially as herein set forth.

2. In an oil-can, a case or jacket bent so as to conform to the shape of an ordinary can-nozzle, placed over and soldered to the nozzle, as shown, the exterior case having a thread, in combination with a screw-threaded cap, substantially as herein set forth.

3. In an oil-can, a case or jacket, the outer end provided with a thread, combined with the internally-threaded cap arranged to fit on the head of the case or jacket, the reduced external end provided on its inner side with packing, substantially as herein set forth.

4. The combination of the spout having a rigid case or jacket, also soldered to the can, said spout and jacket being attached together at their outer ends, with the spout-tip projecting beyond the end of the jacket screw-threaded, with the screw-threaded cap or head having a reduced portion to receive the packing, substantially as herein set forth.

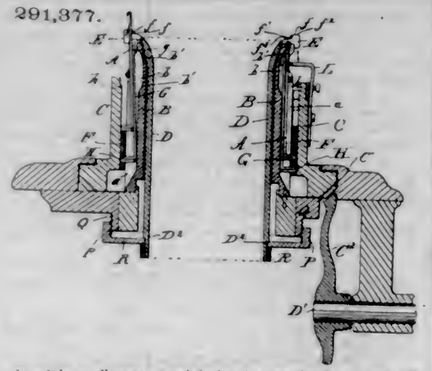
291,376. TRICYCLE. NELSON MERRILL, New York, N. Y. Filed May 29, 1882. (No model.)

Claim.—1. In a velocipede or motor, the combination, with its axle or driving-shaft, a seat mounted to vibrate vertically over the same, and an idle-shaft rotating in line parallel with the axle or driving-shaft, of one or more cranks formed on said idle-shaft and coupled by pitman-rods with the vibrating seat or seat-lever, pedal-cranks also formed on said shaft at an angle of about one hundred and twenty degrees with each other and with the seat-cranks, and counterpart pedal-cranks formed on the axle or driving-shaft, and coupled by connecting-bars with the pedal-cranks on the idle-shaft, substantially in the manner and for the purpose herein set forth.

2. The combination, with the rotating fork or spindle carrying the steering-wheel of a velocipede, a vibrating lever pivoted to the standard supporting said fork and actuated by cranks upon the axle or a counterpart idle-shaft driven thereby, and a seat fitted upon the lever to partake of its movement, of a steering wheel or handle mounted upon said lever within reach of the rider upon the seat and geared to the fork or spindle of the driving-wheel, substantially in the manner and for the purpose herein set forth.

3. The combination, in a velocipede or motor, with the counterpart pedal-cranks upon its driving-axle and auxiliary idle-shaft, of a pedal bar or bars adapted to uphold the foot of the operator above the crank of the idle-shaft during its entire revolution, and to couple said crank with the corresponding crank upon the driving-axle, substantially in the manner and for the purpose herein set forth.

291,377. KNITTING-MACHINE. JOSEPH M. MERROW, Mattow, Conn. Filed Mar. 5, 1883. (No model.)



Brief.—The machine is provided with web-holders at its "knitting-edge," which web-holders obviate the necessity of weights or tension on the knitted fabric to keep it from rising or being carried forward by the needles as they are advanced to pass through the newly-formed loops or to receive yarn from the yarn-carrier. Devices are also provided for moving the needles laterally, so as to place the portion of the fabric between the stitches on the needles in the hooks of the web-holders as the needles are advanced, and to move said portion of the fabric out of said hooks as the needles are retracted. Means are also provided for adjusting the web-holders with respect to the needles, so as to lengthen or shorten the stitch.

Claim.—1. The combination, with a needle-support and a series of web-holders arranged at the knitting-edge of said needle-support, of a series of needles and means, substantially as described, for imparting a reciprocating and lateral movement to said needles, substantially as shown and described.

2. The combination, with a needle-support having fixed web-holders, of needles held in said support, devices for pressing the needles into the grooves in the support, and devices for pressing the needles outward at suitable times, substantially as set forth.

3. The combination, with a cam-cylinder, C, of the needle-support B, provided with needle-grooves *a*, having a bevel surface, the needles A, the blanks G, held in the needle-grooves, needle-operating cams, a cam or cams adapted to operate the blanks, web-holders E at the knitting-

291,377.

edge of the needle-support, and devices for operating the machine, substantially as shown and described.

4. The combination, with the needle-support and cam-cylinder C, provided with needle-operating cams, plate F, a cam-groove, H, having a lower and upper part on the inner surface of the cam-cylinder, of the needle-cylinder B, the needles A, the blanks G, web-holders E, and devices for operating the cam-cylinder, substantially as herein shown and described, and for the purpose set forth.

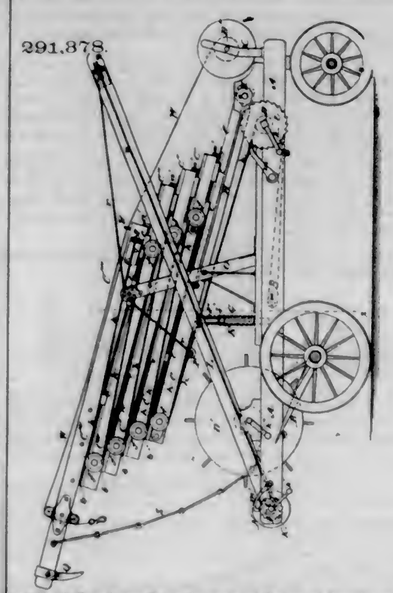
5. The combination, with a needle-support provided with grooves having beveled surface *b'*, of blanks G, needles A, and means for reciprocating said blanks and needles, whereby a lateral movement is imparted to the hooked ends of the needles, and also a reciprocating movement to the same, substantially as shown and described.

6. The combination, with the cam-cylinder C, having an annular shoulder, A, at the upper edge of its inner surface, of the cam J, provided with arms *k* at its ends, the needle-cylinder B, needles A, blanks G, cams for operating the needles, and blanks and devices for operating the cam-cylinder, substantially as herein shown and described, and for the purpose set forth.

7. The combination, with the base of the machine, provided with a collar having a screw-threaded neck, Q, and the needle-cylinder B, of the cylinder D, contained in said cylinder B, and provided with a groove, D^2, on the lower part thereof, the web-holders E on the cylinder D, the ring P, screwed on said neck Q, and provided with a flange, R, projecting into said annular groove D^2, substantially as shown and described, whereby the cylinder D may be adjusted axially, independently of the needle-cylinder B, as set forth.

291,378. FIRE-ESCAPE. ABRAHAM S. MILLER, Republic, Ohio. Filed May 14, 1883. (No model.)

Brief.—The bifurcated claw secured to the top of the boom is made in one piece and embraces three sides of the upper section. C-shaped clips on the under side of one section embrace the edges of plates secured upon the upper face of the next lower section. The extension-boom is raised to a vertical position by a pivoted derrick and an arrangement of ropes and a windlass. A spring-support for the boom when down is a bow-shaped support connected to a guide-bar, around which a spiral spring is placed. A flexible ladder is secured to the top of the boom.



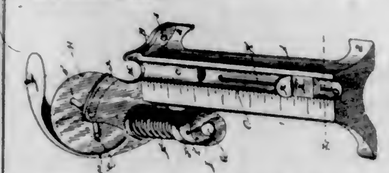
Claim.—1. The combination, with a fire-escape boom, of the bifurcated claw Q, made in one piece and embracing the upper end of the boom on three sides, substantially as described.

2. The combination, with a base or support, an extension-boom pivoted to said support, provided with means for raising and extending the same, and a hook at the upper or outer extremity for engaging some part of a building and taking from said boom strains otherwise due to leverage, as herein described, of a pendulous flexible extension-ladder attached to the upper part of said boom, and adapted to hang therefrom parallel with the wall of the building, or nearly so, substantially as and for the purpose specified.

3. A boom for fire-escapes, provided with plates *b* on one section and C-shaped clips *c* on another section, said clips having their ends turned around and under the edges of and embracing the facing-plates, and forming bearings for said plates, thus performing the double function of holding two sections of the boom together, and forming the bearing-surface of the upper section, substantially as described.

4. The combination, with a base or support, an extension-boom pivoted to said base, a derrick-boom also pivoted to said base, and adapted to raise said extension-boom by shortening a bight in a rope passing under the extension-boom, and operated by a windlass pertaining to the derrick-boom, of a support, G, attached to the base, and arranged to bend the branches of said bight and lessen the power required to be applied

291,378.



to said windlass during the early stages of the act of elevating said extension-boom, substantially as and for the purpose specified.

5. As a detail of construction in a portable fire-escape, the spring-support intermediate between the extension-boom and the frame of the truck, consisting of the uprights E, the bow F, having thereon the step *n*, the vertical guide-bar G, and the helical spring *s'*, all constructed, arranged, and operating substantially as described.

6. In a fire-escape comprising an extension-boom and a flexible ladder attached thereto, the flexible ladder herein described, formed of the ropes S, rings *t*, and rungs T, passed through bights in the ropes S and between the ropes and the rings, and bent or clinched on or around the rings, substantially as and for the purpose specified.

291,379. CIGAR-CUTTER. FREDRICK C. MILLER, Newport, Ky. Filed May 1, 1883. (Model.)

Claim.—1. In a cigar-cutter, the stationary shear-plate B and cutter-arm F, mounted on a shaft journaled in the shear-plate, in combination with a retractile spring coiled around said shaft, and one end of which rests loosely in a boss, J, attached to the shaft, and having a lug, *d'*, against which the end of the coil of the spring presses, and a similar boss and lug on the shear-plate for supporting the other end of the spring, substantially as described.

2. A cigar-cutter consisting of the shear-plate B, the cutter-arm F, the shaft G, and a coiled spring, E, secured at each end by spiral sockets, against which the ends of the spring thrust, one socket being attached to the shaft and the other to the shear-plate, for expanding the spring by the downward movement of the cutter-arms, substantially as described.

3. The combination of the shear-plate B, the cutter-arm F, carrying a cutter, and having an attached arm, G, provided at its end with a serrated collar, the sleeve C, arranged on the shaft of the cutter-arm and provided with a serrated socket, and the spring E, coiled on the sleeve, and having one end supported by the shear-plate and its other end by the serrated socket, substantially as described.

4. In combination with the cutter-arm F, shaft G, journaled in a sleeve, C, and coiled spring E, adjustably secured to shaft G by means of stationary serrated collar I and serrated adjustable socket J, whereby the tension of the spring is regulated, substantially as herein set forth.

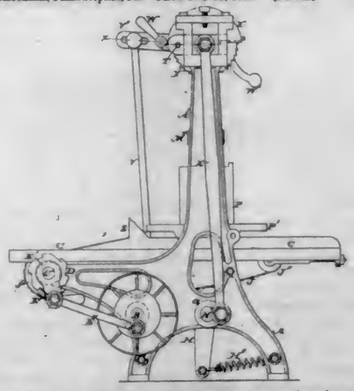
5. In combination with the adjustable gage N and grooved base T, having a slot, the spring S and screw P, for holding said gage adjustably in position, substantially as herein set forth.

6. The shear-plate B, having the rigidly-attached sleeve C, provided with a serrated socket, in combination with the cutter-arm F, having the attached shaft G, arranged in said sleeve and provided with a serrated collar, and the spring E, coiled on the sleeve, and having one end resting in a groove in the shear-plate and its other end secured to the serrated collar, substantially as described.

7. The combination, with the cutter-arm F, shaft G, and sleeve C, within which the cutter-shaft G is journaled, of shear-plate B, and the spring E, coiled around sleeve C, and secured to shaft G in such a manner that the downward movement of arm F expands the spring, substantially as herein set forth.

291,380. DRAFTING IMPLEMENT. NEVIN MILLOY, Cincinnati, Ohio. Filed May 31, 1883. (No model.)

Claim.—1. A drafting-rule consisting of a flexible elastic strip, in combination with a series of pins for retaining said rule in contact with the drawing, and at any desired curvature, said pins being so constructed as to leave the bottom portion of one side of the rule unobstructed, substantially as and for the purposes described.



2. A ruler, A, consisting of a strip of flexible elastic material, in combination with a series of pins, B, consisting of two legs or branches, *b b'*, the leg *b* adapted to be driven into the drawing, the leg *b'* being shorter than the leg *b*, and adapted to engage with the face of the ruler at its upper portion only when the ruler is in position on the drawing, substantially as and for the purposes described.

3. The ruler A, consisting of a strip of flexible elastic material, and provided with the eyes *a*, in combination with the pins C and a series of pins located between said eyes *a*, and constructed so as to leave the bottom portion of one side of the rule unobstructed, substantially as and for the purposes described.

4. The ruler consisting of a strip of flexible elastic material, and provided with the eyes *a*, in combination with the pins C and a series of pins, B, substantially as and for the purposes described.

5. The combination, substantially as hereinbefore set forth, of the elastic flexible strip A, provided with eyes rigidly attached to said strip, and fastening-pins adapted to penetrate the substance upon which the drawing is to be made, and hold said strip in position.

291,381. CAKE AND CONFECTIONERY MACHINE. J. HENRY MITCHELL, Philadelphia, Pa. Filed Dec. 15, 1880. (Model.)

Claim.—1. In an organized cake or candy machine, the combination of a material-box, a pan-supporting table, an endless conveyer and its drums or pulleys, and a positively-operated ratchet-wheel having differential teeth, substantially as and for the purpose set forth.

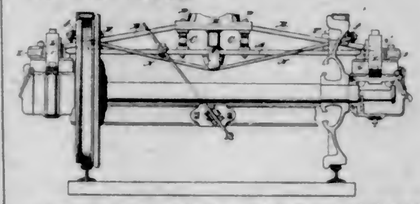
2. In an organized cake and candy machine, the combination, with a dough or material box and the piston thereof, of a rising and falling head and advancing mechanism, substantially as described, whereby said piston is advanced into and returned from the material-box and additionally advanced on the return, and alternately ejects and stops the flow of the material, as stated.

3. The material-box with discharge nozzles or outlets at the bottom and open at top, in combination with a forcing-piston, N, having an air-vent, *d*, and valve S, substantially as and for the purpose set forth.

4. The material-box having at its bottom discharge-nozzles R and pendent stops *c*, which are longer than said nozzles, substantially as and for the purpose set forth.

5. The material-box provided with stops, and the pan-conveyer, in combination with a scrap-receiving box having a perforated lid which sustains the pan during the deposit of the material and permits scraps to fall into the box, substantially as set forth.

6. The piston in combination with the screw-shafts M, the rising and falling head L', gear-wheels *b'*, rotary shaft L, and gear-wheel *b*, substantially as and for the purpose set forth.



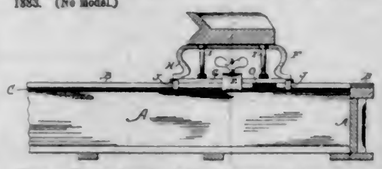
7. The combination, with the ratchet X and the sliding rod T, of the throw-off Y, fitted loosely on the shaft L and formed with a flange, Y', and notch *g*, substantially as and for the purpose set forth.

8. The threaded shaft L, traveler or nut U, and sliding rod T, in combination with the ratchet X and throw-off of the pawl W, substantially as and for the purpose set forth.

9. The cam G and arm H, in combination with the arms or rods K and the rising and falling head with the suspended piston, substantially as and for the purpose set forth.

10. The rising and falling table C, in combination with the shaft C', cam F, pan-carrier J, and pulleys J' J'', substantially as and for the purpose set forth.

291,382. CAR-TRUCK. WILLIAM H. MONTS, Lehighton, Pa. Filed Sept. 10, 1883. (No model.)



Claim.—1. As a means for connecting the bolster with the truck-frame, the cap I, having the form shown, and provided with the recess *i* and side flanges, *i'*, substantially as specified.

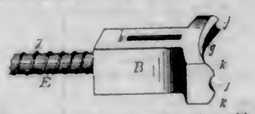
2. As an improvement in car-trucks, the hereinbefore-described bolster, composed of the bars A and B, connected together at their ends, and having their centers united and held in relative vertical positions by means of the posts C and bolts D, in combination with the truss-rods N, substantially as and for the purpose shown.

3. The hereinbefore-described car-truck, in which the trussed bolster, cap, and frame are constructed and combined in the manner and for the purpose substantially as set forth.

291,383. WAGON-SEAT. SETH MOORE, Salem, Ohio. Filed Sept. 8, 1883. (No model.)

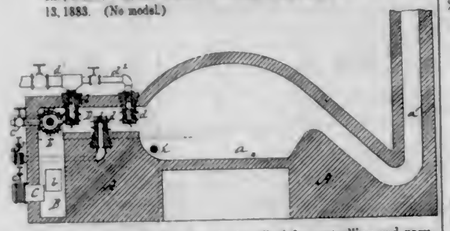
Claim.—The combination, with the wagon-bed having grooves in its sides, of the seat-supporting plates G, having lugs J, the clamps E, having lips L M overlapping the sides of the bed, and screws N, passing through the said clamps and plates and bearing against the sides of the bed, substantially as shown and described.

291,384. MAIL-BAG FASTENER. JACOB MOORE, Albany, N.Y. Filed Dec. 18, 1882. (No model.)



Claim.—1. In a bag-fastener, the locking-bar D, provided with eccentric holding-piece D', held in bearings secured to one side of the mouth of the bag, in combination with catch C, secured with the flap, and adapted to engage with said locking-bar when turned in one direction and be disengaged when turned in an opposite direction, substantially as set forth.

2. The combination, with a series of flexibly-connected locking-bars which are arranged to be simultaneously turned in bearings secured to one side of a bag for engagement with coacting catches attached to a closing-flap, of hasp F, attached to or made with one of said locking-bars, and staples *k*, adapted to receive the bow of a padlock, substantially as and for the purpose set forth.



3. In a mail-bag fastener, the combination, with plate *g*, having aperture A, and locking bar D', provided with eccentric piece D, and rotated in bearings, of duplex catch C, provided with holding-lips *e* and *f*, for operation substantially as set forth.

291,385. CAR-COUPLING. DAVID E. MORGAN, Detroit, Mich., assignor of one-half to Adam G. Monroe, same place. Filed Oct. 22, 1883. (No model.)

Claim.—In a car-coupling, the combination, with the ordinary-shaped draw-head having an open socket with flaring entrance, of the spring-dog B, having a concave face on its horizontal plane, and a convex face with a groove across its center on its vertical plane, slot *b*, stop-pin *c*, cylindrical extension E, spiral spring *d*, block D, oval coupling-pin C, provided with a stop-pin, *f*, seat or recess A, coupling-pin guide *s*, and the ordinary coupling-link, all substantially as described, and for the purposes set forth.

291,386. GAS-FURNACE FOR METALLURGIC AND OTHER PURPOSES, AND METHOD OF OPERATING THE SAME. JOHN T. MORGAN, Selma, Ala., and HENRY F. HAYDEN, Washington, D.C. Filed Apr. 13, 1883. (No model.)

Claim.—1. The method herein described for controlling and varying the character of the flame in metallurgic and like furnaces, which consists in first bringing together the proper volumes of air and gas to produce complete combustion at the point of initial combustion, and then surcharging the flame with oxidizing or carburizing gases between the point of initial combustion and the working-chamber of the furnace, substantially as and for the purposes specified.

2. A burner for gas-furnaces, having a general C form in cross-section, and consisting of a longitudinally-slotted hollow cylinder having a reticulated or closely-perforated jacket, substantially as and for the purpose specified.

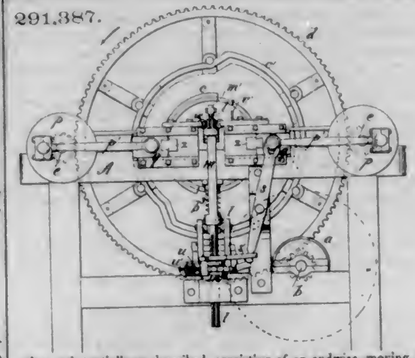
3. In a gas-furnace, the combination of a burner consisting of a hollow longitudinally-slotted cylinder having a perforated jacket, and a supply-pipe arranged to deliver into the hollow center of the longitudinally-slotted burner, substantially as and for the purpose specified.

4. In a gas-furnace, the combination of a burner consisting of a hollow longitudinally-slotted cylinder having a perforated or reticulated jacket, and a mixing-chamber having a series of pendent and projecting walls which divide the chamber into zigzag or irregular passages, substantially as and for the purpose specified.

5. In a gas-furnace, the combination, with a mixing-chamber divided into zigzag passages by a series of hollow perforated projecting walls, of a gas-burner arranged at the mouth of the mixing-chamber to deliver the flame thereto, substantially as and for the purpose specified.

6. In a mixing-chamber for metallurgic and similar gas-furnaces, the combination of a series of hollow, perforated, detachable cross-walls of less height than the mixing-chamber, and arranged alternately above and below to form zigzag or irregular flame-passages, substantially as and for the purpose specified.

291,387. MACHINE FOR FORMING EYEBOLTS. LAURIDS J. M. MORTENSON, Racine, Wis., assignor of one-half to Stephen Andersen, same place. Filed Mar. 29, 1883. (No model.)



Claim.—1. The combination of the rod *l*, provided with the piece *l'*, having the projection or former l^3, the rod *m*, and the slides *q*, carrying welding-dies *r*, substantially as described, for operation in holding, bending, and welding a heated rod to form an eyebolt.

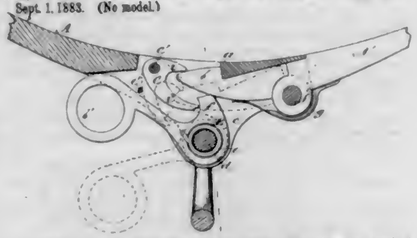
2. In machines for welding eyebolts, the combination of the mechanism, substantially as described, consisting of an endwise-moving rod and a former, between which the rod to be welded is clamped, supports for holding the rod while being bent, and reciprocating dies for welding the rod after being bent, so as to bend and weld an eyebolt at one heat.

3. The combination, with the rod *l*, having former l^3, of the supports *w w*, the gage *v'*, the cam *c'*, and the lever *k*, whereby the rod may be bent around the former, as described.

4. The combination, with the rod *l*, of the lever *s*, connection *s'*, and dog *u*, to give a quarter-turn to the rod, as described.

291,387.

291,388. CUPPING-GLASS. CHAS. L. MYERS, New Hamburg, N. Y. Filed Apr. 16, 1883. (No model.)

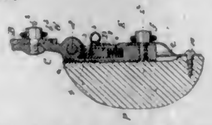


Claim.—The combination, with the cupping-glass, of the pivoted taper-holder E, adjustable to the varied positions in the application of the glass, constructed and operating substantially as and for the purpose described.

291,389. VEHICLE-SEAT LOCK. FRANK J. NEWACHECK, Green Spring, Ohio. Filed Nov. 6, 1883. (No model.)

Claim.—The combination, with the seat-rail, of the hinged detachable seat, connected to the rail by means of the slotted recessed strap C, the pivot-strap G, and the pivoted hook I, substantially as set forth.

291,390. HAME-FASTENER. MARSH NOE, Davenport, Iowa. Filed Sept. 1, 1883. (No model.)



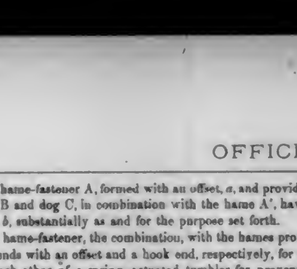
Claim.—1. The combination of the hame A', having the notched end *b*, the hame A, having the end notch, *a*, side plates, *c c*, and fixed cross-bolt *d*, the spring *e*, fastened at one end to and coiled about said bolt, the tumbler B, pivoted on the bolt and connected with one end of its spring, and the dog C, pivoted at *c'*, and having members *i i'*, as and for the purpose specified.

2. The hame-fastener A, formed with an offset, *a*, and provided with the tumbler B and dog C, in combination with the hame A', having the notched end *b*, substantially as and for the purpose set forth.

3. In a hame-fastener, the combination, with the hames provided at their lower ends with an offset and a hook end, respectively, for engagement with each other, of a spring-actuated tumbler for preventing the ends of the hames from being disengaged, substantially as herein shown and described.

4. In a hame-fastener, the combination, with the hame A, provided with the offset *a* and the side plates, *c*, and the hame A', provided with the hooked end, of the tumbler B, pivoted in the said side plates, the spring *d*, the latch C, and the stop-pin *c'*, substantially as herein shown and described.

291,391. TRUSS. JOSEPH F. NOONE, Peterborough, N. H. Filed Aug. 17, 1883. (Model.)



Claim.—1. The body-spring A, having the end piece, B, provided with recesses combined with the pad, its arm C, having cogs to engage the said recessed end piece in any of the several lateral adjustments of which the pad is thereby capable, a fastening device, *b'*, and a spring-bolt, D, to engage the lower end of the said pad-arm to hold the pad in any of the in and out adjustments thus permitted, substantially as shown and described.

2. The combination, substantially as shown and described, of the pad, the pad-carrier E, upon which the pad is movable longitudinally, the ring-bolt or the like, *f*, to hold the pad and its carrier in adjusted position, and the lever connecting the pad and body-spring, to which lever the pad is hinged and rendered movable toward and from the wearer, and held in such position by a spring-bolt in the carrier, all as set forth.

291,392. LOCKING-LATCH. ELIJAH NYSWONGER, Hanford, Cal. Filed Aug. 17, 1883. (Model.)

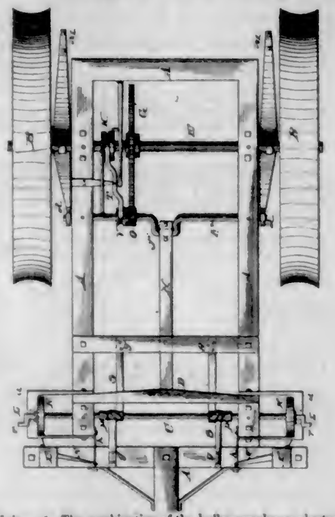
Brief.—A hinged section of the lock-case is adapted to be locked in position to prevent the rotation of the spindle by which the latch-bolt is operated. The hinged section serves as a weight, and takes the place of a spring to shoot the latch-bolt.

Claim.—1. In a lock, the combination, with a sliding bolt, of a hinged section of the casing for thrusting the bolt outward, and means for locking said hinged section in position, substantially as herein shown and described.

2. In a lock, the combination, with a casing having a hinged section, and means for locking the same in position, of a sliding bolt connected to an arm of a nut surrounding the knob-spindle, and a collar surrounding the nut, and provided with a downwardly-projecting arm, substantially as herein shown and described.

3. In a lock, the combination, with a casing provided with a hinged section having a loop at its free end, of a sliding latch-bolt for engagement with the loop of the hinged section, and means for operating said latch-bolt, substantially as herein shown.

4. In a lock, the combination, with a casing provided with a hinged section having a loop on its free end, of a sliding latch-bolt for engagement with the loop of the said hinged section, a tumbler pivoted to the latch-bolt, and means for operating the tumbler, substantially as herein shown and described.



5. In a lock, the combination, with a lock-casing provided with the hinged part B, having loop L, the bolt C, connected to the arm of the nut E, surrounding the knob-spindle, and the armed collar G, surrounding the nut, of the latch-bolt *k*, provided with the lugs K', and the angular tumbler N, pivoted to the latch-lock, substantially as herein shown and described.

6. In a lock, the combination, with a lock-casing provided with the hinged part B, having loop L, the bolt C, connected to the arm of a nut, E, surrounding the knob-spindle, and an armed collar, G, surrounding the nut, of the latch-bolt K, provided with the lugs K' and the projection W, and the angular tumbler N, pivoted to the latch-bolt and provided with the offset *m*, substantially as herein shown and described.

7. The combination, with a lock-casing, of the hinged part B, the nut E, the collar G, provided with an arm, J, and the arm D, the latter connected with the sliding bolt C, substantially as herein shown and described, and for the purpose set forth.

8. The combination, with a lock-casing, of the hinged part B, having a recess, J', the nut E, provided with a tooth, I, the collar G, provided with a recess, H, and an arm, J, and the arm D, the latter connected with the sliding bolt C, substantially as herein shown and described, and for the purpose set forth.

291,393. CORN-PLANTER AND CHECK-ROW ATTACHMENT. CALVIN S. PAGE, Champaign, Ill. Filed Mar. 22, 1883. (No model.)

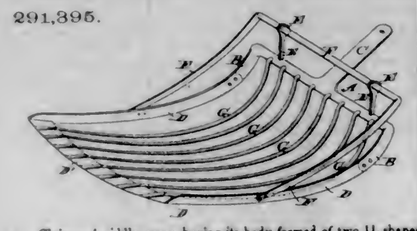
Claim.—1. The combination of the hollow spades or planters, having tubular or funnel-shaped attachments, the vertically-movable plunger *b*, and the movable frame D, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination of the movable frame D, the spades, a movable plunger, crank-pin *r*, wheel R, rotary shaft *c*, and check-rowing devices, all constructed and adapted to operate substantially in the manner and for the purposes described.

3. The combination of the movable frame D, the vertically-movable spades, the vertically-movable plunger, the arm H, the crank J, the gearing V G, the clutches *p*, and the straps S, all constructed and adapted to operate substantially in the manner and for the purposes described.

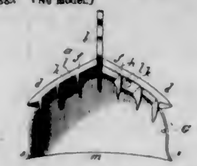
4. The combination of the cam-wheel K, lever T, and markers M, all constructed and adapted to operate substantially in the manner and for the purposes described.

5. The combination of the cam-wheel, the ratchet-teeth therein, the pivoted fingers or pawls *i*, the brakes *l j*, and the markers M, all constructed and adapted to operate substantially in the manner and for the purposes described.



291,394. MUSTACHE-SPOON. ISAAC WARREN PARMENTER, New York, N. Y. Filed July 9, 1883. (No model.)

Claim.—In a table-spoon having a cover attached thereto, provided with an outlet and inlet, the cover having a vertically-projecting flange at the inlet, substantially as shown and described.

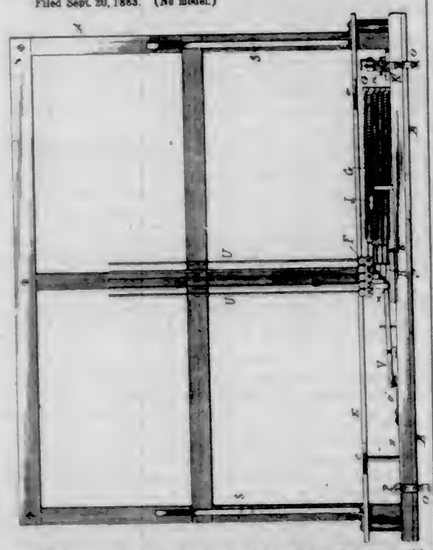


291,395. COMBINED POTATO-SCOOP AND RIDDLE. HENRY PEDEN, Windham, Ohio. Filed Oct. 20, 1883. (No model.)

291,395.

Claim.—A riddle-scoop having its body formed of two U-shaped frames, with prong ends riveted together, and opposite cross-bars connected by carved rods, said rods being welded flat at one end to cross-bar D', and at the other end passing into cross-bar A, as shown and described.

291,396. CORN-COVERER. WILLIAM H. PENNOCK, Wilmington, Del. Filed May 26, 1883. (No model.)



Claim.—1. A rake-head attachment for cultivators, consisting of a transversely-arched rake and a transversely-arched rearwardly-inclined covering and smoothing plate secured thereto in rear, substantially as specified.

2. The rake-head consisting of the rake *a*, having the outwardly and rearwardly inclined and downwardly-arched branches *d*, and the transversely-arched and downwardly and rearwardly inclined covering-plate G, having the angular front edge, *h*, and the rear smoothing-lip, *s*, substantially as specified.

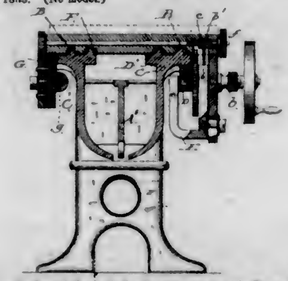
3. An adjustable rake-head attachment consisting of the transversely-arched rake *a*, having the curved and perforated shank *b*, and the transversely-arched and rearwardly and downwardly inclined covering and smoothing plate G, secured to perforated lugs of the rake, substantially as specified.

291,397. MUSIC-LEAF TURNER. DEMETRIO PRIETO, Mexico, Mexico. Filed Sept. 20, 1883. (No model.)

Claim.—1. A music-leaf-turning rack provided on its bottom with plates beveled on their inner ends, as shown and described, in combination with a plate permanently attached to a musical instrument, and beveled, as shown and described, whereby said rack may be attached to and detached from said musical instrument, substantially as set forth.

2. The swinging leaf-turning levers F, pivoted to the rack below the music-rest, in combination with a guide, J, secured to the rack below said levers, whereby said levers are made to swing in a proper horizontal plane, substantially as set forth.

3. The combination of a pivoted releasing-lever, a spring adapted to hold said lever normally in proper position to prevent the leaf-turning levers from swinging, a holding-catch pivoted to said releasing-lever, and a spring adapted to hold said catch in proper position to hold the leaf-turning levers, substantially as set forth.



4. A pivoted retaining-catch, M N, and a spring for holding it normally in a position to not interfere with the swinging of the leaf-turning levers, in combination with a pivoted releasing-lever, K, provided with a holding-catch, L, and with a projection, *h*, extending back of the pivotal point, said projection being adapted to engage with the retaining-catch, whereby the said catch is raised simultaneously with the depression of the holding-catch, substantially as set forth.

5. The combination, with a music-turning lever, of a vertical rod, T, rigidly secured at or near the end thereof, a second rod, U, pivoted to said lever and adapted to turn in a vertical plane, and a spring, *m*, adapted to hold said rod U normally in a vertical position, substantially as and for the purpose set forth.

6. The combination of the swinging lever F and the bar V, provided with a catch, *n*, substantially as set forth.

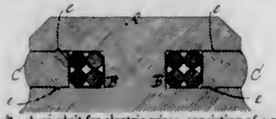
7. The combination of the lever F, the bar V, provided with a catch, *n*, and the spring *o'*, substantially as and for the purpose set forth.

291,398. LATHE-BED. SALMON W. PUTNAM, Fitchburg, Mass. Filed July 21, 1883. (No model.)

Claim.—1. In a lathe-bed, the front way or track, B, made wider or at a more obtuse angle than the rear track, B', in combination with the track B' and the carriage, substantially as and for the purpose set forth.

2. The improvement in a lathe-bed, the rigid transverse rib C, the longitudinal rib A', and the projections *a a*, whereby the bed is stiffened and tremor is avoided, substantially as and for the purpose set forth.

3. In a lathe-bed, the rib A', secured longitudinally through the center of the table, substantially as and for the purpose set forth.



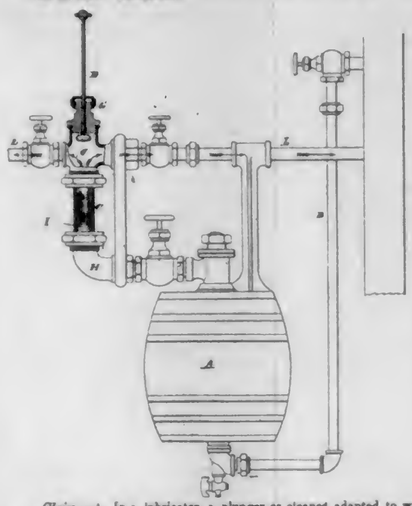
4. The rack-pinion D and gear, in combination with the carriage and the yoke E, arm-bearing *e*, and rack D', constructed to operate substantially as and for the purpose set forth.

5. The rod F and gear, in combination with the eccentric plate G and screw-nut *g*, whereby the nut may be opened or closed from the front side of the carriage, substantially as and for the purpose set forth

6. The rod F, provided with the hub *b'*, perforated at *c*, in combination with the yoke E, provided with the stop-pin *b*, substantially as and for the purpose set forth.

291,399. CONDUIT FOR ELECTRIC WIRES. NELSON RANDALL, Jersey City, N. J. Filed Oct. 10, 1883. (No model.)

Brief.—Consists of a wooden molding having longitudinal grooves and an assemblage of wires therein, and surrounded by a sheathing of lead or other water-proof material, and means for confining the wires and sheathing, consisting of detached tongues fitted into the mouths of the grooves, and provided with ribs which are embedded in the sides of the molding.

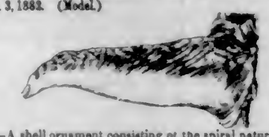


Claim.—A conduit for electric wires, consisting of a wooden strip or molding having longitudinal grooves, and of detached tongues fitted into the mouths of the grooves, and provided with a longitudinal rib or elevation on either or both sides, substantially as and for the purpose described.

2. The combination, with a conduit consisting of a wooden strip or molding having longitudinal grooves and of detached tongues fitted into the mouths of the grooves, of an assemblage of wires laid in each groove, and provided with a sheathing of sheet-lead or other water-proof material, substantially as and for the purpose described.

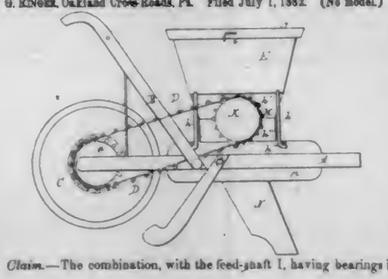
3. The combination, with a strip or molding having grooves, of electric wires arranged therein, a sheathing of sheet-lead or other water-proof material around the wires, and means for confining the wires and their sheathing in the grooves of the strip or molding, substantially as described.

291,400. LUBRICATOR. WILLIAM A. REID, St. Louis, Mo. Filed Oct. 31, 1883. (No model.)



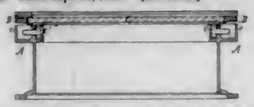
Claim.—1. In a lubricator, a plunger or cleaner adapted to wipe the interior of the sight-tube, as set forth.

2. In a lubricator, a plunger or cleaner working in a stuffing-box located above the sight-tube, for the purpose of wiping the interior of the tube and clearing the escape-pipe, substantially as and for the purpose set forth.



3. In combination with a lubricator having a single condenser and a single sight-tube, the duplex head provided with two supply-pipes, substantially as shown and described, for the purpose set forth.

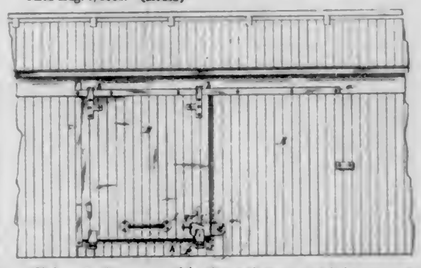
291,401. SHELL ORNAMENT. JOHN M. REYNOLDS, Chicago, Ill. Filed Oct. 3, 1883. (Model.)



Claim.—A shell ornament consisting of the spiral naturally polished and tinted interior only of the *Strombus* species of shells, substantially as described.

291,402. SEED-PLANTER AND FERTILIZER-DISTRIBUTER. JOS. G. RINGER, Oakland Cross-Roads, Pa. Filed July 1, 1882. (No model.)

Claim.—The combination, with the feed-shaft I, having bearings in the meeting edges of the two parts of the seed and fertilizing box, of the removable feed-wheels having longitudinal recesses extending throughout the length of said wheels, and provided with beveled edges adapted to receive strips of wood for varying their depth to regulate the amount of material discharged, and the rubber block M, having its concave edge above the periphery of the seed-wheel, substantially as specified.



291,403. MARINER'S COMPASS. EDWARD SAMUEL RITCHIE, Brookline, Mass. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a liquid-compass, the body of the bowl combined with the bottom thereof, or with the glass-pane holder, by means of a yielding annulus, or by two or more yielding annuli, substantially and arranged and applied as set forth.

2. The body of the bowl not only combined with the bottom thereof, or with the glass-pane holder, by means of a yielding annulus, or by two or more yielding annuli, arranged and adapted as described, but provided with one or more guards, as represented, arranged with the yielding annulus or annuli, and for the protection thereof, as set forth.

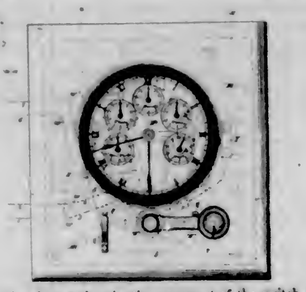
291,404. CAR-DOOR FASTENING. SALISBURY F. ROSSE, Sedalia, Mo. Filed Aug. 6, 1883. (Model.)

Claim.—1. As a new article of manufacture, a latch for cars, consisting of the portions *i j k*, the portion *i* being perforated for the pivotal attachment of the latch to the car-side, the portion *j* constituting a shoulder, and the portion *k* having a lip, *d*, at its lower edge, and a perforated ear, *e*, at or near its upper forward corner, substantially as set forth.

2. The combination, in a car, of a door having a staple on its outer side, a keeper projecting from the side of the car, a latch pivoted to the side of the car and provided with a lip and perforated ear, and adapted to be moved to a position to cause its lip to bear against the keeper, and thereby wedge the door in its closed position, and a seal-connection, *q*, for connecting the staple with the perforated ear of the latch, substantially as described.

3. The combination, in a car, of a sliding door, a keeper projecting from the side of the car, a latch pivoted to the side of the car, and having a portion, *i*, adapted, when the door is unlatched and moved, to pass between the door and the side of the car, and with a shoulder and lip, the former adapted, when the latch rests within the keeper, to be arranged transversely across the front edge of the door, and prevent its longitudinal movement, while the lip bears against the keeper and wedges or clamps the door against the side of the car, substantially as set forth.

4. The combination, in a car, of a sliding door, B, having a staple, *f*, keeper P, projecting from the side of the car, a shouldered latch, C, pivoted to the side of the car and consisting of the portions *i j k*, and having a lip, *d*, and perforated ear *e*, all arranged and operating substantially as herein set forth.



291,405. METER FOR ELECTRIC CIRCUITS. PHILIP G. RUSSELL, Washington, D.C. Filed July 2, 1883. (No model.)

Claim.—1. In a meter for measuring the length of time of the passage of an electric current over a circuit, the combination of the switch, the winding-arbor of the registering-clock, and suitable connecting mechanism, all so arranged that the movement of the switch to turn the current through the circuit will wind up the clock, substantially as shown and described.

2. In combination with the winding-gear, the switch-shaft, the clutch mechanism connecting the two, and means for throwing said clutch mechanism out of operation near the end of the movement of the switch, and before the current is turned on through the circuit, substantially as and for the purpose described.

3. The switch, in combination with means whereby the spring of

291,405.

the time mechanism is wound up by the movement of the switch, and means for preventing overwinding of the spring, substantially as shown and described.

4. In combination with the spring winding-arbor, the switch-shaft, and suitable connecting-gearing, all so arranged that the movement of the switch to turn on the current winds up the spring means for automatically disconnecting the gearing from the spring winding-arbor when the spring is wound up, substantially as and for the purpose shown and described.

5. The combination of the switch, the switch-shaft, the winding-gearing connected therewith and with the spring winding-arbor, means for disconnecting the switch-shaft from the winding-gearing when the switch-arm has nearly reached the limit of its movement, and means for disconnecting the winding-gearing from the arbor when the spring is wound up, substantially as and for the purpose set forth.

6. The combination of the switch-arm, the switch-shaft, the switch-disk fast thereon, the conducting-strip on the disk, the contact-springs and circuit-wires, the clutch mechanism connecting the shaft with the winding-gearing, and suitable means for disengaging this clutch mechanism near the end of the throw of the switch-arm, and just before, by the action of switch-disk and contact-springs, the current is turned through the meter-circuit, substantially as and for the purpose set forth.

7. In an electric meter, the combination of the switch, its shaft, and the backing-ratchet form of clutch connecting the shaft with the winding-gearing of the time-register, so that the switch-shaft can be turned back without turning the gearing, substantially as shown and described.

8. The combination of the switch, its shaft, the spring thereon, the clutch-disk sliding on the shaft, but turning therewith, and provided with diametrically-opposite cams, and the lugs acting in connection with the cams, and so relatively situated as to raise the clutch-disk out of engagement with the corresponding disk, fast on the arbor of the first wheel of the winding-gear, as the switch-arm approaches the limit of its throw, substantially as shown and described.

9. The combination of the switch-arm and switch-shaft, the clutch-disk sliding on the shaft, but turning therewith, and pressed down toward the end thereof by a spring, the flange on the disk, provided with diametrically-opposite cam-tongues, and the lugs acting in connection with the tongues to raise the disk up on the shaft against the stress of the spring, substantially as shown and described.

10. The combination of switch-arm T', switch-shaft T, disk U, conducting-strip W, contact-springs W' W² W³, clutch-disk V, flange V' thereon, cam-tongues V³ on the flange, lugs V² V³, spring S², clutch-disk O on the arbor of wheel N of the winding-gear, and suitable circuit and connecting wires, substantially as and for the purpose set forth.

11. The switch connected with and operating the winding-gearing, in combination with the single-toothed wheel and clutch-hub on the spring winding-arbor, the notched stop-wheel carrying a cam, the clutch-pinion sliding on the arbor and meshing with the winding-gearing, and the spring-arm adapted to normally press the pinion down into clutch with the hub, but to be struck by the cam and raised, so as to unclutch the pinion and hub when the spring has been sufficiently wound, substantially as shown and described.

12. The switch and connecting gearing, in combination with the wheel H and clutch-hub *h*, spring winding-arbor, grooved clutch-pinion K, sliding thereon, wheel I, cam *i*, and forked spring L, substantially as and for the purpose set forth.

13. The time-registering mechanism of the meter, in combination with means for automatically short-circuiting the current from the working back to the main circuit when the mechanism has nearly run down, substantially as set forth.

14. The combination of the toothed wheel on the winding-arbor, the stop-wheel gearing therewith, the cam on the stop-wheel, the contact-spring, the contact button or piece, and the connected wires, all so arranged that when the clock has nearly run down the cam is brought under the spring and forces it up against the contact-piece to short-circuit the current from the working-circuit, substantially as and for the purpose described.

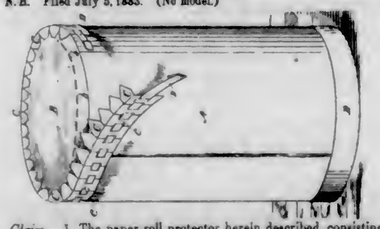
15. In combination with the winding-arbor, the wheel H, wheel I, cam i^2, spring y^3, contact-piece y^4, and wires 10 and 11, connected with the wires from the main line or circuit, substantially as and for the purpose set forth.

16. In combination with the mechanism for measuring the time during which the electric current passes over a working-circuit, means adapted to cause the current from the main line to flow over the working-circuit when said circuit is connected with the main line, and to allow it to flow from one main-line wire to the other without passing over the working-circuit whenever undue resistance occurs in the latter, substantially as and for the purpose set forth.

17. In combination with the working-circuit, the meter adapted to measure the time of use of the working-circuit, and the resistance device suitably connected with the wires of the main or supply circuit and offering a resistance to the passage of the current greater than the normal resistance of the working-circuit, so that if any break occurs or any undue resistance is interposed in the working-circuit the current will not pass over said circuit, but from one main wire through the resistance device back to the other, substantially as set forth.

18. The combination of the time mechanism, a stop device adapted to arrest the movement of the escapement, so that the balance-spring shall always be put under stress when the stop device is in operation, means for holding said stop device in action, and means for throwing it out of action when an electric current passes over the circuit to which the meter is applied, substantially as and for the purpose set forth.

19. The combination of the balance or escape lever of the time-registering mechanism, a stop device applied thereto and adapted, when in engagement therewith, to force and hold the lever away from its dead-center, and means for disengaging the stop device from the lever when the current passes over the circuit to which the meter is applied, substantially as set forth.



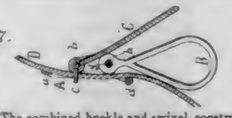
20. In combination with the time mechanism, the stop-lever adapted to engage the end of the escape-lever and force the same to either side of its dead-center, so as to stop the time mechanism and put the balance-spring under sufficient stress to make certain the starting of the movement when the levers are disengaged, and means for disengaging the stop-lever from the balance-lever when an electric current passes over the circuit to which the meter is applied, substantially as shown and described.

21. The combination of the escape-lever having a portion made V-shaped in cross-section with the armature-lever provided with a stop-pin adapted to engage said V-shaped portion of the escape-lever, and an electro-magnet to operate the armature-lever, substantially as and for the purpose set forth.

22. The combination of the balance or escape lever formed with the V-shaped portion, the stop-lever provided with a projection to engage such portion, and an armature, the spring, and the electro-magnet interposed in the meter-circuit, and adapted to attract the armature and disengage the projection and balance-lever when the current passes through the circuit, substantially as and for the purpose described.

23. The combination of the electro-magnet X, interposed in the meter-circuit, the lever E, armature e^2 thereon, conical pin f', spring f^3, attached to the frame and end of the lever, and the balance or escape lever D, having portion *d*, V-shaped in cross-section, substantially as and for the purpose set forth.

291,406. DEVICE FOR PROTECTING THE ENDS AND CORNERS OF ROLLS OF PAPER IN SHIPMENT. HERBERT SANGER, Franklin, N.H. Filed July 5, 1883. (No model.)

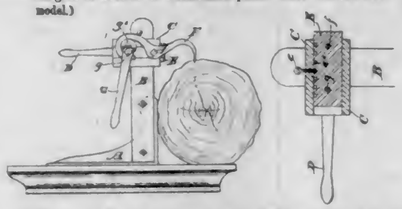


Claim.—1. The paper-roll protector herein described, consisting of a circular disk or head, and a flanged binding-strip formed of a series of connected metallic segments adapted to fit the sides of the roll and extend over its end to engage with the disk, for the purpose set forth.

2. The combination, with the roll A and slotted heads B *b*, of the series of segments C C and the band D, provided with suitable fastening devices, for the purposes set forth.

291,407. COMBINED BUCKLE AND SWIVEL. SAMUEL S. SARGEANT, Newark, N.J. Filed Oct. 31, 1883. (No model.)

291,407.

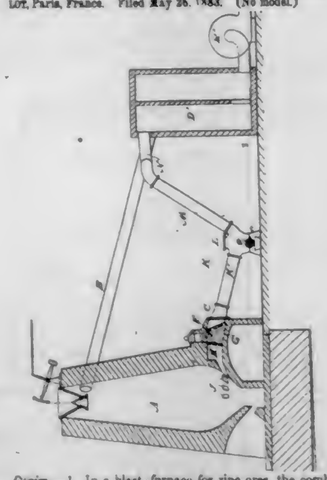


Claim.—The combined buckle and swivel, constructed substantially as herein specified, the buckle being provided with a cross-bar, *f*, having a downwardly-curved part, *g*, and the swivel being provided with an eye, *h*, hung on the said curved part of the cross-bar, for the purpose set forth.

291,408. PLASTERING COMPOUND. HANNAH E. SCALES, Newton, Mass. Filed Apr. 11, 1883. (No specimens.)

Claim.—The compound herein described for plaster or stucco work, consisting of rice-flour, sand, salt, and lime or plaster-of-paris mixed with weak glue, and compounded together in the proportions substantially as stated.

291,409. SAW-MILL DOG. WILLIAM F. SCHOWE, Indianapolis, Ind., assignor to Schowe & Thoms, same place. Filed Nov. 10, 1883. (No model.)



Claim.—1. The combination, in a saw-mill dog, of a vertical standard, a block, C, adapted to be moved along the same, two cams, *c*, having projecting pins *c'*, and a handle, D, having cam-slots which fit over and engage with said pins, whereby said cams may be operated to impinge on said standard, and thus secure said block in position thereon, substantially as set forth.

2. The combination, in a saw-mill dog, of a sustaining-block, a dog centrally secured by a pivot, and a cam-lever pivoted to the same block as the dog, the cam end whereof engages with one end of said dog, and thus as said lever is raised and lowered will withdraw the dog from the log or force it into the same, substantially as set forth.

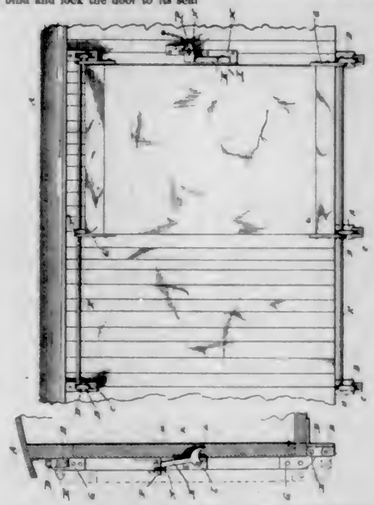
3. The combination, in a saw-mill dog, of the standard B, the block C, movably mounted thereon, the cams *c*, having projecting pins *c'*, the handle D, provided with cam-slots, which fit over and engage with said pins, whereby said block is secured in position on the standard, the horizontal sliding block E, the dog F, mounted thereon, and the cam-lever G, for operating the same, substantially as described, and for the purposes specified.

291,410. BLAST-FURNACE FOR ZINC ORES. AMÉDÉE M. G. SÉBILLOT, Paris, France. Filed May 26, 1883. (No model.)

Claim.—1. In a blast-furnace for zinc ores, the combination, with the furnace-chamber, of the outlet-pipe leading directly from the latter to a condenser, and a second outlet-pipe communicating with a chamber containing pieces of charcoal, and with a condenser, said charcoal-chamber communicating with the furnace-chamber, substantially as and for the purpose set forth.

2. A blast-furnace for zinc ores, constructed with an upper and lower outlet-pipe, the latter being connected with a series of condensing-pipes, substantially as herein shown and described.

3. A blast-furnace for zinc ores, constructed with two outlet-pipes connected with independent chambers having exhaust-fans or analogous devices, substantially as herein shown and described.



4. A blast-furnace for zinc ores, constructed with an upper and a lower outlet-pipe, the latter being provided with a chamber filled with pieces of charcoal or pieces of other material adapted to be heated to a high temperature, substantially as herein shown and described.

5. A blast-furnace combined with an upper and lower outlet-pipe, of which the former is connected with a condensing-chamber and the latter is connected with a condenser formed of pipes and a metal collecting-chamber, which pipe-condenser is connected with a condensing-chamber, substantially as herein shown and described.

6. The combination, with a blast-furnace having a cavity, H, having openings leading to the interior of the furnace, of the chamber F, containing pieces of charcoal, the outlet-pipe C, and the condenser K, substantially as herein shown and described, and for the purpose set forth.

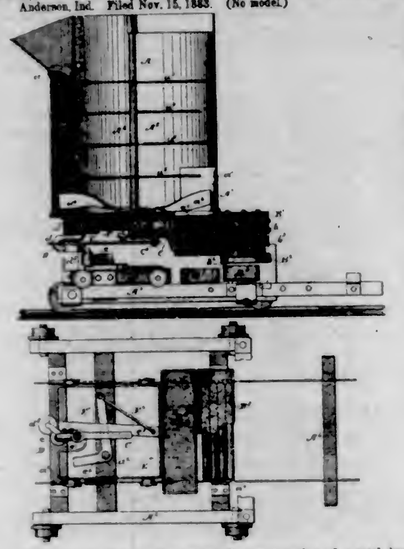
291,411. CAR-DOOR. WM. W. SHALLIS, Lancaster, Pa., assignor of one-half to Henry H. Keen, same place. Filed Oct. 10, 1883. (No model.)

Brief.—Supported by brackets in which are pivoted arms carrying movable longitudinal guide-rods is a door having brackets adapted to slide thereon. A lock-lever is fulcrumed to a plate attached to the edge of the door, and is formed with a hooked end adapted to engage a slot and bind and lock the door to its seat

Claim.—1. The combination, with a freight-car, of the brackets secured thereto, having sockets in which are pivoted arms carrying longitudinal guide-rods, and the door having brackets adapted to slide thereon, substantially as specified.

2. In combination with the door mounted upon movable longitudinal guides E, the lock lever H, adapted to bind the door to its seat and lock it thereto, substantially as and for the purpose specified.

291,412. VEHICLE-SPRING. DENNIS P. SHARP, Ithaca, N. Y. Filed July 24, 1883. (No model.)



Claim.—1. The improved spring-coupling consisting of a ball-and-socket joint formed on the ends of the springs, and a coupling-bolt passing through the center of said joint, substantially as described and shown.

2. The combination, with the ball-and-socket joint, of the cushion *r*, interposed between the ball and socket, and the coupling-bolt *e*, passing

vertically through the joint, all substantially in the manner shown and set forth.

291,413. BRICK-MACHINE. FRANK W. SHELLEY and SAMUEL KISER, Anderson, Ind. Filed Nov. 15, 1883. (No model.)

Claim.—1. In a brick-machine, the combination of a mud-box having a front wall, *b'*, and a die pivoted at its rear end, and its front end free to move vertically and provided with a lip, which abuts against the wall *b'*, substantially as described.

2. In a brick-machine, the combination of a mud-box having recessed walls provided with adjustable side plates and a plunger, substantially as described.

3. In a brick-machine, the combination of a mud-box having recessed walls provided with adjustable side plates and a plunger having adjustable side walls, substantially as described.

4. In a brick-machine, the combination of a reciprocating carriage having a projection upon its top, a standard having a lever fulcrumed thereon, one end of said lever connected to the carriage by a link, and a revolving shaft having an arm which alternately strikes the projection of the carriage and the free end of the lever, substantially as described.

5. In a brick-machine, the combination of a mud-box and a plunger having adjustable side plates, substantially as described.

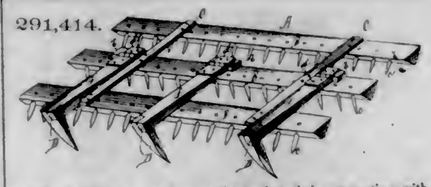
6. In a brick-machine, a drum having openings *a'* and *a²*, the latter in the bottom, and a substantially rectangular box closed top, and attached to the walls of the drum and closing the opening *a'*, substantially as described.

7. In a brick-machine, the combination, with a drum having openings *a'* and *a²* in the bottom, and a rectangular box closing the opening *a'*, of a mud-box attached to the bottom of the drum beneath the opening formed by the rectangular box, substantially as described.

8. In a brick-machine, a drum having its interior cylindrical, and provided with a rectangular opening in its bottom for the escape of the mud, substantially as described.

9. In a brick-machine, the combination of a drum having its interior cylindrical, and provided with rectangular opening in its bottom for the escape of mud, and a mud-box attached to the bottom of the drum below the rectangular opening, substantially as described.

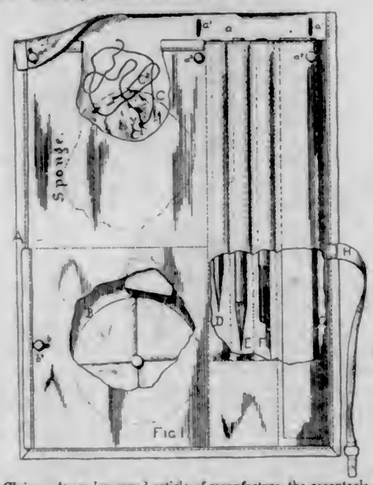
10. In a brick-machine, the combination of a drum having a revolving agitator, a mud-box below the drum, a plunger within the mud-box and connected to a crank-shaft by a pitman, and said crank-shaft connected to the shaft of the agitator by gear-wheels, substantially as described.



11. In a brick-machine, the combination of a groove and slide and a stepped stop held in place by ways, and adapted to be moved in front of the groove and slide, substantially as described.

12. In brick-machines, the combination of a mud-box and a die-plate pivoted at its rear end, and its front end in contact with the front wall of the box, but free to move vertically, as set forth.

291,414. HARROW. SAMUEL SHOEMAKER, Nokomis, Ill. Filed Mar. 15, 1883. (No model.)



Claim.—The combination, in a harrow, of the triangular bars B B

291,414.

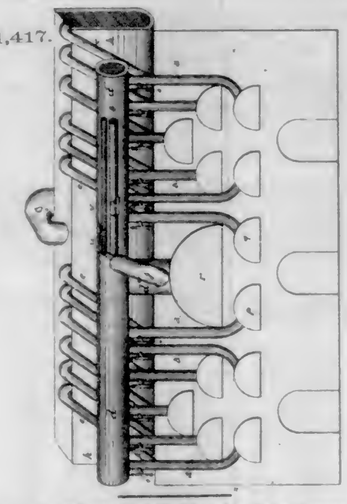
B, provided with a smooth front portion, and on their rear portions with teeth inclined rearwardly at the same angle, and laterally at different angles, the bars B B B being rigidly connected to each other by cross-bars C C, so as to provide a rigid frame, and markers D, hinged to the central portion of the harrow-frame, the parts being constructed and organized substantially as shown, and for the purpose set forth.

291,415. SCHOLAR'S COMPANION. MARY J. SPENCER, Brooklyn, N. Y. Filed May 14, 1883. (No model.)

Claim.—As an improved article of manufacture, the receptacle for school-children's implements herein described, the same consisting of the case A, composed of flexible material, provided with the flap *a* at one end, and provided with the water-proof sponge-pocket C, and with two or more parallel elongated pockets so arranged that the buttoning down of the flap *a* closes the mouth of the sponge-pocket and the mouths of the parallel elongated pockets, and prevents the contents of the said pockets from escaping.

291,416. PEN-HOLDER. ALBERT H. SPENCER, Boston, Mass. Filed Mar. 8, 1882. (No model.)

Claim.—1. As a new article of manufacture, a pen-holder formed of two paper tubes, one within the other, the space between them being about the thickness of a pen.



2. The pen-holder described, formed of two paper tubes of suitable size placed one within the other, the inner tube being slightly longer than the outer, as and for the purpose set forth.

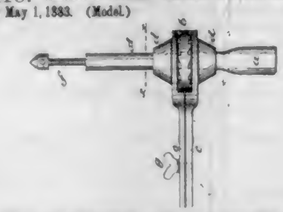
291,417. PROCESS OF AND APPARATUS FOR MAKING COAL GAS. ANTON STAMM, Leadville, Colo. Filed Sept. 5, 1882. (No model.)

Claim.—1. The improvement in the process of manufacturing gas, which consists in converting the tarry vapors given off from fresh charges of bituminous coal in gas-retorts, during the early part of the distillation, into a fixed gas by injecting such vapors, by the combined action of a jet of gas under pressure and a small jet of steam, into and through a mass of incandescent coke in a separate retort, substantially as shown and described.

2. In a plant for manufacturing coal-gas, the combination, with the common distilling-retorts *p q*, the stand-pipes *a a*, and the hydraulic main *k*, of the connecting-pipes *d* and *d'* and *e e e e*, the gas and steam pipes *s* and *u*, the injector *j* for gas and steam, and the regenerating-retort *r*, all substantially as shown and described.

291,417.

291,418. HARNESS-ROSETTE, DOOR-PLATE, &c. ANDREW STEINER, Brooklyn, N. Y. Filed July 23, 1883. (Model.)



Claim.—1. The combination of a glass plate having a beveled edge and an etched back, covered with metallic leaf coated with asbestus composition, substantially as set forth.

2. The combination of a glass plate having an etched back covered with metallic leaf coated with a protecting composition, substantially as set forth.

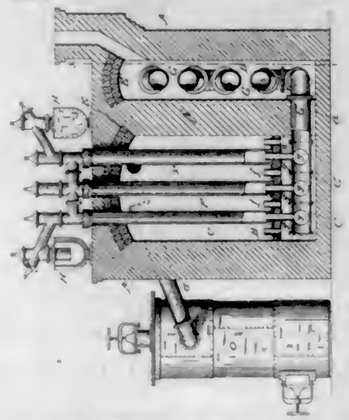
3. The combination of a glass plate covered with metallic leaf coated with a protecting composition, substantially as set forth.

4. The combination of a glass plate covered with metallic leaf coated with a protecting composition, and a back plate having a flange to hold the glass plate, and a loop for attachment, substantially as set forth.

291,419. RATCHET-DRILL. RICHARD STEPHENS, Negaunee, Mich. Filed May 1, 1883. (Model.)

Claim.—The combination, with the brace-stem A and opposite washers, *d d*, made fast thereto, of the rigidly-keyed block *b*, having teeth in the same direction on its opposite edges, and the loose match-handles *c c*, carrying pawls *e e*, said handles being adapted to be clamped together and operate as a unit, or separated and operate alternately, as described.

291,420. BARBED FENCE-WIRE. AMASA W. STEVENS, East Brookfield, assignor to Frank P. Bullard, Palmer, Mass. Filed May 8, 1883. (No model.)



Claim.—1. A fence-wire having loops at any desired distance apart, and provided with transverse barb-wires interlocked with said loops by single-coil bends, the double or crossing point of each barb-wire being located within the coacting loop of the fence-wire, so as to be embraced by the latter and locked by this embrace when the fence-wire is stretched, substantially as herein set forth.

2. A fence-wire having loops at any desired distance apart, formed by single-coil bends, and provided with transverse barb-wires interlocked with said loops by similar coil-bends, the double or crossing point of each barb-wire being located within the coacting loop of the fence-wire, and the double or crossing point of the latter within the loop of the barb-wire, as herein described, for securing the loops of the fence-wire against opening or spreading under strain, in the manner set forth.

3. A fence-wire having loops at any desired distance apart, formed by single-coil bends in one and the same direction, and provided with transverse barb-wires interlocked with said loops by similar coil-bends, the double or crossing point of each coil-bend being located within and embraced by the coacting loop, as herein specified, thereby attaching the barbs by knots composed of uniform loops in the respective wires, as set forth.

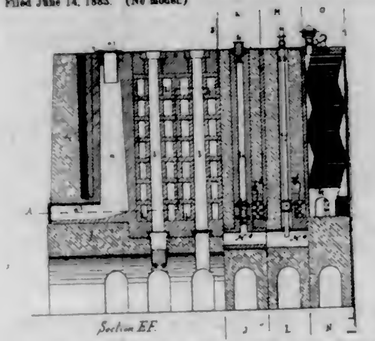
291,421. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. JOHN L. STEWART, Philadelphia, Pa. Filed May 2, 1883. (No model.)

Claim.—1. The process of producing illuminating-gas, which consists in first generating heating-gas, composed of hydrogen and carbonic oxide, forcing such gas, under pressure, into an injecting device, and thereby spraying hydrocarbon liquid into a vaporizing apparatus, conducting the commingled gases and vapor through the heated vaporizer, and then combining and fixing the mixture in heated retorts.

2. The improvement in the art of manufacturing gas, which consists in generating a mixture of hydrogen and carbonic oxide by decomposing steam in contact with incandescent fuel, cooling such mixed gases, and then forcing them by a pump into an injecting device, and thereby spraying a stream of hydrocarbon liquid into a heated vaporizer, and finally combining and fixing the resulting vapor and gases by passing them through heated retorts.

3. The combination of the generator for producing water-gas, the vaporizing and mixing conduits or retorts provided with an injecting and atomizing device, the combining and fixing retorts, and connecting-pipes, whereby hydrocarbon liquid may be conducted into and through the vaporizing-retorts by a current of water-gas, as described.

4. The combination of the generator for producing water-gas, an exhausting and forcing pump, an injector and atomizing apparatus connecting with the gas-pipe, and an oil-supply pipe and suitably connected conduits or retorts for combining and fixing the mixture of the gas and vapor.



5. The two generators for producing water-gas, in combination with the vaporizing-conduits, the connected vertical fixing-retorts, pipes connecting the water-gas producers with the retort-ovens for supplying gas for heating the retorts, and a pipe connecting the water-gas producers with the vaporizing-conduits and an oil-supply pipe.

6. The injecting device having a connecting gas-supply pipe and a nozzle therefor projecting into the mouth-piece of the retort, and an adjustable threaded oil-supply pipe with a conical nozzle projecting into the gas-supply nozzle, in combination with the vaporizing conduits or retorts, all constructed and operated as described.

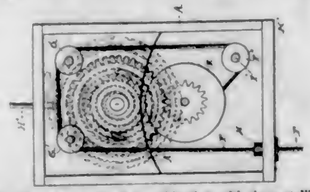
7. The vaporizing conduits or retorts having connected gas and oil supply pipes, in combination with the vertical fixing-retorts, a large connecting-pipe extending from the base of the vaporizer through a chamber below the fixing-retorts, and short stand-pipes uniting such pipe with the bases of the vertical retorts, in the manner shown and described.

8. The gas-retort oven having a horizontal division wall or diaphragm near the base thereof, provided with numerous outlet-passages between the retorts leading to the flue connecting with the chamber containing the vaporizing-conduits, in combination with the heating-gas producers, one or more, and a connecting-pipe conducting heating-gas into the top of the retort-oven, for the purpose described.

291,422. COKE-OVEN. HEINRICH STIER, Zwickau, Saxony, Germany. Filed June 14, 1883. (No model.)

Section EF.

Claim.—1. The combination, with a generator, *a*, and coke-shafts *b*, of channels a^2 and b^2, arranged in front of and surrounding said generator and coke-shafts, said channels being composed of layers of perforated stone, or its described equivalent, for heating the gas or air used for combustion, substantially as described.



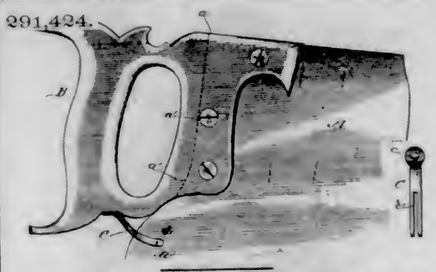
2. In an oven adapted for the production of coke or distillates, the combination, with a generator, *a*, and coke-shaft *b*, of perforated walls a^2 b^2, constructed and arranged substantially as and for the purpose set forth.

3. The combination of the movable slides or registers a^3, a^4, b^3, b^4, and b^5, with the entrance and exit channels of the coke-chambers, said slides being arranged substantially as shown, whereby, by their proper adjustment, each coke-chamber may be utilized as such, or by closing the passage for the outflowing products of distillation and connecting the coke-chamber with the main gas-channel, each coke-chamber may be utilized as a generator, as set forth.

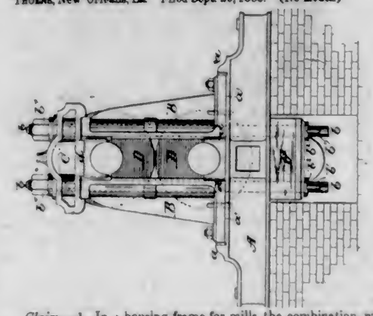
4. The combination, with the escape-channel for the non-condensible products of distillation, of a heating apparatus, consisting of perforated walls or channels a^2 b^2 in the surrounding or inclosing walls of the generator and coke-shafts for the preliminary heating of the gases, substantially as set forth.

291,423. FIRE-ESCAPE. SAMUEL J. STOVER, North Liberty, Ind. Filed July 26, 1883. (No model.)

Brief.—A fire-escape in which the rope-reel is geared to the shaft of the coiled spring, and which is provided with a sliding guide-pulley for the rope.



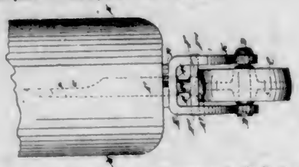
Claim.—In a fire-escape, the combination, with the metallic casing having partitions, and the shaft having the coil-spring secured thereto and to the casing, and the main cog-wheel, of the shaft having the meshing pinions and the flanged rope-drum, the traveling rope-guiding pulley, the non-sliding rope-guiding pulley, the rope-thimble, and the rope or chain, the said shafts being journaled in the casing and its partitions, substantially as described.



291,424. HANDSAW. CORNELIUS TENNEY, Brooklyn, N. Y. Filed Nov. 9, 1883. (No model.)

Claim.—In a handsaw, the combination of a blade and handle, constructed substantially as shown and described, with a brace secured to the handle about opposite the hand-opening, and having forwardly-projecting slotted arms firmly riveted or bolted to the blade, as and for the purpose set forth.

291,424.



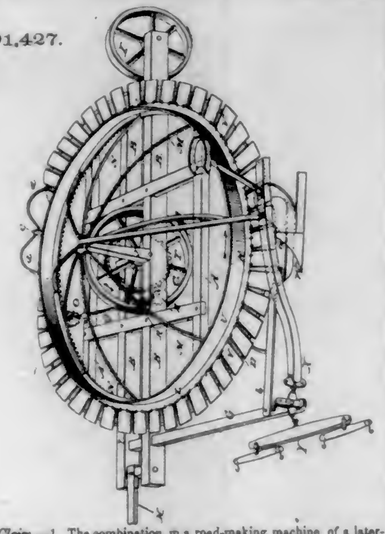
291,425. HOUSING FOR SUGAR AND OTHER MILLS. BURCHARD THOMS, New Orleans, La. Filed Sept. 29, 1883. (No model.)

Claim.—1. In a housing-frame for mills, the combination, with the bed-pieces A, having the recesses *a'*, of the brackets B, each having a hollow cylindric pillar, b^2, provided with a foot, b^1, caps C, and bolts or rods *b*, with securing devices, substantially as and for the purpose set forth.

2. In a housing-frame for mills, the combination, with the bed-pieces A, having the recesses *a'*, with shoulders *a*, of the brackets B, each consisting of a hollow cylindric pillar, b^2, having a rear web, b^4, and flanged foot b^1, caps C, and rods or bolts *b*, with securing devices, substantially as and for the purpose set forth.

291,426. CASTER. ARTHUR THOMPSON and GEORGE H. RICE, Brooklyn, N. Y., assignors to themselves, Isaac Mason, and Edward C. Barlow, all of same place. Filed Apr. 25, 1883. (Model.)

Claim.—1. A caster-swivel made in two parts, E F, the part F bridging across and connecting the two arms of the part E and strongly uniting them, as herein specified.



2. In a caster, the shank A, having a flattened portion, A^3, in combination with a swivel, E F, having one bearing above and the other below such flattened portion, adapted to serve as herein specified.

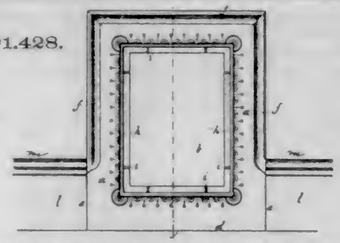
3. The shank A, having a flattened portion, A^3, and the caster-swivel E F, having a bearing above and below the said flattened portion, in combination with each other and with the pin D and wheel C, adapted to serve in the leg M, as herein specified.

291,427. ROAD-MAKING MACHINE. WILLIAM HENRY TIDLAND, Oakwood, Dak. Filed Sept. 11, 1883. (No model.)

Brief.—A plow adjustably attached to a cross-beam of the main frame delivers to a "shoe," from which the material is taken by a series of "cups" pivoted to a wheel revolving in an inclined plane, and having a vertical flange preventing material crowding up the cups and falling within its rim. Cups travel over, and their outer ends are supported by, a circular inclined track having at its highest point a fall or "shoulder," and an incline to drop and discharge and to raise the cups. The cogged rim of the wheel is geared through a shaft and cogged gears to the riding-wheel.

291,427.

Claim.—1. The combination, in a road-making machine, of a laterally-inclined circular track mounted upon a wheeled frame, and having the highest portion of the track forming a vertical shoulder and an inclined portion, an elevator-wheel journaled to travel in the same plane as the track, having means for rotating it, provided with a number of hinged elevator-cups hinged to its rim and traveling upon the surface of the track, and provided with an upright annular flange upon its upper surface at the inner end of the hinged cups, and a plow traveling at the side of the machine, throwing the soil upon the elevator-cups at the lowest point of the track, as and for the purpose shown and set forth.

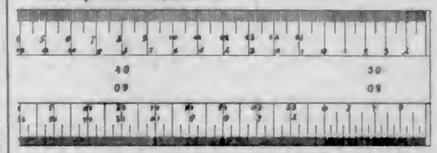


2. In a road-making machine, the combination of a laterally-inclined circular track mounted upon a wheeled frame, and having the highest portion of the track forming a vertical shoulder and an inclined portion, an elevator-wheel journaled to turn in the same plane as the track, rotated by means of connection with the drive-wheel, and provided with a number of elevator-cups hinged to its rim and traveling with their outer ends upon the track, and with an upright annular flange projecting from the upper surface of the rim at the inner ends of the cups, a plow traveling at the side of the machine, throwing the soil upon the elevator-cups at the lowest point of the track, and a shoe secured at the lowest point of the track, having the elevator-cups passing through it and serving to receive the dirt or soil from the plow, as and for the purpose shown and set forth.

3. The combination of a laterally-inclined frame having a cross-bar extending to one side, provided with a forwardly-projecting tongue at its inner end and a double-tree at its outer end, and provided with a caster or guide wheel at its rear end, a drive-wheel journaled in the frame supporting the same, and having a cogged rim engaging a pinion meshing with one of a number of other pinions, a circular track fastened upon the frame, and having its highest portion forming a vertical shoulder and an inclined portion, an elevator-wheel journaled upon an upright bar upon the frame, turning in the plane of the track, having a cogged rim upon its under side meshing with one of the pinions engaged by the rim upon the drive-wheel, provided with elevator-cups hinged to its rim, and with an upright annular flange, a spoon-shaped shoe secured to the rear end of a beam fastened at its forward end to near the outer end of the cross-bar at the forward end of the frame and secured to remain at the lowest point of the track, the elevator-buckets traveling through it, and a plow traveling at the side of the machine, having the forward end of its beam secured adjustably to the outer end of the transverse bar at the front of the frame, and throwing the soil into the shoe and upon the elevator-cups, all constructed to operate as and for the purpose shown and set forth.

291,428. FRAME FOR HOT-AIR REGISTERS. CHAS. W. TROTTER, Rochester, assignor to the Tuttle & Bailey Manufacturing Company, New York, N. Y. Filed Feb. 24, 1883. (Model.)

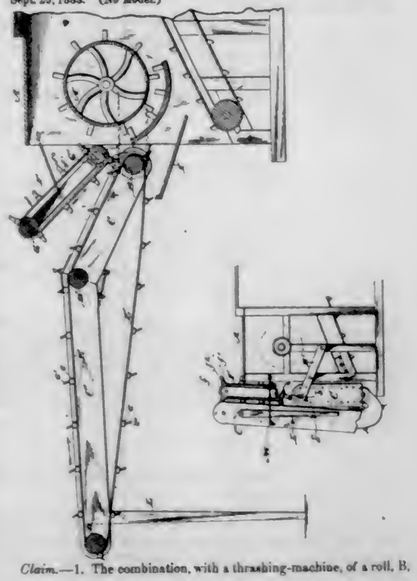
Claim.—1. A cast-metal hot-air-register frame consisting of front plate, *a*, having opening *b* for the register-box, and flanges *d e f*, which are flush with the outer edge of the frame and adapted to bear against the surface of the plaster wall and support the front plate flush with the front surface of the mop-board, substantially as described.



291,428.

2. A cast-metal hot-air-register frame consisting of front plate, *a*, having opening *b* for the register-box, and flanges *d e f*, to bear against the wall, the bottom flange, *d*, and the side flanges, *e*, being square to the face *a*, and the flange *f* being molded in conformity with the mop-board finish, or substantially so.

3. A cast-metal hot-air-register frame consisting of front plate, *a*, and flanges *d e f*, said front plate having opening *b* for the register-box, with surrounding depressed flange *h*, and bearing-ribs *i*, substantially as described.



291,429. GRADUATED SCALE. GEORGE F. TUTTLE, Newark, N. J. Filed Sept. 18, 1883. (No model.)

Claim.—1. A graduated scale having a zero one linear unit or part thereof, of any standard measure, from each end, and having the space between the zeros, and also the end linear units, divided into different and independent subdivisions on one and the same edge of the scale, substantially as herein shown and described.

2. A graduated scale having a zero one lineal unit from each end of each graduated edge, the end units being divided into thirty, fifty, seventy-five, and eighty parts, respectively, and the units between the zeros being divided into forty and sixty parts, respectively, substantially as herein shown and described.

291,430. GRAIN-FEEDER AND BAND-CUTTER FOR THRASHING-MACHINES. ORRIN COLLIN VAN NESS, Pomme de Terre, Minn. Filed Sept. 29, 1883. (No model.)

Claim.—1. The combination, with a thrashing-machine, of a roll, B, journaled at the feed end of the machine, side pieces C, pivoted at one end adjacent to the roll, side pieces C', hinged to the other ends of the pivoted side pieces, a roll, D, journaled at the outer ends of the hinged side pieces, a traveling grain-carrier mounted on the rolls, a traveling band-cutter carrier arranged above the delivery end of the carrier, and a cutter secured to said cutter-carrier, substantially as described.

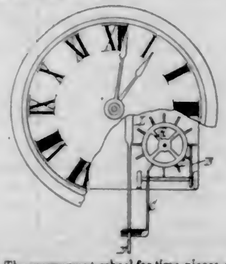
2. The combination, with a thrashing-machine, of a folding grain-carrier frame pivoted adjacent to the feed-opening of the machine, a band-cutter carrier pivoted above and adjacent to the said feed-opening, the grain-carrier and cutter-carrier being capable of folding up against the feed end of the machine, and means for holding the carriers in such position for transportation, substantially as described.

3. The combination, with a thrashing-machine, of an endless traveling grain-carrier and an endless traveling band-cutter carrier converging toward each other, and both pivoted at the feed end of the machine to fold up for transportation, and means for holding the carriers in such position, substantially as described.

4. The combination, with the thrashing-machine, of the carrier having a jointed extension-frame, and the bars supporting said frame having forked ends to receive the journals of the roll carrying the apron, substantially as described.

5. The combination, with the grain-carrier having inclined spikes, of the band-cutter and straw-spreader, said carrier and band-cutter converging toward each other, and the band-cutter traveling at a greater speed than the grain-carrier, substantially as described.

291,431. MANUFACTURE OF SMOOTH-FACED NAPLESS FELT BODIES. CHARLES VERO and JAMES EVERITT, Atherstone, County of Warwick, England. Filed Oct. 17, 1883. (No specimens.) Patented in France July 18, 1883, No. 156,596; in England Aug. 22, 1883, No. 4,072; in Belgium Aug. 25, 1883, No. 62,411, and in Germany Aug. 25, 1883.



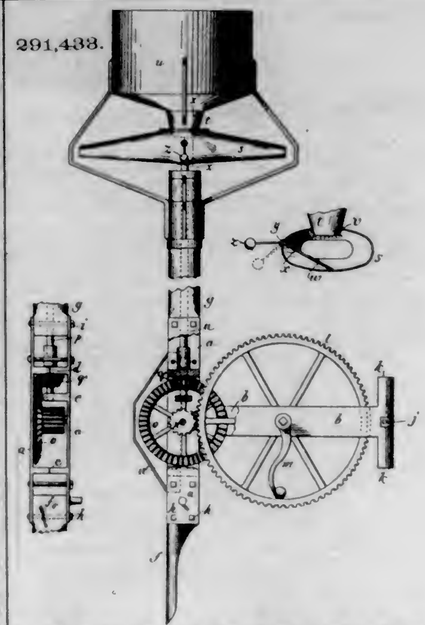
Brief.—Improvement on Letters Patent No. 284,924, dated September 11, 1883.

Claim.—1. The process of consolidating a covering of fur with a hardened and unfelted body, that is carried upon a perforated metal cone, or of consolidating a covering of fur that has been blown onto a perforated metal cone, the process consisting in wrapping wet flannels around the covering and placing over them another perforated metal cone, next admitting steam to the interior of the inner cone, and afterward working the outer cover to and fro.

2. The process of still further consolidating or combining a fur cover with a hardened and unfelted body, consisting in placing the previously hardened and unfelted body of wool or mixed wool and hair that has had a covering of fur partially secured to it onto a steam-heated perforated and canvas-covered cone, and over it placing a conical closely-fitting metal cover, to which an oscillatory revolving motion is then given to harden the bodies together.

3. The process of manufacturing napless fur-covered hat-bodies, consisting in mounting a previously-hardened body of wool, or mixed wool and hair, onto a steam-heated perforated and canvas-covered cone, and stretching over this a partially-hardened fur body, and over it placing a conical closely-fitting metal cover, to which an oscillatory revolving motion is then given to consolidate the two bodies together.

291,432. ESCAPEMENT-WHEEL. CARL VOTH, Philadelphia, Pa. Filed Aug. 4, 1883. (No model.)



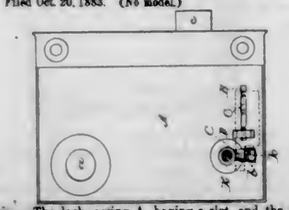
Claim.—1. The escapement-wheel for time-pieces, composed wholly of metal and formed integral with the cylindrical teeth L, substantially as described.

2. In a time-piece, the combination, with the pendulum and the anchor having flukes, of the escapement-wheel A, cut or stamped from sheet metal and formed integral with the cylindrical teeth L, whereby the flukes of the anchor glide easily out of and into contact with the teeth, and the latter are prevented from becoming loose, substantially as described.

291,433. BROADCAST SEED-SOWER. JOHN CALVIN WADDELL, Union City, Tenn. Filed May 16, 1883. (No model.)

Claim.—1. The gear-frame and staff of a broadcast sower, consisting of the T-plates *a b*, step *f*, and wood staff *g*, bolted together, the plates having stop-studs *c d k*, also stop-stud *e*, and having the pivot-bearings of the gear formed in them, substantially as described.

291,433.



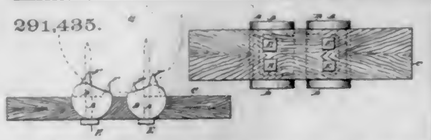
2. The stop-studs *k* of the parts *b* of the gear-frame plates, extended transversely to said parts *b* to form a handle for holding the machine when in use, substantially as described.

3. The combination, in the gear-frame and supporting-staff of a broadcast sower, of plates *a b*, handle *k*, and the guard *a'*, substantially as described.

4. The combination, in the supporting and driving gear of a broadcast seed-sower, of the T-plates *a b*, bearing studs *c d e*, step *f*, staff *g*, driving-wheel *l*, pinion *n*, bevel-wheel *o*, pinion *q*, and the shaft *p*, said shaft being arranged in the staff *g* and having the cross-spout attached to it, substantially as described.

5. The combination, with the revolving cross-spout *s* and nozzle *t*, of the valve *w* and bent lever *x*, pivoted to said spout, and having said valve and the counterpoise *z* secured directly thereto, the said lever extending through and to the outside of the said spout, essentially as shown and described, and for the purpose set forth.

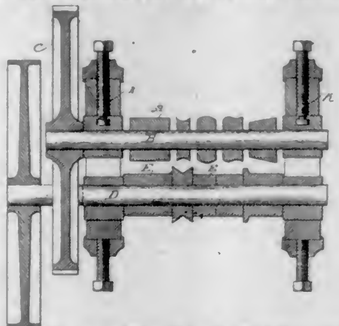
291,434. KEY-FASTENER. EDWARD WILLIAM WAGNER, Cherokee, Cal. Filed Oct. 20, 1883. (No model.)



Claim.—The lock-casing A, having a slot, and the bolt C within said casing, and having a thumb-piece projecting through said slot to the outside, in combination with the key K, having bit *k*, with a notch, *m*, with which said bolt is adapted to engage to prevent the key from turning, substantially as herein described.

291,435. DEVICE FOR ATTACHING CROSS-BARS TO TELEGRAPH-POLES. CHRISTOPHER H. WAGNER, Elkhart, Ind., assignor of one-third to William Kline, Toledo, Ohio. Filed Apr. 19, 1883. (No model.)

Brief.—Cross-bars are attached to telegraph-poles by means of clamps consisting of wedge-shaped horizontally-slotted plates having rearwardly-projecting lugs and forwardly-extending flanges at their ends, the cross-arm being fitted between said flanges and fastened by bolts or spikes.



291,435.

Claim.—1. The herein-described clamps or holders for attaching cross-arms to telegraph-poles, the same consisting of wedge-shaped horizontally-slotted plates having rearwardly-projecting sharp-pointed lugs or barbs and forwardly-extending flanges at their upper and lower ends, substantially as set forth.

2. The combination, with a telegraph-pole, of a pair of clamps or holders consisting of wedge-shaped horizontally-slotted plates having rearwardly-projecting sharp-pointed lugs or barbs and forwardly-extending flanges at their upper and lower ends, a cross-arm fitted between said flanges, and fastening bolts or spikes, substantially as and for the purpose set forth.

291,436. METHOD OF AND MACHINE FOR ORNAMENTING WOOD. CARL WAGNER, Columbus, Ind. Filed June 13, 1883. (No model.)

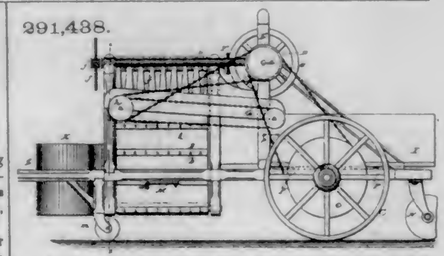
Claim.—1. The method hereinbefore described of ornamenting wood, consisting of crushing in or depressing, without the removal of any part thereof, by means of roughened raised surfaces of a die, all the parts about the figures to be produced, whereby an imitation of carving is formed, substantially as described.

2. A die or tool for making wood-carving, consisting of sunken ornamental parts or figures and raised roughened parts, substantially as described.

3. A die or tool for making wood-carving, consisting of sunken ornamental parts or figures and raised roughened parts, said tool having ventilating-holes X X, all substantially as described.

291,437. CONSTRUCTION OF PACKING VESSELS OR CANS. FRANCIS A. WALSH, Milwaukee, Wis. Filed Nov. 6, 1883. (No model.)

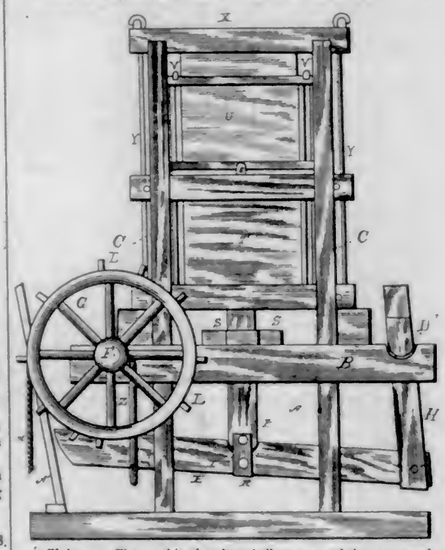
Claim.—1. In a can or package, the combination of a support partially embedded in its body, with a cover suitably secured thereon, as set forth.



2. In a sheet-metal can, the wire *a*, in combination with the bead *b*, for supporting the cover *c*, substantially as described, and for the purpose set forth.

3. In a sheet-metal can, the body A, having outside bead, *b*, supporting the wire *a*, in combination with the cover c and the lip *d*, substantially as shown and described, and for the purpose set forth.

291,438. COTTON-HARVESTER. FERNANDO I. WARNER, Memphis, Tenn. Filed Mar. 6, 1883. (No model.)

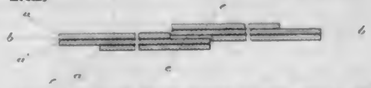


Claim.—1. The combination, with the toothed belts A, two pairs of rollers, *a a'*, and the pinions F on the upper rollers, *a*, of the gear-wheels *e*, the two independent shafts *d*, the wheels D thereon, the pulleys secured on the supporting-wheels C, and the driving-belts, as described, whereby each picker-belt is run by its own supporting-wheel independently of the other, as specified.

291,438.

2. The combination, with the frame E, of two toothed belts, A, their rollers *a'*, journaled in the swinging frames *k*, and means for adjusting said frames relative to a vertical plane, for the purpose specified.

291,439. BALING-PRESS. COLUMBUS C. WARREN and WILLIAM H. OLIVER, Beauregard, Miss. Filed June 22, 1883. (No model.)



Claim.—1. The combination, in a baling-press, of the compound lever consisting of the beam I and arms H, the latter being provided with a transverse fulcrum-beam, D, which is seated in the longitudinal sills B, as shown, and the vertical beam P, attached to the follower and secured at its lower end in a bearing in the said lever I, with mechanism for operating the same, substantially as specified.

2. In a baling-press, the compound lever E, vertical beam P, and follower, constructed and arranged as described, in combination with the driving wheel and shaft and connecting rope or chain for operating the lever, substantially as specified.

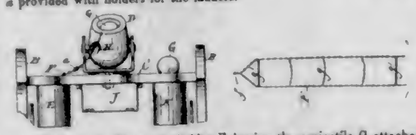
3. The combination, in a baling-press having a hinged cap-block, of the beam attached to the upper face thereof, and slotted at its ends to receive the side rods, adapted to hold the said block and beam down, substantially as shown and described.

291,440. ROOFING FABRIC AND METHOD OF APPLYING THE SAME. CYRUS M. WARREN, Brookline, Mass. Filed Mar. 30, 1883. (No model.)

Claim.—1. A roofing fabric composed of three webs or layers of felt or other suitable material cemented together with layers of water-proof cement, the outer layers of which are so arranged or disposed as to make the fabric of two thicknesses of felt at the edges, as set forth.

2. A roofing fabric composed of a series of layers of felt or other material cemented together in the manner described, so as to leave a ledge or rabbeted portion at both edges, the rabbeted portions having cemented thereto a strip of Manila paper or other thin material.

3. A roof the covering of which is composed of roofing-felt, the layers of felt being overlapped at the edges and secured to the roof-boards by means of a wire or wires and staples or hooks, as set forth.



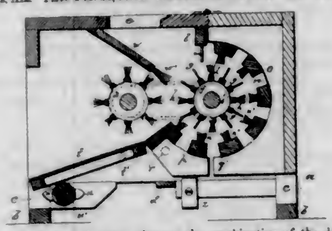
4. A fastening for the overlapping edges of a felt or fabric roofing, consisting of a thin strip of metal bent at its center, so that the lower end can be placed on or within the underlapping edge of the felt and the upper end placed over the overlapping edge of the felt, as set forth.

5. A roof-covering composed of overlapping layers of felt, substantially such as described, the overlapping edges of which are secured by metallic straps and wires, substantially as described.

6. In a machine for making roofing-felt, in which the edges are made thinner than the main portion, the rollers A B, the opposite ends of which are made larger or of a greater diameter than the other portions of the rolls, and mounted so as to leave a space between the enlarged portions and the opposite roll to admit of the passage of the thin edges of the felt therethrough, as set forth

291,441. FIRE-ESCAPE. GEORGE W. WATTS, Brooklyn, N. Y. Filed Feb. 10, 1883. (No model.)

Brief.—The projectile and anchor are connected to the ladder by a swiveled chain to prevent twisting of the ladder by the revolutions of the projectile. The mortar is secured to a cross-piece on the truck, which is provided with holders for the ladders.

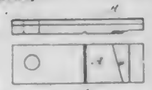


Claim.—1. The chain ladder F, having the projectile G attached to it by the swiveled chain *f*, in combination with the grapnel or anchor H, substantially as and for the purposes set forth.

2. The combination, with the projectile G, of the ladder F and swiveled chain *f*, connecting the ladder and projectile together, whereby any revolution that the projectile may have will not be communicated to the ladder, substantially as and for the purpose set forth.

3. The cross-piece C, provided with the holders E and box J, in combination with the mortar D, chain ladder F, and projectile G, substantially as and for the purposes set forth.

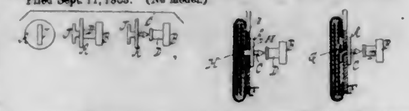
291,442. SEED-COTTON CLEANER. JOHN WESLEY WEBB, Union Springs, Ala. Filed Feb. 24, 1883. Renewed Oct. 16, 1883. (No model.)



Claim.—1. In a seed-cotton cleaner, the combination of the drum *f*, having the teeth and brushes *g h*, the spreader *l* above the drum, the curved brush *n*, the fan-brush *s*, guide-board and brushes *w w'*, and the jolting-screen *t*, substantially as and for the purposes specified.

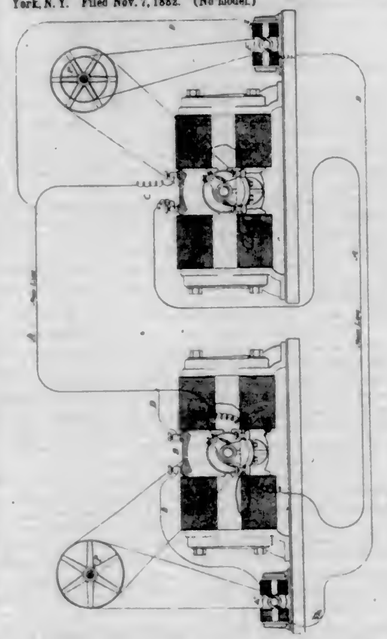
2. In a seed-cotton cleaner, the combination, with the sectional curved brush, of the drum *f*, having the brushes and teeth, the spreader *l*, and the brush-fan *s* and jolting-screen *t*, substantially as specified.

3. In a seed-cotton cleaner, the combination, with the brushes and spreader, as described, of the feed-board having a brush-strip at its lower end, substantially as specified.



291,443. NAILING-MACHINE. HORACE WEBB, Boston, Mass. Filed Oct. 15, 1883. (No model.)

Claim.—1. The movable jaw A, provided with a cutting-edge cavity, *c*, and driving-recess *a'*, with the movable jaw B, having the cutter *e* and nail-holding recess *d'*, all substantially as and for the purposes described.



2. The combination of the cam D, the movable jaws A B, as described, and levers *d' d*^{4}, whereby the waste is cut from the wire by the movement of one jaw, and the nail then severed from the wire and fed under the driver by the movement of the other jaw, all substantially as and for the purposes described.

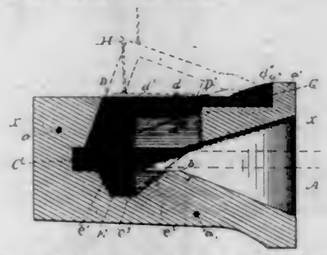
291,444. NECK-WEAR FASTENER. JOSEPH WEIL, New York, N. Y. Filed Sept. 11, 1883. (No model.)

Claim.—The combination, with a bow or scarf having a shield provided with an opening, as specified, of a fastener which is composed of the button-head and back, having posts for engagement with each other, and which is provided with means, substantially such as herein described, for detachably securing it to the shield in said opening thereof.

291,445. METHOD OF AND APPARATUS FOR REGULATING THE ELECTRICAL TRANSMISSION OF POWER. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Nov. 7, 1882. (No model.)

Claim.—1. In a system for the electrical transmission of power, the combination of a generator, a motor, a circuit connecting the generator and motor, and an independent regulating-circuit, and means included therein, for controlling at the motor the current generated or power transmitted.

2. In a system for electrical transmission of power, the method hereinbefore described of regulating the current generated, which consists in exciting the field of the generator by a circuit of normally constant electro-motive force, regulating the amount of current flowing in said circuit by a counter electro-motive force and varying the counter electro-motive force in proportion to the speed of the motor, as set forth.



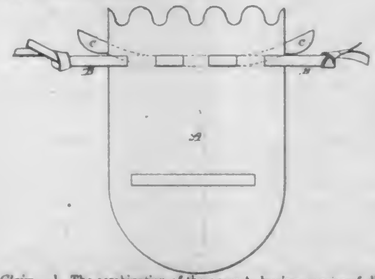
3. The combination, with a main line, a generator of electricity, and a motor included in the same, of an independent regulating-line parallel with the main and regulating devices included therein, the operation of said devices being made to depend upon the speed of rotation of the motor, substantially as and for the purpose set forth.

4. The combination, with an electric circuit, a generator driven at a constant rate of speed, and a motor, of an independent circuit, including the field-magnet coils of the said generator, a generator of relatively high electro-motive force included in said circuit and driven at a constant rate of speed, and an opposing generator of relatively low electro-motive force driven at a speed corresponding to that of the motor.

5. The combination, with a driving-engine, a generator, a motor, and a circuit including the motor and the armature of the generator, of

an independent circuit, including the field-magnet coils of the generator, a generator of relatively high electro-motive force included in said circuit and connected with the driving-engine, and an opposing generator of relatively low electro-motive force connected with or driven by the motor, substantially as set forth.

291,446. CAR-COUPLING. RANSOM S. WHEELER and JAMES WHEELER, Red Oak, Ma. Filed June 23, 1883. (No model.)

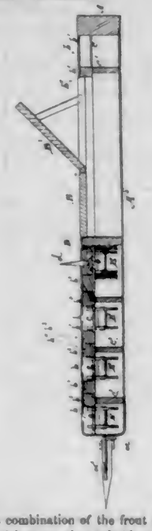


Claim.—1. The herein-described coupling device, having the draw-head formed with the outwardly-flaring mouth, the chamber C at the inner end of the mouth, the aperture D, extending from said chamber to the top, the slot D′, the recess d^4, the abutments d^3, in combination with the vertically-swinging link-fastener, having the engaging part F′, the web F^3, arranged to have the engaging part F′ bear against the said abutments d^3, the arm F, pivoted at its forward end to the top of the draw-head, and arranged to rest within the recess d^4, substantially as set forth.

2. The combination of the draw-head having the inwardly-contracting mouth, the chamber C at the inner end of the mouth, the aperture D, extending from said chamber to the top, and formed with an inner inclined wall, d', and with an abutment or shoulder, d^3, at its front side, and the vertically-swinging link-fastener, having the arm F pivoted at its forward end, and the pin portion or engaging part F′, which bears against the shoulders d^3, and which, when rising, strikes against the said inclined wall d', substantially as and for the purposes set forth.

3. The combination of the draw-head having the chamber C, the recess E in the bottom thereof, the shoulders e^2, the aperture D, extending from the chamber C to the top of the draw-head, the shoulders or abutments d^3 at the front of said aperture, and the link-fastener, having the arm F pivoted at its forward end, and the pin portion or engaging part F′, which is situated in the aperture, and which, when engaging with the link, is situated across the chamber C, and bears against the lower shoulders or abutments, e^2, and the upper shoulders or abutments, d^3, substantially as and for the purposes set forth.

4. The combination of the draw-head having the chamber C, the recess E in the bottom of said chamber, having the inclined wall e, the shoulders d^4, the aperture D, extending from the chamber C to the top of the draw-head, the shoulders or abutments d^3, the slot D′, the recess d^4, and the fastening device having the web F^3, with a front inclined edge, f, adapted to lie in proximity to the wall e, the arm F, pivoted at its forward end, and the pin portion or engaging part F″, wider than the web F^3, and adapted to bear against the shoulders or abutments d^3 and e^2, substantially as set forth.



291,447. PURSE. NELLIE J. WHEELER, West Winfield, N. Y. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination of the purse A, having a series of slits or openings made through its top, with the divided strings B, which have their free ends passed through the slits in opposite directions and then fastened together, and which strings are provided with the ears C, substantially as shown.

2. The combination of the bag A, having a series of slits made through its upper end, with the divided strings B, provided with the ears C, the free ends of the strings being passed through the slits in opposite directions and then fastened together, the ends which are provided with the ears C being stitched in or to the purse A, so as to be held permanently in position, substantially as set forth.

291,448. HARVESTER-PLATFORM. CHARLES WHITNEY, Sycamore, Ill., assignor of three-fourths to C. W. Marsh and W. W. Marsh, both of same place, and Ralph Emerson and William A. Talcott, both of Rockford, Ill. Filed May 1, 1883. (No model.)

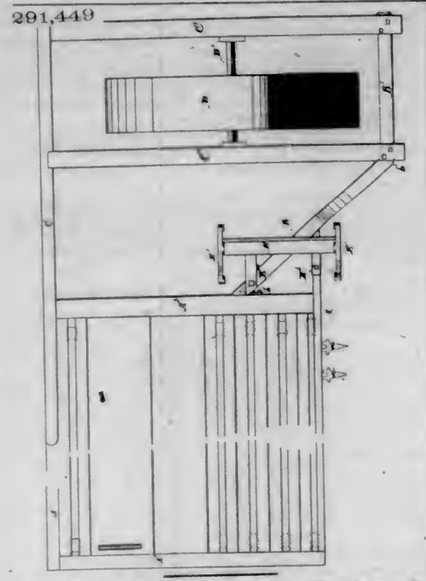
Claim.—1. The combination of the front platform-chain and the finger-beam, formed of iron or other suitable material, and having its upper edge turned inward over the chain to form a shield or covering for the front of the chain and enable the latter to work close to the sickle and on the butts of the grain, substantially as and for the purpose described.

2. A finger-beam having its upper edge turned inward to form a shield for a front platform-chain, and having its front face provided with an angle-iron, a, substantially as and for the purpose described.

3. A grain-receiving platform consisting of removable strips b', secured to strips b'' b^2 to form slots or openings b, for enabling access to be had to the interior of the platform for repairs and cleaning, substantially as specified.

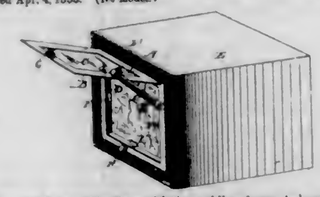
4. A grain-receiving platform consisting of the front and rear section, having slots b, formed by strips b', secured to secondary strips, b'' b^2, trackway c, supports c', and bottom A^2, in combination with a chain, D, having teeth d, substantially as and for the purposes specified.

5. The frame F, adjustably mounted on the platform-frame, and having side pieces, between which is journaled the pulley E, in combination with means for securing the said frame in its adjusted position, and the carrier-chain supported by the pulley and guide by the side pieces of the frame, substantially as described.



6. The frame F, having at one end a longitudinal slot, f'', and at its other end the side pieces, f, between which the pulley E is journaled, in combination with a bolt, g, passing through the slot of the frame, for adjusting and holding the frame, and the carrier-chain supported by the pulley and guided by the side pieces of the frame, substantially as described.

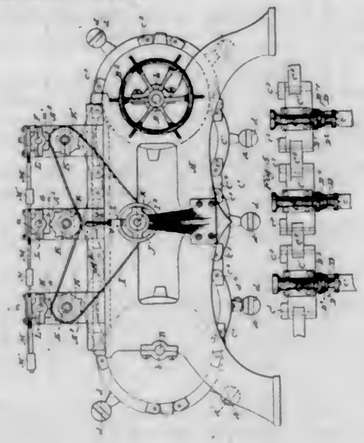
291,449. GRAIN-HARVESTER FRAME. CHARLES WHITNEY, Sycamore, Ill., assignor of three-fourths to Ralph Emerson and William A. Talcott, both of Rockford, and C. W. Marsh and W. W. Marsh, both of Sycamore, Ill. Filed May 1, 1883. (No model.)



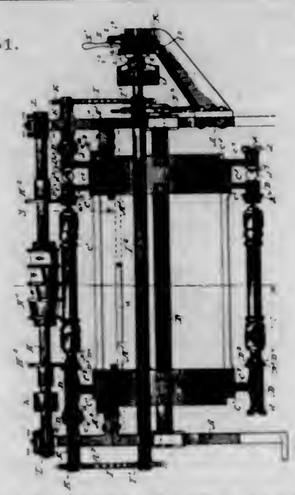
Claim.—1. The combination of the main drive-wheel frame, the platform-frame, the finger-bar, and a brace extending from the front sill of the main drive-wheel frame to the platform back of the finger-bar, the latter being secured thereto, whereby the finger-bar is supported at its inner end by said brace and the main drive-wheel frame, platform, and finger-bar are braced, substantially as described.

2. A front sill and bracing, B B′, of a single piece of material, bent or curved in shape to form a front sill to a main drive-wheel frame and a brace and connection for the grain-receiving platform and drive-wheel frame, and to furnish also a support for the inner end of the finger-beam and a binder-frame, substantially as specified.

291,449



291,450. SHOW-BOX COVER. JOHN GEO. WHITE, Pensacola, Fla. Filed Apr. 4, 1883. (No model.)



Claim.—The combination, with the molding-frame A, having strips D near the outer edges, of the frame B, hinged to fit within it, and having stud L projecting from a jaw, L′, on the frame B, the thumb-screws F, and the brace J, pivoted to frame A, and having the longitudinal slot K, terminating in a notch, a, whereby the cover may fit closely in the box and be held open, as described.

291,451. GEOMETRIC LATHE. SAML. K. WHITE, Chicago, Ill. Filed Mar. 29, 1883. (No model.)

291,451.

Claim.—1. In a geometric lathe, the combination, with a rotating movable cutter-arbor and relatively stationary blank-spindles, of independently-movable bearings for the several ends of the cutter-arbor, and a cam on each blank-spindle for controlling the distance between the several ends of the cutter-arbor and the ends of the blank, substantially as described.

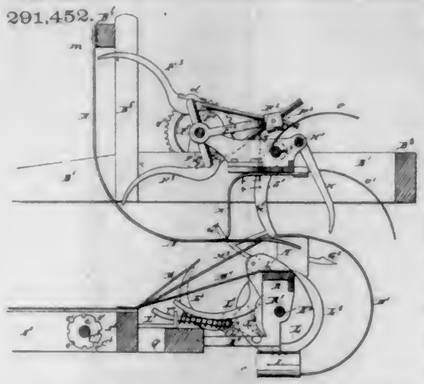
2. In a geometric lathe, the combination, with the rotating movable cutter-arbor and with the blank-spindle, of a pattern-cam secured to the blank-spindle and a plate opposed to said cam, mounted on the said arbor, or a part belonging thereto, and having a curved surface for contact with the cam of practically equal radius with the cutters, substantially as described.

3. In a geometric lathe, the combination, with a movable cutter-arbor, a traveling support provided with spindles for the blank, and a stationary spindle constructed to engage the blank-spindle when the latter is in working position with reference to the cutter-arbor, of a disk or cam upon said stationary spindle, arranged to control the distance between the cutter-arbor and the blank, substantially as described.

4. In a geometric lathe, the combination, with two or more rotating and independently-movable cutter-arbors arranged in a practically horizontal plane, of a series of blank-spindles, a continuous chain-carrier for supporting said blank-spindles, means for guiding said chain-carrier in a plane parallel with that of the cutter-arbors, means for intermittently moving said chain-carrier so as to present each one of the blanks in succession to the said cutter-arbors, and means for rotating the said blank-spindles when opposite the cutter-arbors, substantially as described.

5. The combination, with two or more cutter-arbors, and with the series of connected plates C′, for supporting the blank-spindles at the same distance apart as the cutter-arbors, of mechanism for moving said plates, stationary guides for said plates, and means for rotating the spindles when opposite the cutters, substantially as described.

6. The combination, with the cutter-arbors and a chain-carrier for the blank-spindles, of wheels B′, guides A′, placed between said wheels, and means for rotating the blank-spindles when opposite the cutters, substantially as and for the purposes set forth.



7. In a geometric lathe, the combination, with a rotating cutter-arbor and with spindles for supporting the blanks, of the blank-spindle carrier composed of a double series of plates, C′, oppositely arranged and rigidly connected in pairs, mechanism for moving the carrier, and stationary guides for said plates, substantially as described.

8. In a geometric lathe, the combination, with the slotted standards A^2, the independently-movable cutter-arbors mounted therein, and traveling carrier for the blank-spindles D, of the spindles E, mounted in the standards A^2, and driving mechanism applied thereto, substantially as described.

9. The combination, with the standards A^2, of the cutter-arbor journal-boxes mounted movably therein, and with driving-spindles E, also mounted in said standards, of pattern-cams secured to said spindles, and plates mounted on the boxes of the cutter-arbor in position to engage said cams, substantially as described, and for the purposes set forth.

291,452. GRAIN-BINDING HARVESTER. CHARLES WHITNEY and WILLIAM W. MARSH, Sycamore, Ill. Filed June 19, 1882. (No model.) Patented in England May 6, 1880, No. 530, Dec. 7, 1880, No. 5,088, and May 3, 1881, No. 1,920.

291,452.

Claim.—1. The combination of the crank on the binder-arm shaft, the wheel E″, the adjustable wrist-pin on said wheel, and the extensible pitman connecting the wrist-pin with the crank on the binder-arm shaft, the whole for adjusting the throw of the binder-arm.

2. The combination of a clutch, a clutch-dog adapted to engage and disengage the same, a clutch trip-lever carried by the tripping compressor-finger shaft for locking the clutch-dog, and means for adjusting the clutch trip-liver to vary its contact with the clutch-dog, substantially as described.

3. The tripping compressor-finger shaft H′ and frame H″, in combination with the clutch trip-lever H³, adjusting-screw A, clutch I, and clutch-dog I³, for automatically releasing the clutch by the pressure of the inflowing grain, and varying the size of the bundles, substantially as specified.

4. The clutch trip-lever H³, adapted to be operated from the pressure of the inflowing grain, and engaging a clutch, in combination with a guide arm or bar for holding the lever disengaged while the binding operation is being performed, substantially as specified.

5. The clutch trip-lever H³, engaging a clutch, and adapted to be operated from the inflowing grain, in combination with the guide arm or bar H⁴ on the pitman G and the pressure-spring h′, substantially as and for the purposes specified.

6. The metal plates M, located at the base of the slot M′, in combination with the discharging-fingers for preventing the point of the fingers engaging with the inflowing grain, substantially as and for the purposes specified.

7. The adjustable fender-bars N′, in combination with the binding-platform for increasing or decreasing the throatway or passage for the inflowing grain to the binder, substantially as specified.

8. The curved rods or bars N and the adjustable fender-bars N′, in combination with the binding-platform for the grain, for delivering the grain to the binder, substantially as specified.

9. A lever for operating the cord-holder, consisting of two angle-plates adjustably connected together for changing the throw of the dog and causing it to properly perform its work, substantially as described.

10. The folding finger located on the main or drive wheel and adapted to engage the bundle and move it backward, and means for operating the finger, substantially as specified.

11. The finger T, having an arm or extension, T′, in combination with a spring and devices for throwing the finger out, substantially as and for the purposes specified.

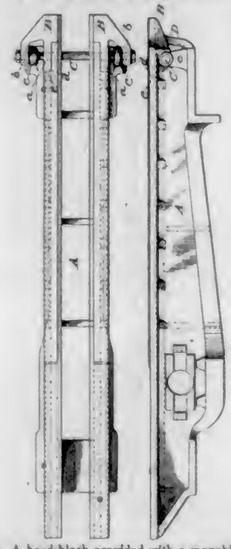
12. The finger T, having an arm or extension, T′, in combination with a spring r, rod or link T″, and arm or lever T², and operating mechanism for folding and projecting the finger, substantially as and for the purposes specified.

13. The finger T, in combination with the rod or link T″, arm or lever T², and cross-beam B², for projecting the finger to engage the butt-end of the bundle, substantially as and for the purpose specified.

14. A sprocket-wheel having two diameters, as described, in combination with a driving-chain, whereby the wheel is adapted for use either as a driver or driven wheel in operation, substantially as and for the purposes specified.

15. The sprocket-wheel U, having the faces s and notches or depressions t, forming together two diameters on the same wheel, in combination with a drive-chain, and operative mechanisms for adapting either the wheel or the chain to act as the driver, substantially as and for the purposes specified.

16. The brace-bars X′ X³, in combination with the front beam, B, cross-beam B², and front beam of the platform-frame, for forming a bracing and support for the finger-beam, substantially as specified.



17. In a grain-adjusting mechanism, a longitudinally-adjustable shaft, a worm wheel or screw connected with the rear end thereof, and located on the binding-platform, and means for adjusting the angle at which the wheel operates on the platform, substantially as described.

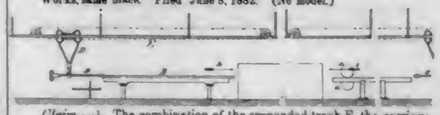
18. In a grain-adjusting mechanism, a shaft and a worm wheel or screw located on the grain receiving and binding platform, and connected with the shaft by a universal joint, whereby its angle relative to the shaft can be varied, substantially as described.

19. The combination of packer-fingers and an adjustable connection between them and the binder-arm, for causing them to enter and leave the grain and varying the operative position of the fingers, substantially as described.

20. The combination of continuously-operating packer-fingers, a binder-arm, and an adjustable connection between the fingers and the arm, whereby the stroke of the fingers may be varied and they are carried out of the grain as the binder-arm descends, substantially as described.

291,453. SAW-MILL HEAD-BLOCK. THEODORE S. WILKIN, Milwaukee, Wis. Filed Nov. 15, 1883. (No model.)

Claim.—1. A head-block provided with a movable nose-section or fore end adapted to yield when encountering an obstruction, substantially as and for the purpose explained.



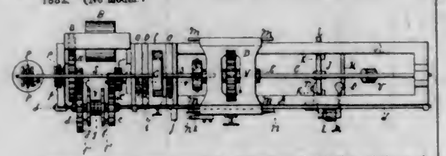
2. In combination with a saw-mill head-block, a separate nose or fore end connected therewith by a hinge or joint, substantially as shown and described.

3. In combination with a saw-mill head-block, substantially as shown, a fore end or nose-section pivoted thereto, and having its vertical faces beveled from the sides inward toward the middle, substantially as and for the purpose explained.

4. In combination with a head-block and a fore end or nose-section pivoted thereto, a fixed stop to limit the descent of the nose-section.

5. In combination with head-block A, having ears c, nose-section B, having ears a b, pivot-bolt C, and stop or rest to limit the descent of the nose-section, substantially as shown.

291,454. MECHANISM FOR INTRODUCING TUBES INTO FURNACES. EDWARD W. WOLFE, Reading, Pa., assignor to the Reading Iron Works, same place. Filed June 8, 1882. (No model.)



Claim.—1. The combination of the suspended track E, the carriage D, adapted thereto, the swiveling sleeve j and pusher-bar x, the chain P, connected at both ends to the carriage, the pulley L′, the shafts G J, bevel-wheels H H′ I, clutch R, and chain-pulley L on the shaft J, all substantially as set forth.

2. The combination of the suspended track, the carriage adapted thereto, the driving-shaft G, the bevel-wheels and clutch thereon, the shaft J, its chain-pulley L and bevel-wheel I, the sliding rod U, and

mechanism whereby the said sliding rod, actuated by the carriage, is caused to operate the clutch and throw the said shaft J out of gear, all substantially as set forth.

3. The combination of the carriage, the forked rod i, swiveled thereto, the sleeve j, and the push-rod x, adapted to the sleeve and connected thereto, substantially as set forth.

291,455. LATHE. AUBIN WOOD, Worcester, Mass. Filed Dec. 22, 1882. (No model.)

Claim.—1. The combination, in a shaft-turning lathe, of the tool-holders t, fixed tools t′, traversing puppet D, and supporting-pulleys p, as described, and for the purposes set forth.

2. The combination, in a shaft-turning lathe, of the tool-holders t, fixed tools t′, traversing puppet D, hollow spindle E, and supporting-pulleys p, as described, and for the purposes set forth.

3. The combination, in a shaft-turning lathe, of the stationary tool-holders t, fixed tools t′, and supporting-pulleys p, with means for rotating the shaft, as described, and for the purposes set forth.

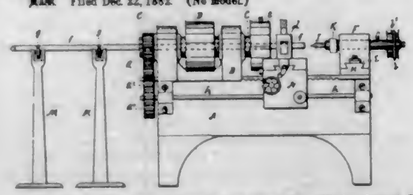
4. The combination, in a lathe, of two or more cutting-tools, t′, separate tool-holders t, slides o o o, by means of which each tool-holder t and its cutting-tool t′ may be independently adjusted and without loosening the tools in the tool posts or holders, and the slide l carrying the slides o o o, and by means of which all the tool-holders and their tools may be adjusted conjointly, as and for the purpose set forth.

5. The combination, with the traversing puppet D, of the cam-plate k, bell-crank lever q, clutch y, gear-wheels d and e, and feed-screw S, all arranged and operating as set forth, and for the purpose specified.

6. The shaft-supports I and T, sliding plate J, rack R′, sector R″, and weighted lever V, in combination with the shafts C and S, as described, and for the purposes set forth.

7. The shaft-supports I and T, sliding plate J, arms N N, weighted lever V, operating as described, and the actuating cam-plates m m, attached to the puppet D, as and for the purposes set forth.

8. The combination, with the supports I and T, plate J, arms N N, and groove R, of the latching device consisting of the lever Q, spur W, and weighted lever O, all operating as described, and for the purposes set forth.



9. The combination, in a shaft-turning lathe, of the tool-holders t, fixed tools t′, traversing puppet D, substantially as described, and means for supporting the free end of the shaft in a horizontal and vertical plane coincident with its axis of rotation, as and for the purpose set forth.

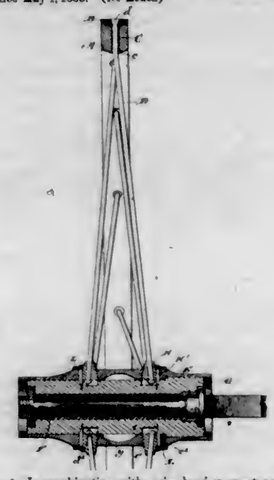
10. In a shaft-turning lathe, the combination of the tool-holders t, cutting-tools t′, supporting-pulleys p, post P, capable of a lateral motion at the top, turning on the pivots 4 4 at the base, and suitable means for rotating the shaft, as and for the purpose set forth.

11. In a shaft-turning lathe, the combination, with a series of supporting-pulleys, of a series of posts, P, with pivots 4 4 at the bottom of each post, so as to allow a slight lateral motion to the top of the post, as and for the purpose set forth.

12. In a shaft-turning lathe, the posts P, flanges 7 7, and check-screws 5 5, as and for the purpose set forth.

291,456. SHAFT-CENTERING LATHE. AUBIN WOOD, Worcester, Mass. Filed Dec. 22, 1882. (No model.)

Claim.—1. The combination, in a turning lathe, with head-stock B, spindle C, tail-stock F, and spindle G, of the rotating drill-holding spindle G′, as described, and for the purposes set forth.



2. The combination, with the tail-stock of a turning-lathe, of a rotating drill-holding spindle and suitable connected means for operating the same, as and for the purposes set forth.

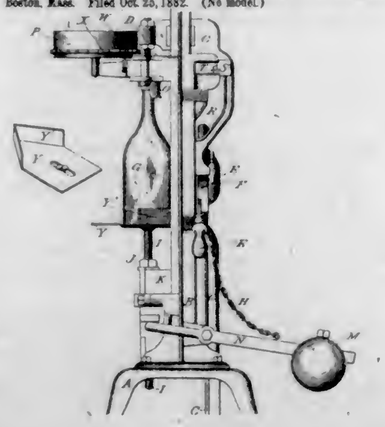
3. The combination, in a turning-lathe, of the tail-stock F, spindle G, rotating drill-spindle G′, and connecting yoke or bar K, as and for the purposes set forth.

4. The combination, in a turning-lathe, of the transversely-sliding tail-stock F, spindle G, rotating spindle G′, and the stops L and L′, as described, and for the purposes set forth.

5. The combination, with a shaft-centering lathe, of one or more pairs of anti-friction pulleys, the pulleys of each pair overlapping each other and being arranged in proper position with reference to the lathe, so as to allow the shaft while being centered to rotate upon the peripheries of the pulleys, as and for the purpose set forth.

291,457. VEHICLE WHEEL. ALONZO B. WOODARD, Hornellsville, N. Y. Filed May 1, 1883. (No model.)

Claim.—1. In combination with a rim having apertures, and bushings for said apertures having flanges and flaring outer ends, as shown, a series of metal spokes having enlarged ends, the outer ends being received in the bushings, and the inner ends held to the hub by movable locking-bearings, substantially as described.



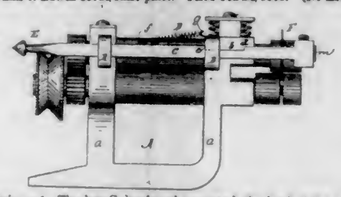
2. The combination, in a vehicle-wheel, of the spokes passing through the rim, the wedge-blocks secured to said spokes, the hub mortised for the reception of the wedge-blocks, and the keys for securing the wedge-blocks in position, substantially as described.

3. The combination of a spoke-locking block having a spoke-receiving groove with an apertured hub, a spoke having a straight face at its inner end, and a fastening-key, substantially as described.

4. The combination of a metallic hub having a wood filling and radial mortises with spokes having wedge-shaped locking-blocks, and keys driven into the wood filling, substantially as described.

5. The combination, with the spokes, the hub having recesses, and the wedge-shaped locking-blocks, of the locking-keys and the band L, for locking the entire series of keys in place, substantially as described.

291,458. MACHINE FOR CORKING BOTTLES. EDWIN E. WORDEN, Somerville, GEORGE TAYLOR, Everett, and JOHN POWER and EBEN D. COLBY, Boston, Mass. Filed Oct. 25, 1882. (No model.)



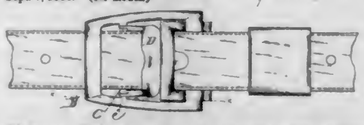
Claim.—1. In a machine for corking bottles, the combination of the independent removable cork-receiver bushing V, and corresponding plunger, D, and curved guide-plate O, constructed and arranged substantially as shown and described, as and for the purposes set forth.

2. In a machine for corking bottles, the combination of the adjustable bottle-guide holder Y, provided with the angle or incline vertical sides Y', whereby various sizes of bottles may be guided into proper position beneath the cork driver or plunger, as and for the purposes set forth.

3. In a machine for corking bottles, the combination, with the weighted lever N, having an adjustable weight, M, and operating-handle E, of the chain H, connecting said handle and lever direct, substantially as shown and described, as and for the purposes set forth.

291,459. DEVICE FOR SHARPENING THE BLADES OF FABRIC-SEAM TRIMMERS. AARON WRIGHT, Phœnix Mills, N. Y., assignor of one-half to Edwin Groat, same place. Filed Oct. 24, 1883. (No model.)

Claim.—1. The bar C, having the recess *b*, the hook *f*, the groove *i*, for holding the sharpening material, and perforation for receiving the set-screw, in combination with the loops B B, spring D, and hook *g* of a seam-trimmer frame, substantially as specified.



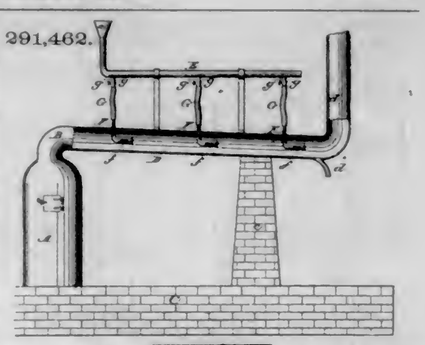
2. The combination, with the cutting-disk and frame A of a fabric-seam trimmer having the loops B, of the sharpening apparatus consisting of the bar C, having recess *b*, handle E, hook *f*, groove *i*, for receiving the sharpening material, the threaded perforation for receiving the set-screw, and spiral spring D, all adapted to operate substantially as specified.

291,460. PEG-CUTTER. SAMUEL YEATMAN, Marietta, Ga. Filed May 22, 1883. (No model.)

Claim.—A peg-float consisting of a suitable head provided with a dovetailed groove on its upper side, in combination with a handle provided with a dovetail shank adapted to fit in the groove in the head, substantially as described.

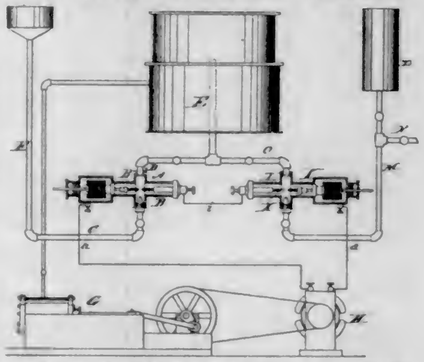
291,461. BUCKLE. MELANCTSON K. ZELLER, Bluffton, Ohio. Filed Sept. 7, 1883. (No model.)

Claim.—1. The combination, with the buckle-frame, substantially such as described, of the bail and tongue-plate, the latter having arms which extend down on either side of the trace, and are terminally pivoted to a cross-bar on the frame, as and for the purpose set forth.



2. The combination, with the buckle-frame, substantially such as described, of the bail and tongue-plate, the latter having arms which extend down on either side of the trace, and are pivoted to a cross-bar on the frame and secured thereto by means of integral terminal fingers, as and for the purpose set forth.

291,462. FUME-CONDENSING ATTACHMENT FOR ORE-FURNACES. ELI M. ALDERMAN, Tucson, Ariz., assignor of two-thirds to E. J. Benedict and Paul Marvney, Sr., same place. Filed June 26, 1883. (No model.)

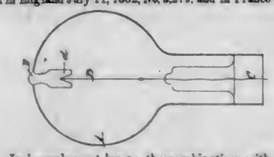


Claim.—1. The smoke-stack of an ore furnace or smelter and the pipe D, connected therewith, in combination with the elbow-pipes F, having perforated arms within pipe D, the water-distributing pipe E, adapted to receive water under pressure, the couplings *g*, stop-cock *g'*, and hose-connection G, all arranged and operating substantially as and for the purpose herein described.

2. In combination with the smoke-stack of an ore furnace or smelter, the pipe D, connected therewith and having the discharge *d*, continuation *d'*, and an inclination slightly below a horizontal to its discharge *d*, the spray-pipes F, the water-distributer E, and connections between said spray-pipes and water-distributer, substantially as and for the purpose herein described.

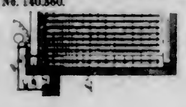
291,462.

291,463. ELECTRIC GAS-GENERATOR. CHARLES E. BALL, Philadelphia, and CHARLES S. BRADFORD, Jr., West Chester, Pa., assignors to said Ball. Filed Feb. 24, 1883. Renewed Nov. 12, 1883. (No model.)



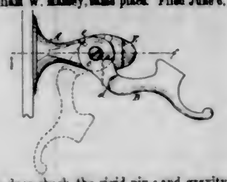
Claim.—1. The combination, with an apparatus or plant for electrically generating hydrocarbon gas, of means, substantially as described, for generating hydrogen gas for mixing or combining therewith, substantially as set forth.

2. The combination of chambers A I, electrodes B B, K K, supply-pipes F M, motor G, and electric generator H, substantially as shown and described.



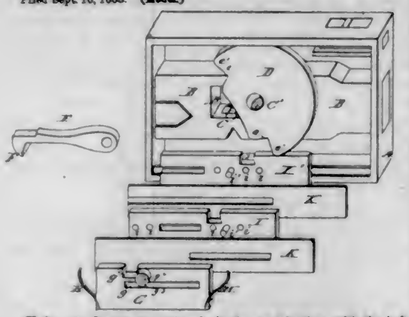
3. The process herein described of obtaining mixed or combined hydrocarbon gas and hydrogen, consisting in generating hydrocarbon gas in an electrical generator, and hydrogen gas in another electrical generator, and mingling said gases, substantially as set forth.

291,464. SUPPORT FOR FILAMENTS OF INCANDESCENT LAMPS. JOSEPH S. BEEMAN, London, England. Filed Apr. 23, 1883. (No model.) Patented in England July 11, 1882, No. 3,279, and in France Jan. 9, 1883.



Claim.—In incandescent lamps, the combination, with the globe or bulb and the incandescent filament, of a projection or pendent piece fitted to or formed on the interior of the globe in a position to embrace and support the filament when the latter is inserted in place in the globe, as hereinbefore set forth.

291,465. SECONDARY-BATTERY REGULATOR. JOSEPH S. BEEMAN, WILLIAM TAYLOR, and FRANK KING, London, England. Filed Feb. 28, 1883. (No model.) Patented in England Aug. 10, 1882, No. 3,813, and in France Jan. 15, 1883, No. 140,860.



Claim.—The combination, in a secondary-battery cell, with the battery-plates proper, of a regulator-plate, A, of relatively less storage capacity, a gas-chamber, B, and the elastic diaphragm D, or its equivalent, for operating contact makers or breakers, substantially as and for the purposes hereinbefore set forth.

291,466. DOOR-CHECK. CHAS. R. BRADFORD, Elyria, Ohio, assignor of one-half to William W. Massey, same place. Filed June 6, 1883. (Model.)

Claim.—In a door-check, the rigid pin *e* and gravity-pin A, in combination with the spring arm or catch B, screw *c*, spring *a*, and stop A, for the purposes above set forth, and substantially as described.

291,467. PERMUTATION-LOCK. LOUIS BILAK, Iowa City, Iowa, assignor of one-half to F. J. Berak and J. K. Beranek, both of same place. Filed Sept. 10, 1883. (Model.)

Claim.—1. In a permutation-lock, the combination, with the bolt B and the pivotal dog F, carried thereby, of the straight slotted and notched slides or tumblers I I', lying alongside of and parallel with said bolt, the setting-slide G, the knob C, having a stem, C', and cam-disk D, substantially as described.

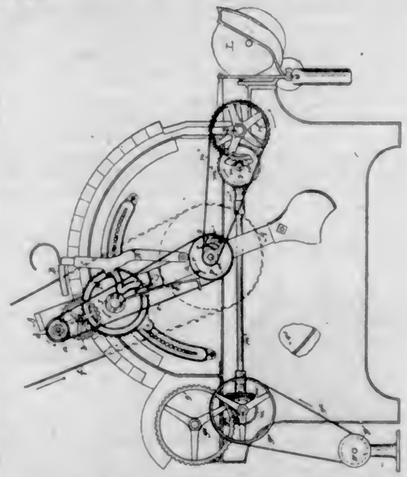
2. In a permutation-lock, the combination, with a knob through which the combination is worked, and the notched and slotted permutation-slides, of the cam-disk attached to the knob-stem and the setting-slide located below or beside said disk and at right angles to the knob-stem, substantially as described.

291,468. WAGON RUNNING-GEAR. RICHARD CHAPMAN BLACKWELL, Henderson, Ky., assignor of one-half to George Dulker, same place. Filed Apr. 23, 1883. (No model.)

Claim.—In combination with the tongue D, pivoted at *d* to the bounds E, the reach F, loosely connected to the rear end of said tongue by the parts A A' *f*, the flat plate *a*, and the bail-plate *a'*, for allowing play to the tongue, as set forth.

291,469. DEVICE FOR GRINDING ROLL-BARS. CHARLES JAMES BRADBURY, Boston, assignor of one-half to John H. Horne, Lawrence, Mass. Filed Mar. 15, 1883. Renewed Nov. 26, 1883. (No model.)

Claim.—The trough or box C, having lips *b* and cross-ribs *c*, and containing abrading material D, for the purpose set forth.



291,470. PROCESS OF MAKING WROUGHT-IRON. LUCIUS D. CHAPIN, Chicago, Ill., assignor to the Chapin Pneumatic Iron Company, same place. Filed June 23, 1883. (No specimens.)

Claim.—1. The process of making wrought-iron from crude or cast iron high in phosphorus, which consists in subjecting such molten iron, in a Bessemer converter having a refractory lining, to the action of an air-blast until the objectionable impurities which the air-blast is adapted to remove shall have been substantially eliminated, and then transferring the metal to a separate furnace or balling chamber having, essentially, an oxide-of-iron lining, and therein subjecting it to reverberatory flame and to puddling action until brought to a wrought condition to form a ball or loop, dolomite being added to the metal during its treatment, substantially as described.

2. The process of making wrought-iron from crude or cast iron containing phosphorus in injurious quantity, which consists in subjecting molten cast-iron, in a Bessemer converter having a refractory lining, to the action of an air-blast until the objectionable impurities which the air-blast is adapted to remove shall have been substantially eliminated, then transferring the metal to a ladle wherein dolomite is placed, and then transferring the metal to an iron-oxide lined balling or puddling chamber wherein dolomite is placed, and there subjecting it to a reverberatory flame and to a puddling action until it is reduced to a wrought condition to form a ball or loop, substantially as described.

291,471. MECHANISM FOR STRIPPING THE FLATS OF CARDING-ENGINES. EDWARD P. DENNIS, Lowell, Mass., assignor of one-half to J. S. Ladlam, same place. Filed Jan. 15, 1883. (No model.)

Brief.—To prevent strain to the belt of the stripping mechanism, when shifted from the high-speed pulley to the slow-speed pulley, in machines as heretofore constructed, the high or fast speed pulley is secured upon the main shaft nearest the cylinder, the slow-speed pulley is placed loosely upon said shaft, outside of the fast pulley, chambered at its outer side and provided with a toothed ratchet, with which engage pawls secured to a disk provided with an elongated hub, which revolves loosely upon the hub of the loose pulley, said elongated hub being engaged by a belt extended over a pulley on the shaft of one of the feed-rollers. Thus as the disk is driven its teeth or pawls engage the toothed ratchet fast on the loose slow-speed pulley and drive it at a slower speed than that of the fast-speed pulley. By this arrangement, as the belt is being shifted, the slow pulley will partake of the speed of the fast pulley as long as said belt is on them both, the ratchet-teeth running forward faster over the pawl secured to the slow pulley, thus avoiding all strain to the belt and parts.

Claim.—1. The combination, substantially as hereinbefore set forth, with the main shaft A^2, the cylinder A^3, stripping mechanism and frame A, which carries the same, of the high-speed pulley A fast on the shaft A^2, the slow-speed pulley *s* outside of it and loose on the said shaft, the ratchet-plate rotating with said slow pulley, the loose disk and its pawls, and means to rotate the said disk independently of the main shaft, as and for the purpose set forth.

2. The shaft n^2 of the feed-roller, belt-pulley thereon, belt n^4, actuated by it, and the pawl-carrying disk driven by the said belt, the shaft A^2,

and the slow-speed loose pulley and its ratchet, combined with the high-speed fast pulley, the belt c^3, belt-shipper, and means to actuate it, substantially as and for the purpose described.

3. The main shaft A^3 and high-speed fast pulley thereon, combined with a slow-speed loose pulley placed at the side of it, the ratchet-wheel attached to the said pulley, and the loose disk provided with a series of pawls, and means to rotate the said disk at a speed slower than that of the high-speed pulley, and a belt-shipper and belt whereby when the said belt is shifted from the high to the slow speed pulley the latter pulley is moved at a speed corresponding with that of the belt, and its ratchet-teeth are moved forward under the teeth of the said pawls irrespective of the movement of the said disk, substantially as and for the purpose set forth.

4. The shaft A^3, means to move it, the pulley h fast thereon, the pulley s loose thereon, the disk r, loose with relation to the said shaft and the said loose pulley, means between the said loose pulley and disk to permit the said disk to turn the said pulley with it in one direction only, and a belt to drive the said disk and means to drive the said belt, combined with a belt driving the said fast pulley, stripping mechanism driven by the said belt, and a shipper to move the said belt from the fast to the loose pulley, the combination being and operating substantially as described, whereby the belt shifted from the fast to the loose pulley moves the latter at a speed faster than the speed of the said loose pulley derived from the said disk.

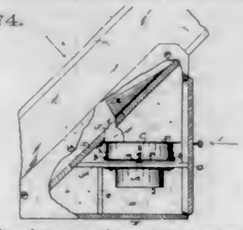
291,472. TELEPHONE-TRANSMITTER. DANL. DRAWBAUGH, Eberly's Mill, Pa. Filed Dec. 27, 1882. (No model.) Patented in England Sept. 4, 1883, No. 4,247, and in Belgium Sept. 15, 1883, No. 62,503.

Claim.—1. In a telephone, the combination of two diaphragms covering opposite sides of the inclosing box or case of the instrument and rigidly secured to said box or case, a means of modifying an electric current so as to render it capable of transmitting articulate speech, arranged between said diaphragms and influenced by the vibrations of both of them, and a means of reflecting or concentrating sound-waves upon that one of the two diaphragms which does not face the source of sound, substantially as described.

2. In a telephone, in combination with an inclosing box or case containing two diaphragms on opposite sides thereof, and a means of modifying an electric current so as to render it capable of transmitting articulate speech, arranged between said diaphragms and influenced by the vibrations of both of them, two communicating sound-receiving chambers—one chamber being formed annularly, or substantially so, around the exterior of the inclosing-case, and the other being formed in rear of said case, substantially as described.

3. The combination of, first, a telephone containing an inclosing-case, two diaphragms, and means for modifying an electric current so as to render it capable of transmitting articulate speech; second, a back board or base; third, supports arranged between the rear side of said telephone and the back board; and, fourth, a sound-reflecting projection attached to said back board and surrounding the telephone-case, substantially as described.

291,473. PANTALOONS. HUGO F. ENGELS, Dorchester, assignor of one-half to George Fern, Boston, Mass. Filed July 19, 1883. (No model.)

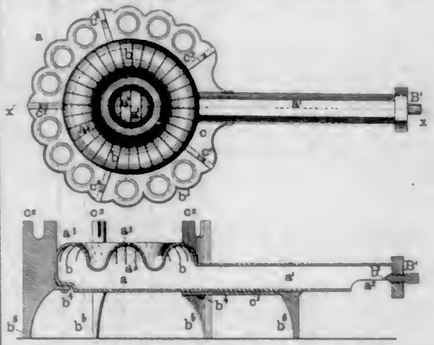


Claim.—As a new article of manufacture, the pantaloons described and shown, consisting of the body and leg portion A and the waistband B, attached thereto, said waistband being provided with the tabs or upward extensions C and C' C', made in one piece or integral therewith, substantially as and for the purpose specified.

291,474. AUTOMATIC GRAIN AND FLOUR SAMPLER. JOHN M. FINCH, Jackson, Mich., assignor of one-half to George S. Bennett, same place. Filed Mar. 21, 1883. (No model.)

Claim.—1. In an automatic grain and flour sampler, the combination of an inclosing-casing, a rotating vertical shaft, a horizontal carrying-plate mounted on the upper end of the shaft, a compartment-case

291,474.



provided with pockets arranged around a common center and mounted on the upper surface of the carrying-plate, means for connecting the case with the horizontally-rotating carrying-plate and permitting its removal therefrom, and a stationary feeding-chute arranged eccentrically to the compartment-case, substantially as set forth.

2. In an automatic grain and flour sampler, the combination of a horizontally-rotating carrying-plate provided with upwardly-projecting fingers, and a compartment-case provided with a series of circularly-arranged pockets supported upon and carried by the rotating plate, substantially as set forth.

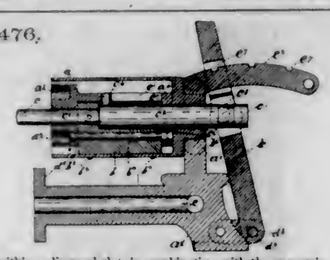
3. In an automatic grain and flour sampler, the combination of an inclosing-casing, a horizontally-rotating carrying-plate mounted upon the upper end of a driving-shaft, a removable compartment-case provided with pockets arranged around a common center, means for connecting the case with the rotating plate and permitting its removal therefrom, a feeding-chute arranged eccentrically to the compartment-case, and the cover adapted to close the open upper ends of the pockets, and provided with an opening for the feeding-chute, substantially as set forth.

4. In an automatic grain and flour sampler, the combination, with the horizontally-rotating removable compartment-case, the hinged cover provided with a slot for the feeding-chute, and the feeding-chute provided with a curved portion, j, formed on an arc of a circle described from the hinge of the cover, substantially as set forth.

291,475. GAS-BURNERS FOR HEATING PURPOSES. THOMAS FLETCHER, Warrington, County of Lancaster, England. Filed July 11, 1883. (No model.) Patented in England Apr. 28, 1882, No. 2,019, and in Canada Dec. 7, 1882, No. 15,919.

Claim.—1. A gas-burner for heating purposes, consisting of the inlet or supply tube a', having an air-opening, a^2, and gas-jet B', and a center burner, a^3, arranged within an annular burner, a^4, each being provided with a series of narrow cut openings or slits, a^4 and b, the whole mounted upon a suitable supporting-frame, substantially as specified.

2. A gas-heating burner consisting of the following parts, all cast or formed of one piece: the inlet or supply tube a', provided with the air-opening a^2, gas-jet B', and an annular burner, a^3, surrounding the burner a^3, substantially as described.

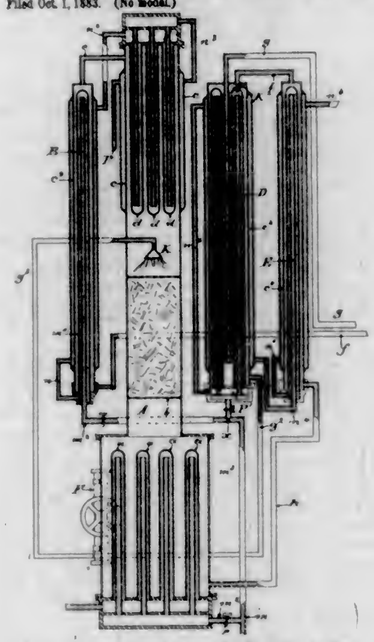


291,476. VALVE-GEAR. FREDK. A. GARDNER, Buffalo, N. Y. Filed Mar. 30, 1883. (No model.)

Claim.—1. The case a, the frame a^2, and frame a^3 a^4, provided with the diagonal slot a', the reversing-arm c^2 and its reversing-roller, and the reversing-gear, substantially as specified, in combination with the supporting device b and the joints upon which it swings, for the purposes described.

2. The casing a, jointed to the frame a^2, and the device b, secured with the casing, in combination with the eccentric jointed thereto and provided with a diagonal slot and with a reversing bar and lever, substantially as described.

3. The arm d^2 and reversing-bar c^2, provided with a roller, c^4, ar-



291,476.

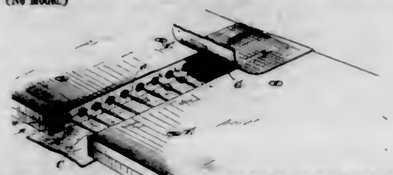
ranged within a diagonal slot, in combination with the eccentric, set on journals in the part b, substantially as and for the purposes described.

4. A pivoted eccentric for engines, having the curved slot, through which the shaft c passes, placed to one side or slightly out of the center, or at a point between the center of the eccentric and the center of the journal b^2, or nearer the periphery at the point upon which it turns, and having the pivot b^2 arranged at a point on the line with the periphery of the eccentric, so that the eccentric may be moved from one position for reversing the direction of movement to the other without moving the valve-rod while the engine is on the dead-center, the crank being on the same side, whereby the lead of the valve is kept in its proper position at all times, substantially as specified.

291,477. ICE AND REFRIGERATING MACHINE. DANL. L. HOLDEN, Cincinnati, Ohio, assignor of two-thirds to P. T. Millar and T. E. Livesey. Filed Oct. 1, 1883. (No model.)

Claim.—1. In an absorption ice and refrigerating machine, a generator having cooling devices within and about its upper end, substantially as described.

2. In the generator of an absorption ice or refrigerating machine, the combination of a grating and pieces of tin or other substance not destroyed by heated ammonia resting on said grating, substantially as described.

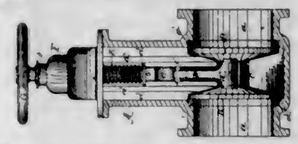


3. In an absorption ice or refrigerating machine, the combination of a generator, a condenser, an absorber, and a cooler securely attached to and supported by said generator, substantially as described.

4. In an absorption ice or refrigerating machine, the combination of a generator, a condenser, an absorber, a cooler, and a pump securely attached and supported by said generator, substantially as described.

5. In an absorption ice or refrigerating machine, the combination of a generating-chamber and steam-pipes of the internal-circulation type, substantially as described.

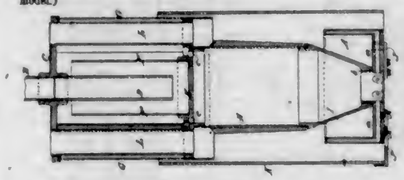
6. In an absorption ice or refrigerating machine, the combination of a generator having cooling devices about its upper end, and a condenser, a congealer, an absorber, and a cooler, substantially as described.



291,478. SECTIONAL COMPOUND TELEGRAPH-WIRE PROTECTOR. JOSEPH W. HORNER, New York, N. Y. Filed Nov. 2, 1883. (No model.)

Claim.—1. The two-part box having registering recesses formed in its meeting faces, in combination with the wires passing through said recesses, and an insulating material enveloping said wires and securing them within said recesses, substantially as described.

2. The within-described sectional compound conductor, composed of a series of two-part boxes set upon edge, and having registering recesses formed in their meeting faces, with wires passing through said recesses and held therein, and insulated from the boxes by an insulating material filling the recesses and enveloping the wires, the wires of one box being united with those of an adjoining box, and the joint between the boxes being made by a filling of insulating material covering the wires, and by a covering-strip, substantially as described.



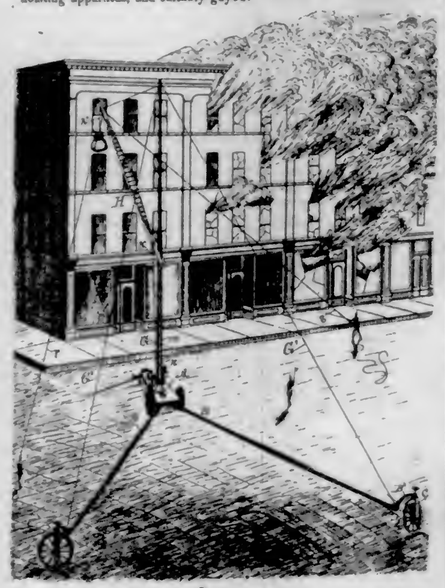
291,479. STRAIGHT-WAY VALVE. ROBERT HUGHES, Waterford, assignor to Thomas A. Knickenbacker, Troy, N. Y. Filed Sept. 1, 1883. (No model.)

Claim.—1. In a straight-way valve, the valves or gates B, having coniform backs, and provided with stems b, as herein described, a lifter, C, provided with a loop or stirrup, c, in which the stems b of said valves fit loosely, and the pendulous arms D, hinged to the lifter C and arranged to force the valves B into contact with the seats of the valve-casing A, as and for the purpose herein specified.

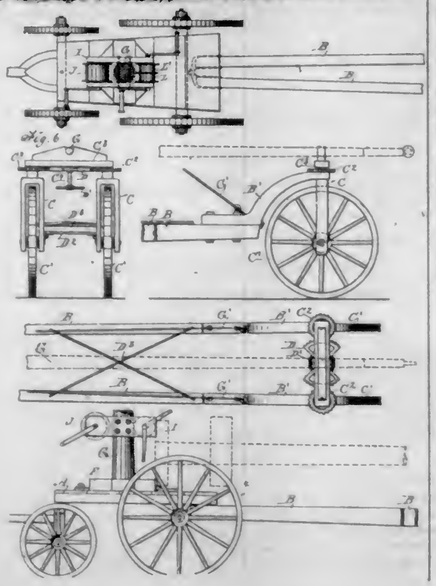
2. The combination, with a valve-casing, A, having cam-shaped projections a^4, and the valves B, provided with coniform backs, and stems b, as herein described, of the lifter C, adapted to carry the valve or valves B, as herein set forth, and having pendulous arms D hinged thereto, and means, substantially as described, for imparting a reciprocating motion to said lifter and its subsidiary parts, in the manner and for the purpose herein specified.

291,480. GAS-BURNER. ANDREW B. LEPSKY, West Hoboken, N. J., assignor to William Bell, New York, N. Y. Filed June 12, 1883. (No model.)

Claim.—1. The combination, with the upwardly-extending annular burner-tip A or a circular series of burner-tips, of the downwardly-extending gas-supply pipe D, and the pipe H I, communicating with the pipe D and extending downward to a central body piece, whence gas is supplied to the burner tip or tips, and made much larger than the pipe D, so as to form a chamber wherein the gas will be heated by the flame and ascending products of combustion, substantialy as specified.

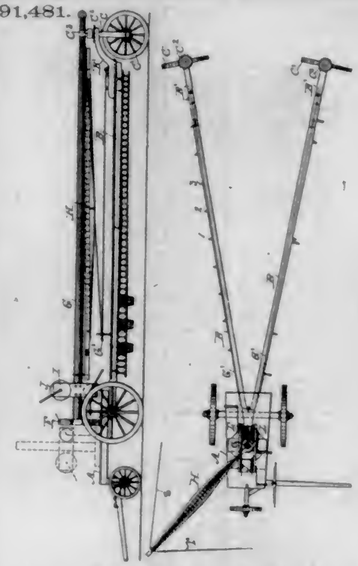


2. In a gas-burner, the combination of a gas-supply pipe by which the burner is to be suspended, and which is open at the lower end, a second pipe of larger size surrounding the gas-supply pipe, closed at the lower end and open at the upper end, a shell surrounding said second pipe and communicating with the open upper end thereof, a third pipe arranged below and communicating with said shell, and an annular burner-tip, or a circular series of burner-tips supported by the last-mentioned pipe, and to be supplied with gas therefrom, substantially as specified.



3. The combination, with an annular burner-tip, or a circular series of burner-tips, of the pipe B, the shell G, connected to the disks C E, a pipe establishing communication between the space inclosed by the said shell G and a central body-piece, whence gas is supplied to the burner tip or tips, a chimney, and the pipes L, arranged within the shell G, substantially as specified.

291,481. FIRE-ESCAPE AND HOOK-AND-LADDER CARRIAGE.



ISAAC G. MORGAN, Des Moines, Iowa. Filed Feb. 21, 1883. (No model.)

Brief.—Two adjustable reaches, each having a traction-wheel at the rear end, are connected, when to be transported, by a detachable cross-piece carrying two segmental gears which mesh with pinions on the reaches. Upon the truck is hinged a mast carrying a crane-arm and hoisting apparatus, and suitably guyed.

291,481.

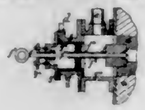
Claim.—1. The combination of two adjustable reaches, each having a traction-wheel at its rear end, with the rear portion of a carriage or truck, for the purposes specified.

2. The combination of two reaches, B B', two wheel-bearers, C, and a detachable cross-piece, C^2, to produce a transformable rear carriage, substantially as and for the purposes set forth.

3. The cross-piece C^2, carrying a duplex segmental gear or gear-wheel, the wheel-bearers C, having gear-wheels fixed thereto, and journals at their top ends, the traction-wheels C', and the pivoted reaches B B', arranged and combined relative to each other, and a front carriage or truck, substantially as and for the purposes set forth.

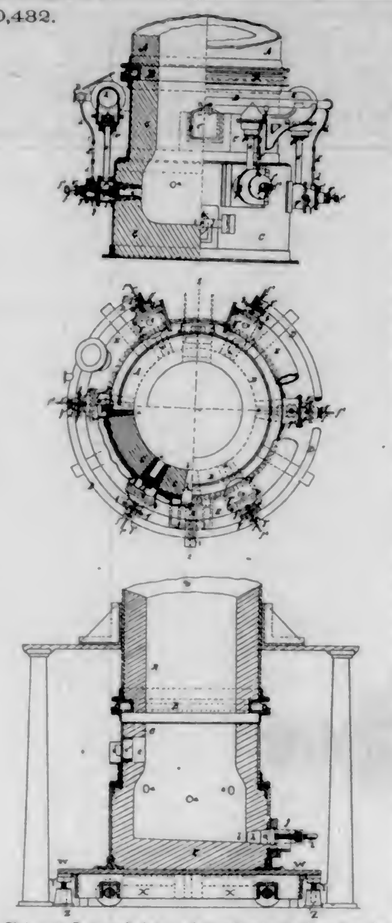
4. The detachable brace, platform, or step D^2, in combination with the wheel-bearers C, the detachable cross-piece C^2, the shaft C^4, the gear-wheel D, the hand-wheel D', and the wheel-bearers C, having gear-wheels C^3 fixed thereto, substantially as shown and described, for the purposes specified.

5. The flexible or jointed guys G', in combination with the hinged adjustable post G, and the pivoted reaches B B' of a transformable rear carriage, substantially as shown and described, for the purposes specified.



6. A post or post-base having a winch, J, and winches L L' attached thereto, a jib or crane-arm, H, adjustably connected with the post, and ropes *k*, *m*, *n*, *r*, and *s*, arranged and combined upon a truck or carriage, substantially as and for the purposes set forth.

7. The portable fire-escape and hook-and-ladder carriage composed of the following elements, to wit: a truck or carriage having a post-support and body, A, and hinged post-base or post-socket F, two pivoted reaches, B B', two wheel-bearers, C, each carrying a traction-wheel, and a gear-wheel, C^3, a detachable frame or cross-piece, C^2, carrying a shaft, C^4, gear-wheel or duplex segmental gear D, and a hand-wheel, D', a detachable brace, step, or platform, B^2, an adjustable post, G, flexible or jointed guys G', winches J, L, and L', a jib or crane-arm, H, and ropes *k*, *m*, *n*, *r*, and *s*, substantially as shown and described, to operate in the manner set forth.



REISSUES.

10,432. CUPOLA-FURNACE.

WILLIAM J. CLAPP, Nantyglo, and THOMAS GRIFFITHS, Blaenavon, County of Monmouth, England, assignors to James Porter Witherow and Henry William Oliver, Jr., both of Pittsburg, Pa. Filed Oct. 25, 1883. Original No. 271,683, dated Feb. 6, 1883. Patented in England Mar. 28, 1881, No. 1,372; in France Sept. 27, 1881, No. 145,039; in Belgium Sept. 27, 1881, No. 55,846; in Germany Sept. 27, 1881, No. 18,250; in Austria Sept. 27, 1881, and in Spain Oct. 1, 1881.

10,482.

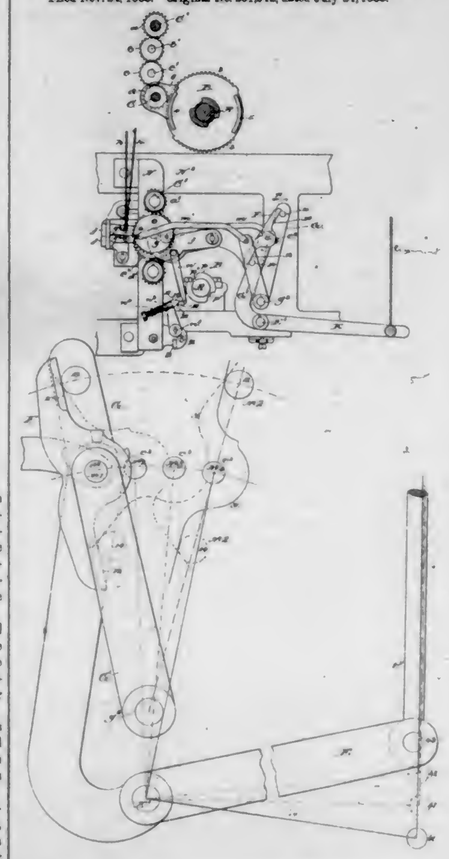
Claim.—1. In a cupola-furnace, the combination of a bottom section or vessel having a tuyere-opening and external blast and steam chambers, and a plug provided with a stem and a piston fitted in said chambers, with a pipe for admitting steam in rear of the piston for forcing the plug into the tuyere-opening, and an air-blast pipe leading into the chamber in front of said piston, for removing the plug from the tuyere-opening and admitting air through the latter into the bottom section of the furnace, substantially as and for the purpose set forth.

2. The combination of the vessel C, having the tuyeres *a*, external air-chamber, g^4, and vertical pipes *e*, leading into said chamber, and the stationary air-pipe E, having bottom openings for the reception of the pipes *e*, and valves for closing said openings, with the shaft of the furnace and means for elevating and transporting the vessel C, as and for the purpose set forth.

3. The combination of the vessel C, having tuyeres *a* through its sides, external air-chamber, g^4, attached to the vessel, stopper *f*, and hollow stem *f''*, communicating with both air-chamber and tuyere when the tuyere is closed by the stopper, substantially as and for the purposes described.

4. The combination of a fixed converter or cupola-furnace for treating molten metal, having all its tuyeres provided with plugs, stoppers, or valves seating at the outer end, to prevent the escape of the molten metal therethrough, with a blast-pipe and organized means for seating and unseating the said plugs, stoppers, or valves simultaneously during the operation of the converter, substantially as and for the purpose described.

5. A cupola-furnace or converter having a removable lower section or crucible, tuyeres in said lower section below the metal-line, a blast-pipe, detachable connections between said blast-pipe and tuyeres, and means for simultaneously closing the tuyeres against the passage of the metal therethrough, substantially as and for the purposes described.



6. A cupola-furnace or converter having a removable lower section or crucible provided with tuyeres in its sides, a blast-pipe supported on the fixed section of the converter, detachable connections between said blast-pipe and tuyeres, and means for closing the openings of the blast-pipe when the connections are removed, substantially as and for the purposes described.

7. A cupola-furnace or converter having tuyeres fixed in its sides below the metal-line, a blast-pipe, and external air-chambers fixed to its sides, with which the tuyeres communicate and from which they receive the blast, in combination with plugs, stoppers, or valves situate in said chambers, and means for simultaneously operating the stoppers from the outside to open or close the tuyeres at pleasure, substantially as and for the purposes described.

8. A cupola-furnace or converter having a tuyere or tuyeres, and an external air chamber or chambers with which the tuyere communicates and from which it receives the blast, in combination with a plug, stopper, or valve to close the tuyere to prevent the escape of the molten metal therethrough, means for operating the stopper, and a passage for admitting a small stream of air through the tuyere when the stopper is closed, substantially as and for the purposes described.

10,433. MECHANICAL MOVEMENT.

GEORGE CROMPTON and HORACE WYMAN, Worcester, Mass., assignors to George Crompton, same place. Filed Nov. 24, 1883. Original No. 281,842, dated July 24, 1883.

Claim.—1. The main lever, to be moved different distances, and a secondary lever pivoted thereon, and provided with two faces, 10 12, combined with movable carriers and studs or pins 13 14, to act upon the said faces and turn the secondary lever and its fulcrum and move the main lever, substantially as described.

2. The toothed cranks and means to move them, two connecting-rods, and two studs or pins held by carriers, combined with a main lever, and a secondary lever pivoted thereon and acted upon at each side of its fulcrum by studs or pins actuated by the carrier, substantially as described.

3. The yielding holder, combined with the latches and vibrators, and with the cam *p*, to operate substantially as described.

4. The vibrators, their attached toothed cranks and partial gear to move them, and latches *n*, combined with a holder, and with a cam to at times maintain the engagement of the latches and holder and at times permit their disengagement, substantially as described.

5. The vibrators *f*, toothed cranks carried by them, and the two partial gears *a' a'*, arranged, respectively, above and below them, a pattern-chain, levers moved by it, and connections *h*, joining the said levers with the said vibrators, whereby the vibrators are raised to engage the toothed cranks with the partial gear *a'*, substantially as described.

PHOTO-LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of New York.

ROBERTS v. WALLEY.

Decided October, 1882.

1. INFRINGEMENT—COMPELLING DEFENDANT TO GIVE NAME OF CUSTOMER.

In a suit for the infringement of a patent, where the validity of the patent and the infringement are denied, the complainant cannot, as part of his preliminary proof, compel the defendant to disclose the names of his confidential customers to whom he has furnished articles alleged to be covered by the patent, but he may be required to give the name of one person to whom he has furnished such articles.

2. CONTEMPTS—POWER OF EXAMINER TO RULE ON EVIDENCE.

The examiner has no power to rule on the admissibility of evidence, and defendant, when a witness before him, has a right, upon a question not free from doubt, to take the opinion of the court; and when he refuses to answer under advice of counsel and apparently in good faith he should not be punished for contempt of court, even though he acted mistakenly.

[On motion to punish defendant for contempt of court in refusing under advice of counsel to answer certain questions in proceedings before the examiner in an action for the infringement of a patent for oil-well torpedoes. The complainant called the defendant as his witness, and after he had testified that he was engaged in the business of torpedoing oil-wells in this State, and that he owned the patents for the processes used by him, he was asked to give the names of the persons for whom he had put in torpedoes in oil-wells in this State prior to January 1st. Under advice of counsel he refused to answer.]

Mr. F. G. Finche for the motion.
Mr. H. Ward, contra.

COXE, J., in delivering the opinion of the court, said:

The question presented is simply this: Can the complainant in a patent suit, where the infringement and the validity of the patent are both denied, as part of his preliminary proof compel the defendant to disclose the names of confidential customers to whom he has furnished articles alleged to be covered by the patent? The complainants do not submit a brief, and the court is referred to no authority bearing directly upon the question. It appears, however, after a somewhat careful examination, that the books contain many cases where similar questions have been asked in proceedings before the master, and but few in which such proof has been allowed before the examiner, the patent and the infringement both being in dispute. (*Turrell* v. *Spaeth*, 2 Bann. & Ard., 185; *Storm* v. *United States*, 94 U. S., 76; *Burnett* v. *Phalon*, 19 How. Pr., 530; Greenleaf on Ev., 13th ed., 509, 510, 410; *Lord Melville's case*, 29 How. State Tr., 549; *Rex* v. *Woburn*, 10 East, 395; *Fenn* v. *Granger*, 3 Camp., 177; *Brady* v. *Atlantic Works*, 15 O. G., 965.)

Although the examination of the defendant was proper within certain limits, it was not proper to the extent insisted upon by the complainants. The necessary proof of infringement could, it seems, be obtained without requiring witness to disclose the names of all his customers in this State, as required by the second question. This knowledge might be of advantage to complainant in other prosecutions; but how it could materially aid the court upon the question of infringement it is not easy to discover. If the patent is sustained and the device of the defendant determined to be an infringement, his previous testimony that he had used his torpedoes in great numbers in this State is surely sufficient evidence of use to sustain an interlocutory decree. While it would seem that the complainants are not entitled to pursue this line of examination *ad libitum*, they are entitled to sufficient evidence to enable them to present to the court clearly and intelligently a complete description of the defendant's torpedo, the manner of its use, and the effect produced by its explosion. It follows, therefore, that the question calling for the name of one person or firm should have been answered. Should the complainants desire again to examine the witness he should be required to answer as suggested. It is very clear from these views that the motion to punish for contempt must be denied. The examiner had no power to rule on the admissibility of the evidence, and the defendant had the right upon a question which, to say the least, was not free from doubt, to take the opinion of the court. Had he answered, the mischief which he seeks to avoid would have been accomplished, and he would have been left remediless. He acted under the advice of counsel, apparently in good faith, and even though he acted mistakenly, it is not a case where he should be punished. (*In re Judson*, 3 Blatchf., 148; *Smith* v. *Stage Co.*, 18 Abb. Pr., 419; *Hilliker* v. *Hathorne*, 5 Bosw., 710; *Weeks* v. *Smith*, 3 Abb. Pr., 211.)

Motion denied.

U. S. Circuit Court—Northern District of New York.

KIMBALL v. HESS.

Decided February 26, 1883.

PROCESS—INFRINGEMENT.

Defendants treated tobacco in a method similar to the process patented by plaintiffs, except that defendants made use of an equivalent for the gum-arabic used by the plaintiffs to produce the same effect as that rendered by plaintiffs' process. *Held*, that this was infringement.

Bill in equity for the infringement of a patent. The facts appear in the opinion.

Mr. George B. Selden and *Mr. B. F. Thurston* for the complainant.

Mr. W. F. Cogswell and *Mr. H. McGuire* for the defendants.

WALLACE, J., in delivering the opinion of the court, said:

Infringement is alleged of letters patent granted to the complainants as assignees of William S. Kimball, bearing date June 30, 1874, for an improvement in preparing tobacco. The patent contains two claims—one for a process, the other for the product. The invention relates to a process of treating tobacco while being prepared for use by which the product known in the trade as "flake-cut tobacco" is made. Tobacco known by that name is readily distinguished by its appearance from other varieties of the manufactured article, but was unknown until it was introduced to the trade by the patentee about a year prior to obtaining his patent. When the process of its preparation is completed, the article as designed for use, instead of being fluffy like the long-cut, or fleecy like the fine-cut, or broke like the granulated, is in the form of thin flakes, the particles adhering closely together and being hard and dry. When crumbled for use, the flake-cut does not pack as closely in the pipe as the other preparations, and thereby facilitates a better draft, and the smoke is cooler and freer, and does not burn the tongue. Practically there is no difficulty in determining what is meant by the term "flaky" as descriptive of the characteristic of the product. The validity of the patent is contested upon the grounds that the specification is so ambiguous and obscure as to render the patent void, and that there is neither novelty nor utility in the invention. In view of the prior state of the art the gist of the invention described in the patent consists in treating the leaves of the tobacco while they are being prepared for the cutting-machine with a solution of gum-arabic or an equivalent adhesive material, so that the leaves will adhere together without other pressure than they are subjected to by the cutting-machine. A sufficient quantity of the gum-arabic or its equivalent must be employed, so that the fibers will adhere together after passing through the cutting-machine and remain in flakes or lamina after the product is dried and prepared for use. This broad construction is given because the patentee was the first, so far as the proof shows, to employ an adhesive material during the process of preparation for the purpose of producing the flaky characteristic, which not only serves to distinguish the product, but imparts to it its peculiar value. The proofs show that tobacco prepared for chewing has customarily been treated with a variety of materials for sweetening or flavoring it. Some of these, like licorice, contain sufficient gum to produce more or less adhesion between the leaves when they are moistened and pressed together in the cutting-machine. They were never applied with the object of producing adhesion, and the degree of adhesiveness which they contributed, when appreciable, was inconsiderable. Unless they are used in such proportions as to be not only an equivalent for gum-arabic, but to impart the flaky characteristic to the product after it is dried and fully prepared for use, the patented process is not infringed. The defendant for a time adopted the precise treatment described in the patent. Subsequently, however, they dispensed with the gum-arabic and saturated the leaves of their tobacco with adhesive substances by sweetening them with sirup and intermixing with the leaves what is known as "plug-scrap," which is highly charged with adhesive material. Their product, upon examination, is found to contain a greater quantity of adhesive material than the complainant's product as usually prepared according to the process of the patent. Whether the defendants have thus attempted a colorable evasion of the patented process, or whether, in good faith, they have believed themselves justified in adopting their substituted treatment, is not material. They have used an equivalent for the gum-arabic of sufficient adhesive properties to impart the flaky characteristic to the product when dried. This is infringement.

Decree for complainants.

FOREIGN PATENT LAWS.

SPANISH PATENT LAW.

Patent law dated July 30, 1878.

DON ALPHONSO XII by the Grace of God Constitutional King of Spain.

Let all to whom these presents shall come know that the Cortes have decreed and we have sanctioned the following:

SECTION I.

General Provisions.

Paragraph 1. Spaniards or foreigners who intend to establish or have established a new branch of industry shall have the exclusive right to work the same during a certain number of years, subject to the rules and conditions laid down by the present law.

Par. 2. The said right shall be acquired by obtaining a patent of invention from the government.

Par. 3. The following objects shall be patentable, viz: machinery, apparatus, instruments, processes, or mechanical or chemical operations, being entirely or partly a new and peculiar invention, or such works which, without these conditions, have not been established or executed in the same way or form in the Spanish dominions.

New industrial products or results obtained by new or known means, provided their working forms a new branch of industry in the country.

Par. 4. Patents relating to products or results mentioned in the second part of the previous paragraph shall not prevent others from using the objects mentioned in the first part of the paragraph for obtaining the same products or results.

Par. 5. The character of novelty as required by paragraph 3 of this law shall appertain to all such objects as have not been known, executed, or worked in the Spanish dominions nor abroad.

Par. 6. Patent-rights, or otherwise the right derived from the application, can be transferred entirely or partly by observing the usual provisions of our laws regulating private property.

Par. 7. Letters patent can be granted to one person or more, or to a society, whether at home or abroad.

Par. 8. The grant of patents shall not only apply to the Peninsula and adjacent islands, but also to the ultramarine provinces.

Par. 9. The following objects shall not be patentable:

First. The result or product of machinery, apparatus, instruments, processes, or operations mentioned in the first part of paragraph 3, provided they are not contained in the second part of the same paragraph.

Second. The use of natural products.

Third. Scientific principles or discoveries, so far as they are of a mere speculative nature and are not likely to be applicable to machinery, apparatus, instruments, processes, or mechanical or chemical operations.

Fourth. Pharmaceutical operations or medicines.

Fifth. Schemes or combinations of credit and finance.

Par. 10. Patents shall not be delivered for more than one single object of industry.

Par 11. Patents shall be delivered without previous examination as to novelty or utility. Thus they shall in no case be considered as a declaration or proof of the novelty or utility of the respective object. The onus of such proof lies with the interested and responsible party, according to the provisions of the present law.

SECTION II.

Of the Duration of Patents and Government Fees.

Par. 12. The duration of patents for new and peculiar inventions shall be twenty years, without prolongation. The duration of patents for all objects that are not peculiar inventions, or being so, yet are not new, shall only be five years, without prolongation.

Nevertheless patents for peculiar inventions shall be granted for ten years, even when the inventor has obtained a patent for the same object in one or more foreign countries, provided an application therefor is made in Spain before the expiration of two years from the date of the foreign patent.

Par. 13. The working of the patent is subject to an annual and progressive government fee in the following manner: 10 pesetas for the first year, 20 pesetas for the second year, 30 pesetas for the third year, and so on to the fifth, tenth, or twentieth year, the respective payments being then 50, 100, and 200 pesetas.

Par. 14. The annual payments mentioned in the previous paragraph shall be made in advance, and shall in no case be omitted.

SECTION III.

Formalities to be Observed in the Grant of Patents.

Par. 15. Applicants for patents shall deliver to the Secretary of the Civil Government of the province in which they are domiciled, or of any other province in which they elect to be domiciled—

First. A petition to the Minister of Public Works, Commerce, and Instruction,* indicating the sole object of the patent, and stating whether the said object is a new and peculiar invention or not, and the address of the applicant or his attorney. In the latter case this power of attorney must accompany the application, and it must contain neither conditions, restrictions, nor reservations.

Second. A specification in duplicate describing the machine, apparatus, instrument, process, or mechanical or chemical operation relating to the patent. The whole with the greatest possible distinctness, so as entirely to remove any doubt as to the object or property represented to be a new and peculiar invention, or as to not having been worked or executed in the same way or form in Spain. The description shall contain a final note expressing clearly, distinctly, and particularly which part, piece, movement, mechanism, operation, process, and substance is intended to be the object of the patent. This only shall be the content of the said note.

The specification must be written in Spanish, without abbreviations, corrections, or erasures of any kind, on sheets folded and numbered. Weights and measures must be given according to the metrical decimal system.

Specifications must not contain conditions, restrictions, or reservations.

Third. The drawings, patterns, or models which the interested party might think necessary for the better comprehension of the specification, all in duplicate.

The drawings must be made on cloth paper with india-ink, and according to the metrical decimal scale.

Fourth. The public paper money corresponding to the first annual payment.

Fifth. A signed list of all the documents and objects presented, which latter must also be signed by the applicant or his attorney.

Par. 16. The Secretary of the Civil Governor, upon receiving the documents and objects mentioned in the preceding paragraph, shall enter in a special register the day, hour, and minute of the presentation, sign the list jointly with the interested party or his attorney, and deliver a proper receipt. The same secretary shall close and seal the box or packet containing the two copies of the specification, drawings, patterns, or models, and write underneath the inscription of the box or packet "Presented on such a month, day, hour, and minute," signing the same and affixing the official seal.

The right of priority of the applicant shall be established by the entry in the register of presentation indicating the day, hour, and minute of presentation.

Par. 17. Within a term, not exceeding five days from the date of presentation of the application, and of the aforesaid documents and objects, the civil governors shall remit to the Director of the Conservatory of Arts at Madrid the application, together with the documents and objects and a certificate of registry, and the contents of the box or packet delivered by the secretary with the counter-signature of the governor. The cost of remittance must be borne by the interested party.

Par. 18. The Secretary of the Conservatory of Arts shall examine the contents of the box, and sign and seal, at the foot of the certificate mentioned in the preceding paragraph, a statement as to their completeness or defects.

Par. 19. The Secretary of the Conservatory of Arts shall at once compare the two copies of the specification and drawings or models for identification solely, and when found identical and provided with the note at the end of the specification mentioned in the second portion of paragraph 16, he shall draw up, sign, and seal a memorandum as a supplement to both copies.

In case of any defects in the documents, they must be pointed out in the proceedings, and it must be left to the interested parties themselves or their attorneys to amend them. For this end they shall be allowed a term of two months from the day of application made at the administration of the province, when it belongs to the Peninsula or the adjacent islands, of four months for the Canaries or Antilles, and of eight months for the Philippines.

These terms cannot be prolonged, and when once lapsed without the defects of the application being amended, such application remains without effect, and the petition shall be considered as null and void.

* Ministro de Fomento.

Par. 20. The requirements mentioned in the two preceding paragraphs having been observed, the Director of the Conservatory of Arts, in conformity with the provisions contained in paragraph 11 of this law, shall deliver the petition to the Minister of Public Works, &c., together with a report, stating—

First. Whether the form of petition is in conformity with the provision of paragraph 15.

Second. Whether the specification and the forementioned drawings, patterns, and models, all in duplicate, and the government fees for the first year have been delivered.

Third. Whether the duplicates of the specifications, drawings, patterns, or models are identical.

Fourth. Whether the object of the patent is comprised among one of the cases of paragraph 9.

Fifth. Whether, taking all circumstances into consideration, it is advisable to allow or disallow the petition.

Par. 21. Whenever the result is favorable, the Minister of Public Works, &c., shall inform thereof the Director of the Conservatory of Arts, who shall publish this decision in the *Madrid Gazette*, and within one month from the date of publication the interested party or his attorney shall appear at the Conservatory of Arts to pay the stamp duty for the delivery of the letters patent. Should this not be done within the given term, the petition and proceedings remain without effect, and are considered as null and void.

Par. 22. After the due payment mentioned in the preceding paragraph the Director of the Conservatory of Arts shall inform thereof the Minister of Public Works, &c., who will expedite at once the letters patent and deliver them to the Conservatory of Arts, whose Director shall communicate them to the governor of the respective province, for the purpose of having them duly entered in the register mentioned in paragraph 16, and who, moreover, shall have them copied by the Secretary of the Conservatory in a special register, after which they shall be delivered by him to the interested party or his attorney, against receipt attached to the document.

Par. 23. At the head of the letters patent there shall be printed, in letters of a larger type than any in the context, the following:

"Letters patent without guarantee of the government as to novelty, fitness, or utility of the object for which they are granted."

Par. 24. The Secretary of the Conservatory of Arts shall deliver at the same time with the patent one of the copies of the specification, and drawings, patterns, models accompanying the same, to the interested party or his attorney, taking a receipt for the same, and the whole shall be considered as an integral part of the patent and so designated therein.

Par. 25. The special register of patents at the office of the Conservatory of Arts remains at the disposition of the public during the hours fixed by the director. The entries in this register shall be considered as evidence in courts.

SECTION IV.

Of the Publication of Patents and Publicity of Specifications, Drawings, Patterns, or Models.

Par. 26. Within the second moiety of the months of January, April, July, and October the Director of the Conservatory of Arts shall deliver to the editor of the *Madrid Gazette*, for immediate publication in that official newspaper, a report on all patents granted during the preceding quarter, in which the object of the patent shall be clearly expressed.

The provincial governor shall have these reports published in the official provincial papers immediately after their publication in the *Gazette*.

Par. 27. The specifications, drawings, patterns, and models relating to the patents shall be kept at the office of the Conservatory of Arts for public inspection during certain hours fixed by the director.

Any person wishing to make a copy thereof may do so at his own expense, after previous consent of the Director of the Conservatory of Arts, who will fix the place, days, and hours for such purpose.

Par. 28. After the expiration of patents the specifications, drawings, patterns, and models shall belong to the Conservatory of Arts for eventual exhibition in its museum.

SECTION V.

Of Certificates of Addition.

Par. 29. During the term of the grant the owner of a patent or his assignee possesses the right of making any alterations, modifications in, or additions to, the object of his patent he may think proper, in preference to any other person applying at the same time for a patent for the same object to which the alterations, modifications, or additions relate.

Such alterations, modifications, or additions shall be legalized by certificates of addition, delivered in the same way and with the same formalities as the original patent, and after due application and the legal proceedings as prescribed by paragraph 15.

Par. 30. Certificates of addition are subject to a government fee of 25 pesetas in one single payment.

Par. 31. Certificates of addition shall form part of the original patent, and shall have the same effect from the respective dates of the application and grant. Their legal term expires at the end of the original patent.

SECTION VI.

Of the Cession and Transfer of Patent-Rights.

Par. 32. All entire or partial cessions of rights relating to patents or certificates of addition made either by gift or contract, and any other act involving a modification of the original right, must be established by a deed attesting a certificate of the Secretary of the Conservatory of Arts, signed by the Director, showing that the due legal payments have been made, and that the assignor

is the real owner of the patent or certificate of addition according to the entry in the records.

Par. 33. No assignment or other deed involving a modification of the patent-right can prejudice a third party, unless it be entered at the office of the provincial administration where the original addition took place.

Par. 34. The registration of cessions and of all deeds involving a modification in the patent-right is effected by the presentation and delivery of a legalized attestation of the deed or contract of cession or modification to the administration of the respective province.

On this attestation the secretary shall mark the day and page of the register.

Par. 35. The civil governor of the province where the assignment or any other deed or contract involving a modification in the patent-right is registered shall, within five days after the registration, transmit to the Director of the Conservatory of Arts a copy both of the deed of assignment or modification and of the protocol testifying that the registration took place at the office, all attested by the secretary and signed by the governor.

Par. 36. The Secretary of the Conservatory of Arts shall note in the patent records all occurring modifications in the patent-right, after having taken cognizance of the certified copy of the deed or assignment annexed to the application.

Par. 37. The Director of the Conservatory of Arts in transmitting the report mentioned in paragraph 26 to the editor of the *Madrid Gazette* shall inform him of all modifications that have taken place in the patent-right.

SECTION VII.

Liabilities of Patentees.

Par. 38. Owners of patents or certificates of addition shall be required to prove before the Director of the Conservatory of Arts, within two years of the date of the patent or the certificate of addition, that they have established a new industry on Spanish territory.

The term of two years within which such working has to be proved can only be prolonged by a law on equitable ground, and only for a term not exceeding six months.

Par. 39. The Director of the Conservatory of Arts shall ascertain the fact either by himself or through a practical engineer, or any competent person deputed for that purpose, by means of a least offensive yet effectual inquiry he deems expedient, and for this end he may demand the assistance of all authorities and corporations, who are bound to lend him their services.

Par. 40. When the Director of the Conservatory of Arts thinks that the report concerning the working of the patent is well founded, he shall transmit the same, together with a report, to the Minister of Public Works, &c., for final decision.

Par. 41. All costs caused by such an inquiry are to be borne by the interested party, who need only pay them when approved by the Director of the Conservatory of Arts.

Par. 42. The Director of the Conservatory of Arts shall cause the entry of the ministerial decision in the register of the copies of patents, and communicate the same to the governor of the respective provinces.

SECTION VIII.

Of the Annulment and Expiration of Patents.

Par. 43. Patents shall be annulled—

First. Whenever it is proved that the requirements of originality and novelty have not been observed, that the invention has not been worked in the Spanish dominions agreeably to the essential conditions or fundamental statements of the application of the patentee.

Second. Whenever it is found that the object of the patent is contrary to public order, or safety, morals, or to the laws of the country.

Third. Whenever the object of the patent applied for is different from the object or work obtained thereby.

Fourth. Whenever it is shown that the specification does not contain all that is required for the complete intelligence and working of the patent, or when it does not completely indicate the real means of manufacturing the same.

Par. 44. Actions for annulment can only be instituted by the interested party.

The public prosecutor, however, may demand the annulment when the patent comes under the second provision of paragraph 43.

Par. 45. The provisions mentioned in paragraph 43 apply likewise to all certificates of alterations, limitations, or additions relating to the orignal patent.

Par. 46. The expiration of patents takes place—

First. At the expiration of the term of the grant.

Second. By non-payment of the annual fee before the beginning of each year of the duration of the patent.

Third. When the object of the patent has not been worked in the Spanish dominions within the time mentioned in paragraph 38.

Fourth. When the working has been interrupted for one year and one day, unless the owner can show good cause for such interruption.

Par. 47. The declaration of expiry of patents coming under the first, second, and third provisions of paragraph 46 belongs to the Minister of Public Works, &c., on the previous advice of the Director of the Conservatory of Arts. Against the decision of the Minister of State there may be lodged an appeal to the council within thirty days. The declaration of expiry of a patent coming under the fourth provision of the same, paragraph 46, belongs to the courts of justice on the application of the interested party.

Par. 48. The Director of the Conservatory of Arts, after having caused the required entries to be made in the patent records, shall transmit to the editor of the *Madrid Gazette*, together with the report mentioned in paragraph 26, a further list of the patents that have become void by ministerial decision.

The civil governors shall cause such reports to be published in the official journals of their provinces and to have the due entries made at their offices.

SECTION IX.

Of the Infringements and Forgeries of Patents and of the Penalties to which they are Subject.

Par. 49. Infringers of patents are those who knowingly shall encroach on the rights of the legal owner by manufacturing or executing the object of the patent by identical means.

Accomplices are those who knowingly shall assist in the manufacture, execution, and sale or expedition of the counterfeit patent articles.

Par. 50. Infringements of patents are subject to a fine of from 200 to 2,000 pesetas.

In case of a second offense, the fine shall amount to from 2,001 to 4,000 pesetas.

A second offense is established by the infringer having been punished within five years preceding the same offense.

Complicity in infringements shall be subject to a fine of from 50 to 200 pesetas, and a second offense to a fine of from 201 to 2,000 pesetas.

All counterfeit products shall be delivered to the patentee, besides damages for the loss he may have sustained. Insolvents shall in both cases be subject to a subsidiary imprisonment corresponding to the provisions of paragraph 50 of the Criminal Code.

Par. 51. Infringers of patents are liable to the penalties mentioned in the first section of chapter 4, part ii, of the Criminal Code.

Par. 52. Actions for infringements made statutable and punishable by the present section can only be entered by the public prosecutor on the complaint of the injured party.

SECTION X.

Of the Jurisdiction of Patent Matters.

Par. 53. All civil and criminal actions concerning patent matters shall be instituted before special juries, (experts.) Until their organization such actions shall be brought before the common courts of justice.

Par. 54. Whenever the action is brought against the grantee, as well as against one or more co-grantees, the competent tribunal shall be determined by the domicile of the grantee.

Par. 55. Civil actions shall be instituted according to the provisions made for incidental causes in common pleadings, and criminal actions shall be regulated by the criminal procedure.

Par. 56. The public prosecutor shall take part in all actions intended for the annulment or extinction of a patent.

Par. 57. In that case all parties interested in the grant shall be summoned according to the register of the Conservatory of Arts.

Par. 58. As soon as a patent has been declared to be null and void or extinct, the tribunal shall communicate the judgment to the Conservatory of Arts for due entry, and the annulment or expiry shall be published in the *Madrid Gazette* within the same terms and at the proper time as prescribed by the present law for the publication of patents.

The civil governors shall republish such annulments or expiries in the provincial official papers and enter the same in the patent records of their offices.

SECTION XI.

Transitory Dispositions.

Par. 59. From the day the present law comes into force all anterior dispositions relating to patents for inventions, importations, and improvements shall be abrogated.

Par. 60. All existing patents for inventions, importations, and improvements, obtained under the old law, shall continue to be in force during the term previously granted.

Par. 61. All applications made before the publication of the present law shall be terminated in accordance with the old law; the applicants, however, may choose the term and mode of payment of the present law.

Par. 62. All actions for infringements, counterfeiting, annulment, or extinction of patents which were not begun before the execution of the present law shall be pursued according to the provisions of the same.

Therefore, we command all tribunals, justices, magistrates, governors, and other civil, military, and ecclesiastical authorities, of any class and rank whatever, to observe and cause to be observed, to fulfill and execute, the present law in all its parts.

Given in our palace on the 30th day of July, 1878.

I THE KING.

The Minister of Public Works, Commerce, and Instruction,

C. FRANCISCO QUEIPO DE LLANO.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., December 28, 1883.

SIR: I am directed by the Secretary to inform you that he has ordered that Edwin H. Hall, of Boston, Massachusetts, be not recognized from and after this date as an attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

AMOS HADLEY,
Acting Chief Clerk.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
Washington, January 4, 1884.

SIR: I am directed by the Secretary to inform you that the order of the Department, dated August 29, 1876, by which P. C. Hughes, of Eureka, Kansas, was disbarred from practice before this Department and its bureaus, has this day been rescinded.

Very respectfully,

AMOS HADLEY,
Acting Chief Clerk.

The Commissioner of Patents.

Issue of January 8, 1884.

Patents	378	No. 291,482 to No. 291,859, inclusive.
Designs	16	No. 14,535 to No. 14,544, inclusive.
Trade-marks	18	No. 10,833 to No. 10,850, inclusive.
Labels	23	No. 3,807 to No. 3,829, inclusive.
Reissue of patents	3	No. 10,434 to No. 10,436, inclusive.
Total issue	432

DESIGNS.

14,535.—CORSET.—*James Bowers*, Newark, N. J. Application filed October 1, 1883. Term of patent 7 years.

14,536.—ORNAMENTATION OF HARDWARE.—*John J. Kennedy*, Branford, Conn. Application filed November 10, 1883. Term of patent 7 years.

14,537 to 14,542, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed November 21, 1883. Terms of patents 3½ years.

14,543.—SEWING-MACHINE STAND.—*Isaac Newton Poe*, Toledo, Ohio. Application filed October 4, 1883. Term of patent 7 years.

14,544.—AGRICULTURAL FORK.—*John H. Smith*, Jackson, Mich., assignor to *Withington & Cooley Manufacturing Company*, same place. Application filed April 13, 1883. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,833.—WHISKY OR ITS COMPOUNDS.—*Cook & Bernheimer*, New York, N. Y. Application filed December 4, 1883.

"The representation of a lion."

10,834.—REMEDY FOR PILES.—*John E. Butler*, Golconda, Ill. Application filed December 1, 1883.

"The word 'HEMORRHOIDINE.'"

10,835.—COTTON YARNS AND BRAIDS.—*Dollfus-Mieg & Co.*, Mülhausen, Alsace-Lorraine, Germany. Application filed December 13, 1883.

"The representation of a bell."

10,836.—MIXTURES OF MEAT, IRON, AND QUINQUINLA.—*Jules Ferré*, Paris, France. Application filed November 2, 1883.

"The fanciful arrangement of the letter and word 'F. AROUD,' in Roman characters, superimposed on the script representation of the same letter and word."

10,837.—MIXTURE OF MEAT, IRON, AND QUINQUINLA.—*Jules Ferré*, Paris, France. Application filed November 2, 1883.

"The word 'AROUD.'"

10,838.—MIXTURE OF MEAT AND QUINQUINLA.—*Jules Ferré*, Paris, France. Application filed November 2, 1883.

"The fac-simile signature 'AROUD.'"

10,839.—EMBROIDERY-COTTON.—*Henry E. Frankenberg*, New York, N. Y. Application filed December 7, 1883.

"The word 'MOSAIC' and the letters 'J. O. C.'"

10,840.—DENTIFRICE.—*Frederick S. Hanf*, Jersey City, N. J. Application filed December 15, 1883.

"The word 'GLYCHODEN.'"

10,841.—BITTERS.—*William O. Hurd*, New York, N. Y. Application filed December 15, 1883.

"The arbitrarily-selected word-symbol 'BLUE GRASS.'"

10,842.—COMPOSITION AS A SUBSTITUTE FOR HARD RUBBER.—*The James D. Frary & Son Co.*, Bridgeport, Conn. Application filed November 26, 1883.

"The word 'RUBBEROID.'"

10,843.—HAIR-NETS AND RETICULATED FABRICS.—*A. G. Jennings & Sons*, Brooklyn, N. Y. Application filed December 12, 1883.

"The representation of a tapering shield having straight sides and rounded ends in or near the center of a larger piece of cardboard."

10,844.—CANNED RASPBERRIES, STRAWBERRIES, CHERRIES, AND OTHER FRUITS.—*Knowles & Anderson*, Camden, N. J. Application filed December 10, 1883.

"The representation of a woman's left hand and wrist, with the thumb and middle finger holding the stem of a fruit."

10,845.—BEER.—*Adolphe Kreiss*, Schiltigheim, Germany. Application filed August 9, 1883.

"A divided circle, a crown, and the words 'LES COURONNES.'"

10,846.—MAGNETIC BODY-WEAR, BEDDING, AND MEDICAL APPLIANCES GENERALLY.—*August P. Lighthill*, Boston, Mass. Application filed December 15, 1883.

"The word-symbol 'VOLTA MAGNETIC,' in connection with the representation of a hand holding a magnet."

10,847.—PREPARED TEA AND COFFEE.—*The New York Textile Filter Company*, New York, N. Y. Application filed November 26, 1883.

"The arbitrary word-symbol 'FILTRINA.'"

10,848.—MEN'S HEAVY BOOTS AND SHOES.—*Pingree & Smith*, Detroit, Mich. Application filed November 17, 1883.

"The arbitrarily-selected word or name 'BIJAH.'"

10,849.—BITTERS.—*Theodor Ripke*, Hamburg, Germany. Application filed October 19, 1883.

"The arbitrarily-selected word 'VENEZUELA.'"

10,850.—SPRING SHADE-ROLLERS.—*Saginaw Manufacturing Company*, Saginaw, Mich. Application filed November 19, 1883.

"The arbitrarily-selected word 'VICTOR.'"

LABELS.

3,807.—Title: "BAUM'S EVER-READY CASTORINE." (FOR AN AXLE OIL.)—*L. Frank Baum*, Syracuse, N. Y. Application filed December 10, 1883.

3,808.—Title: "C. & W." (FOR HYDROCARBON OIL.)—*Clark & Warren*, Corry, Pa. Application filed December 15, 1883.

3,809.—Title: "LUZ DIVINA" (FOR KEROSENE OIL.)—*Ilsley, Doubleday & Co.*, New York, N. Y. Application filed December 13, 1883.

3,810.—Title: "COMPOUND QUININE PLASTER."—*Charles F. Fish*, Saratoga Springs, N. Y. Application filed December 14, 1883.

3,811.—Title: "P. B. B." (FOR TIP-LININGS OF HATS.)—*Francis G. Hanson*, Brooklyn, N. Y. Application filed December 13, 1883.

3,812.—Title: "STANDARD TIME" (FOR TIP-LININGS OF HATS.)—*Francis G. Hanson*, Brooklyn, N. Y. Application filed December 13, 1883.

3,813.—Title: "HARRISON'S GOLDEN COLOGNE WATER."—*Apollos Wolcott Harrison*, Philadelphia, Pa. Application filed December 18, 1883.

3,814.—Title: "RED PILLS."—*William O. Hurd*, New York, N. Y. Application filed December 15, 1883.

3,815.—Title: "RIBBED HOSE."—*Lewis Jones*, Bristol, Pa. Application filed December 17, 1883.

3,816.—Title: "ZENITHIA TOILET SOAP."—*James S. Kirk & Co.*, Chicago, Ill. Application filed December 19, 1883.

3,817.—Title: "ZENITHIA COLOGNE."—*James S. Kirk & Co.*, Chicago, Ill. Application filed December 19, 1883.

3,818.—Title: "BERMUDA WATER." (FOR A TOILET PREPARATION.)—*James S. Kirk & Co.*, Chicago, Ill. Application filed December 19, 1883.

3,819.—Title: "JUVENILE" (FOR SOAP.)—*James S. Kirk & Co.*, Chicago, Ill. Application filed December 19, 1883.

3,820.—Title: "WILLIAM LASSON'S HAIR ELIXIR."—*Otto Knop*, Berlin, Germany. Application filed December 5, 1883.

3,821.—Title: "HOPE FOR THE INVALID." (FOR A MEDICAL COMPOUND.)—*Eben B. Merrill*, Wellston, Ohio. Application filed December 6, 1883.

3,822.—Title: "MICHAELIS & SON'S EXTRACT OF CREAM GINGER ALE."—*M. Michaelis & Son*, New York, N. Y. Application filed December 13, 1883.

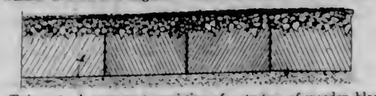
3,823.—Title: "BAIT" (FOR A PERFUME FOR THE BREATH.)—*Frank Parker, Albertus L. Vandewater*, and *Thomas G. Talmage*, Islip, N. Y. Application filed December 3, 1883.

3,824.—Title: "PRATT'S AROMATIC GENEVA GIN."—*Samuel Pratt*, New York, N. Y. Application filed December 12, 1883.

3,825.—Title: "SNAPS FOR THE BREATH."—*A. J. Richards* and *W. E. Conner*, Marietta, Ohio. Application filed December 17, 1883.

3,826.—Title: "WHITE DROPS" (FOR A MEDICINAL PREPARATION.) *William Russell, Jr.*, Providence, R. I. Application filed December 6, 1883.

3,827.—Title: "RUSSELL'S WHITE DROPS" (FOR A MEDICINAL PREPARATION.)—*William Russell, Jr.*, Providence, R. I. Application filed December 6, 1883.



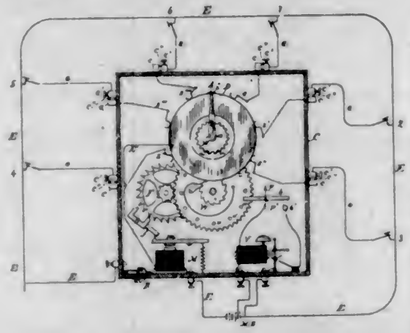
3,828.—Title: "DANDELION BITTERS."—*John Sutton*, Tower City, Pa. Application filed December 13, 1883.

3,829.—Title: "CADY'S ORIGINAL BAG-DAD CIGAR."—*The Westfield Cigar Company*, Westfield, Mass. Application filed December 17, 1883.

PATENTS

GRANTED JAN. 8, 1884.

291,482. COMBINED WOOD AND BROKEN-STONE PAVEMENT. WILLIAM A. ABBERS, Chicago, Ill. Filed Nov. 26, 1883. (No model.)



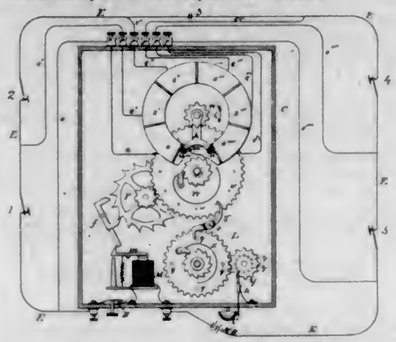
Claim.—1. A pavement consisting of a stratum of wooden blocks supported upon a suitable foundation, covered by a stratum of hard broken stone, and a surface stratum of hard finely-broken stone to compact and cover the same, substantially as specified.

2. The herein described method of forming street-pavement, by laying wooden blocks upon a suitable foundation, filling the spaces between them, placing over them a stratum of broken hard stones, rolling the broken stones with sufficient pressure to partly embed them in the blocks, and to compact them together, and then placing over said stratum a covering of the same, but finer material, and compacting the two upper coorses or strata together by a second rolling, substantially as described.

3. The herein-described method of restoring worn or partly-decayed wooden pavements, by filling the lower decayed or worn portions to the level of the sound blocks with broken hard stones, then applying a complete stratum of broken hard stones, heavily rolled to drive them into the blocks and compact them together, and then applying a covering stratum of finely-broken or pulverized hard stones and rerolling the same, substantially as specified.

291,483. ELECTRICAL INDICATOR AND ALARM. WILLIAM H. BAKER, Brooklyn, N. Y. Filed Apr. 28, 1883. (No model.)

Claim.—1. In an electrical indicator, the combination of an electro-magnet in a normally-open electrical circuit, having one or more normally-open branches connected to said electrical circuit through the medium of a metallic disk or ring, one or more circuit-closers located at various points in the electrical circuit, and a motor-driven radial arm for automatically breaking connection between said circuit and its branches.



2. In an electrical indicator, the combination of an electro-magnet located in a normally-open electrical circuit, one or more normally-open branch circuits connected to the said electrical circuit through the medium of a metallic disk or ring, one or more circuit-closers located at various points in the said electrical circuit, and a motor-driven radial arm normally held in check by said electro-magnet for automatically breaking connection between said electrical circuit and each branch circuit in succession.

3. The combination, in an electrical indicator, of a normally-open circuit having a series of branches, a circuit-closer for each branch, located at various points in the said circuit, an electro-magnet the coils of which form part of the said circuit, a motor-driven arm held in check by the electro-magnet, and a dial and pointer.

4. The combination, in an electrical indicator, of a normally-open electrical circuit having a series of branches, a series of circuit-closers, one for each branch, located at various points in the said circuit, an electro-magnet located in said circuit, a conducting disk or ring having upon its periphery a series of springs, one for each branch, a motor-driven arm, and a dial and pointer.

5. In an electrical indicator, the combination of a normally-open circuit having a series of branches, a conducting ring or disk having a series of springs connecting said circuit and branches, a series of circuit-closers for completing the normally-open circuit, an electro-magnet in said circuit, a motor-driven arm, a dial and pointer, and an alarm-bell.

291,484. ELECTRICAL INDICATOR AND ALARM. WILLIAM H. BAKER, Brooklyn, N. Y. Filed May 18, 1883. (No model.)

Claim.—1. In an electrical indicator, the combination of a normally-closed electrical circuit containing the coils of an electro-magnet, two or more circuit-breakers located at different points in the circuit, and means for automatically short-circuiting each circuit-breaker in succession.

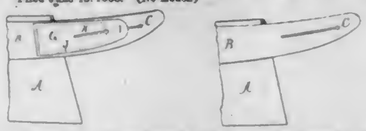
2. In an electrical indicator, the combination of a normally-closed electrical circuit having a series of normally-open branches, a series of circuit-breakers located at various points in the circuit, an electro-magnet located at the indicator, and means for automatically short-circuiting each of said circuit-breakers in succession.

3. The combination, in an electrical indicator, of a normally-closed circuit having a series of normally-open branches, a series of circuit-closers located at various points in said circuit, an electro-magnet in said circuit at the indicator, a conducting-ring composed of a series of insulated sections, and a motor-driven radial arm normally held in check by the said electro-magnet.

4. The combination, in an electrical indicator, of a normally-closed electrical circuit having a series of normally-open branches, a series of circuit-closers located at various points in the circuit, an electro-magnet at the indicator, means for short-circuiting each circuit-closer in succession, and an automatic alarm.

291,485. HAT-RANGING ATTACHMENT. WILLIAM H. BARRY, New York, N. Y. Filed Mar. 15, 1883. (Model.)

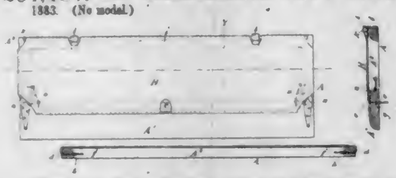
Claim.—1. In a hat attachment, the combination of a band or main stem, a spring-arm, a catch on end of arm, and a ring or loop on arm midway between the spring and end of arm, said catch to engage with the main stem to keep the arm and main stem close together when en-



291,485.

gaged, a spring to force the spring-arm out, when said catch is released, to an angle of about forty-five degrees, forming a hook, and a spring-base on said main stem, secured by eyelets or pivots to a base-plate fastened to hat by rivets or other appropriate means, as and for the purposes set forth.

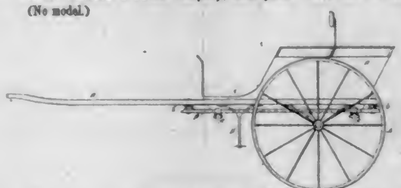
2. In a device to be attached to hats for the purpose of hanging them up under various conditions, the combination of the main stem L, spring C, spring-arm K, catch B, ring or loop A, spring-base E E' and D, and base-plate H, constructed substantially as herein shown and described, and for the purposes set forth.



291,486. BUTTON-HOLE. FREDRICK BEERMEISTER, Jr., Troy, N. Y. Filed June 13, 1883. (No model.)

Claim.—1. An attachment for the button-hole end of a collar or other wearing article, consisting of a short stay-piece formed with a horizontal slit of a size to receive a collar-button, or the like, and of a length less than the collar-button hole, substantially as set forth.

2. The combination, with a collar or other wearing article formed with an elongated button-hole, of a short stay-piece formed with a horizontal slit of a size to receive a collar-button, or the like, and of a length less than the said button-hole, and fastened on opposite sides of the button-hole and at points lying between straight lines of the respective ends of the said button-hole, substantially as shown, and for the purposes set forth.



291,487. SEAT. MARSENA BENEDICT, New York, N. Y. Filed Feb. 24, 1883. (No model.)

Claim.—1. The combination, in a seat, of a frame having longitudinal slots in its front side and in both ends, a web of cloth passing through said slots on its front and end edges, and having pockets on such edges, key-rods inserted in said pockets, and means for attaching the web to the rear side of the frame, substantially as and for the purpose described.

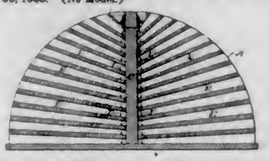
2. The combination, in a seat, of a frame, a web of cloth having a longitudinal pocket on its rear edge, a key-rod inserted in such pocket, hasps attached to the rear side of the frame to engage said rods, as specified, and means for attaching the web to the front side and the ends of the frame, substantially as and for the purpose described.

291,488. ROAD-CART. JUDSON W. BREED, Cincinnati, Ohio, assignor to the Emerson & Fisher Company, same place. Filed Jan. 12, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, the body E, connected to the side bars, D, the latter being connected at their ends to a supporting frame or platform supported by the axle, substantially as and for the purposes specified.

2. In a two-wheeled vehicle, the body E, connected to the side bars, D, the latter being connected at their ends to the end bars, *b b'*, said end bars being supported by the platform C, connected to the axle, substantially as and for the purposes specified.

3. In a two-wheeled vehicle, the platform C, connected to the axle by means of brackets *a*, and having the thills B, connected to the front end of said platform, in combination with the body E and side bars, D, the latter being connected at their ends to the platform C, and the body being connected to the side bars by spring-connections *e*, substantially as and for the purposes specified.



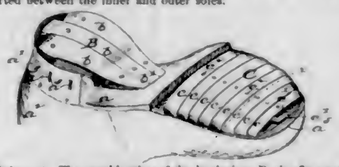
4. In a two-wheeled vehicle, the axle A and platform or frame C, formed by the rear ends of the thills, and secured to the axle by brackets *a*, in combination with the side bars, D, and end bars, *b b'*, the latter being connected to the platform C, and the side bars being connected to the end bars, substantially as and for the purposes specified.

5. In a two-wheeled vehicle, the axle A and platform C, the latter secured to the axle by brackets *a*, in combination with the end bars, *b b'*, secured rigidly to the platform, and the side bars, D, rigidly secured at their ends to the end bars, and the body E, suspended from the side bars by suitable springs, *e*, substantially as and for the purposes specified.

6. The combination of the end bars, *b b'*, and the side bars, D, secured to said end bars by means of the brackets or stirrups *d*, raised above or depressed below the end bars, substantially as and for the purposes specified.

7. The combination of the end bars, *b b'*, connected to the platform C, and the side bars, D, connected to the end bars by means of the brackets *d* and clips *d'*, the brackets being raised above or depressed below the end bars, and the body E, connected to the side bars by spring-connections *e*, substantially as and for the purposes specified.

291,489. PAPER-BAG HOLDER. ALBERT BROWN, Mendocino, Cal. Filed Oct. 30, 1883. (No model.)



Claim.—1. As an improvement in paper-bag holders, the combination of a pair of semicircular sides having inclined grooves, a bottom and a vertical center piece connecting the said sides, and inclined shelves held detachably in the grooves of the said sides, substantially as set forth.

2. The combination, in a paper-bag holder, of the semicircular sides having inclined grooves, the bottom and a vertical center piece connecting the said sides, the shelves, and the top shelves connected so as to form a trough having partitions, as shown, forming separate compartments, the end compartments being provided with perforated cross-strips, as and for the purpose set forth.

3. In a paper-bag holder, the combination, with the sides, of detachable shelves, the inner ends of which are provided with upwardly-projecting points or prongs, substantially as and for the purpose set forth.

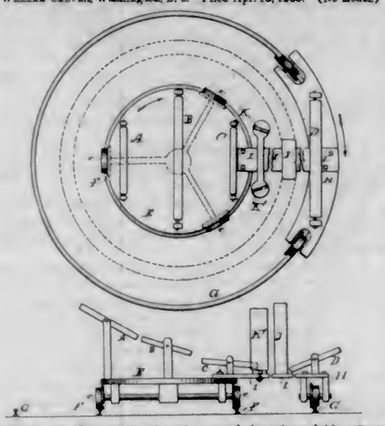
291,490. BOOT OR SHOE. GEORGE C. BUSH, Eureka, Mo. Filed Aug. 23, 1883. (No model.)

Brief.—The yielding heel is provided with longitudinal springs which extend forward under the shank, and transverse elliptical springs are inserted between the inner and outer soles.

Claim.—1. The combination of the heel-piece D, the flange *d*, having projections *d'*, the flange *a'*, attached to the heel, and having elongated openings, which receive said projections, and a heel-spring, substantially as described.

2. A boot or shoe having longitudinally-arranged springs for the heel and shank, in combination with a yielding heel-piece, D, substantially as described.

3. A boot or shoe having a transversely-arranged sole-spring, C, consisting of sections *c c c* between the inner sole, *a''*, and the outer sole, *a*, substantially as described.



4. The combined heel and shank-spring B, consisting of sections *b b b*, as a new article of manufacture, substantially as described.

5. The combination, with a hollow boot or shoe heel, of a spring, B, which is partially inclosed in the yielding heel and extended forward thereof beneath the shank, thereby serving the double purpose of a heel-spring and a shank-spring, substantially as described.

6. The combination of the longitudinal springs *b b'*, curved as described, with a hollow yielding heel and a covering shank-piece, E, substantially as described.

7. In a boot or shoe, the combination of the yielding heel D, the longitudinal heel and shank-spring B, the covering E for the forward portion of spring B, and the transverse sole-springs C, all as described.

291,491. MEANS FOR UTILIZING THE RAYS OF THE SUN. WILLIAM CALVER, Washington, D. C. Filed Apr. 18, 1883. (No model.)

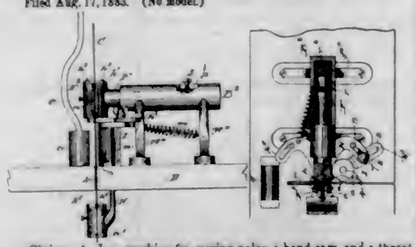
Claim.—1. The combination of a central pivoted revoluble reflector and a receiver adapted to receive the rays from the reflector during its entire revolution, substantially as specified.

2. The combination of a central pivoted revoluble reflector, laterally-located secondary reflectors, and a receiver, substantially as specified.

3. The combination of a central pivoted revoluble reflector, a concentrically-movable reflector, and an interposed receiver, substantially as specified.

4. The combination of a central reflector adapted to be revolved, with a receiver and an outer reflector, both of which are adapted to be revolved concentrically and simultaneously with said central reflector, substantially as specified.

5. The combination of two circular concentric tracks and cars adapted to move upon the same and carrying reflectors, with a connecting-bridge carrying a receiver, substantially as specified.



6. The combination of two cars connected by a bridge, and adapted to be revolved bodily about a center, with inner and outer reflectors, a receiver, and secondary reflectors, substantially as specified.

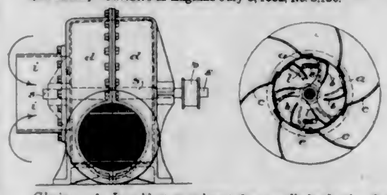
7. The car E, mounted upon the circular track F, in combination with the reflectors A B C, one of which is centrally located, substantially as shown and described.

8. The combination of the car E, reflectors A B C D, bridge I, receiver J, and car H, mounted upon the track G, substantially as shown and described.

9. The combination of the car H, carrying a reflector, D, with the bridge I, receiver J, and car E, carrying reflectors, substantially as shown and described.

291,492. BAND-SAW MILL. HENRY F. CAMPBELL, Concord, N. H. Filed Aug. 17, 1883. (No model.)

Claim.—1. In a machine for sawing poles, a band-saw, and a throat having a slotted hub adapted to guide the band-saw near the table of the machine, combined with a roller, *a*, connected with the said throat and adapted to serve as a support for the band-saw, whereby pressure of the pole being sawed against the said roller moves the throat and turns the band-saw in the proper direction, substantially as described.



2. In a machine for sawing poles, the throat having two slotted hubs to receive the band-saw, and a box to receive one of the slotted hubs of and sustain the said throat and act as a bearing for it in its oscillations, combined with an adjustable roller, *a*, connected with the said throat and adapted to operate, substantially as described.

3. In a machine for sawing poles, the throat having a slotted hub, and a box to receive and sustain the said hub loosely, and the bracket and roller *a*, attached to the said yoke, combined with the anti-friction plates in the said hub to bear against the back edge and sides of the band-saw, substantially as described.

4. In a machine for sawing poles, the throat having a slotted hub, and a box to receive the said hub and permit it to oscillate, and a roller, *a*, adjustably connected with the said throat, combined with a spring and a stop to regulate the extent of oscillation or turning movement of the said throat, substantially as described.

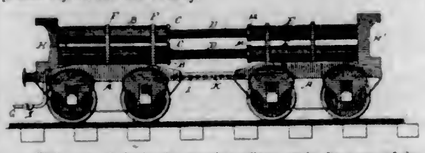
5. The bed, standards, box, and adjustable arm, and the throat H, having a slotted hub to receive the band-saw, and supported loosely in the said box, combined with the roller *a*, adjustably connected with the said throat, substantially as described.

291,493. BLAST OR EXHAUST FAN. GEORGE MARIE CAPELL, Passenham, County of Northampton, and GEORGE SCOUGAL MACBEAN, The Grove Bishopstoke, County of Hants, England. Filed Apr. 14, 1883. (No model.) Patented in England July 3, 1882, No. 3,130.

Claim.—1. In a blast or exhaust fan, a cylinder having fastened thereto a series of internal and external blades, said cylinder being provided with port-holes between the points where said blades are fastened, for the purpose herein set forth.

2. In a blast or exhaust fan, in combination, substantially as shown and described, the cylinder *a*, having port-holes in the body thereof, internal curved blades, *b*, external blades, *c*, shafts *s*, and casing *d*.

3. In a blast or exhaust fan, in combination, substantially as shown and described, the adjustable internal blades, *b*, and the cylinder *a*, having slots *e e* made in the end thereof, and pins *l l*, made fast to the side plates supporting the external blades, *c*.



291,494. FURNITURE-CASTER. GEORGE DWIGHT CLARK, Plainville, Conn. Filed Mar. 13, 1883. (No model.)

Claim.—In a caster, a pintle having two swaged shoulders and a flat disk washer seated against one shoulder and retained in place by the upset metal of the other shoulder, substantially as set forth.

291,495. DEVICE FOR STOPPING RAILWAY-TRAINS. JOHN WILLS CLOUD, Altoona, Pa. Filed June 23, 1883. (No model.)

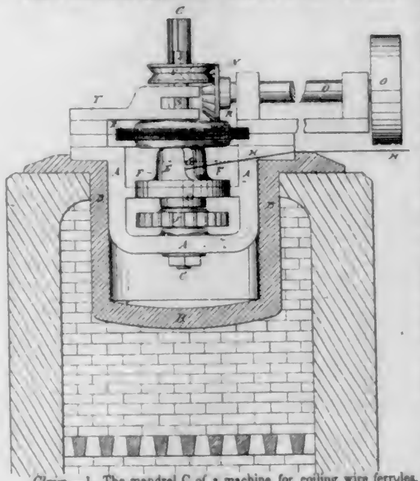
Brief.—A device to be attached to either end of a train of cars, or permanently fixed at the end of a track to serve as a bumper. It consists of an independent car or structure adapted to close together under violent pressure. Cylinders with pistons are attached to the car or structure. The piston-rods are made shorter than the cylinders, and have elastic washers, the object being that the air in the cylinder shall not be compressed beyond the limit of safety.

Claim.—1. A device for stopping railway-trains by means of the compression of elastic fluids, which consists of an independent car or structure adapted to close together under violent pressure, and in doing so to compress a volume of such elastic fluid, substantially as shown and described

2. The combination of the truck A, having cylinders B attached thereto, with a truck or structure having pistons C and rods D attached thereto, all substantially as shown and described.

3. In a device for stopping railway-trains, substantially as shown and described, the combination of the trucks A A' with the draft-chain K, substantially as shown and described.

4. In a device for stopping railway-trains, substantially as shown and described, the combination of the trucks A A' with a yielding brace, I, substantially as shown and described.



5. In a device for stopping railway-trains, substantially as shown and described, the combination of the cylinders B, the piston-rods D, made shorter than the cylinders, and the elastic washers M, all substantially as shown and described.

6. In combination with a device for stopping railway-trains, substantially as shown and described, the jaws or lips H H', adapted to keep the device in proper position, substantially as shown and described.

7. In a device for stopping railway-trains, substantially as shown and described, the combination of the compression-cylinders B with the air-hose G and valve *g*, all substantially as shown and described.

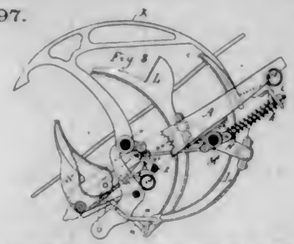
291,496. MACHINE FOR MAKING COILED-WIRE FERRULES

JOSEPH CROWFOOT, Bridgeport, Conn. Filed Feb. 23, 1883. (No model.)

Claim.—1. The mandrel C of a machine for coiling wire ferrules, made tubular and of elastic strips at the upper end, to admit of inward compression and a ready escape of the ferrule-tube, as described.

2. In a machine for coiling wire ferrules, the combination, with a rotary mandrel, of a fixed bearing, D, and a jacket, E, made fast to said bearing, whereby the jacket will surround the coils of wire while the solder is being applied thereto, as described.

3. In a machine for making coiled-wire ferrules, the combination, with the rotary mandrel C and the stationary band I, having inclined upper edge, of the jacket E, having apertures F to admit solder, and an inclined slot, H, to receive the wire, substantially as herein shown and described, whereby the coiled wire is kept in place as it is pushed up the mandrel, as set forth.



4. In a machine for making coiled-wire ferrules, the rotary mandrel C, made substantially as herein shown and described, with its upper part tubular and slitted longitudinally from its upper end, whereby the mandrel can be kept cool more readily, and will allow the coiled wire to move upward upon it more easily, as set forth.

5. In a machine for making coiled-wire ferrules, the combination, with the rotary mandrel C and its driving mechanism, of the rotary brush R and its driving mechanism, substantially as herein shown and described, whereby the uncombined solder is brushed off and the coiled wire is polished, as set forth.

6. In a machine for coiling wire ferrules, the combination, with the mandrel C, bearing D, and jacket E, of a stationary band, I, inclined at the upper edge to push the wire upwardly as fast as coiled, as described.

291,497. GRAIN-BINDER.

ERASTUS M. DEANE, St. Paul, Minn. Filed Mar. 24, 1883. (No model.)

Claim.—1. In a grain-binder, the combination, with the adjustably-yielding packer-shaft, of the adjustably-yielding trip-lever which controls the binder-clutch, said parts being so arranged that the movement of the packer-shaft shall be communicated to the trip-lever, substantially as described.

2. In a grain-binder, the combination, with the yielding packer-shaft, of the adjustable spring mechanism for controlling the movement of said shaft, substantially as described.

3. The combination, with the main drive-shaft and with the yielding packer-shaft connected to the inner end thereof, and sustained in movable bearings, of the trip mechanism which controls the binder-clutch, substantially as described.

4. The combination, with the main drive-shaft and with the revolving arm thereon having catches to engage the binder-pinion, of the movable packer-shaft connected to the inner end of said main shaft, and the trip-lever which controls the binder-clutch, substantially as described.

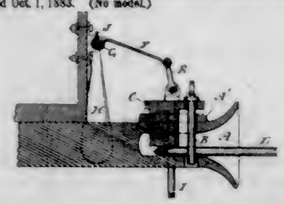
5. In a grain-binder, the combination, with the packers mounted upon cranks and adapted to work through the binder-table, of the movable packer-shaft, the spring for controlling the movement of said shaft, means for adjusting said spring, and suitable means for communicating the movement of the packer-shaft to the binder-clutch, substantially as described.

6. The combination, with the packer-shaft and its sliding boxes, of the connecting-rod, the rock-shaft, and the trip-lever that controls the binder-clutch, substantially as described.

7. The combination, with the trip-lever which controls the binder-clutch, of a movable packer-shaft and a movable gavel-support, both arranged to shift by impact of the accumulating gavel, thereby tripping said lever to start the binding mechanism, substantially as described.

8. A revolving shaft having packers set on the cranks thereof, in combination with sliding boxes for said shaft, and the trip-lever which controls the binder-clutch, the several parts being relatively arranged, substantially as described, so that the impact of the accumulating gavel shall act upon said crank-shaft, which moves the trip-lever that shifts and starts the binding mechanism, substantially as set forth.

9. A revolving shaft having packers set on the cranks thereof, in combination with yielding bearings or boxes for said shaft, a movable gavel-support, and the trip-lever which controls the binder-clutch, the several parts being relatively arranged, substantially as described, so that the impact of the accumulating gavel shall cause said lever to shift and start the binding mechanism, substantially as set fortn.



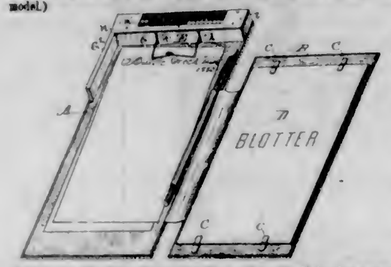
10. The combination, with the packer-shaft, its yielding supports and adjusting-springs, of the trip-lever to control the binder-clutch, an adjusting-spring for said lever, and suitable mechanism intermediate the supports and lever, whereby, in co-operation, the accumulating gavel will shift the shaft and cause it to act upon the trip-lever, substantially as described.

11. The combination, with the packer-shaft M', mounted in yielding boxes, of the tension-spring *h*, the connecting-rod o^4, the rock-shaft 2, and the trip-lever Q, controlling the binder-clutch, substantially as described.

12. The combination, with the packer-shaft M', mounted in yielding boxes, of the tension-spring *h*, the connecting-rod o^4, the rock-shaft 2, having arm R, the gavel-supporting fingers S, and the trip-lever Q, controlling the binder-clutch, substantially as described.

291,498. CAR-COUPLING.

CHARLES DEVLIN, Pembroke, Ontario, Canada. Filed Oct. 1, 1883. (No model.)



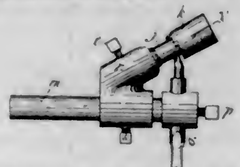
Claim.—1. The combination of a draw-head, A, having a slot in the top and pin-hole in the bottom, and a weight or bar, D, sliding in said slot, and carrying forwardly a draw-pin entering a hole in the bottom of the draw-head, whereby the lower end of the weight or bar is adapted to bear on the end of an inserted draw-link and keep it in position for coupling by pressure against the bottom of the draw-head, as set forth.

2. The combination of a draw-head, A, having a slot in the top and a pin-hole in the bottom, a bar or weight, D, sliding in said slot, and carrying a pin, B, entering a hole in the bottom of the draw-head, and a yoke, I, attached to the top of weight or bar D, whereby the under part of the yoke, by striking against the under side of the draw-head, will limit bar or weight D rising out of its slot.

3. The combination, with the weight or bar D, having pin B and head C, of the shackle E, arm F, staple J, and rock-shaft G, having weighted arms H, as set forth, for the purpose described.

291,499. COMBINED PAPER-HOLDER, CALENDAR AND BLOTTER.

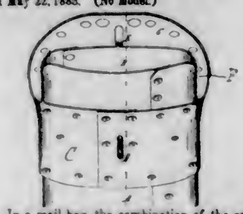
CORNELIUS DE VOS, Battle Creek, Mich. Filed Mar. 24, 1883. (No model.)



Claim.—1. The hinged blotter holder and carrier B, having paper-fastening devices C C, in combination with the base or tablet A, having a block, G, and spring-clasp E at its top end, and a bar, G^3, at its side, substantially as shown and described, for the purposes specified.

2. As an improved article of manufacture, the combined tablet, blotter, and calendar, composed of the base A, hinged blotter and carrier B C C, the spring-clasp E, the block G, having a channel in its top, side, and center, the adjustable slide *m*, and a cover, *n*, having a slot, *r*, substantially as shown and described, for the purposes specified.

291,500. WIRE-COILING MACHINE.



EDWARD W. DURKEE, Mason, Ill. Filed May 21, 1883. (No model.)

Claim.—In a wire-coiling machine, bar *m*, wire-guide *o*, casting *r*, mandrel *j*, and cylinder *k*, grooved as described, and all combined in the manner specified.

291,501. MAIL-BAG.

H. CLAY EVANS and GEORGE JONES, Chattanooga, Tenn. Filed May 22, 1883. (No model.)

Claim.—1. In a mail-bag, the combination of the extended top of the bag, adapted to be folded down backward into a pocket, and means for securing the same in position, substantially as set forth.

2. In a mail-bag, the combination of the extended top of the bag, adapted to be folded down backward into a pocket formed between the rear side of the bag and the flap, the flap being adapted to be folded down forward over the folded-down top, and means for securing the same in position, substantially as set forth.

3. In a mail-bag, the combination of the downwardly and backwardly folded top, the pocket formed by the flap and body of the bag, the back flap being provided with an eyelet, and the staple, substantially as described.

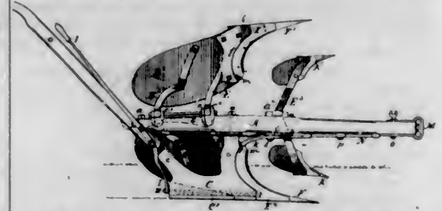
4. The herein-described mail-bag, constructed with an extended top, a pocket in the rear of the top, an eyeleted flap, and a staple, the extended top being adapted to fold down into the pocket, the flap being adapted to fold down over the folded-down top, the staple to pass through the eyelet to permit the bag to be locked, as herein described.

291,502. SPRING-ROLLER FOR CURTAIN-FIXTURES.

JAMES B. PINCH, Newark, N. J. Filed Apr. 23, 1883. (Model.)

Claim.—1. In combination, the spring-actuated curtain-roll, the compound detent having the incline *s*, the box *e*, having abutments for said detent, and an inwardly-projecting lug, *m*, the plate *t*, and projection *r*, all arranged and operating substantially as herein set forth and shown.

2. In combination, the spring-actuated curtain-roller, carrying the box *e*, having the slots *h i*, with inwardly-projecting lug *m*, the detent *m' n*, having the incline *s*, and lug or projection *r*, all being arranged and operating substantially as and for the purpose herein set forth and shown.



3. In combination, in a spring-actuated curtain-roll, the box having the lug *m*, adapted to throw the sliding detent into engagement with an abutment on said box, and having an abutment to receive said detent when said box is revolving at a slow rate of speed, and a sliding detent having its opposite extremities free to engage with said abutments and lug, substantially as set forth and shown.

4. In combination, the box having the slots *h i* and lug *m*, and the sliding detent, all arranged and operating substantially as and for the purposes set forth.

291,503. REVERSIBLE PLOW.

HORATIO GATES, Worcester, Mass. Filed Mar. 10, 1883. (No model.)

Brief.—The arms or standards carrying the mold-boards are curved to fit upon the front edge of the frame to take the strain. The connections to the lever lock and unlock the plow and the jointer. The clevis is automatically shifted by the plows coming in contact with the levers reaching back from the clevis.

Claim.—1. A swivel or reversible plow having two mold-boards, D D', connected together by rocking arm E' and rocking arm E, provided with triangular pieces E^2, in combination with the hubs or bearings e' on the top of the beam, and means for retaining either of said mold-boards at working position, substantially as set forth.

2. A swivel or reversible plow having two mold-boards, D and D', rigidly connected at diametrically-opposite positions by the rocking arms E and E', which are hinged to hubs or bearings on the top of the beam A, in combination with the fastening-rod H, which passes through the landside C into the triangular end of the arm E, and the lever I, adapted for simultaneously operating the fastening-rod H and the fastening-rod J, substantially as shown and described.

3. In combination with a swivel or reversible plow, the reversible jointer or sod-plow K, having two small mold-boards connected by the rocking arm E^2, which is hinged to the hubs or bearings G^2, in combination with the beam A, substantially as shown and described.

4. A swivel or reversible plow having two mold-boards, D D', connected together by rocking arms E E', hinged to hubs or bearings on the beam A, in combination with two jointers or sod-plows, K, connected by swinging arms E^2, hinged to hubs or bearings G^2 on the top of the beam, and devices for simultaneously fastening and releasing said mold-boards and sod-plows, substantially as described.

5. In combination with a swivel or reversible sod-plow or jointer, the fastening-rod J, hinged to the lever I and passing forward at the under side of the beam A, with its forward ends provided with hooks *n* for fastening the sod-plow or jointer firmly in working position at either side of the beam, substantially as shown and described.

6. In a swivel or reversible plow, the arm E, which connects the mold-boards D D' and shares F F', provided with the offset or lip *f*, in combination with the forward landside-standard *c*, as and for the purpose set forth.

7. In a swivel or reversible plow having two mold-boards connected

by rocking arms E E', the hinge-plate G, provided with side guards, *g*, and supporting lugs or ribs A, substantially as and for the purpose set forth.

8. In a swivel or reversible plow having two mold-boards connected by rocking arms hinged to the top of the beam, the plate carrying the ears or bearings *d'*, adapted for attachment to the wood beam A by the same bolts which secure the standards of the stationary landside C to said beam, as shown and described.

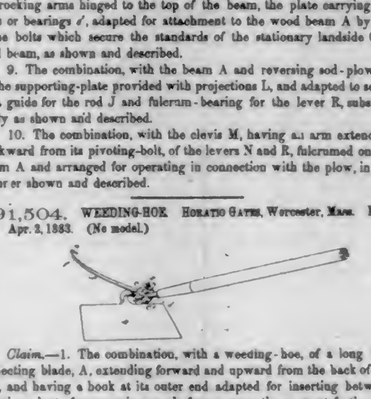
9. The combination, with the beam A and reversing sod-plow K, of the supporting-plate provided with projections L, and adapted to serve as a guide for the rod J and fulcrum-bearing for the lever R, substantially as shown and described.

10. The combination, with the clevis M, having an arm extending backward from its pivoting-bolt, of the levers N and R, fulcrumed on the beam A and arranged for operating in connection with the plow, in the manner shown and described.

291,504. WEEDING-HOE. HORATIO GATES, Worcester, MASS. Filed Apr. 2, 1883. (No model.)

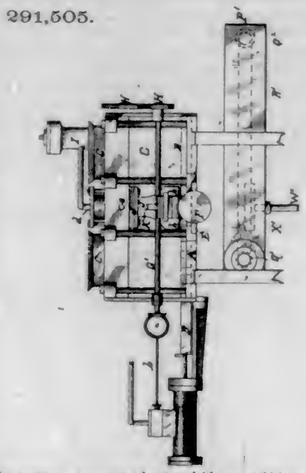
Claim.—1. The combination, with a weeding-hoe, of a long thin projecting blade, A, extending forward and upward from the back of the hoe, and having a hook at its outer end adapted for inserting between growing plants for removing weeds from among them, as set forth.

2. A weed pulling or cutting attachment for hoes, consisting of the long narrow blade A, hooked and sharpened at its outer end, as described, and provided at its inner end with attaching-clamp, whereby it can be secured upon an ordinary weeding-hoe in the manner substantially as set forth.



3. The combination, with a weeding-hoe, of a long thin blade or forwardly-projecting curved finger formed of sheet-steel, with sharp cutting-edges, as *f f*, at its outer end, said blade being arranged in relation to the main blade B of the hoe, in the manner substantially as described, for the purpose set forth.

4. The combination, with a weeding-hoe, of the long thin forwardly-projecting blade or weed-cutter A, detachably connected to the shank of the hoe by means of the clamping mechanism C C', adapted to embrace said shank and blade, substantially as set forth.

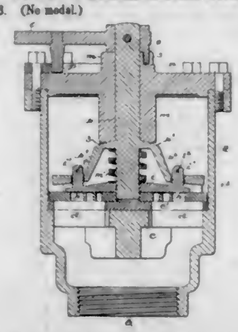


5. The combination of the weed-cutting blade A, the clamping-jaw C, rigidly fixed upon the end of said blade, the clamp-jaw C', grooved to embrace the shank, and connected to jaw C by a lock-hinge, *d*, and the clamping-screw E, as and for the purposes set forth.

291,505. MACHINE FOR MAKING PAVING-BLOCKS, BRICKS, &c. JOHN GAUNT, Gloucester, N. J., WILLIAM P. POTTS, Philadelphia, Pa., and WILLIAM CALHOUN and JACOB C. DAUBMANN, Camden, N. J. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination, in a brick-machine, of a mold-board, devices for reciprocating the same longitudinally, a vertically-moving compressor arranged above the mold-board, and reciprocated by hydraulic pressure to compress the material in the mold-board, a pressure-plate arranged as described, and devices for moving the same after the compressing operation, to permit the contents of the mold-board to pass or be forced therefrom, substantially as set forth.

291,505.



2. The combination, in a brick-machine, of a mold-board, devices for longitudinally reciprocating the same, a vertically-moving compressor arranged above the mold-board to compress the material in the same, a pressure-plate arranged as described, devices for moving the same after the compressing operation, to permit the contents of the mold-board to pass or be forced therefrom, and a balanced conveyer arranged to receive said contents, substantially as set forth.

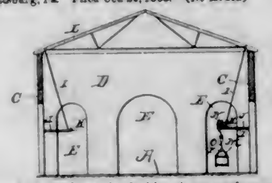
3. The combination, in a brick-machine, of a longitudinally-moving mold-board, a compressor arranged above the same, a pressure-plate, devices for transversely moving said pressure-plate to permit the contents of the mold-board to move or be ejected therefrom, a balance-conveyer arranged, as described, to receive said contents, and a belt arranged in a water-trough, substantially as and for the purpose set forth.

4. The combination, in a brick-machine, of molding and compressing devices, arranged as described, a balance-conveyer for depositing the molded bricks on a carrying-off belt, and devices for effecting a partial movement of said belt to carry the deposited bricks from beneath the conveyer and mold without operating the belt upon a reverse movement of said devices, substantially as and for the purpose set forth.

291,506. VALVE. J. MORTIMER GOLDSMITH, Boston, MASS. Filed Feb. 26, 1883. (No model.)

Claim.—1. The valve-seat provided with ports, and the main valve controlling the said ports, and itself provided with relief-ports, combined with the secondary valve controlling the said relief-ports, and the actuating mechanism for the said main and secondary valves, whereby the latter is operated to relieve the pressure on the main valve prior to the movement of the said main valve, substantially as described.

2. The valve-seat, the main valve provided with relief-ports seated thereon, and the secondary valve combined with the valve-stem, having a shoulder seated at the end of its socket, the said valve-stem being connected with the secondary valve to move it positively, and the main valve being engaged after the secondary valve is moved over the relief-ports of the said main valve, substantially as and for the purpose described.



3. The valve-seat, and main valve thereon, provided with relief-ports and actuating projections, combined with the secondary valve seated on the main valve, and controlling the relief-ports thereof, and the valve-stem, provided with arms connected with the secondary valve, and adapted to engage the actuating projections of the main valve, substantially as and for the purpose described.

4. The valve-seat, the main valve thereon, and secondary valve seated on the main valve, combined with mechanism for actuating the said valves, as described, and a stopping device for the main valve, whereby it is positively stopped in a definite position relative to the ports controlled by it, substantially as described.

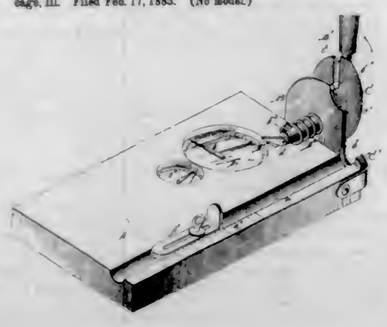
5. The valve-seat and main and secondary valves, combined with the valve-stem having a projection or shoulder seated upon its socket, and the spring whereby both the said valves and the said shoulder are pressed against their respective seats, substantially as described.

6. The valve-stem provided with a shoulder or projection seated at the end of its socket, and with valve-actuating arms, combined with the valve longitudinally movable on the said stem, and provided with lugs or projections engaged by the shoulder of the said arms, and operated thereby on a seat opposite to that of the valve-stem, substantially as described.

291,507. PIG-CARRIER FOR BLAST-FURNACES. FRED. W. GORDON, Pittsburg, Pa. Filed Oct. 29, 1883. (No model.)

Claim.—1. In a pig-carrier for blast-furnaces, the combination of a roof and side wall of a cast-house, an overhead track-rail, braces from said rail to the side wall, suspenders from said rail to the roof at a point at or near the top of the side wall, and a pig-cradle arranged to travel upon said track-rail, substantially as set forth.

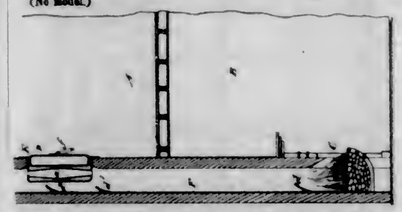
2. In pig-carriers for blast-furnaces, the combination of a sloping cast-house floor, a railroad located below the level of the cast-house floor, as set forth, an overhead track-rail in the cast-house, having a prolongation from the cast-house over said railroad, and a pig-cradle fitted to travel upon said track-rail, substantially as set forth.



3. In pig-carriers for blast-furnaces, the combination of a cast-house, a blast-furnace located at one end of the same, two independent overhead track-rails located between the side walls of the cast-house and the transverse center of the cast-house, and pig-cradles arranged to travel upon said track-rails, substantially as set forth.

4. The improved pig-cradle consisting of the suspended bail, the two bell-crank arm structures pivoted therein, and the double-ended latch-piece fitted to engage the upper portion of the arm-pieces, substantially as set forth.

291,508. PLASTERING COMPOSITION. HENRY GRAF, Sebewaing, Mich. Filed May 5, 1883. (No specimens.)

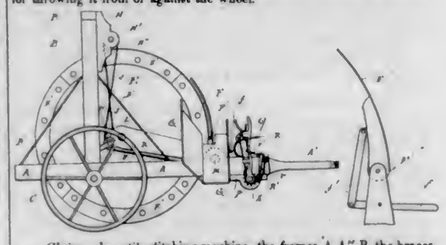


Claim.—A plastering composition composed of slaked lime, plaster-of-paris, sawdust, cow's hair, glue, and glycerine, prepared substantially as and for the purpose set forth.

291,509. CIGAR-CUTTER. JOHN GRATZ and PETER HAGEDORN, Chicago, Ill. Filed Feb. 17, 1883. (No model.)

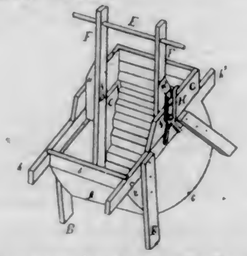
Claim.—The combination, with the box or block A, containing a registering mechanism, and provided with a groove, *a*, and an adjustable gage, A', of the plate B, secured to one end of said box, and having a beveled semicircular opening, *b*, the knife C, pivoted to said plate and having a slot, *c*², the hand-lever B', having a pivot, *b*², passing through the plate B, and provided with a stud, *b'*, engaging the slotted knife C, the spring B³ on the pivot *b*², for returning the knife, and means for actuating the registering devices at each stroke of the knife, all substantially as shown and described.

291,510. APPARATUS FOR WARMING THE UPPER ROOMS OF BUILDINGS. JOHN SAMUEL HEISER, Rushville, Ind. Filed June 30, 1883. (No model.)



Claim.—1. A box having a front opening and provided with vertical flues or drums, substantially as shown, said box extending into and partially across the flue of a chimney, in combination with one or more deflecting-plates, *d'*, secured to the opposite side of the flue, substantially and for the purposes described.

2. In a room-heating device, the combination of the box E, having tubes or drums *a*, the closing cover or stopper D, the chimney or flue F, deflecting-plates *d'*, fire-place C, and deflecting-plate *d*, all constructed and arranged substantially as set forth.

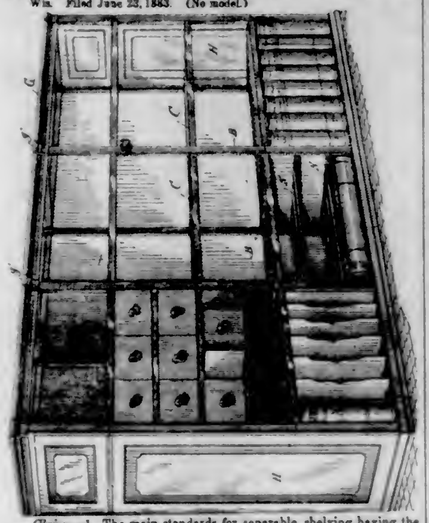


291,511. TILE-DITCHING MACHINE. GEORGE L. HOBEN and FRANK P. HILBURN, Mount Vernon, Ind. Filed Aug. 31, 1883. (No model.)

Brief.—A cutter-disk excavator-wheel is journaled in a bifurcated pivoted lever. Cords run from the free end of such lever over a roller on a braced upright frame, down under pulleys, and forward to a windlass. A pivoted lever is connected by a pitman to a pivoted hand-lever for throwing it from or against the wheel.

Claim.—In a tile-ditching machine, the frames A A'' B, the braces B', the roller H'', the ropes J, the pulleys N, the bifurcated lever K, the windlass P, and wheel E, having knives E', in combination with scraper F, having pitman *f''*, and lever F, substantially as described, and for the purposes set forth.

291,512. WASHING-MACHINE. CHARLES HOFFMAN, Republic, Mo. Filed Feb. 15, 1883. (No model.)



Claim.—1. In a washing-machine, the rubber D, having the cross-pieces a^3 a^3 and rollers b^3 b^3, the latter set below the face of the former, in combination with the board C, having the cross-pieces *a a* and the rollers *b b*, the latter set above the face of the former, whereby the clothes

will be operated on principally by the rollers, and danger of tearing lessened, as set forth.

2. In a washing-machine, the board C, having the rollers and cross-pieces provided with the grooves p^3, as set forth.

291,513. ADJUSTABLE SHELVING. HORACE J. HOFFMAN, Neillsville, Wis. Filed June 23, 1883. (No model.)

Claim.—1. The main standards for separable shelving having the projecting flanges, substantially as described.

2. The main standards for separable shelving having the oblique backwardly-projecting flanges, substantially as described.

3. The combination, with the main standards having projecting flanges, of the locking-wedges, or their equivalents, for connecting the abutting ends of said main standards, substantially as described.

4. The combination, with the main standards having flanges, of the shelf-plates having bent ends to clasp said flanges, substantially as described.

5. The combination, with the main standards, of the shelf-plates having flanges, and having bent ends to engage with the main standards, substantially as described.

6. The combination, with the main standards having flanges, of the wooden shelves having metal plates to engage with said flanges, substantially as described.

7. The combination, with the main standards having flanges, of the cross-plates having ends adapted to fit within said flanges, substantially as described.

8. The combination, with the main standards having flanges, of the end plates adapted to fit within the flanges of said main standards, substantially as described.

9. The combination, with the main standards having flanges, of the cornice having lugs adapted to clasp the flanges of the main standards, substantially as described.

10. The combination, with the main standards having flanges, of the cornice having lugs adapted to clasp said flanges, and the top plate adapted to rest upon said main standards, substantially as described.

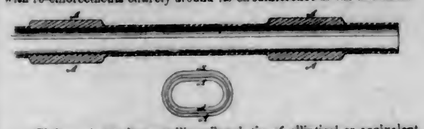
11. The combination, with the main body of the shelving, of the cornice formed in sections having overlapping bracket-shaped ends, and having clips for holding said sections in position, substantially as described.

12. The combination, with the main standards and the shelf-plates having flanges, of the drawer-rests having ends adapted to fit between the flanges of the shelf-plates, substantially as described.

13. The combination, with the main standards and the shelf-plates, of the drawer-rests having the guide-ribs, substantially as described.

14. The combination, with the shelving, of the book-supporting rods, each of said rods being provided with a series of small rolls thereon, upon which the several books may rest and slide independently, substantially as described.

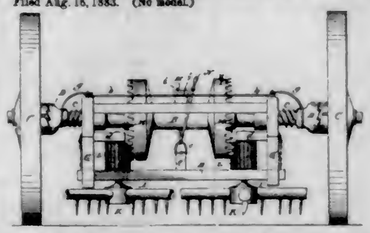
15. The combination, with shelving for books, of the rods carrying small rollers whereon the books may rest, and the movable plates for forming individual book-spaces, substantially as described.



16. The combination, with the main standards, of the cross-plates, the upper and lower rods and small rollers, and the division-plates for forming individual book-spaces, substantially as described.

17. The combination, with the main standards having flanges, of the cross-plates having ends projecting within said flanges, and the long rollers journaled in said cross-plates, substantially as described.

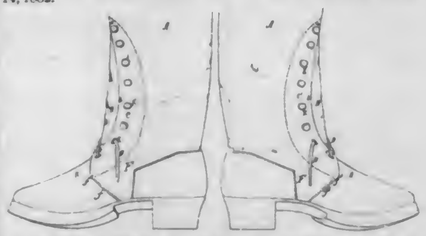
18. The combination, with the metal parts of the shelving, of the wooden facing attached thereto, substantially as described.



291,514. RAILROAD-TIE. HENRY R. HOLBROOK, Pueblo, Colo. Filed May 2, 1883. (No model.)

Brief.—A tubular elliptic or equivalent formed hollow tie provided with re-enforcements entirely around its circumference at the rail-seats.

Claim.—A tubular metallic railroad-tie of elliptical or equivalent form in cross-section, provided at the points over which it is designed to secure the rails with re-enforcements A A, extending uniformly around the circumference, whereby sufficient strength with the minimum degree of weight is secured, substantially as hereinbefore set forth.

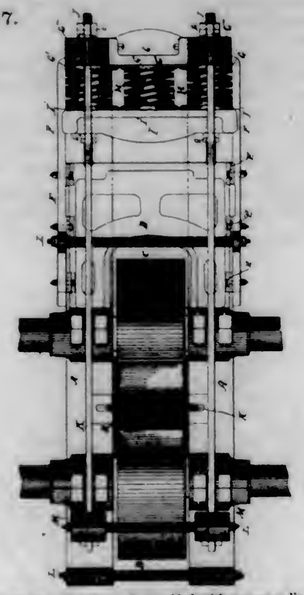


291,515. ROTARY HARROW. JULIUS HUGO HOOF, Quincy, Dak. Filed Aug. 16, 1883. (No model.)

Claim.—A harrow-frame having journaled therein a main shaft, upon which are mounted the usual drive-wheels and suitable gear-wheels, in combination with a vertically-sliding cross-beam, vertical shafts carrying horizontally-revolving harrows, and elongated pinions, said beam having connected thereto an elevating-lever, substantially as and for the purpose set forth.

291,516. BOOT. WILLIAM IRVIN, Anoka, Minn., assignor, by mesne assignments, to himself and George Cole Irvin, Boston, Mass. Filed Sept. 29, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 254,993, dated March 14, 1882.

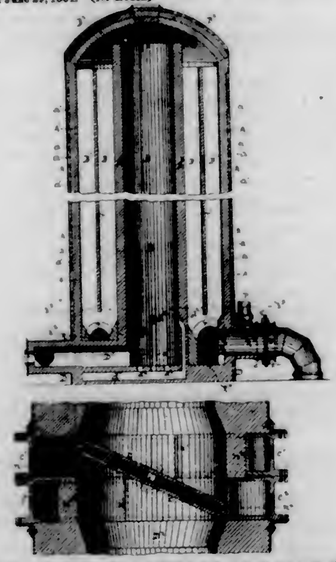


Claim.—A boot of the kind described, consisting of the leg A, having the slit in front, and the quarters F, the vamp B, running the entire length of the slit, secured to the leg A at the top of the slit, along the sides of the slit back of its edges, and partly to the lower edges, *f*, of the quarters F, the flies C, around the vamp B at the slit, and having their lower ends, *e'*, detached from the vamp, whereby when the flies are pulled together, they come over the vamp, as set forth.

291,517. ROLLER-MILL. JAMES W. JACKSON, Denver, Colo. Filed July 28, 1883. (No model.)

Claim.—1. In a roller-mill in which the movable roll is mounted in a sliding frame and constantly advanced parallel to the stationary roll, the combination of the sliding frame D, rolls B C, the head G, provided with recesses G', the cross-head I, having recesses I', springs H, and the threaded rods J, having nuts on each end, arranged as set forth, whereby the tension of the springs H is transmitted through threaded rods J to the sliding frame D, substantially as and for the purpose set forth.

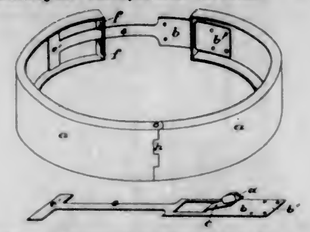
2. The combination of the sliding bearing-frame D, having planed



291,517.

surfaces *d*, with the side pieces, F, provided with corresponding planed surfaces, supports E', and removable gibs E, substantially as described.

3. The combination, with the sliding frame D, cross-head I, springs H, threaded bolts J, head G, and side pieces, F, of the bed-plates A, standards M, transverse brace-rods L, and the longitudinal brace-rods K, extending from the standards M to the sectional head G, all constructed and arranged substantially as shown and described.

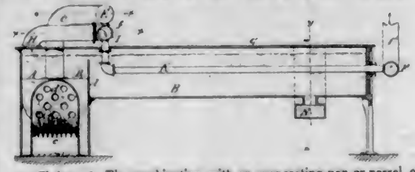


291,518. HOT-BLAST STOVE. DANIEL N. JONES, Johnstown, Pa. Filed June 29, 1881. (No model.)

Claim.—1. In a cylindrical hot-blast oven having a central combustion-chamber, B, and a surrounding regenerator-chamber, B', separated by a dividing-wall, A^3, the said wall A^3 extending up into proximity to the oven top or cover, and forming a throat, B^3, of about the same or less area than the combustion-chamber, whereby the flow or passage of the air or gas over the wall A^3 with practical uniformity on all sides is assured, substantially as set forth.

2. The water-bores c' c^2, having each a metallic water-backed face extending half or a little more than half way around its annular length and lined through the rest of its annular length, in combination with a hollow water-supplied butterfly-valve, substantially as set forth.

291,519. SAFETY APPLIANCE FOR BRACELETS. ERNEST JONES, London, England. Filed Apr. 3, 1883. (No model.)



Claim.—1. The combination, substantially as shown and described, of the bracelet having one end of its central guard enlarged and riveted to the wall of the bracelet, with a portion of said enlargement projecting beyond the abutting end of the segment, the snap device riveted to said projecting enlargement, and the push-piece fastened to the end of the snap device.

2. In a safety appliance for bracelets and other similar articles, the combination, substantially as shown and described, of the protector *e*, guard *e'*, base-plate *b*, extension *b'*, snap-piece *c* being integral with said base-plate *b*, and the push-piece *d* on the end of said snap-piece *c*.

3. A bracelet having a double locking device, in combination with a central protector, *e*, and guard *e'*, said protector working independent of the locking device, substantially as shown and described.

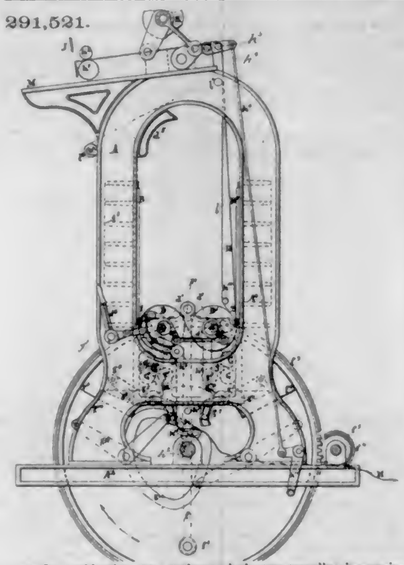
291,520. EVAPORATOR. ADOLF KAYSER, Buffalo, N. Y., assignor of one-half to Albert B. Young, same place. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination, with an evaporating pan or vessel, of a heating apparatus whereby a portion of said pan is heated, while another portion thereof remains comparatively cool, a cover which extends over the cool as well as the hot portion of the pan, and whereby the steam or vapor rising from all portions of the pan is collected, and a conduit which conducts the collected steam or vapor through or under the cooler portion of the pan, and in which the steam or vapor is condensed and its heat transmitted to the surrounding liquid, substantially as set forth.

2. The combination, with the compartments A and B, separated by a partition, *l*, having an overflow, *l'*, of a heating apparatus whereby the compartment A is heated, a cover, G, and a vapor-conduit, K, substantially as set forth.

3. The combination, with the compartments A and B, of a conduit whereby the hot liquid is conducted from one compartment into the other, a heating apparatus whereby the compartment A is heated, and a conduit whereby the vapor rising from the liquid is conducted through or under the liquid contained in the compartment B, substantially as set forth.

4. The combination, with the compartment A, furnace *c*, and compartment B, of a cover, G, and smoke-pipes *f* and vapor-pipes K, arranged in the compartment B, substantially as set forth.



5. The combination, with the evaporating-pan, of a cover, G, vapor-pipes H, manifold head I, vapor-pipes K, manifold head F, and chimney *f'*, substantially as set forth.

6. The combination, with an evaporating-pan, of heating-pipes constructed with flat tops and receding sides, and immersed in the liquid in the pan, substantially as set forth.

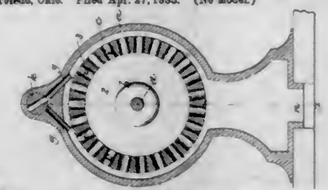
291,521. PRINTING-MACHINE. WELLINGTON P. KIDDER, Malden, assignor to the Kidder Press Manufacturing Company, Boston, Mass. Filed Oct. 30, 1882. (No model.)

Claim.—1. In combination with a stationary bed and an impression-cylinder traveling over it, guides for the web, one at each side of the impression-cylinder, and a feeding device which feeds the proper length of web while the impression is thrown off, all substantially as described.

291,521.

2. In combination, two stationary beds, two traveling impression-cylinders, and a feeding mechanism, substantially as described, combined together and with suitable guides, substantially as described, and operating to print both sides of a web, as set forth.

3. In combination, two stationary beds, two traversing impression-cylinders, and a third printing mechanism, substantially as described, with an intermittent web-feeding mechanism, substantially as described, common to all three printing mechanisms, the first stationary form and its cylinder printing one side of a given length of web, the second printing the other side of that length of web, and the third printing mechanism printing on the same length of web already printed by the other two, all as set forth.



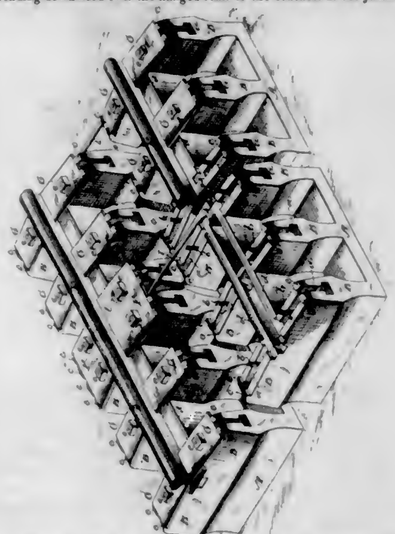
4. In combination, two beds, two impression-cylinders, a reciprocating carriage, and two sets of inking apparatus, both cylinders and both sets of inking apparatus being carried by the carriage, all substantially as described.

5. In combination, the two vertical stationary beds, their traversing impression-cylinders, and the carriage reciprocating vertically between the beds, arranged together so that the type-beds face each other and the carriage reciprocates vertically between them, as set forth.

6. In combination, two beds, two impression-cylinders, their carriage, and mechanism arranged and operating, substantially as described, to throw the cylinders each toward the other at the end of the impression-stroke of the carriage, and to throw each cylinder away from the other at the end of the back-stroke of the carriage.

7. The web-perfecting press above described, consisting of the two stationary beds, the two traversing impression-cylinders, the two sets of inking apparatus, the web-guiding mechanism, substantially as described, and the intermittently-operating web-feeding mechanism, substantially as described, all operating together substantially as described.

291,522. MOTOR. EPHRAIM M. KIMBALL and CHARLES M. KIMBALL, Toledo, Ohio. Filed Apr. 27, 1883. (No model.)



Claim.—1. A motor composed of an upright casing, two valved induction-ports at the top of said casing, leading in opposite directions, and arranged, as described, so that one shall be closed when the other is open, and a wheel substantially concentric with the casing, having open-ended and curved-faced buckets, as set forth.

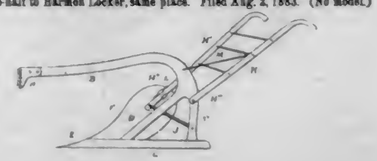
2. In a motor or meter, a journaled wheel having a rim or flange concentric with its axis, and having radial orifices with curved bearing-faces passing through said rim and constituting open-ended radial buckets, as set forth.

291,523. RAILWAY-TRACK. JOHN GEORGE KRICHBAUM, Youngstown, Ohio, assignor of one-half to John C. Kloffenstein, same place. Filed Feb. 17, 1883. (No model.)

Brief.—Rail-supports consisting of castings having transverse brackets which have T-shaped slots, and shoulders on their top surfaces to keep the coupling-plates from sliding. The joint-coupling plates have lugs to fit in the flanges of the rails. The casting has a central rail-bed and side flanges to assist in keeping the rails from spreading. The castings are prevented from spreading by brace-rods having flanged arms extending downward over the flanged seats of the brackets at the joints.

Claim.—1. The brackets B, formed with T-shaped slots *a*, in combination with the screw-bolts and nuts and the plates F G, as a means for securing the rail-sections in position, substantially as and for the purpose set forth.

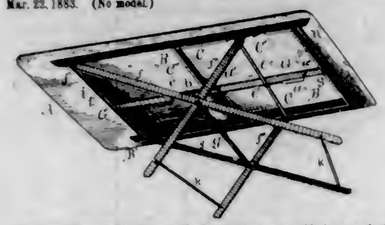
2. The castings A and brackets B, having T-shaped slots *a* and shoulders *c*, in combination with the screw-bolts and nuts, the plates G, and plates F, the latter having lugs *f* to fit in notches in the flange of the rail-sections, substantially as and for the purpose specified.



3. The castings A, formed with central rail-bed, C, having flanges *d* and slotted brackets B, in combination with the plates F G, and suitable screw-bolts and nuts for fastening them in place over the flange of the rail-sections, substantially as and for the purpose set forth.

4. The combination, with the castings A, formed with central flanged seat, C, and brackets B, arranged transversely and upon each side thereof, of the transverse brace-rods I, having flanged arms *k* extending downwardly and over the ends of the flanged seats of the four castings, substantially as and for the purpose set forth.

5. The castings A, having central flanged seat, C, and a series of brackets, B, arranged transversely and upon each side of the seat, and having between the brackets the blocks *i*, in combination with the stay-rods H, having suitably-formed heads *h*, substantially as and for the purpose set forth.



6. The castings A, having brackets B, and flanged seat C for the rail-sections, in combination with the brace-rods I, having flanged arms *k*, and the stay-rods H, having suitable heads, *h*, substantially as and for the purpose specified.

291,524. PLOW. THEODORE A. LANSCHA, Flanagan, Ill., assignor of one-half to Harmon Locker, same place. Filed Aug. 2, 1883. (No model.)

Claim.—In plows of that kind in which a shortened beam, B, has its standard C fastened to the rear extremity of the landside G and is stiffened by the forwardly-projecting brace D, the handles H H' and brace-rod M, in combination with the mold-board F, having dovetail lugs H^2, and a wedge, by means of which one of said arms, H', is rigidly secured to said mold-board, as set forth.

291,525. FOLDING TABLE. NATHAN H. LONG, Muncie, Ind. Filed Mar. 22, 1883. (No model.)

Claim.—The combination, with the table-top provided on each side of its under surface with notches, of pivoted legs *f f* and legs f^2 f^2, the latter being connected by a grooved round, *e*, and a rod secured to the table-top, said rod consisting of a rigid wire portion, and a spring-wire portion, and adapted to rest in the groove of the round *e*, substantially as set forth.

291,526. SECONDARY BATTERY. EUSEBIUS J. MOLERA and JOHN C. CEBRIAN, San Francisco, Cal.; said Molera assignor to said Cebrian. Filed Jan. 26, 1883. (No model.)

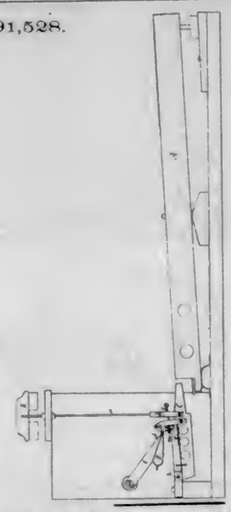
Claim.—1. A secondary-battery element consisting of a mixture of carbon and lead compressed or molded into any desired form, and having a layer of active material applied to its surface, substantially as set forth.

2. A box or receptacle for a secondary battery, made of wood or paper charred on the inside and boiled in paraffine, substantially as set forth.

291,527. ELASTIC FABRIC. GEORGE C. MOORE, East Hampton, Mass. Filed Feb. 10, 1883. (No model.)

Brief.—The fabric consists of face warps, back warps, and rubber warps, and face wefts, back wefts, and central wefts, arranged to form three plies. The outer plies are bound to the central ply, which contains the rubber warps, by face warps which extend between the back and central wefts, and by back warps which extend between the face and central wefts.

Claim.—1. The herein-described elastic fabric, consisting of face warps, back warps, and rubber warps, and face, back, and central wefts, all arranged to form three plies, the outer plies being bound to the central ply, which contains the rubber warps, by face warps extending between the back and central wefts, and back warps extending between the face and central wefts, substantially as described.



2. The herein-described elastic fabric, consisting of face and back warps of different colors, face and back wefts corresponding in color to the face and back warps, respectively, rubber warps, and a central weft, the latter being interwoven with said rubber warps and the face and back warps, substantially as described.

291,528. PIANO-PORTE DAMPER ACTION. GEORGE WASHINGTON NEILL, Boston, Mass. Filed June 5, 1883. (No model.)

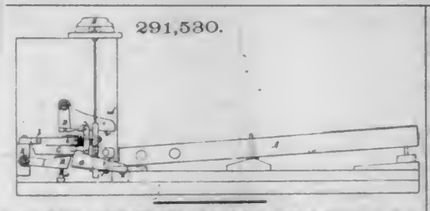
Claim.—1. The combination, with the movable retainer to be elevated by a pedal, and with the damper and its operative lever, of the latch and its actuating-spring, and means for arresting the forward movement of the said latch, as explained.

2. The damper-lever provided with the abutment and the latch, its operative spring, and adjustable stop, in combination with the damper and also with the retainer to be moved by a pedal and to operate with the latch, substantially in manner and for the purpose as explained.

291,528.

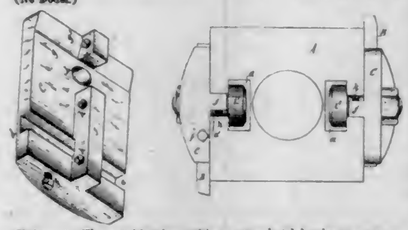
291,529. PIANO-DAMPER ATTACHMENT. GEORGE WASHINGTON NEILL, Boston, Mass. Filed June 27, 1883. (No model.)

Claim.—The combination of one or more dampers, B, their levers C, rods *a*, and the projections E, placed on said rods *a*, with the transverse wedge-shaped bar or retainer D, and its supporting-arms *c* and stops *d* and *e*, as set forth.



291,530. PIANO DAMPER ATTACHMENT. GEORGE WASHINGTON NEILL, Boston, Mass. Filed July 17, 1883. (No model.)

Claim.—1. The combination of the upper retainer and the damper-lever and its latch with the lower retainer and with the damper-rod joint-piece extended below the damper-lever, and provided with the pin to operate with the said lower retainer, all being substantially as set forth.

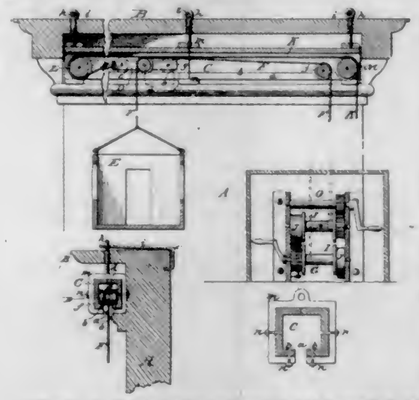


2. The damper-rod joint-piece extended below the damper-lever, and provided with the pin *s*, in combination with the retainer G, arranged below the said damper-lever and to operate with the said pin, substantially as represented.

3. The combination of the movable bar H, to be operated, essentially as described, by a pedal, with a damper-lever and joint-piece, their latch and pin, and with the upper and lower retainers arranged with the said damper-levers, and to operate with the latch and pin, substantially as set forth.

291,530.

291,531. TOOL-HOLDER. JOHN F. PARKER, North Tonawanda, N. Y., assignor of one-half to Caleb W. Watkins, same place. Filed Apr. 23, 1883. (No model.)



Claim.—1. The combination, with a cutter-head having a groove, *a'*, for securing a tool-holder thereto, of a tool-holder provided with a rib, *j*, projecting into said groove, and adjusting mechanism applied to the side of said rib, substantially as described, whereby the width of said rib can be adjusted to correspond with the width of said groove, substantially as set forth.

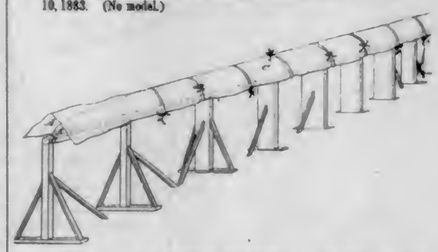
2. The combination, with a cutter-head having a groove, *a'*, for securing a tool-holder thereto, of a tool-holder provided with a rib, *j*, projecting into said groove, and adjusting-screws *k*, applied to the side of said rib in said groove, for adjusting the width of the rib to fit in the groove, substantially as set forth.

3. The combination, with a cutter-head provided with a longitudinal groove, of a tool-holder composed of a socket portion, *d*, having a groove, *e*, and an extension, *g*, having bolt-hole *h*, and a raised edge, *g'*, substantially as set forth.

291,532. FIRE-ESCAPE. DENISON C. PIERCE, Chicago, Ill. Filed Apr. 13, 1883. (No model.)

Brief.—The tube or way upon which the carriage runs is formed in sections united by an overlapping band, into which eyebolts are secured, which pass down through the top of the cornice to hold it thereto. The axles of the wheels of the carriage fit closely within the tube or way to prevent derailment. The hoisting and moving cables are wound on windlasses and are operated independently.

Claim.—1. In a fire-escape substantially such as described and shown, a shell or tube, C, formed in separate sections, the sections being united by an outside band overlapping the joint of the sections, substantially as and for the purpose set forth.



2. The herein-described fire-escape, consisting of tube or shell C, car D, provided with sheave *d*, pulleys L M, cable K, connected with car D, and passing around pulley L and over pulley M, cab E, pulley *j*, cable F, passing over pulley *j*, and sheave *d* and winding-drum G N, arranged to independently wind and hold said cables, substantially as set forth.

3. In combination with drum N, the brake-band J, normally pressed against pulley I, and the lever *l*, arranged, substantially as shown and described, to relieve the pulley from the pressure of said band.

4. In combination with cornice B, the tube or shell C, eyebolts *h*, and rods *i*, all arranged as shown.

5. The herein-described car for use in a fire-escape substantially such as shown and described, consisting of side bars, *c*, wheels *f*, and their axles *g*, sheave *d*, and axle *e*, said axles being made of a length slightly less than the interior width of the tube or sheath within which the car is to travel, substantially as and for the purpose set forth.

291,533. MANUFACTURE OF BOATS FROM CELLULOID, &c. CHARLES P. PITMAN, Freehold, and HAL ALLAIRE, Allaire, N. J. Filed Nov. 10, 1883. (No model.)

Claim.—1. As an article of manufacture, a boat made of sheet-celluloid formed into shape on a mold or model, A, by means of heated formers D D, substantially as shown and described.

2. The within-described process of forming the shell or hull of a boat out of a sheet of celluloid or similar substance by means of a mold, A, and heated formers D D, substantially as shown and described.

3. In the construction of boats from sheet-celluloid, the formers or jackets D D, in combination with a mold or model, A, upon which the sheet-celluloid is pressed into shape, substantially as shown and described.

4. In the construction of boats from sheet-celluloid, the combination of the concave mold D and mold A, having a loose gunwale, B, substantially as and for the purposes shown and described.

5. In the construction of boats from sheet-celluloid, the model A, made of metal, and false gunwale B, of wood, for the reception and retention of the sheet of celluloid when pressed into shape by formers D D, substantially as shown and described.

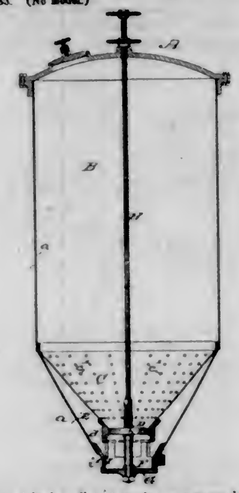
6. A boat or racing-shell with a hull composed of sheet-celluloid or similar substance, formed into shape over a paper or wooden boat already made, whereby the exact shape and proportions of such wooden or paper boat may be obtained in celluloid, substantially in the manner and by the means herein shown and described.

291,534. APPARATUS FOR SETTING BUTTONS. SAMUEL L. PRATT, Hingham, Mass. Filed June 11, 1883. (No model.)

Claim.—1. In a button-setting apparatus, spring-jaws to grasp the edges of the button-shank and hold the button, substantially as described.

2. In a button-setting apparatus, spring-jaws to grasp and hold the edges of the shank, and stop to arrest the end of the said button-shank, substantially as described.

3. The member *a*, combined with the spring-jaws to grasp the edges of the button-shank, and provided with lips to extend under the flat side of the said shank, substantially as described.



4. The member *a*, combined with the spring-jaws, and yielding connecting device, substantially as described, to permit the said jaws, with the button-shank between them, to move toward and from the said member, as set forth.

5. The member *a* and spring-jaws to grasp the edges of the button-shank, combined with the anvil, substantially as described.

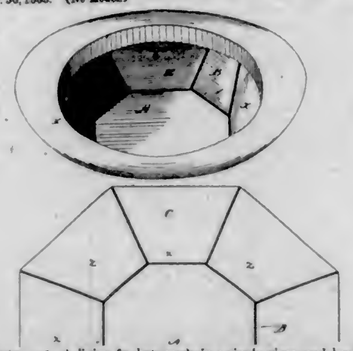
6. The member *a* and anvil, combined with spring-jaws to grasp the edge of the button-shank, and provided with a stop for the end of the button-shank, substantially as described.

7. The member *a*, the spring *c*, and the anvil, in combination with the member *b*, provided with the spring-clasp *m*, substantially as described.

291,535. LARD AND OIL TANK. HENRY RALL, St. Louis, Mo. Filed Feb. 19, 1883. (No model.)

Claim.—1. A lard or oil tank having an inner and an outer bottom, each separate from the other, the inner bottom being perforated and the outer bottom being imperforated, and each bottom having for the discharge of the residue an opening in its lower end capable of being closed by a valve, and the valve in the outer bottom capable of being opened and closed independently of the valve in the inner bottom, for the purpose described.

2. A lard or oil tank having the perforated tapering bottom C, the valve D, the closed tapering bottom *a*, independent of the bottom C, and having the valve G and the rod H, substantially as described.



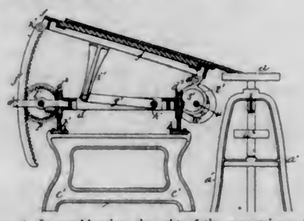
3. The combination of the bottom C, the valve D, having the lugs *d d*, the projections *i i*, the bottom *a*, the valve G, and the rod H, substantially as described.

4. The combination of the bottom C, the valve D, having the lugs *d d*, the part I, having the projections *i i*, and the seats *i' i'*, the valve G, and the rod H, substantially as described.

5. The combination of the bottom C, the valve D, the lugs *d d*, the projections *i i*, the valve G, and the rod H, said rod being squared to rotate said valve D, and having a shoulder, *h*, to lift said valve D, substantially as described.

6. A lard or oil tank having an inner perforated bottom above the outer bottom, said inner, as well as the outer, bottom also having an opening closed by a valve, for the discharge, when desired, of the residue downward from the tank.

291,536. HAT-LINING. CYRUS RAYMOND, 2d, Danbury, Conn. Filed Nov. 30, 1883. (No model.)

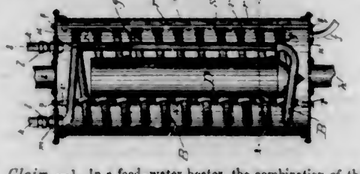


Claim.—1. A lining for hats made in a single piece, and having cuts running from the outer edge inward toward the crown portion, whereby the parts at the side may lap over each other and the lining is made adjustable to any sized hat.

2. A lining for hats made in a single piece, and having beads around the crown and from the crown to the outer edge, and cuts at one edge of the beads extending from the edge to the crown, as described, and for the purpose set forth.

3. The combination, with a hat, of a lining having beads around the crown and from the crown to the edge, and cuts from the outer edge inward, whereby the parts at the side are permitted to overlap, and the entire lining is made to consist of a series of planes.

291,537. GRINDING-MACHINE. JAMES H. REED, Brooklyn, N. Y. Filed May 10, 1883. (No model.)



Claim.—1. In combination, the table *f*, the eccentrics *s s'*, straps *t t'*, hand-wheel *w* and clamp *y*, the racks *j j'*, pinions *l l'*, hand-wheel *p*, and clamp *q*, and levers *g g'*, and brackets *i i'*, substantially as and for the purpose set forth.

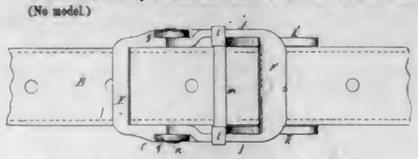
2. In combination, the table *f*, the eccentrics *s s'*, straps *t t'*, the racks *j j'*, and pinions *l l'*, and levers *g g'*, and brackets *i i'*, substantially as and for the purpose herein set forth.

3. In combination, table *f*, the eccentrics *s s'*, straps *t t'*, hand-wheel *w*, and clamp *y*, and racks *j j'*, with pinions *l l'*, hand-wheel *p*, and clamp *q*, substantially as and for the purpose set forth.

291,538. FEED-WATER HEATER. WILLIAM ROLLAR, Chicago, Ill.; Robert Tarrant Executor of said Rollar, deceased. Filed Nov. 24, 1882. (No model.)

Claim.—1. In a feed-water heater, the combination of the shell A, having an inlet and an outlet pipe for the passage of the exhaust-steam from the engine, worm B, supported within the shell, and provided with an inlet and an outlet through the shell for the passage of the water on its way to the boiler, and the cylinder D, suspended within the confines of the worm, and shorter than the interior of the shell A, substantially as described.

2. In a feed-water heater, the combination of the shell A, provided with an inlet and outlet for steam, worm B, inclosed within the shell, and provided with an inlet and outlet through the shell for water, bars *v*, extending longitudinally through the shell, and secured to the heads thereof, and the strips *s* and nut-bolts *r*, securing the worm to the bars *v*, substantially as described.

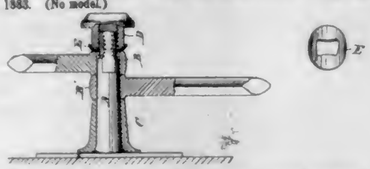


3. In a feed-water heater, the combination, with the shell A, having an inlet and an outlet pipe, worm B, provided with an inlet and an outlet through the shell, bars *v*, extending longitudinally through the shell, and secured to the heads thereof, and the metal strips *s* and nut-bolts *r*, securing the worm to the bars *v*, of the conical-ended cylinder D and braces *g*, substantially as described.

291,539. LATCH. WILLIAM SALLADE, Philadelphia, Pa. Filed Jan. 9, 1883. (No model.)

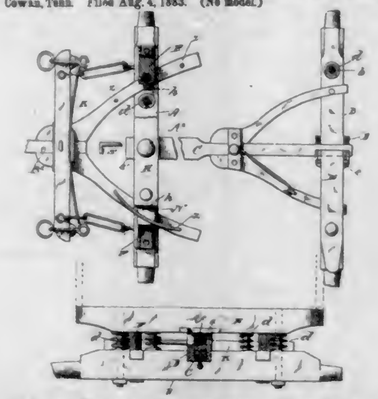
Claim.—In a door-latch, the combination of the latch D upon the inside of the door, provided with the spindle B, for connecting said latch with the hinged hasp A upon the outside of the door, and the staple E and suitable lock, F, substantially as and for the purpose set forth.

291,540. TRACE-BUCKLE. DANIEL SCHOENTHALER, AKRON, assignor of one-half to Harvey D. Blakeslee, Buffalo, N. Y. Filed May 18, 1883. (No model.)



Claim.—1. The combination, in a buckle, of a buckle-frame having a front cross-bar D, and a rear cross-bar, E, a tongue-plate, F, arranged above the front cross-bar D, and having the rear ends of its side bars *f* pivoted to the buckle-frame, and a tug-bail having its side bars arranged between said bars of the tongue-frame, and provided with outwardly-projecting ears *l*, bearing upon the side bars of the tongue-frame, substantially as set forth.

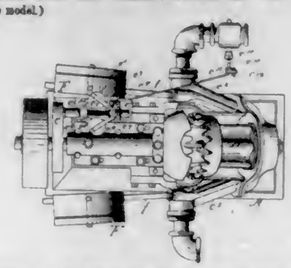
2. The combination, in a buckle, of a buckle-frame having its front cross-bar provided with a recess or depression, a tongue-frame pivoted at its rear end to the buckle-frame, and a tongue secured to the tongue-frame and arranged to bear against the front cross-bar of the buckle-frame, in the recess thereof, substantially as set forth.



3. The combination, with a buckle-frame having a front cross-bar D, provided with a recess, *i*, of a tongue-frame pivoted at its rear end to the buckle-frame, and having its tongue A arranged to engage in the recess *i* of the buckle-frame, and a tug-bail having ears *l*, which bear upon the side bars of the tongue-frame, substantially as set forth.

291,541. NUT-LOCK. ANSON SEARLS, Newark, N. J. Filed Mar. 15, 1883. (No model.)

Claim.—The combination, with the screw-threaded standard A, or its equivalent, provided with a flattened surface at its screw end, and the nut D, of the spring-washer E, the central opening of which is of oblong form or its equivalent, as and for the purpose described.



291,542. VEHICLE RUNNING-GEAR. BENJAMIN COPLIN SEATON, Cowan, Tenn. Filed Aug. 4, 1883. (No model.)

Claim.—1. The combination of the front axle having the castings secured on top at its ends and provided on their inner faces with a vertical tongue, the front bolster having the end plates provided with vertical grooves receiving said tongues, springs or cushions interposed between the axle and bolster, and the bounds passing under the castings on the axle and provided with the braces passing over said castings, substantially as and for the purpose set forth.

2. In running-gear, the combination, with the rear axle provided with a centrally-arranged casting formed with a longitudinal opening for the passage and reception of one end of a reach, and provided with a space and an elastic cushion for the reception of the bolster, substantially as and for the purpose set forth.

291,543. ENGINE. SAMUEL NORMAN SILVER, Auburn, assignor to the Chandler Water Motor Company, Lewiston, Me. Filed Mar. 12, 1883. (No model.)

Claim.—1. The combination of the compound cylinder B, pivoted to swing or move, as described, and having one or more counterbalancing-weights, its pistons b^2, the main shaft b^4, and devices connecting the pistons and cylinder with the main shaft, all substantially as described, and for the purposes set forth.

2. In combination with the revolving compound cylinder B, pivoted to swing as described, its pistons b^2, the weight or weights F, and means for adjusting their position in relation to the cylinder, the main shaft b^4, and devices, substantially as specified, for connecting the cylinder and pistons with the main shaft, all substantially as and for the purposes set forth.

3. The combination of the revolving compound counterbalanced pivoted cylinder B, its pistons b^2, the shaft b^4, and devices, substantially as specified, for connecting the cylinder and pistons with the shaft, with the governor c^3, and the supply-valve c^{10}, all substantially as and for the purposes described.

4. The combination of the revolving pivoted compound cylinder B, the supply and exhaust chambers c c', the tubular arms c^2 c^2, which provide supply and exhaust passages, and the couplings c^4 c^4, all substantially as and for the purposes described.

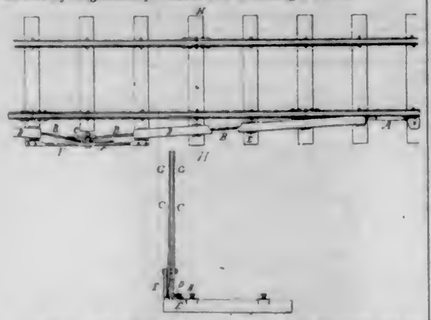
5. The combination of the revolving pivoted compound cylinder B, the supply and exhaust chambers c c', the tubular arms c^2 c^2, which provide supply and exhaust passages, the couplings c^4 c^4, and arms c^3, having pivots c^{10}, which enter the arms c^2 c^2, all substantially as and for the purposes described.

6. The combination of the revolving, swinging, or pivoted compound cylinder B and the frame or support C, containing the supply and exhaust passages, and having arms c^2 c^2, by which it is pivoted or swung, all substantially as and for the purposes described.

291,544. PROCESS OF COLORING PHOTOGRAPHS. IRVING B. SNELL, Philadelphia, Pa. Filed July 12, 1883. (Specimens.)

Claim.—1. The process of coloring photographs and other pictures upon paper, which consists of the following steps: first, coating the picture with a wash composed of gum-arabic, sugar, and water; second, applying colors composed of Diamond Package dyes dissolved in cold and hot water; and, third, coating the picture with a wash composed of gum-arabic, sugar, and water, substantially as set forth.

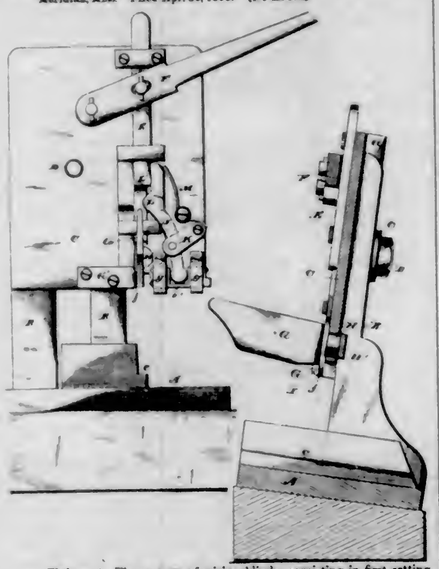
2. The process of coloring photographs and other pictures upon paper, which consists of the following steps: first, coating the picture with a wash composed of gum-arabic, sugar, and water; second, applying colors composed of Diamond Package dyes dissolved in cold water, to which is added a solution of gum-arabic and sugar in a mixture of hot water and alcohol, or its equivalent; and, third, coating the picture with a wash composed of gum-arabic, sugar, and water, substantially as set forth.



3. The process of coloring photographs and other pictures upon paper and pasting the same upon glass, which consists of the following steps: first, coating the picture with a wash composed of gum-arabic, sugar, and water; second, applying colors composed of Diamond Package dyes dissolved in cold and hot water; and, third, pasting the picture upon glass with a paste composed of corn-starch, transparent gelatine, and water, substantially as set forth.

4. The process of coloring photographs and other pictures upon paper and pasting the same upon glass, which consists of the following steps: first, coating the picture with a wash composed of gum-arabic, sugar, and water; second, applying colors composed of Diamond Package dyes dissolved in cold water, to which is added a solution of gum-arabic and sugar in a mixture of hot water and alcohol, or its equivalent; and, third, pasting the picture upon glass with a paste composed of corn-starch, transparent gelatine, and water, substantially as set forth.

5. The process of preparing colors to be used in coloring photographs and the like, which consists in first dissolving Diamond Package dyes in cold water, and then adding a solution of gum-arabic and sugar in a mixture of hot water and alcohol, or its equivalent, substantially as set forth.



291,545. RAILWAY-SIGNAL. ABRAHAM B. SNYDER, Louisville, Ohio. Filed Aug. 27, 1883. (No model.)

Brief.—The rod connecting the signal with the spring is held in and covered by longitudinally-recessed boards forming a casing.

Claim.—The boards D, provided with longitudinal recess, and the blocks E, having recess, in combination with the rod B and spring A, substantially as and for the purpose specified.

291,546. DEVICE FOR WIRING BLIND-SLATS. GEO. W. SOULE, Meridian, Miss. Filed Apr. 26, 1883. (No model.)

Claim.—1. The process of wiring blinds, consisting in first setting the staple astride of the slat or rod, then simultaneously driving the staple downwardly, bending the ends or points of the staples inwardly, and forcing the said bent ends or points into the slat or rod

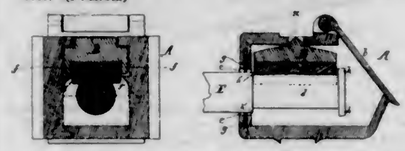
2. In a machine for wiring blinds, the combination, with a staple-driver, of devices for bending the points of the staples and forcing the bent ends into the blind slat or rod, substantially as set forth.

3. In a machine for wiring blinds, the combination, with a staple guide or feeder and a staple-driver, of a rigid jaw and movable jaw adapted to act in conjunction therewith for the purpose of bending the staples and forcing the points thereof transversely into the blind slat or rod, substantially as set forth.

4. In a machine for wiring blind-slats, the combination, with a staple guide or feeder, a staple-driver, and a yielding holder, of a rigid staple-bending jaw and an adjustable movable bending-jaw, substantially as set forth.

5. The combination, with the grooved bed-plate, standards, and adjustable face-plate provided with an open slot, of a staple-driver and devices for bending the ends of the staple and forcing the said bent ends into the opposite faces of the slat or rod, substantially as set forth.

6. The combination, with the grooved bed-plate, standards, and adjustable face-plate provided with an open slot, of a staple-driver, a rigid bending-jaw, and a movable bending-jaw, all of the above parts combined and adapted to operate as described.



7. The combination, with the driver, a rigid bending-jaw, and a movable bending-jaw, of interposed mechanism for simultaneously moving the staple-driver and movable bending-jaw.

8. The combination, with the driver, a rigid bending-jaw, a yielding staple-holder, and a movable bending-jaw, of interposed mechanism for simultaneously moving the driver and movable jaw.

9. The combination, with the staple guide or feeder, the staple-driver, yielding holder, rigid bending-jaw, and movable bending-jaw, of interposed mechanism for moving the movable jaw simultaneously with the driver, substantially as set forth.

10. The combination, with the adjustable face-plate, staple-driver, yielding holder, rigid jaw, movable jaw, and staple guide or feeder, of the lever interposed between the staple-driver and movable jaw, and a fulcrum-pin adjustably secured to the face-plate, all of the above parts combined and adapted to operate as described.

291,547. BEARING FOR CAR-AXLE JOURNALS. GEO. W. STEWART, Atlanta, Ga., assignor, by direct and mesne assignments, to Edmund Holland, same place, Gustavus G. Lansing, New York, N. Y., Theophilus P. Brown, Toledo, Ohio, and Geo. W. Smith, Lafayette, Ind. Filed May 29, 1883. (No model.)

Claim.—1. The non-conducting condensed wood bearing for axle-journals, in combination with a metal journal bearing and sustaining box, substantially as and for the purpose described.

2. The combination of the wood bearing C with a metal bearing-box, B, provided with projections *f f*, substantially as and for the purpose described.

291,548. TOY WHISTLE. HENRY C. SWAN, Swanville, Pa. Filed June 4, 1883. (No model.)

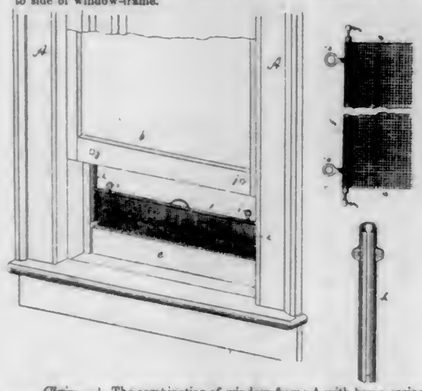
Claim.—1. A whistle, or device to aid in whistling, provided with an aperture or apertures, such as described, and adapted to be held by or within the lips of the operator, the tones or musical sounds of varying pitch being produced as in the ordinary manner of whistling.

2. A whistle composed of a block, disk, plate, or other suitably-shaped piece of metal, glass, or other material having a hole through it, formed as described, so as to produce the proper vibrations in the air blown through it to make a whistling sound, which can be varied by the muscular action of the mouth, tongue, and throat, and by the breath, as in the ordinary manner of whistling, so as to produce all the notes of the musical scale, as set forth.

3. A block, disk, plate, or any suitably-shaped piece of metal or other material, having therein or therethrough one or more holes so formed that when the air or the breath is forced through it the proper vibrations of the air will be made to produce a whistling sound, which can be perfectly controlled by the muscles of the mouth, tongue, throat, and volume of air exhaled from the lungs to produce the notes of a musical scale, as set forth.

4. A whistle composed of a block, disk, plate, or any suitably-shaped piece of metal, glass, or other material having two or more holes in or through it of such shape as when adjusted to the mouth or lips and air being blown therethrough will produce two or more distinct or independent tones, each hole producing a tone differing in pitch from any one of the other holes, which can be varied by the muscular action of the mouth, tongue, and throat, and breath, and made to produce the notes of the musical scale, as set forth.

5. A whistle composed of a block, disk, plate, or any suitably-shaped piece of metal, glass, or other material, having a hole through it, one end of which is smaller than the other, with a smooth sharply-finished edge, through which the air or the breath being forced a whistling sound will be produced, which can be controlled by the mouth, tongue, throat, and breath, so as to produce the notes of the musical scale, as set forth.

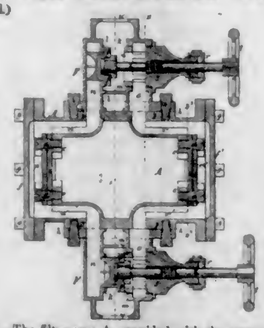


6. In a whistle composed of any suitably-shaped piece of metal, glass, or other material, the combination of the chambers *h* and *g* with the hole *c*, having at one end the flaring edge *d*, and the other end, *o*,

finished with a smooth square shoulder or edge, as and for the purpose set forth.

7. A whistle composed of a block or cylinder of metal or glass, having a diaphragm or partition, *a*, therein, said diaphragm being provided with a central perforation, *c*, which terminates in the cavities or chambers *g* and *h*, as and for the purpose set forth.

291,549. WINDOW-SCREEN. GEORGE A. THOMPSON, Brooklyn, N. Y. Filed June 23, 1883. (No model.)

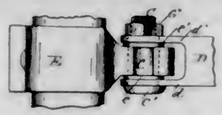


Brief.—A spring-roller screen attached to window-sash, and having a guide-rod with knobs on the ends, which run in split tubes fastened to side of window-frame.

Claim.—1. The combination of window-frame A with box *c*, spring-roller *d*, screen *e*, and rod *f*, having knobs *g*, and with the split guide-tubes *h*, which receive said knobs, substantially as herein shown and described.

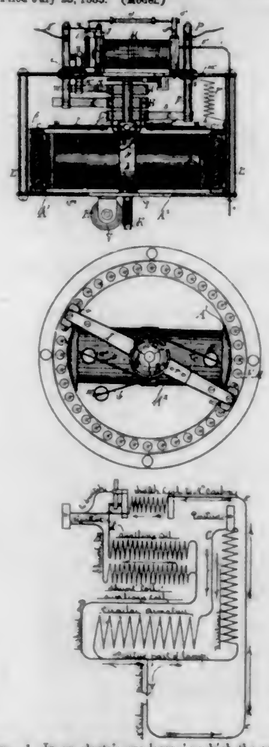
2. The combination of window-frame A with box *c*, spring-roller *d*, screen *e*, rod *f*, having knobs *g* and eyes *i*, and with the guide-tubes *h*, and buttons *j* on the lower sash, substantially as specified.

291,550. FILTER. JOHN TOLAND, Boston, Mass. Filed Aug. 1, 1883. (No model.)



Claim.—The filter-case A, provided with the passages *u v u' v'*, the woven-wire partitions *a a'*, and the heads *f f'*, arranged as set forth, and the valve-chests F F, secured to the case A at opposite ends, and each having the two opposite seats *l m* at opposite sides of the chamber *k*, in combination with the solid reciprocating valves *p p* and their operating-stems *q q*, each valve *p* being arranged across the chamber *k* and adapted to alternately uncover or close one of the seats by being moved transversely across the chamber, as set forth.

291,551. ABDOMINAL SUPPORTER. HARRIET A. TRAVER, Toledo, Ohio. Filed Nov. 5, 1883. (No model.)

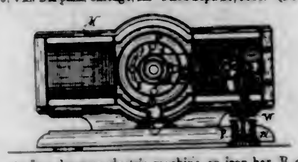


Claim.—In an abdominal supporter, the lever-springs provided with oval-shaped convexed padded plates, and affixed to suitable bearing-plates secured to the girdle-front, in combination with the girdle and straps for adjusting the same to the body, all constructed and arranged substantially as specified.

291,552. THILL-COUPLING. SAMUEL B. ULM, Ashville, Ohio, assignor of one-half to Charles Steward, same place. Filed June 28, 1883. (No model.)

Claim.—The combination of the clip-extension A, provided with a socket, *a*, and a thill-iron having parallel arms *d d'*, with a bolt having an elliptical body, and washers upon said bolt between the clip-extension and the arms of the thill-iron, substantially as and for the purposes described.

291,553. ELECTRIC-ARC LAMP. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed July 23, 1883. (Model.)



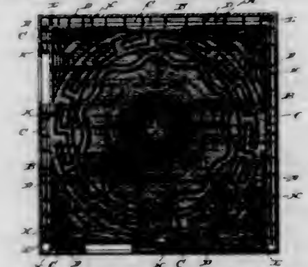
Claim.—1. In an electric-arc lamp in which the carbons are made to approach and recede from each other by the action of an electric motor, an auxiliary coil of comparatively low resistance placed on the revolving armature thereof, and so wound and connected that on starting the light it will receive a portion of the main circuit, and cause said armature to rotate until the carbons have met, and means for then automatically cutting said auxiliary coil or coils out of circuit, when the lamp will begin to work normally, substantially as described.

2. An electric lamp in which the carbons are made to approach and recede by the action of an electric motor provided with coils for magnetizing the rotating armature thereof, which are included in a shunt around the arc, in combination with the ordinary mechanism and circuits thereof, as described, and an auxiliary coil around the revolving armature in addition to the shunt-coil already wound thereon, connections whereby the auxiliary coil is placed in the main circuit whenever the carbons in said lamp do not meet at the starting of the light, which will cause said revolving armature to rotate in such direction as to make the carbons come together, and means for cutting the auxiliary coil out of circuit as soon as this has been effected, when the current will pass through and between the carbons, substantially as described.

3. In an electric-arc lamp, the combination, with the feed mechanism thereof and a rotating armature wound with a shunt-circuit of high resistance, of an auxiliary circuit of comparatively low resistance also wound upon said armature, and so connected as to give passage to the main current when the same cannot pass through the carbons, thereby operating the feed mechanism and bringing them together, and also, by reason of its greater conductivity, preventing injury to the shunt-circuit, substantially as set forth.

4. In an electric-arc lamp having positive or mechanically-operated carbon-feeding mechanism, and in which the carbons do not meet when the light is not in operation, an auxiliary magnetizing-helix placed upon or around such parts of the feed mechanism in said lamp as will, when the same are magnetized thereby, cause the carbons first to meet on establishing the current through the lamp or a series thereof, in combination with means, substantially as described, for cutting out the auxiliary circuit and allowing the lamp to work normally, as set forth.

291,554. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Sept. 10, 1883. (No model.)



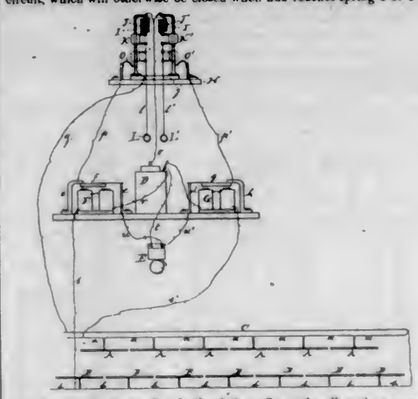
Claim.—1. In a dynamo-electric machine, an iron bar, B, centrally pivoted and adapted to oscillate parallel with one of the cores of and placed under the influence of the field-magnets of such machine, in combination with a brush-holding device, both mechanically connected to one another, so that one may follow the motion of the other, and suitable means for regulating and controlling the movements of the bar B, substantially as described.

2. In a dynamo-electric machine, the combination, with a magnetic bar pivoted in proximity to one of the field-magnet coils, of a commutator-brush-holding device mechanically connected thereto, and an adjustable weight for controlling the movements of the pivoted bar and commutator-brushes, as set forth.

3. In a dynamo-electric machine, the combination, with a magnetic bar pivoted in proximity to one of the field-magnet coils, of a movable commutator-brush holder mechanically connected thereto, and a dash-pot having its piston also connected to said pivoted bar, substantially as described.

4. In a dynamo-electric machine, the combination, with pivoted bar B, toothed sector C, rod R, provided with a rack meshing with the sector C, and also with the adjustable weights W, and piston *p'*, of the dash-pot P, movable brush-holder A, and connections between said pivoted bar and brush-holder, whereby the position of the brushes shall at all times be made to correspond to that of the pivoted bar, as set forth.

291,555. CARPET-STRETCHER. NELS AUGUST VELINE, Villisca, Iowa. Filed Nov. 13, 1883. (No model.)



Claim.—1. The rollers C, provided with hooks D and ratchet-wheel L, and suitably journaled in bearings H, substantially as shown, and for the purpose described.

2. The combination of the rollers C, provided with ratchet-wheel L, the hooks D, and bearings H, substantially as shown, and for the purpose specified.

3. The combination of the rollers C, provided with the ratchet-wheel L, the hooks D, bearings H, and lever M, substantially as shown, and for the purpose mentioned.

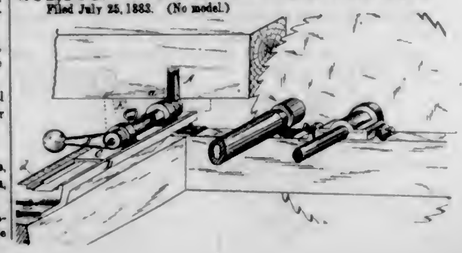
291,556. ELECTRIC RAILWAY-SIGNAL. WILLIAM VOGEL, Chicago, Ill., assignor of one-half to William T. Underwood and Bernhard Schram, same place. Filed May 15, 1883. (No model.)

Brief.—Two track-testing circuits, one for each line of rails. Station-master draws down hub K or K', establishing a circuit through the uninsulated portion of the standard, wire *q*, one of the lines of rails, and magnet F or G, withdrawing the armature thereof and breaking the alarm-circuit, which will otherwise be closed when hub reaches spring O or O'.

Claim.—1. In an electric circuit for railway signaling, the connections from middle to middle of adjoining rails by sectional wires, substantially as and for the purpose set forth.

2. In an electric signaling system for railways, the combination of the two independent circuits for the two lines of rails, the electro-magnets F and G, one included in each of said circuits, and a secondary or local circuit in which is located an alarm, and of the armatures *f* and *g*, operated to form parts of the independent circuits, respectively, when the track-circuits are complete, or parts of the local circuit when the track-circuits, respectively, are interrupted, as set forth.

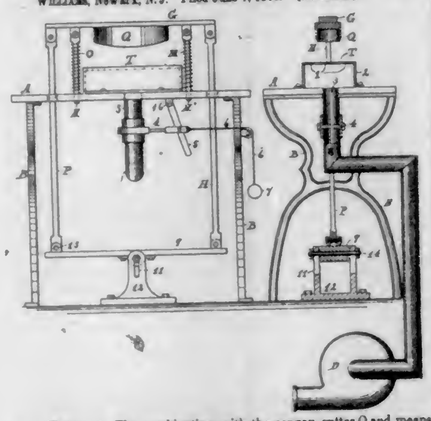
3. In an electric circuit for railway signaling, substantially as described, the metallic standards I, coated on their upper portion with insulating material, and each forming the guide for a metallic hub, K, suspended on a spring, J, to be pulled by a cord, *l*, and forming the electric switch for the track-rail circuit, and in combination with spring O for the bell-circuit, all substantially as set forth, to operate as specified.



291,557. PACKING-CAN. JAMES T. WALKER, Baltimore, Md. Filed Mar. 14, 1883. (Model.)

Claim.—1. In the art of hermetically packing edibles or perishable substances in metallic vessels, the following method: consisting in, first, filling the vessel, then applying to same an imperforate flanged head, then interlocking the chines of the body and the flanges of the head, then inverting the vessel, and while inverted soldering the interlocked parts, substantially as and for the purpose set forth.

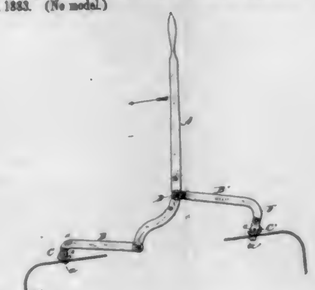
2. The within-described method of hermetically packing substances in metallic cans or vessels, namely: first filling the vessel, then applying an imperforate flanged head to same, then interlocking the chine and the flange of the head by bending one over the other, leaving the overlap apart from the plane of the head, and then dipping the interlocked portion of chine and flange in solder, substantially as and for the purpose set forth.



291,558. GAGE FOR SAW-MILLS. JESSE WALRATH, Racine, Wis. Filed July 25, 1883. (No model.)

Claim.—1. The combination, substantially as before set forth, of a saw-mill gage mounted on a journaled shaft at right angles to its face, and a weighted arm on the shaft, whereby the gage is held normally erect, but allowed to yield in the direction of the feed.

2. The combination, substantially as before set forth, of the gage, the journaled shaft on one end of which it is mounted, the combined stop and index-finger connected with the gage, the fixed scale, and the weighted arm on the shaft.

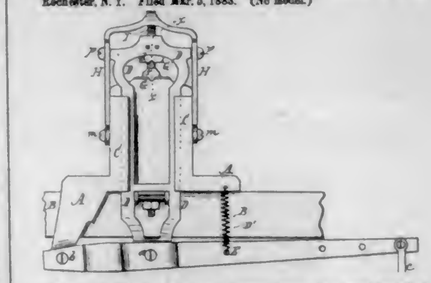


291,559. MACHINE FOR CUTTING CIGAR-WRAPPERS. JOHN R. WILLIAMS, Newark, N. J. Filed June 7, 1883. (No model.)

Claim.—1. The combination, with the convex cutter Q and means for operating it, substantially as set forth, of the perforated bed-plate T, mounted upon the chamber 2, the bed-plate being provided with an unperforated surface corresponding to the outline of the cutter, the chamber 2, and means for exhausting air therefrom, substantially as herein set forth.

2. The combination, with the convex cutter Q and means for operating it, substantially as set forth, of the bed-plate T, perforated as described, the chamber 2, air-outlet 3, and valve 4, arranged and operated substantially as and for the purpose set forth.

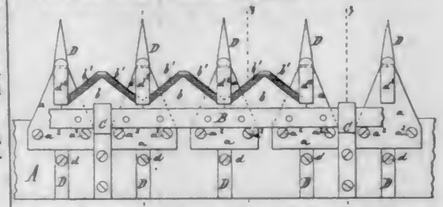
291,560. BALE-BAND TIGHTENER. ROBERT L. WILLIS, Sherman, Tex., assignor of one-half to James A. Trumbull, same place. Filed Sept. 17, 1883. (No model.)



Claim.—The lever A, having the arms B B' pivoted thereto, the outer ends of said arms being provided, respectively, with lugs F *a* and pivoted cams C C', substantially as described, and for the purposes set forth.

291,561. TOBACCO-PIPE. ARTHUR J. WOLFF, Brooklyn, N. Y. Filed Apr. 30, 1883. (No model.)

Claim.—The combination, with the pipe bowl and stem, the latter being provided at its lower end with the combined metallic ferrule and lining and at its upper end with the metallic ferrule, of the removable plug and removable mouth-piece, all of the above parts being constructed, combined, and adapted to operate as described.



291,562. MEANS FOR ATTACHING BUTTONS. WILLIAM H. WOOD, Rochester, N. Y. Filed Mar. 5, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, of the jaws G G', movable with relation one to another, and provided with the thin edges *d d*, notched at *f f*, to properly clamp the button-fastening, and also provided with the cavities *l l*, adjacent to said edges, and at the front of said jaws to receive the button, as set forth.

2. In an apparatus for attaching buttons, the combination, with jaws which close together to compress the sides of the fastening, of a presser or gage, substantially as described, and mechanism to move the same automatically forward to press against the base of the fastening while the jaws are closing, as herein shown and set forth.

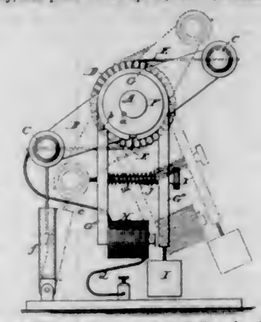
291,563. CUTTING APPARATUS FOR REAPERS AND MOWERS. JACOB WOODLEY, Hampton, Iowa, assignor of one-half to Thos. H. Cobie, same place. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination of the finger-bar A, provided with fingers D, and stationary removable cutters *a*, secured to it by screws *a'*, with projecting guide-heads a^2, and the bar B, having the upper cutters, *b*, fastened to it, substantially as and for the purpose described.

2. The combination of the finger-bar A, provided with fingers D and cutters *a*, secured by screws *a'*, having guide-heads a^2, the upper cutter-bar, B, having cutters *b*, and the clasps C, bearing on the back, top, and front of the cutter-bar B, substantially as and for the purpose described.

3. The combination of the finger-bar A, having guard-fingers D, with inclined open caps d^2 and beveled cutters *a*, secured by screws *a'*, having guiding-heads a^2, and the upper reciprocating cutter-bar, B, having beveled cutters *b*, with serrated cutting-edges, substantially as and for the purpose described.

291,564. BREASTPIN. DEWEY F. ADAMS, Providence, R. I. Filed Oct. 13, 1883. (No model.)



Claim.—As an improved article of manufacture, a breastpin having a front of glass or other material capable of being molded, and a back provided with one or more fastening plugs or dowels, *d*, shaped substantially as described, the said fastening-dowels being embedded in and incased by the material composing the front, and thereby holding the back in place, substantially as set forth.

291,565. PROCESS OF MAKING SIRUP AND SUGAR FROM SORGHUM-CANE. ANDREW J. ADAMSON, Sabetha, Kans. Filed Jan. 2, 1883. (No specimens.)

Claim.—1. The process of manufacturing sirup and sugar from sorghum-cane, which consists in first roasting the cane, and then expressing the juice and filtering and boiling the same, substantially as herein specified.

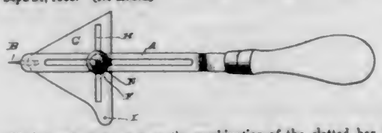
2. The process of separating native impurities from sorghum-juice, which consists in first roasting the cane and then expressing the juice, substantially as herein specified.

291,566. REGULATOR FOR DYNAMO OR MAGNETO ELECTRIC MACHINES. FORDE BAIN, Chicago, Ill., assignor to the Bain Electric Company, same place. Filed Sept. 21, 1883. (No model.)

Claim.—1. The combination, substantially as herein set forth, with the shaft of a revolving armature, of a brush operating and adjusting device mounted thereon and operated thereby, and means for controlling said operation depending upon the strength of the current generated.

2. The combination, substantially as herein set forth, with the shaft of a revolving armature, of a friction device mounted thereon and connected to the brush-holders, and means connected with the circuit of the machine for controlling the amount of friction in accordance with variations in the strength of the current generated.

3. The combination, substantially as herein set forth, with the shaft of a revolving armature, of a friction device mounted thereon and connected to the brush-holder, and a magnet-coil in the external circuit of the machine adapted to control the friction device in accordance with the strength of the current in said circuit.



4. The combination, with an armature-shaft of an electric generator, having a friction-disk connected thereto, of a yoke embracing said disk and connected to the brush-holder, and a magnet-coil in the external circuit of the machine controlling the pressure of said yoke on the friction-disk.

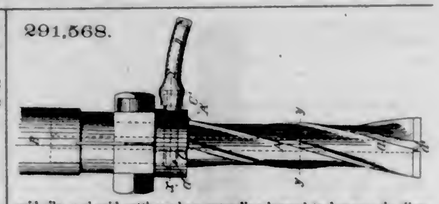
5. The combination, substantially as herein set forth, with the shaft of a revolving armature, of a friction-disk mounted thereon, a yoke surrounding the disk, means for adjusting the initial pressure of the yoke upon the disk, and a magnet in the main circuit for varying the friction in accordance with the varying strength of the current in said circuit.

6. The combination, substantially as herein set forth, of an armature having a shaft, friction-disk secured thereto, a yoke embracing said disk and having prongs or extensions, and a magnet upon one of said prongs included in the circuit of the generator, the other prong serving as an armature to said magnet.

7. The combination, substantially as herein set forth, with the shaft of an armature, of a brush-holder upon the shaft, a disk secured to said shaft, a yoke embracing said disk and having prongs, or extensions, a magnet upon one of the prongs, the coil of which is included in the circuit of the generator, a screw for adjusting the initial pressure of the yoke upon the disk, and retarding devices, as set forth.

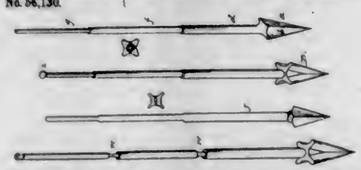
291,567. CAN-OPENER. HARRY BENTHAM, San Francisco, Cal. Filed Sept. 21, 1883. (No model.)

Claim.—In a can-opener, the combination of the slotted bar A, having a handle at one end, and provided at its opposite end with a prod or point, B, the adjustable knife C, and the triangular plate G, having an opening, G', slots H H', and point I, substantially as shown and described.



291,568. ROCK-DRILL. HUGO BORCHARDT, New York, N. Y., assignor to the Parsons Hand Rock Drill Company, same place. Filed June 20, 1881. Renewed July 20, 1883. (No model.)

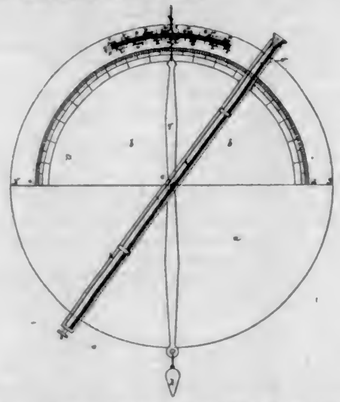
Brief.—The drill-rod has a peculiar construction, and the water-feeding apparatus is adapted to such construction.



Claim.—1. A drilling-tool having spiral external ribs and a longitudinal central channel, the said channel terminating at the junction of cutting-edges formed on the face of said drill upon the continuation of said ribs, and said cutting-edges extending inward to decrease the diameter of the channel and outward to the extremities of said ribs to increase the seting parts of the tool, substantially as specified.

2. A drilling-tool having a central longitudinal channel, *a*, connecting with a transverse water-way, *a'*, and having external flanges or ribs extending lengthwise of the drill, forming bearing-shoulders, combined with a collar, C, resting on said ribs, having annular water-chamber c and pipe-connections thereto, as set forth.

291,568.



291,569. VINE AND FLOWER STAKE. FRANZ BÖRNER, Cologne, Germany. Filed Aug. 24, 1882. (No model.) Patented in France Oct. 20, 1879, No. 133,251; in Italy Apr. 30, 1880, No. 11,823; in Spain Apr. 30, 1880, No. 814; in Austria-Hungary, July 23, 1880, No. 13,859 and No. 2,031; in Germany Oct. 27, 1880, No. 14,206, and in Belgium Nov. 4, 1881, No. 56,130.

Claim.—As an article of manufacture, a gardener's stake consisting of an upwardly-diminishing series of sections, the lower section being provided with a spear-head point and the upper end of each section, except the top one, forming a shoulder for the attachment of vines and other plants, substantially as set forth.

291,570. LATITUDE-INDICATOR. PATRICK BOTHAN, New York, N. Y. Filed July 19, 1883. (No model.)

Claim.—A latitude-indicator consisting of a disk, *a*, on which is inscribed a semicircle divided into ninety degrees on each side of an equatorial line, also above said semicircle divisions extending twenty-three degrees twenty-eight minutes on each side of said equatorial line, said divisions representing the place of the sun during the days of the year, bars *k* and *t*, with clamp-screw *l*, pointer *g*, plumb *h*, tube *i*, cross-plate *s*, said bars, pointer, and tube being suitably pivoted to said disk *a*, as shown and described.

291,571. DENTAL-ENGINE HAND-PIECE. ARTHUR W. BROWNE, Pleasant Plains, N. Y., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Oct. 31, 1883. (No model.)

Claim.—1. In combination with the casing of a dental-engine hand-piece, a spindle fitted to rotate in said casing having a journal tapered at different angles, substantially as described.

291,571.

3. The combination of a spindle fitted to rotate in a hand-piece casing, a tool-locking device carried by said spindle, and connections between said tool-locking device and telescoping sections of said casing, substantially as described.

3. The combination of a spindle fitted to rotate in bearings, an endwise-movable tool-locking clamp carried by said spindle, and a rocking lever to operate said tool-locking clamp, substantially as described.

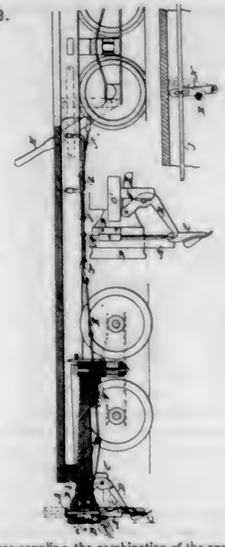
4. The combination of a spindle fitted to rotate in bearings in a casing, an endwise-movable tool-locking clamp carried by said spindle, a rocking lever to operate said tool-locking clamp, and movable sections of said casing to operate said lever, substantially as described.

5. The combination of a spindle fitted to rotate in bearings, a tool-locking device carried by said spindle, a rocking lever to operate said tool-locking device, and a wedge or incline to operate said lever, substantially as described.

6. The combination of the tool-lock-operating lever with the wedge or incline to operate said lever, having a notched or serrated surface, substantially as described.

7. The sectional split clamp tool-locking device, consisting of a front section having an externally-tapered or coned front end, and an internally-tapered mouth or socket at the opposite end, with a rear section having its front end coned or tapered to fit the coned mouth or socket of said front section, substantially as described.

8. In combination, with an endwise-movable clamp-locking device, a headed pin, fitted by its shank in said device and adapted to receive the pressure which closes the jaws of the clamp-lock, substantially as described.



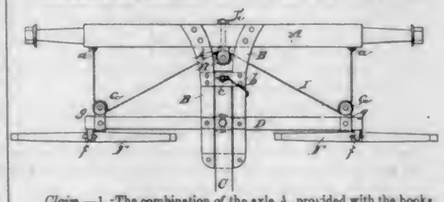
9. The combination of a spindle fitted to rotate in bearings in a casing, but locked from independent endwise movement therein, a tool-locking device carried by said spindle, a driving-shaft also fitted to rotate in said casing and locked from independent endwise movement therein, a telescoping connection between the respective sections of said casing in which the spindle and shaft are mounted, and a connection between said shaft and said tool-locking device, whereby the reciprocation or telescoping of the casing-sections operate said tool-lock, substantially as described.

10. The casing of a dental-engine hand-piece having telescoping sections, one provided with a spline or feather, and the other with a groove to receive said spline or feather, substantially as described, whereby the casing-sections may be telescoped in a right line, but cannot turn relatively to each other.

291,572. CAR-COUPLING. JOHN C. BRYAN, Holly Springs, Ark. Filed May 4, 1883. (No model.)

Claim.—1. In a car-coupling, the combination of the U-shaped frame carrying the coupling-pin, the trip-plate *i*, and spring *k* for acting thereon, the apron-guide, and levers for raising said pin, frame, and guide, substantially as specified.

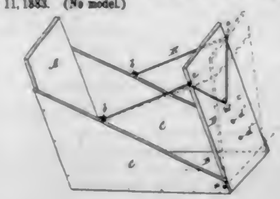
291,572.



2. In a car-coupling, the combination of the apron C, having spring *c*, and the oscillating elbow-levers D, whereby the frame A and apron C may be raised by means of a system of levers, all as shown and described.

3. In a car-coupling, the combination, with the frame A and oscillating levers D, of the bifurcated spring-retained lever E and the rod J, adapted to hold said lever against the action of its spring, substantially as set forth.

4. The combination, with a draw-head, of a sliding frame carrying the coupling-pin, a link-guiding apron attached to the lower part of said frame, and a suitable device for lifting said frame to withdraw the pin and guide the link into the draw-head, substantially as shown and described.

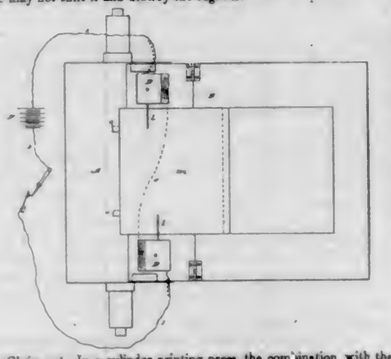


291,573. DRAFT ATTACHMENT FOR WAGONS. JOBST H. BUENING and HERMAN KLOE, Milwaukee, Wis. Filed Mar. 22, 1883. (No model.)

Claim.—1. The combination of the axle A, provided with the hooks or staples *a a*, and central sheave, H, with the evener D, having the sheaves G G—one near each end—and the chain I, the ends of which are secured at *a a* to the ends of the axle, the said chain passing around the sheaves G H G, free from attachment thereto, or to any part of the evener, substantially as set forth.

2. The combination of the axle A with bounds B B, supporting the tongue C between them, and the evener D, suspended from the bounds by slotted plate E *s* and bolt *d*, independent of the tongue, sheaves G G and H, and chain I, all substantially as set forth.

291,574. FILE-BOX. EDWARD W. BYRN, Washington, D.C. Filed June 11, 1883. (No model.)



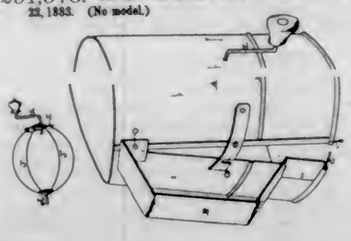
Claim.—1. The combination, with a file-box, of an end piece pivoted or hinged at its bottom, a cord-holding device fixed to one end of the box, and an adjusting-cord or its described equivalent passing through eyes in the side edges of the hinged end piece, and extending therefrom parallel with the sides of the box and connected with the box, as shown, the said cord being of such length as to adapt it to be deflected down to and around the holding device on the end of the box to close the latter, or be thrown up to allow the hinged end piece to fall back, as described.

2. The combination, with a file-box, of an end piece pivoted or hinged at the bottom to swing on either side of the vertical line, and a flexible adjusting-cord connecting the edges of the end piece to the box proper, the said end piece having a range or movement upon either side of the vertical, substantially as and for the purpose described.

3. The combination, with a file-box having a pivoted end piece, of a flexible cord or its equivalent, as described, connected at its ends to the sides of the box, and having its middle part looped around the end piece, and a fastening device for securing the cord when the end piece is drawn to a closed position, as set forth.

291,575. ELECTRICALLY-ACTUATED SHEET-STOP FOR PRINTING-PRESSES. ANDREW CAMPBELL, Brooklyn, assignor to John McLoughlin and Edmund McLoughlin, New York, N. Y. Filed June 13, 1883. (No model.)

Brief.—Provides an electrically-actuated means for holding down the sheet after it has been presented to the front guides and before it has been seized by the grippers, in order that the tremor or jar of the machine may not shift it and destroy the register.

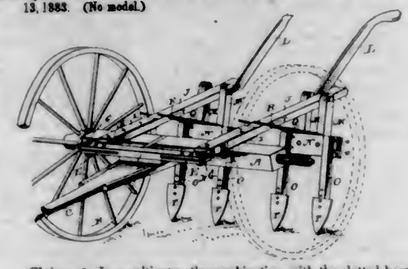


Claim.—1. In a cylinder printing-press, the combination, with the feed-board and front guides, of a sheet-holding finger or fingers, *l*, and electro-magnetic means, substantially as described, for operating said finger or fingers, whereby they are caused to press upon the sheet after it is placed against the front guides and to hold it in place until it is seized by the grippers, substantially as set forth.

2. The combination, with the feed-board and front guides of a printing-press, of the magnet E and its armature, the lever *e h*, link *i*, crank *j*, spring *n*, and finger *l*, all arranged to operate substantially as set forth.

3. The combination, in a printing-press having a feed-board and front guides, of two electro-magnets mounted on the sides of the feed-board, an electric generator to excite said magnets, circuit-wires, and a circuit breaking and closing device, substantially as described, whereby the moving parts of the press are made to break and close the circuit, stop-fingers *l*, and means, substantially as described, whereby the electro-magnets are caused to actuate said fingers, all arranged substantially as and for the purposes set forth.

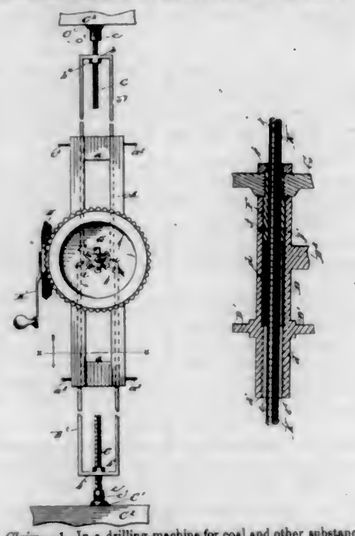
4. A cylinder printing-press provided with a feed-board and front guides, and with two electrically-actuated fingers, *l*, arranged on opposite sides of the feed-board, and in planes substantially at right angles to the line of movement of the sheet in feeding, substantially as set forth.



291,576. SIFTER. HERBERT CLAYTON, Cincinnati, Ohio. Filed Mar. 22, 1883. (No model.)

Claim.—1. A sifter-frame which has its ends pivoted together near their upper edges, and which is provided with the guiding-wire C and the socket *b* at its lower edges, and a pivoted locking-latch, G, in combination with the sieve F and revolving frame J, substantially as shown.

2. A revolving frame, J, provided with the pivot *d*, the short crank L, and a spring locking-pin, I, in combination with the frame A and sieve F, substantially as shown and described.



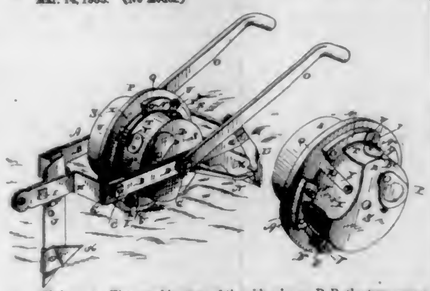
291,577. CULTIVATOR. NATHAN COLEMAN, Oneida, Kans. Filed Oct. 13, 1883. (No model.)

Claim.—1. In a cultivator, the combination, with the slotted beam D, provided with yokes or bails F, secured to the same in the manner shown, of the plow-beams J, provided with plates I at their front ends, said plates connecting a pair of blocks, K, between the same, the blocks being formed with grooves i, to receive the yokes or bails, said parts being arranged to permit the vertical and lateral movement of the plow-beams, as set forth.

2. In a cultivator, the plow-beams having standards M projecting downwardly therefrom, in combination with the rods Q, attached to the standards and provided with notches or recesses, a locking bar or bolt journaled in the beams and arranged to engage the recess to lock the rods Q, cross-pieces N, connecting the standards and slotted at the ends, and plow-feet adjustable in the slots of said cross-pieces, as and for the purposes set forth.

291,578. COAL-DRILLING MACHINE. JONATHAN M. DAVIES and JOHN W. DAVIES, Bryan, Ohio. Filed May 15, 1883. (No model.)

Claim.—1. In a drilling-machine for coal and other substances, the combination of the frame having sides provided upon their inner surfaces with grooves b^2, said sides held in parallel planes by blocks *a*, sliding frames B B', screws C, provided with head-blocks C', with the casting D, provided with trunnions D', whereby the said casting is journaled to the side pieces of the frame A, said casting further provided with curved bar D^2, whereby it is set at different angles, and offset D^3, bar K, and means, substantially as described, whereby said bar is operated, as herein set forth.



2. In a drilling-machine for coal and other substances, the combi-

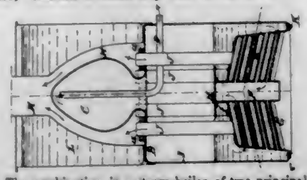
nation of the frame A, having grooves b^2 upon the inner surfaces of its side frames, sliding frames B B', having apertures b^3, and held in place within the frame A by pins a^2, adjusting-screws C, with the casting D, provided with trunnions D', journaled in the side pieces of the frame A, and curved bar D^2, fixed screw-threaded sleeve E, rotating sleeve F, bevel-geared spur-wheels G and H, and screw-threaded bar K, substantially as described.

3. In a drilling-machine for coal and other substances, the sleeve E, divided longitudinally into two equal parts, e e', said parts having their inner surfaces screw-threaded, and further provided upon their outer surfaces with recesses or grooves e^2, in combination with the casting D, having chambered portion d, provided at the sides adjacent to said sleeve E with flanges d', and further having the upper and lower sides, d^2, adjacent to said sleeve chambered out, and provided with screw-threaded apertures, through which pass screw-threaded pins d^3, whereby the halves e e' are adjusted, sleeve F within casting D, screw-threaded bolt K, passing through sleeves E and F, bevel-geared spur-wheels G and H, and frame A, substantially as described.

4. In a drilling-machine for coal and other substances, the combination of the rotating sleeve F, having groove f'', into which projects a pin, f, and further provided with a pin, k', or its equivalent, a key or spline that engages with the longitudinal groove k in the screw-threaded bar K, with the screw-threaded bar K, having the longitudinal slot k, and provided with bit-holding heads K', casting D, frame A, and means, substantially as described, whereby said bar K is operated, as herein set forth.

291,579. SEED-PLANTER. JOSEPH W. DAWSON, Auburn, Ala. Filed Mar. 14, 1883. (No model.)

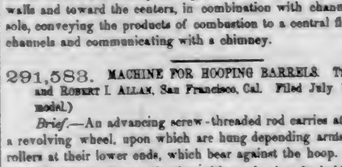
Claim.—1. The combination of the side pieces, B B, the transverse braces C D E, the vertical bars secured upon the ends of the rear brace and carrying the coverer, the diagonal braces connecting the lower ends of the vertical bars with the ends of the center brace, and the handles secured to the ends of the center brace and to the upper ends of the vertical bars, as set forth.



2. The combination of the side pieces, B B, the transverse connecting-braces C, D, and E, all of which are provided with spacing-nuts F and clamping-nuts G, and the revolving seed box or drum journaled upon the center brace, as set forth.

3. The combination of the central disk or ring, the cylindrical heads bolted to the sides of the same, the interposed washers, and a detachable partition-plate secured between the center disk and one of the heads, as set forth.

4. The combination of the central disk or ring having a diametrical brace journaled upon the axle D, the cylindrical heads, and the detachable partition-plate having a radial slot, as and for the purpose set forth.



5. The combination of the center ring, the cylindrical heads having lugs at their inner ends, the transverse connecting-bolts, and the segmental feed-regulating plates pivoted upon said bolts adjoining one side of the center plate, and provided at their free ends with set-screws bearing against the said center plate, as set forth.

291,580. STEAM-BOILER. ALBERT COMTE DE DION, GEORGES TRADER BOUTON, and CHARLES TRÉPARDOUX, Paris, France. Filed Nov. 3, 1883. (No model.) Patented in France May 1, 1883, No. 155,206.

Claim.—The combination, in a steam-boiler, of two principal separable parts, one of which consists of an upright cylindrical external body, and the other of which consists of an internal conical shell, a central water-pocket depending from said shell, inclined water-tubes radiating between said shell and pocket, and fire-tubes attached to said shell, the said separable parts being united by nuts and screw-threads, connecting the said fire-tubes with the crown of the body, and the bases of the said body and shell being united by screw-bolts, substantially as herein described.

291,581. FRUIT-CANNING DEVICE. FARRIER DEPLANTY, Hastings, Mich. Filed Aug. 3, 1883. (No model.)

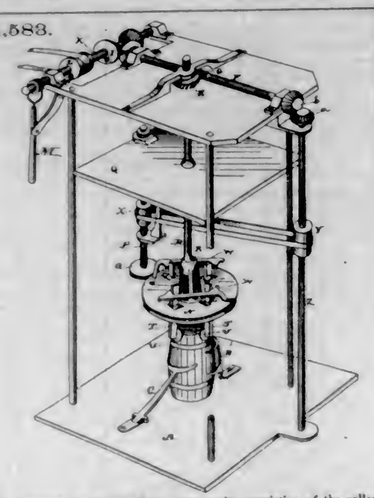
Claim.—In combination with a suitable boiler, a rack consisting of the bed-plate A, standards B, shafts C, pins D, and cap E, substantially as and for the purposes described.

291,582. MANUFACTURE OF BRICKS, TILES, &c. ANTON DEMPF, Munich, Bavaria, Germany, assignor to Michel Puletti, Hoboken, N.J. Filed Jan. 27, 1883. (No model.) Patented in France Sept. 20, 1875, No. 109,557; in Belgium Sept. 24, 1875, No. 37,923, and in England July 14, 1876, No. 2,537.

Claim.—1. The improved process of manufacturing bricks, tiles, and other similar articles, which consists in tempering, kneading, and compacting the clay, molding the same to a shape approximating that of the finished articles, covering these molded masses with powdered tiles, drying the same by heat, compressing the same in dies to the requisite shape and density, and finally firing them in a furnace at an intense heat, substantially as set forth.

2. The improved process of manufacturing bricks, tiles, and other similar articles, which consists in diluting or tempering the clay with heated water, crushing or grinding the diluted clay, kneading and compacting the same, molding the mass into a shape approximating that of the finished article, drying the molded products, pressing the same in a mold or die to the desired finished shape, and finally firing the articles, substantially as set forth.

3. In the manufacture of bricks, slabs, tiles, and other like articles, the combined processes of, first, diluting the loam or clay by heat; second, crushing and grinding the diluted clay by means of cylinders, crushers, or grinders; third, condensing the ground mass; fourth, subjecting the same to a primary compression into approximate shape; fifth, covering the products with brick, tile, or other similar powder; and, sixth, alternately drying and compressing the products before they are finally subjected to the process of burning, all substantially as herein set forth.



4. The combination, in a furnace composed of equidistant fire-places arranged at or near the arched roof and in relation to bridges and the sole of the furnace, as described, of openings in the sole arranged equidistantly from side to side, and so as to cause the products of combustion to descend uniformly through the mass by passing both against the walls and toward the centers, in combination with channels under the sole, conveying the products of combustion to a central flue below said channels and communicating with a chimney.

291,583. MACHINE FOR HOOPING BARRELS. THOMAS C. DUFF and ROBERT I. ALLAN, San Francisco, Cal. Filed July 10, 1883. (No model.)

Brief.—An advancing screw-threaded rod carries at its lower end a revolving wheel, upon which are hung depending arms, which carry rollers at their lower ends, which bear against the hoop.

Claim.—1. In combination with mechanism for holding a barrel in a vertical and stationary position, consisting of the base A, having the fixed adjustable supports B, as shown, and the hinged clamp C, of a device for pressing hoops thereon, consisting of a series of wheels, U, attached to the lower ends of the pivoted arms T, and adapted to rest upon the upper edge of the hook, means by which they are caused to roll around upon the edge of the hoop, and a means by which they are gradually moved downward, substantially as herein set forth and described.

291,583.

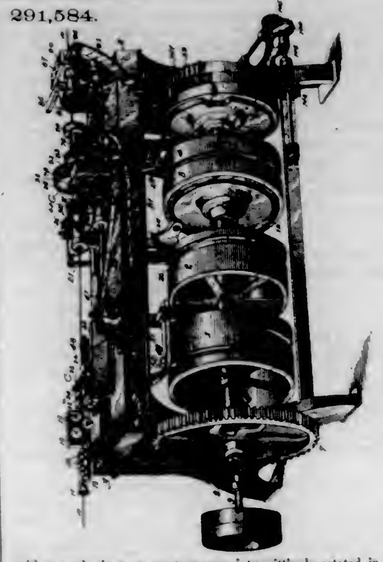
2. A means for forcing hoops upon casks, consisting of the rollers or wheels U, supported upon arms so as to rest upon the upper edge of the hoop to be placed, the driving-wheel N, to which the arms are attached and by which they are revolved around the cask, and a feed-screw shaft D, by which the wheels are moved downward, substantially as herein described.

3. In a machine for hooping barrels, the revolving wheel N, driven by the pinion O upon the shaft P, and provided with the pivoted hinged arm T, carrying the hoop-placing wheels U, the springs V, whereby the said arms are pressed toward each other, and the pivoted brackets W, adapted to press against the upper ends of the arms T, all substantially as shown, and for the purpose described.

4. In a barrel-hooping machine, the screw-threaded shaft D, provided with a gear, E, intermeshing with a screw, G, whereby the shaft is raised or lowered, the wheel N, and operating mechanism, in combination with the pivoted hoop-placing wheels U, supported at their lower ends, the pinion O, and shaft P, journaled to move up and down with the wheel N, the wheel being operated by the main driving-shaft and reversing-gear, all substantially as herein shown and described, and for the purpose set forth.

291,584. MACHINE FOR FORMING CHECK-ROWER WIRES. GEO. B. DURRIE, Chicago, assignor to the Joliet Wire Check-Rower Company, Joliet, Ill. Filed May 28, 1883. (No model.)

Brief.—The wire is fed to the machine through a guide and through straightening-rollers, and it passes over a mandrel carried upon the end of a horizontal rack-bar. The wire is cut back of the mandrel, and the severed end is fed forward under the mandrel by a reciprocating carriage carrying spring gripping-jaws. The mandrel is advanced, pushing the ends of the wires laterally from the line of feed. The ends are then bent into two connected eyes or loops by a rotary looper. The projecting ends of the loops are then coiled around the wire, back of the loops, by oppositely-rotating coilers, each mounted on a reciprocating carriage. A stripper strips the finished loops from the mandrel. A vibrating gage-bar located at the end of the machine draws the wire through the machine after the completion of each pair of loops.



Claim.—1. In a machine for forming check-row wire, the combination of means for intermittingly feeding the wire, means for severing the wire into parts, means for feeding forward one part to cross the ends of the parts, means for bending said ends into connected loops, and means for coiling the terminals of the parts around the main line of the wire back of the links, to form a check or shoulder, substantially as shown and described.

2. The combination, in a machine for forming check-row wire, of mechanism for cutting and bending the wire at intervals into pairs of connected loops, with means for intermittingly actuating the cutting and bending or looping devices, substantially as described.

3. The combination, in a machine for forming check-row wire, of a mandrel upon which the wire rests preparatory to forming loops in the same, a cutting mechanism for severing the wire at one side of the mandrel, and a feed mechanism adapted to pass one end of the cut wire under the mandrel, while the opposing end of the wire is upheld by the latter, substantially as described.

4. In a machine for forming check-row wire, the cutting mechanism consisting of a pair of shears constructed with a jaw rigid upon an intermittingly-vibrating lever, and a pivoted jaw connected by a link

291,584.

with a crank-pin upon a rotary gear, intermittingly rotated in order to open and close the pivoted jaw, substantially as described.

5. The combination, in a machine for forming check-row wire, of a combined cam-grooved and mutilated gear-wheel, with the vibratory lever actuated by the cam-groove in said wheel, and carrying a fixed cutting-jaw, with the pivoted cutting-jaw connected by a link with a crank-pin upon a pinion that is actuated by said mutilated gear, substantially as described.

6. The combination, in a machine for forming check-row wire, of the mandrel upon which one end of the wire rests after it has been severed, and a feed-carriage provided with spring-jaws, by which the wire is grasped and the remaining end pushed forward under the mandrel, substantially as described.

7. The combination, in a machine for forming check-row wire, of a mechanism for cutting the wire at intervals along its length, with an intermittingly-reciprocating mandrel, by which the adjacent ends of the wire are pushed to one side and crossed after the wire has been severed, an intermittingly-rotating looper located and adapted to bend said crossed ends of the wire into connected loops or links upon the mandrel, substantially as described.

8. The combination, in a machine for forming check-row wire, of a mandrel with a rotary and reciprocating looper for bending the wire into connected loops upon the mandrel, and means for automatically and successively reciprocating and rotating the looper, substantially as described.

9. The combination, with the intermittingly-reciprocating mandrel, of the intermittingly-rotating looper, provided with a recess adapted to receive the mandrel, and means, substantially as described, for advancing the looper when the mandrel is retracted, for the purpose specified.

10. The combination, in a machine for forming check-row wire, of the looper F, fixed upon a rotary and slidable shaft, with a vertically-reciprocatory rack-bar engaging a gear upon said shaft for rotating the same, and a vibratory lever for imparting a longitudinal movement to the shaft, in order to advance or retract the looper, substantially as described.

11. The combination, with the intermittingly-rotating looper F, of the mandrel D, carried by a slidable bar, 27, and an intermittingly-vibrating lever for actuating said bar, whereby the mandrel shall be advanced and retracted, substantially as described.

12. The combination, in a machine for forming check-row wire, of means for bending the wire into a pair of connected loops upon a mandrel, with a pair of intermittingly-rotating coilers adapted to coil the ends of the wire around the main line of wire back of the loops, and mechanism for automatically operating the coilers after the loops have been formed, substantially as described.

13. The combination, in a machine for forming check-row wire, of a mandrel and looper adapted to bend the wire into connected loops upon the mandrel, a pair of rotating coilers adapted to rotate in planes at right angles to the plane of rotation of the looper that serves to form the loops, and mechanism, substantially as described, for automatically and intermittingly rotating the said pair of coilers in reverse directions, substantially as described.

14. The combination, in a machine for forming check-row wire, of a

mandrel upon which the wire is bent into connected loops, with a pair of coilers intermittingly rotating in reverse directions, and a mechanism for automatically and simultaneously advancing said coilers into position to coil the wire upon itself back of the loops, and for retracting said coilers after the coils have been perfected, substantially as described.

15. The combination, in a machine for forming check-row wire, of a pair of carriages, each carrying a rotary coiler, with means for causing said carriages to move simultaneously in reverse directions, and mechanism for automatically and simultaneously rotating the coilers in reverse directions, substantially as described.

16. The rotary coiler E, mounted in a slidable carriage, and connected by gearing with an intermittingly-rotating shaft, upon which the carriage moves, substantially as described.

17. In a machine for forming check-row wire, a rotary coiler having a pair of jaws adapted to open in order to allow the checks formed in the wire to pass through the coiler after the completion of the coiling operation, substantially as described.

18. The combination, with the sliding jaws of a rotary coiler, of a ring-gear provided with eccentric-grooves or slots, in which lugs upon the jaws are received, and devices for intermittingly rotating said ring-gear in reverse directions, and a device for holding the jaws against rotation during the action of the ring-gear, substantially as described, whereby said jaws shall be alternately opened and closed, for the purpose set forth.

19. The combination, with the rotary coiler-jaws, of an intermittingly-rotating disk, upon which the jaws slide, and means, substantially as described, for opening and closing the jaws between the intervals of rotation of the disk by which the jaws are carried, for the purposes set forth.

20. The rotary coiler provided with a pair of interlocking jaws, 62 63, one of which carries a pin for bending the wire, said jaws being formed with transverse grooves in their faces, which, when the jaws are closed, form a passage for the wire, substantially as described.

21. The combination, with the rotary coiler-jaws, of a disk, upon which said jaws slide, connected with a hollow hub provided with a gear, an eccentrically slotted or grooved ring-gear engaging the jaw and loosely mounted upon a hub of the said disk for opening and closing the jaws, and means for rotating all of said members in order to coil the wire, and means for solely rotating the ring-gear after such operation, in order to open and close the jaws, substantially as described.

22. The rotary coiler-jaws 62 63, provided upon their rear sides with ribs, which are received in dovetailed grooves in an intermittingly-rotating disk, and also provided with lugs, which are received in grooves eccentrically formed in a rotary ring-gear adapted to turn independently of the disk, substantially as described.

23. The combination of the rotary coiler, comprising jaws, with mechanism for successively opening and closing the jaws between the intervals of rotation of the coiler, and the stop G′, for locking the coiler while the jaws are being opened and closed, substantially as described.

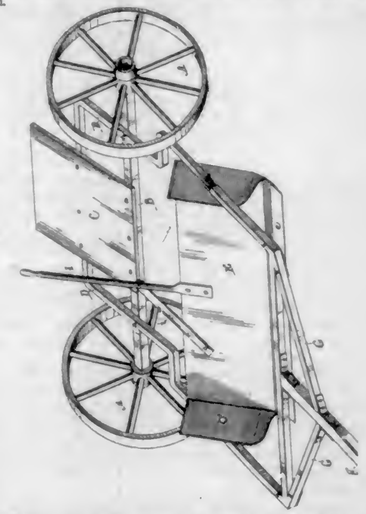
24. The combination, in a machine for forming check-row wire, of a reciprocating carriage supporting a rotary hub provided with a gear and connected to a disk or head carrying a pair of slidable jaws, with means for opening and closing the jaws, and an intermittingly-rotating shaft, and a gear carried by the carriage and actuated by said shaft, for rotating the coiler, substantially as described.

25. The combination, in a machine for forming check-row wire, of means for forming connected pairs of loops along a continuous wire, with an intermittingly-rotating coiler provided with a pair of jaws that are opened after the loops have been formed in the wire, to admit of the latter being drawn through said coiler to the delivery end of the machine, with a rotary clutch, a mechanism adapted to actuate the jaws of the coiler, and means for rotating said clutch in reverse directions, whereby said jaws are successively opened and closed, substantially as described.

26. The combination, with the rotary coiler provided with a pair of jaws and carried by a reciprocating carriage, of the rotary clutch H, and mechanism connecting the clutch and jaws, the clutch H comprising two sections, one of which is carried by the reciprocating carriage and the other permanently located upon the machine, and mechanism timed to intermittingly rotate the permanently-located section of the clutch successively in reverse directions, when the two sections of the clutch are in engagement with each other, whereby the jaws of the coiler shall be successively opened and closed, substantially as described.

27. The combination, with the rotary coiler G, adapted to be moved up to the work and then retracted, of the intermittingly-rotating connecting mechanism, whereby the rotation of this part operates the jaws, clutch H, and the reciprocating rack-bar engaging a pinion connected with another part of said clutch, for rotating the clutch in reverse directions, substantially as described.

28. The combination, with the intermittingly-rotating shaft 52, of the reciprocating carriages, each provided with a wire-coiling mechanism actuated from said shaft, and the pitmen connecting said carriages with the arms of a rocker, whereby when the rocker is vibrated the carriages shall be moved in reverse directions, substantially as described.



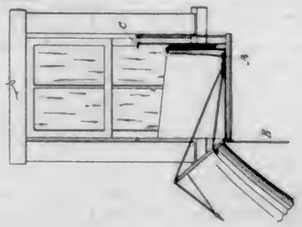
29. The combination, in a machine for forming check-row wire, of the mandrel upon which the wire is bent into loops, with a stripper, and means for advancing the stripper to push the completed loops off the mandrel, substantially as described.

30. The combination, with the mandrel upon which the wire is formed into loops, the retracting-bar, and means for actuating the same, of a stripper, which is advanced by said retraction-bar, substantially as described.

31. The combination, with the slidable rack-bar carrying a mandrel upon which the wire is bent into connected loops, of a rack-bar carrying the stripper, and a pinion intermediate of and engaging said rack-bars, substantially as described.

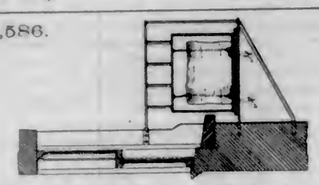
291,585. DIRT-SCRAPER. CHAS. ENDICOTT, Kingsburg, Cal. Filed Apr. 10, 1883. (No model.)

Brief.—A scraper-bowl pivoted in a frame secured to the axle. An operator's platform extending rearward from the axle assists in operating the scraper in connection with the arm secured to the scraper-bowl.



Claim.—1. In a dirt-scraper, the wheeled axle B and the platform C, in combination with the bowl E and the lever-arms D, secured to and forming a frame behind the axle for the support of the platform, and pivoted at their forward ends to the ends of the bowl, substantially as herein described.

2. In a dirt-scraper, the wheeled axle B and platform C, in combination with the bowl E, the lever-arms D, secured to the axle, their rear ends supporting the rear of the platform and their forward ends pivoted to the bowl, and the lever I, secured to the rear top center of the bowl, substantially as herein described.

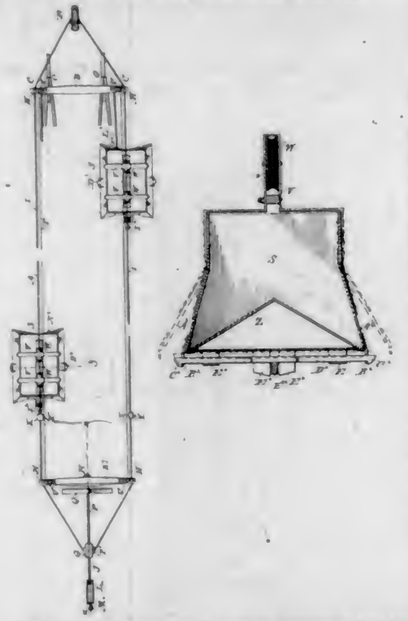


3. A dirt-scraper consisting of the wheels A, axle B, platform C, lever-arms D, pivoted bowl E, having lever I, and the pole F, having bars G, pivoted to the ends of the bowl, substantially as herein described.

291,586. PROTECTOR AND SUPPORTER FOR FIRE-ESCAPES. HARLAN FAIRBANKS, Boston, Mass., assignor to the New England Patent Fire Escape Company, same place. Filed July 12, 1883. (No model.)

Brief.—The storage-box for the chute, and to which it is secured by its upper end, is supported on brackets upon the outside of the building, and is provided with a knockdown part or section and a flanged removable cover.

291,586.

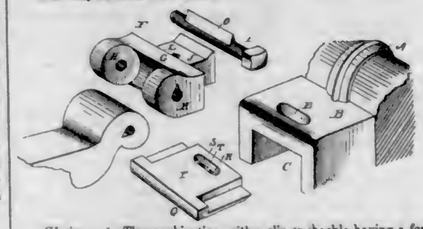


Claim.—1. The combination, with the fire-escape protector and supporter of the character described, of suitable brackets or braces, whereby it is attached to and supported in its proper position upon the outside of the building, all substantially as set forth.

2. The combination, in a fire-escape protector and supporter of the character described, of the bolts A, automatic knockdown part B, and flange-cover C, all substantially as herein shown and set forth.

291,587. APPARATUS FOR TRANSPORTING AND DUMPING EARTH, GRAVEL, &c. QUINCY A. FISK, Springfield, Ill. Filed May 26, 1883. (No model.)

Brief.—Two parallel lines of cable running from opposite ends of a fixed horizontal bar (past the other side of which they are secured to anchoring-post) are attached to a horizontal bar on a pivot-rod resting on suitable support and having a pulley around which the cable runs. Each pulley has a screw-thread connection with a fixed link. The section of loaded cars on one line to return dumped cars on the other is secured by an endless cord connecting such cars. The cars have inclined bottoms and hinged side doors locked by a transverse catch-bar engaging loops on said doors, but thrown out by a longitudinal bar operated by a cord and a bell-crank striking adjustable stop on the cable.



Claim.—1. The combination of an elevated stationary or fixed horizontal bar disposed transversely at one end of the way, a transverse horizontally-disposed bar arranged at the other end of the way, and pivoted or swiveled at its center, the elevated cable connected to the ends of these end bars, and extending longitudinally, suitable transporting-cars arranged to run back and forth on their cables and serve to alternately tilt the pivoted bar, and an endless connecting-cord extending around the cable-way, and secured to the cars, so that they will be at different ends of the way, as and for the purpose set forth.

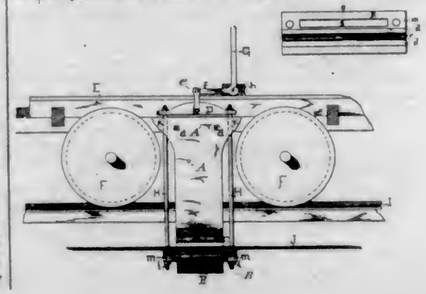
2. An elevated cable-way comprising a transverse horizontal fixed bar at one end, a swiveled pulley-block anchored at the other end of the way, and provided with a projecting bar supported upon a suitable horse or frame, a horizontally-disposed transverse bar pivoted on the end of this projecting bar, the cable anchored at the end of the way having the stationary bar, and diverging from the anchoring point to the ends of the said bar, from which it extends down at both sides of the way, and is secured to the swiveled block, suitable transporting-cars arranged to run on the cables, and a connecting-rope secured to the cars, and having bearings around pulleys at each end of the cable-way, as and for the purpose set forth.

3. The combination, with the elevated cable having an adjustable collar, of the dumping-car hung from brackets carrying rollers by which it runs on the cable, and provided with an inclined bottom, hinged sides having the loops, the transverse latch-bar having ends that engage the said loops, and arranged to slide vertically in guides projecting from the under side of the car, the longitudinal operating bar pivoted at one end, and the bell-crank lever arranged to be operated by the adjustable collar, and connected with the longitudinal bar by a chain or rope, as and for the purpose set forth.

291,588. THILL-COUPLING. JOHN M. FULTON, Roanoke, Ind., assignor of two-thirds to James H. McCahon and Ervin E. Richards, same place. Filed May 24, 1883. (No model.)

Claim.—1. The combination, with a clip or shackle having a forwardly-projecting recessed box, of a coupling-box having a rearwardly-extending shank, secured laterally adjustably in the said recessed box, substantially as set forth.

2. The combination of the clip or shackle having a forwardly-extending box having a transverse groove in its inner rear end, with the coupling-box having a rearwardly-extending shank secured laterally adjustably in the said box, and having at its rear end an upwardly-extending flange fitting in the groove in the recessed box of the clip, substantially as set forth.



3. The combination of a clip or shackle having a forwardly-extending recessed box with a transversely-slotted bottom, a transversely-slotted cap for the said box, a coupling-box having a rearwardly-extending vertically-perforated shank capable of being adjusted transversely in the said recessed box, and a coupling-bolt and nut, substantially as set forth.

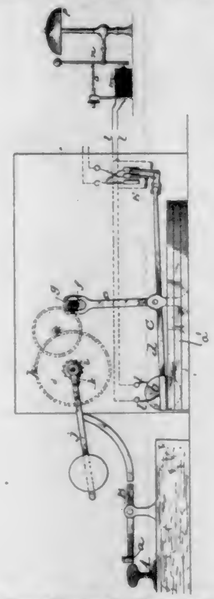
4. The combination of a clip or shackle having a forwardly-extending recessed box with a transversely-slotted bottom, a transversely-slotted cap for the said box, provided with a recess in its under side, a nut seated in the said recess, a covering-plate, a coupling-box having a rearwardly-extending vertically-perforated shank capable of being adjusted transversely in the said recessed box, and a coupling-bolt, all arranged and operating substantially as set forth.

5. The combination of the transversely-slotted box extending forward from the clip or shackle, the transversely-slotted cap for the said box, the coupling-box having a rearwardly-extending vertically-perforated shank, the coupling-bolt and nut, the latter seated in a transverse recess in the cap-plate, and a protecting plate or washer arranged upon the upper end of the bolt, adjoining the head of the same, as and for the purpose set forth.

291,589. TRACTION-ROPE RAILWAY. ELEAZER S. GARDNER, Philadelphia, Pa., assignor of two-thirds to John H. Gould, same place, and Oliver L. Gardner, New York, N. Y. Filed June 8, 1883. (No model.)

Brief.—The lower jaw is perforated to move upon the main grip-bar, and is raised and lowered through vertical rods secured to a yoke, which is operated from a main lever through a link-connection.

Claim.—1. In a traction-rope railway, in combination with a clutch-bar having a rigid clutch-jaw at its lower end, clutch-jaw B, rods H H, and yoke D, said jaw, rods, and yoke having a vertical movement and operated by means of a lever or its equivalent, substantially as set forth.



2. In a traction-rope-railway clutch, the clutch-jaw B, adapted to move upward and downward upon the lower end of the bar A, substantially as and for the purposes set forth.

3. The combination, in a traction-rope-railway clutch, of the clutch-jaw B and rods H H, to raise or lower a cable, substantially as and for the purposes set forth.

4. The combination, in a traction-rope railway, of the clutch-bar A, jaws C B, and rods H H, substantially as and for the purposes set forth.

5. In a traction-rope-railway clutch, the yoke D, rods H H, and clutch-jaws B C, in combination, substantially as described.

291,590. MAGNETO-ELECTRIC RAILWAY-SIGNAL. WESLEY WARD GARY, Boston, Mass. Filed Aug. 18, 1881. (No model.)

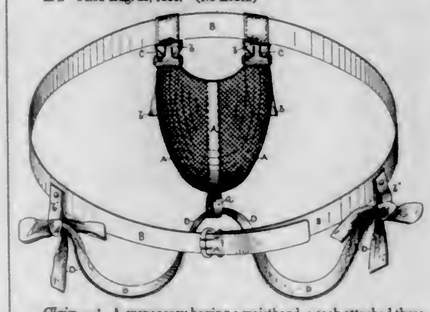
Claim.—1. The combination of a vibratory magneto-electric generator, a train of gear connected therewith, and an operating-lever connected at one end to the driving-gear, and arranged with its opposite end in position to be depressed by passing railway-trains.

2. In a railway signal system, the combination of a bell-signal, an electro-magnet, by means of which the signal is propelled or driven, a vibratory magneto-generator connected therewith, and actuating appliances, substantially such as shown, to be set for action by passing railway-trains.

3. The combination of the railway-signal having an electro-magnet, whereby it is propelled, a vibratory magneto-generator connected with said magnet, and appliances, substantially as shown, to be set for action by passing trains, and to drive the generator with a long-continuing action.

4. In combination with a vibratory magneto-generator, a gear-train for actuating the same, and track-connections, substantially as described, whereby the gear-train may be set in motion by passing railway-trains.

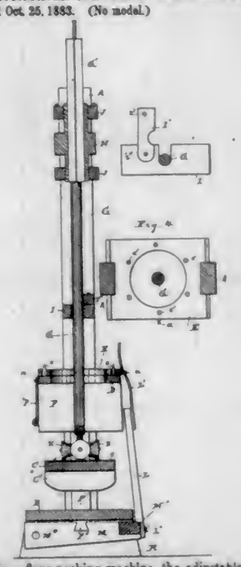
5. In combination with the magnets, the vibratory armature, the eccentric for actuating said armature, and the gear-train provided with an operating-weight, as described, whereby a rapid and long-continuing vibration of the armature may be secured.



6. In combination with the vibratory magneto-generator, the gear-train, and the track-connections for operating said train, the electro-magnetic signal, and the commutator, arranged substantially as described.

291,591. SCISSORS FOR CUTTING FELT ON A BEVEL. JAMES S. GORTON, New York, N. Y., assignor to the Willcox & Gibbs Sewing Machine Company, same place. Filed Oct. 6, 1883. (No model.)

Claim.—In shears, scissors, or other cutting apparatus, the combination, with a cutter or blade, of a device substantially as herein described, arranged to project beyond the cutting-edge in close proximity thereto on the outside of said edge or side opposite from the co-operating cutter or blade for presenting or holding the fabric oblique to the cutting edge or edges, as set forth.



291,592. SUSPENSORY-BANDAGE. LOUIS P. GRIFFIN, Providence, R. I. Filed Aug. 23, 1883. (No model.)

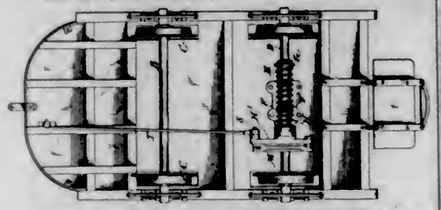
Claim.—1. A suspensory having a waistband, a sack attached thereto, and provided at its lower edge with an elastic loop, *a*, and a tape adapted to pass loosely through said loop, and to be secured to the waistband, substantially as set forth.

2. A suspensory having its sack adjustably and detachably secured to its waistband, and provided with an elastic loop, *a*, adapted to receive loosely a holding-tape, substantially as set forth.

291,593. FLOUR-PACKING MACHINE. ABEL C. HARTSOOK, Lincolnton, N. C. Filed Oct. 25, 1883. (No model.)

Claim.—1. In a flour-packing machine, the adjustable changeable heads provided with means of holding the sack while being packed, substantially as described, and for the purposes set forth.

2. In a flour-packing machine, the frame A and wedge O, in combination with removable head E, as described, and for the purposes set forth.



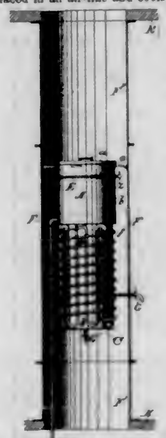
3. In a flour-packing machine, the head D, having spears *e*, adapted to penetrate holes *d'* in head E, in combination with hooks P and bolster F, as shown and described, and for the purposes set forth.

4. The head D, the bolster F, the hooks P, the pieces F', the levers M, having cross-piece M'', in combination with handle L and strap L', substantially as described, and for the purposes set forth.

5. The combination of vertical shaft G, having square part G', with pulley H, substantially as described, and for the purposes set forth.

6. The adjustable floor C, having metal plate *c*, adapted to enter notches *f* in frame A, as described, and for the purposes set forth.

291,594. CAR STARTER AND BRAKE. GEORGE M. HATHAWAY, New York, N. Y., assignor of one-half to Charles C. Kesler, same place. Filed June 7, 1883. (No model.)



Claim.—1. In a car-starter, the combination, with the axle having enlarged portion and right and left hand screw-grooves, of the lever provided with the ratcheted boss containing a ratcheted sleeve having oblique internal lugs traveling in one of the grooves, a friction-wheel having oppositely-oblique lugs traveling in the other groove, the spiral mounted on the shaft, and mechanism for clamping the friction-wheel, substantially as and for the purposes specified.

2. The combination, with the enlarged right and left hand grooved axle, of the spiral spring, the lever provided with an internally-ratcheted boss, the ratcheted sleeve provided with internal oblique lugs, the friction-wheel provided with internal oblique lugs, the clamping-levers and their connecting-links, the crank-pin, and the rod and operating-lever, all arranged substantially as and for the purposes specified.

3. The combination, with the right and left hand threaded shaft, of the sliding lever having a projection provided with an anti-friction wheel, the transverse ways between which said wheel moves, and the mechanism for clamping and moving the lever, substantially as specified.

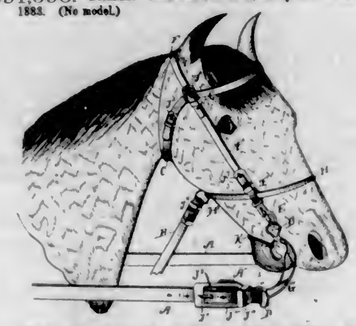
291,595. WATER-COOLER. WILLIAM ALEXANDER HAWTHORN, Hawthorn, Nev. Filed Sept. 18, 1883. (No model.)

Brief.—The cooler with upper and lower chambers connected by long coiled pipe, all parts of each covered with porous fabric kept wet by water-sprays, is placed in an air-flue and cools by evaporation.

Claim.—1. In a water-cooler, a double-compartment water-chamber, one compartment being provided with an inlet and the other with an outlet, and an outside pipe-connection between the two compartments, in combination with an inclosing-casing over said chamber forming an air-space or jacket surrounding the chamber and connecting-pipe, said air-space communicating with the outside atmosphere, whereby a draft or current of air is formed and circulates about the exterior of said chamber and connecting-pipe, substantially as herein described.

2. In a water-cooler, a double-compartment water-chamber, one compartment being provided with an inlet and the other with an outlet, and an outside pipe-connection between the two compartments, in combination with an outer casing covering said chamber and forming an air-space surrounding the chamber and connecting-pipe, and a spray-pipe connected with one water-compartment and discharging within the surrounding air-space, substantially as and for the purpose herein described.

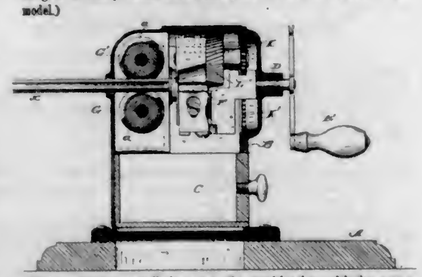
3. In a water-cooler, a double-compartment water-chamber, one compartment being provided with an inlet and the other with an outlet, and an outside pipe-connection between the two compartments, in combination with an outer casing covering said chamber, forming an air-space surrounding the chamber and connecting-pipe, said air-space communicating with the outside atmosphere, whereby a draft or current of air is formed and circulates about the chamber and connecting-pipe, and a spray-pipe connected with one water-compartment and discharging within the surrounding air-space, substantially as and for the purpose herein described.



4. In a water-cooler, the chamber A, having a water connection or inlet, and the chamber C, having outlet G, in combination with the connecting-pipe D, opening from chamber A, and wound about, around, and upon the exterior of chamber C, and discharging therein, substantially as herein described.

5. In a water-cooler, the chamber A, having a water connection or inlet, the chamber C, having outlet G, and the connecting-pipe D, opening from chamber A, and wound about, around, and upon the exterior of chamber C, in combination with the outer casing, F, forming air-space *f*, the pipe F', through the floor, and the pipe F², through the roof, whereby said air-space is connected with the outside atmosphere, substantially as and for the purpose herein described.

6. In a water-cooler, the chamber A, having a water connection or inlet, the chamber C, having outlet G, and the tortuous pipe D on the exterior of chamber C, connecting the two chambers, in combination with the outer casing, F, forming air-space *f*, the pipe F', through the floor, and the pipe F², through the roof, and the annular perforated spray-pipe E, opening from chamber A and discharging within air-space *f*, substantially as and for the purpose herein described.



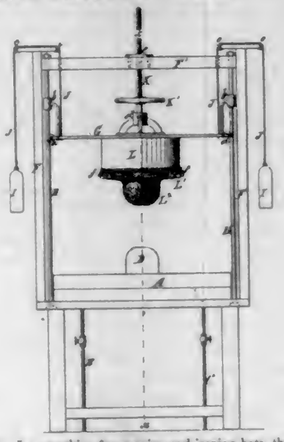
7. In a water-cooler, the chambers A C and tortuous connecting-pipe D, said chambers and pipe being wrapped with woolen or absorbent fabric *b d*, in combination with the outer casing, F, forming air-space *f*, said air-space communicating with the outside atmosphere, and the spray-pipe E, for keeping wet the wrappings of the chambers and pipe D, substantially as herein described.

291,596. BRIDLE. MARCELLUS M. HITT, Leray, Va. Filed Feb. 24, 1883. (No model.)

Claim.—In a bridle, the combination, with buckles J², J³, and J⁴, of the crown-piece and cheek-strap F, made of one piece, throat-latch C, and nose-band H, also of a single piece, for the purpose herein fully described.

291,597. PENCIL-SHARPENER. JOSEPH HOFFMAN, New York, N. Y., assignor to Henry Berolzheimer, same place. Filed Oct. 26, 1883. (No model.)

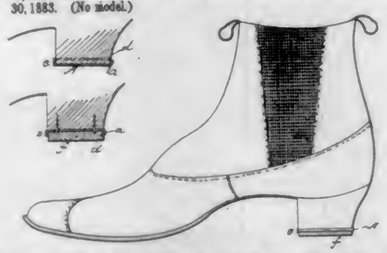
Claim.—1. In a pencil-sharpener, the combination, with the cutter, of automatic spring-controlled pencil-feed mechanism, substantially as hereinbefore set forth.



2. The combination of the pencil sharpening or cutting mechanism proper, the feed-rolls, and the spring, arranged and operating to rotate the same in the direction requisite to advance the pencil held between

them toward the cutting mechanism, substantially as hereinbefore set forth.

3. The combination of pencil-sharpening mechanism, pencil-feed rolls, held together with yielding pressure, and the roll-propelling spring, as and for the purposes hereinbefore set forth.

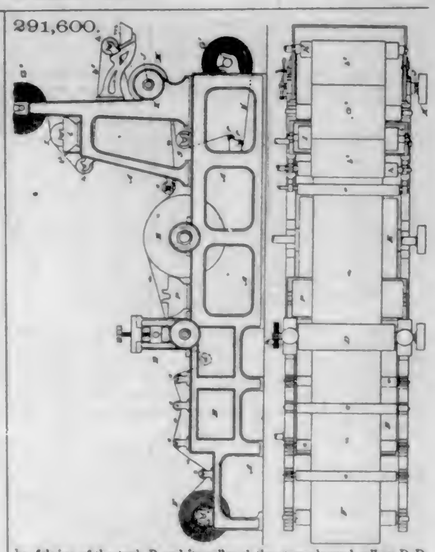


4. The combination of the pencil-sharpening mechanism, the feed-rolls, the crank or handle H, and the spring I, under the arrangement and for operation substantially as hereinbefore set forth.

291,598. MACHINE FOR IRONING HATS. NICHOLAS B. HOOPER, Brooklyn, N. Y. Filed Apr. 27, 1883. (No model.)

Claim.—In a machine for pressing and ironing hats, the combination of the following elements, namely: a fixed steam bed or table and a block supported on its upper surface, a platen movable upward and downward in guides upon the frame of the machine, and a sand-bag on the under side of the platen, moving upward and downward with the platen, and having in it a pocket of muslin, ticking, or other pervious fabric, which conforms exactly to the shape of the crown of the hat to be operated on, and through which moisture may pass from the hat operated on to the sand in said sand-bag, all organized for operation substantially as described.

291,599. HEEL-PLATE. ELIAS HOUSE, Red Creek, N. Y. Filed June 30, 1883. (No model.)



Claim.—As an improved article of manufacture, a heel-plate consisting of a solid piece of metal provided with the inwardly-turned flange *a*, extending around the heel, and adapted to engage a groove in the heel, and terminating at the points *b b*, and provided with the lip *c*, adapted to be bent at right angles to the body of the plate, whereby said plate is secured to the heel, as shown and described.

291,600. APPARATUS FOR MAKING ROOFING-FELT AND SIMILAR FABRICS. JOSIAH JOWITT, Stanley, N. J. Filed Apr. 3, 1883. (No model.)

Claim.—1. In a machine for making roofing-felt and similar fabrics, the combination, with the means for applying a coating of hot pitch or other cementing substance to a web or layer, and for partially drying the same, of a steam-heated roller or rollers, over which one or more other webs are passed before being rolled into contact with the coated web or layer, whereby the coating of pitch is rendered warm and adhesive, and the thorough cementation of the webs or layers is effected, substantially as set forth.

2. The combination, in a machine for making roofing-felt and similar fabrics, of the tank B and its roller *d*, the steam-heated rollers D D, the roller or drum E, for partially drying the coated web, and the steam-heated rollers *g* and *h*, for warming the exterior webs before they are brought into contact with the coated web, all arranged to operate substantially as set forth.

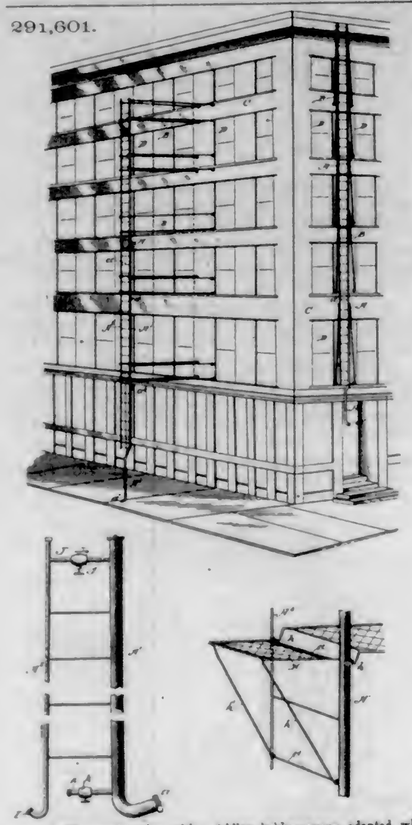
3. The combination, in a machine for making roofing-felt and similar fabrics, of the means described for applying pitch or other cementing material to one web, the steam-heated rollers for partially drying the said cement, the means described for applying paint to the exterior face of one web, the means described for applying sand to the painted surface of said web, and the steam-heated roller for heating or warming the other or non-coated web before it is brought into contact with the cement on the coated web, all arranged to operate substantially as set forth.

291,601. FIRE-ESCAPE. CYRUS EBER, Chicago, Ill. Filed Feb. 27, 1883. (No model.)

Brief.—A ladder which is folded against the building when not in use, and held by a counter-weight, but set at a distance from the same when to be used, and connected to it by links and folding platforms. By connecting a steam-supply pipe to one of the ladder-sides, steam is passed up through said side rail and across through a valved connecting pipe or rung down the other ladder-side, to free the same from ice and snow.

Claim.—1. In a fire-escape attached permanently to a building, a continuous upright ladder constructed to rest closely against such building when not in use, and to be shifted bodily to a material distance therefrom when it is to be used, substantially as herein set forth.

2. In a ladder fire-escape adapted to be set at a distance from or shifted against the building, the combination of the ladder A and links B, hinged to such ladder and building, and arranged to move with such ladder in a vertical plane, substantially as shown, and for the purposes specified.



3. The combination, with a continuous vertical fire-escape ladder, A, adapted to be folded against or set at a distance from the building with which it is connected, substantially as herein described, of folding passage-ways leading from the building to the ladder, substantially as set forth.

4. In a fire-escape having a continuous shifting ladder, the combination, with said ladder, of broad links and pairs of rod-links B, arranged with reference to each other as described, and hinged to the ladder by their outer ends and to the building by their inner ends, substantially as described, and for the purposes set forth.

5. The arrangement of a balcony, D', folding bridge B, and ladder A in such relation to each other and to a window, D, as to form a continuous passage from the latter to the ground, substantially as shown and described.

6. The combination, with an escape-ladder adapted to be shifted to a distance from the building, and to be mounted from the windows when resting against the building, as herein described, of a counter-balance the force of which is sufficient to hold the ladder, when folded, against the building, but which is not sufficient to resist the weight of the ladder when moved from the wall or when a person mounts said ladder, thereby adapting said ladder to be set into position for use by being mounted by a person from the building, substantially as described.

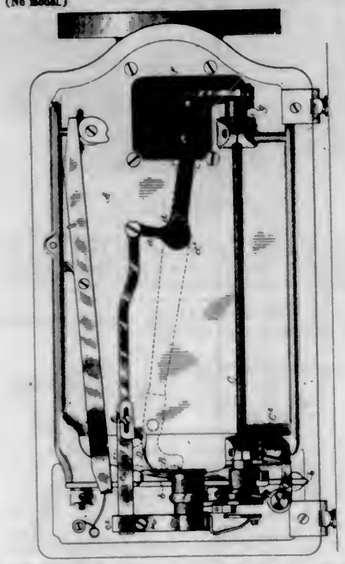
291,601.

7. The combination, with a folding ladder-escape adapted, when folded, to be mounted from the building, as herein described, of the weight E, chain F', and pulley E', said weight E holding such relation to the weight of the ladder as to be overcome when a person mounts the ladder when the escape is folded, substantially as shown, and for the purposes specified.

8. In a folding fire-escape having a vertical ladder, A, and a shorter ladder-section, G, leading from the ladder A to the roof, the combination, with said ladders, of pipes A' and G', hinged together in any suitable manner at their meeting ends, substantially as and for the purposes set forth.

9. In a folding fire-escape having a jointed stand-pipe, a joint formed by bending the meeting ends of the sections of such pipe laterally and inserting them oppositely into a sleeve and securing them therein, substantially as herein shown and described.

10. The combination, with the ladder A, of a platform, H, and braces h', said braces being hinged by their ends to the ladder and the outer side of the platform H, and said platform H being adapted to slide through the ladder A and lie against the inner side of said ladder, substantially as shown and described.



11. In a fire-escape having a non-collapsible ladder constructed wholly or in part of metallic piping, the combination, with said piping, of a coupling device or devices for connecting a supply-pipe from a steam-generator or its equivalent, substantially as and for the purpose set forth.

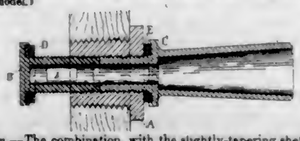
12. The method of freeing a ladder fire-escape of snow and ice, consisting of passing steam or its equivalent upward through one side rail of the ladder and downward through the other, substantially as herein set forth.

13. In a fire-escape ladder having hollow side rails, one of which is a stand-pipe, the combination, with said side rails, of a valved connecting-pipe, J, substantially as and for the purposes set forth.

14. In a ladder fire-escape having hollow side rails, one of which is a stand-pipe, and the two communicating at or near their upper ends by means of the pipe J, the combination, with said stand-pipe, of a valved outlet, K, substantially as and for the purposes set forth.

291,602. SEWING-MACHINE. JEREMIAH KEITH, Florence, Mass., assignor to the Florence Machine Company, same place. Filed June 9, 1883. (No model.)

Claim.—1. The combination, with the eye-pointed needle and looper, of the loop-controller mounted upon a sliding rod provided with a slide bearing or guide at its outer end and beyond the loop-controller, substantially as described.



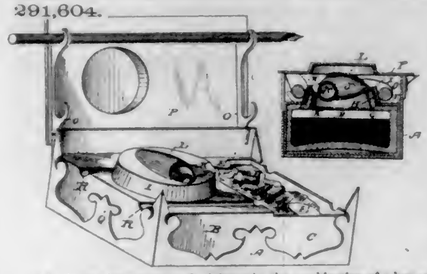
2. The combination, with the eye-pointed needle, looper, feed-bar, and reciprocating slide-bar which lifts the feed-bar, of the loop-controller mounted upon said slide-bar, substantially as described.

3. The combination of the oscillating looper and the loop-controller adjustably mounted upon a longitudinally-reciprocating rod or bar, substantially as described.

4. The combination of the oscillating looper operating within a shuttle-race, the feed rock-shaft for oscillating said looper when clutched thereto, the link, the pendent forked lever, the main shaft, and the cam thereon, engaging with the fork of said lever, substantially as described.

5. The combination, with the cam on the main shaft and the presser-foot bar, of the bell-crank lever for lifting said bar, the slide-plate on which said lever is pivoted, and the set-screw for confining said plate in position, substantially as described.

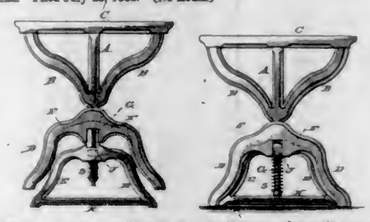
291,603. FAUCET-SOCKET. FRANK G. KINGAID, Somerville, and CLARENCE A. CHANDLER, East Bridgewater, Mass. Filed Feb. 15, 1883. (No model.)



Claim.—The combination, with the slightly-tapering shell or bushing A, externally and internally screw-threaded, as described, and provided with a polygonal head, of externally-screw-threaded valve B, provided with a chambered head, and having holes or ports *g* and *b* and lateral teeth, washer D, the faucet C, provided with the shoulder *f*, integral therewith, and chambered, as described, and having teeth *e e'*, and washer E, all constructed and operating substantially as and for the purpose set forth.

291,604. INKSTAND. THOMAS B. KNOWLES, Toledo, assignor of one-third to Robert Moffett, Cleveland, Ohio. Filed Oct. 3, 1883. (No model.)

Claim.—1. An ink-well casing having the inward-turned lugs E, to retain in position a sponge or pen-wiper, as described.

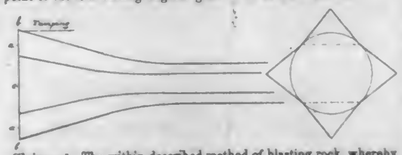


2. The combination, with an ink-well having an opening surrounded by a circumferential collar, of a cover having an inclined concave recess provided with an opening at its lower end, a convex plate or cover secured above the said recess and having an opening at its front end, and a ball arranged in the said recess, and adapted to automatically close the opening in the same, substantially as set forth.

291,604.

3. As an improvement in inkstands, the combination of a box or casing, the top of which is provided with recesses R, to receive the pen handles, with a hinged cover provided upon its under side with pen-racks O, substantially as and for the purpose set forth

291,605. BIER OR COFFIN STOOL. JOSIAH N. KNOX, Evansville, Ind. Filed July 23, 1883. (No model.)



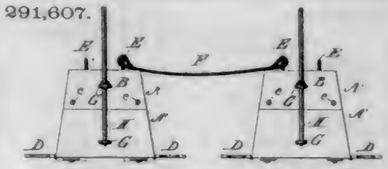
Claim.—1. The combination, in a stool-frame, of a main supporting-bracket, having its legs grooved on their inner side, with an auxiliary bracket constructed and arranged substantially as set forth, whereby it may be set and held at right angles to the main bracket or placed in the same plane and received in the grooves therein, all as and for the purposes set forth.

2. The combination, in a coffin bier or stool, of cross-bar C, legs B, shaft A, and legs D D, the latter being grooved out and notched, as shown at F and G, with legs E E, having cross-bar H, all constructed and arranged to operate as and for the purposes set forth.

3. A coffin bier or stool composed of cross-bar C, supports or legs B B, shaft A, spring S, adjustable legs E E, having cross-bar H, said parts being constructed and arranged to operate substantially as and for the purposes set forth.

291,606. METHOD OF AND TOOL FOR BLASTING ROCK. JOHN L. L. KNOX, Allegheny, Pa. Filed Feb. 10, 1883. (Model.)

Brief.—The blast-hole is made with two or four angles, which are formed by a flat-faced tool of proper outline driven into a circular hole, the point of the tool cutting angular grooves in the side thereof.



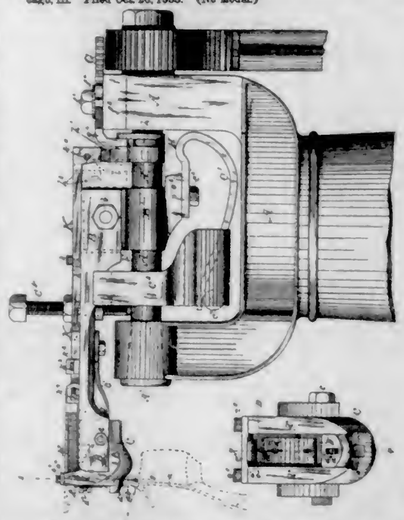
Claim.—1. The within-described method of blasting rock, whereby the alignment of the fractures upon the opposite sides of the bore is insured, which consists, essentially, in forming longitudinal grooves in the opposite sides of a cylindrical bore, said grooves having equal sides, and so situated as that a plane bisecting two opposite grooves will bisect the axis of the cylindrical bore, substantially as and for the purposes described.

2. The within-described instrument for cutting grooves in cylindrical blasting-bores, said instrument having a hexagonal flat cutting-face, two sides, *c*, parallel and of length and distance apart equal to the sides of a square inscribed within the circle of the cylindrical bore to be operated upon, and cutting-edges *a* of equal length, and so situated as that a line joining the points *b* will pass through a point equidistant from the ends of the sides *c*, substantially as and for the purposes described.

291,607. TRUNK. AUGUST KRONING, Berlin, Germany, assignor of one-half to E. Gustav Eschenhorn, same place. Filed July 21, 1883. (No model.)

Claim.—1. A water-proof trunk provided with buoyant wings for the purpose of increasing its stability and buoyancy, substantially as herein shown and described.

291,607.



2. A water-proof trunk provided with buoyant wings hinged to the trunk and adapted to fold under the same or project from the same, substantially as herein shown and described.

3. A water-proof trunk having buoyant wings hinged thereto, and the eyes E, secured to its cover, substantially as herein shown and described, whereby provision is made for attachment of a life-preserver or connecting two or more trunks together, as set forth.

4. A water-proof trunk having buoyant wings hinged thereto, and eyes G, secured to the end of the trunk, substantially as herein shown and described, whereby provision is made for securing a signal-staff to the trunk, as set forth.

5. The combination, with a water-proof trunk formed of top and bottom sections, A A′, and having inclined sides, of packing-strips *a b*, placed in the joints, the angle-plates B, overlapping the top section, and secured to the bottom section by the screw *c*, substantially as herein shown and described.

291,608. HEEL BURNISHING AND MILLING MACHINE. PAUL JOSEPH LAPHAM, Louis, Mich., assignor to himself and Samuel M. Fargo, Chicago, Ill. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination, with a heel-burnishing tool, of a reciprocating slide mounted thereon, and provided with a heel-seat milling or other tool, and suitable actuating means, substantially as specified.

2. The combination, with a heel-burnishing tool, of a reciprocating jointed slide mounted thereon, and provided with a milling or other tool, substantially as specified.

3. The combination, with a heel-burnishing tool, of a reciprocating slide mounted thereon, and a reciprocating slide or tool-holder pivoted thereto and provided with a lip adapted to follow the crease or groove between the heel-seat and counter of the shoe, and a heel-seat milling or other tool, substantially as specified.

4. The combination, with a heel-burnishing tool, of a reciprocating slide mounted thereon, a reciprocating slide or tool-holder pivoted to said slide, and provided with a heel-seat beading-tool, a heel-seat milling-wheel, and a lip adapted to follow the groove between the heel-seat and counter of the shoe, substantially as specified.

5. The combination, with a heel-burnishing tool, of a reciprocating slide mounted thereon, a tool-holder pivoted to said slide and provided with a milling or other tool, and a device for reciprocating said slide, also mounted on said burnishing-tool, and suitable actuating means, substantially as specified.

6. The combination, with a heel-burnishing tool, of a reciprocating

slide mounted thereon, a tool-holder pivoted to said slide and provided with a heel-seat milling or other tool, and a reciprocating wedge mounted on said burnishing-tool for operating said slide, substantially as specified.

7. The combination of a swinging vibratory tool-carrier arm with a reciprocating slide mounted in a block pivoted to said arm, a tool-holder pivoted to said slide, and provided with a lip adapted to follow the groove between the heel-seat and counter of the shoe, and provided also with a heel-seat-ornamenting tool, and a device, substantially as described, for reciprocating said slide, also mounted on said pivoted block, substantially as specified.

8. The combination, with a swinging vibratory tool-carrier arm, of a reciprocating slide mounted in a block pivoted to said arm, and provided with a heel-seat milling or other tool, substantially as specified.

9. The combination of the slide D and tool-holder D′, pivoted thereto, and provided with a lip adapted to follow the groove between the heel-seat and counter of the shoe, and with a heel-seat-ornamenting tool and a spring-connection between said tool-holder and slide, substantially as specified.

10. The combination, with the slide D, of the tool-holder D′, pivoted thereto, and provided with lip d^4 and a heel-seat milling or other tool, and a spring secured to said slide, and provided with a slot which engages a pin secured to said tool-holder, substantially as specified.

11. The combination, with the slide D, of the tool-holder D′, pivoted thereto, and provided with lip d^4 and a heel-seat milling or other tool, and a reciprocating wedge E, provided with dovetails or grooves engaging with corresponding dovetails or grooves in the end of said slides, to reciprocate the same, substantially as specified.

12. The combination, with a heel-burnishing tool, of a swinging vibratory tool-carrier arm, a heel-seat-ornamenting tool mounted movably on said arm, and mechanism for operating the same, consisting of a connecting-bar reciprocating on said arm, and attached to a collar on the rock-shaft of the machine, said collar having a swivel-connection with the actuating lever or device, substantially as specified.

13. The combination, in a heel-burnishing and heel-seat milling or ornamenting machine, of the rock-shaft and the swinging vibratory tool-carrier arm with a sliding collar on the rock-shaft, connected with the mechanism for communicating motion to the heel-seat milling or ornamenting tool and with the operating lever or device, one of said connections being a swivel-connection, substantially as specified.

14. The combination, with swinging vibratory arm B and rock-shaft A′, of connecting-bar K, reciprocating on said arm B, collar H, provided with an arm, h', having slot h^3, for connecting the same with said bar K, rack-bar G, provided with yoke g^4, fitting in groove h of said collar, and segment-lever F, pivoted to the frame of the machine, substantially as specified.

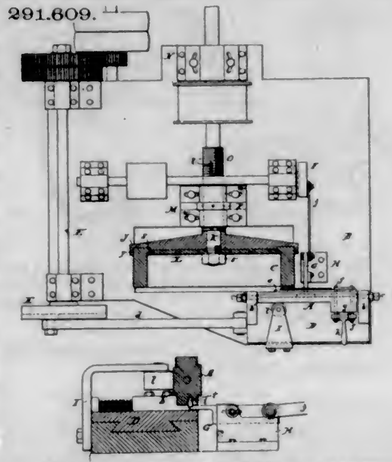
15. The combination of the rack-bar G, provided with slot *g*, with the guide-block g', secured to the cap f^2, on which said rack-bar reciprocates, substantially as specified.

16. The combination of rack-bar G with lever F, provided with toothed segment *f*, bolt f^3, and bushing or collar f^4, surrounding said bolt, to form a bearing for said lever, substantially as specified.

17. The combination of shaft A′ with swinging vibratory tool-carrier arm B, a connecting-bar, K, reciprocating thereon, and a collar, H, adapted to slide on said shaft A, and having a slotted connection with said bar K, to permit of the vibratory movement of the carrier-arm B, substantially as specified.

18. A hollow heel-burnishing tool mounted on a swinging vibratory tool-carrier arm, and provided with a heel-seat milling or other tool having a reciprocating and pivotal or vibratory movement thereon, substantially as specified.

19. The combination, with a heel-burnishing tool pivoted to a swinging vibratory tool-carrier arm, of a reciprocating slide mounted on said burnishing-tool, and provided with a heel-seat-ornamenting tool, a device for reciprocating said slide, also mounted on said burnishing-tool, an operating-lever pivoted on the stationary frame of the machine, and connecting mechanism from said lever to said device, for reciprocating said slide, substantially as specified.



20. The combination of rock-shaft A′ with vibratory swinging tool-carrier arm B, burnishing-tool C, pivoted thereto, reciprocating slide D, mounted on said tool C, reciprocating wedge E, also mounted on said tool C, connecting-bar K, adapted to slide on said arm B, collar H, adapted to slide on said shaft A′, rack-bar G, adapted to slide on said frame A, and a lever, F, for operating the same, substantially as specified.

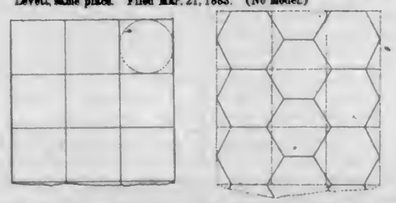
291,609. GRINDING-MACHINE. JOHN R. H. LEONARD, Nashua, Conn. Filed Feb. 13, 1883. (No model.)

Claim.—1. The combination, in a grinding-machine, of a revolving grindstone, a slide and appliances for reciprocating it past the stone at right angles to the shaft thereof, a carrier adapted to hold the article to be ground pivoted to the slide, and appliances, substantially as described, for rocking the carrier, as specified.

2. The combination of the revolving annular grindstone, the slide and the rocking carrier supported thereby, and means for rocking the

291,609.

same, a former secured to the outer face of the carrier, and a stationary bearing supported by the frame of the machine opposite to the former, the several parts being arranged to operate substantially as set forth.



3. The combination of the slide, the carrier supported to rock thereon, the revolving crank-wheel F, and connections whereby the carrier is rocked by the crank-wheel, substantially as set forth.

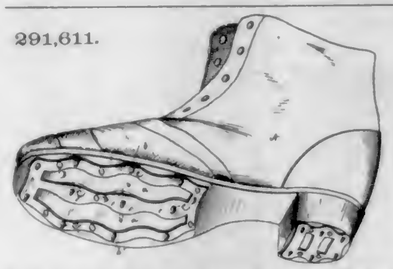
4. In a grinding-machine, the combination of a revolving grindstone connected to a longitudinally-adjustable shaft supported in horizontally-adjustable bearings, in combination with a carrier adapted to hold the article to be ground pivoted to a reciprocating slide, and appliances for rocking the carrier, substantially as and for the purpose set forth.

5. The combination of the flanged annular grindstone, the flanged disk J, and plate L, clamped upon the flange of the grindstone, substantially as set forth.

6. In a grinding-machine, the combination of a revolving grindstone, a slide and appliances for reciprocating it past the stone, a carrier adapted to hold the article to be ground, having a former secured thereto and pivoted to the slide, a stationary bearing supported by the frame of the machine opposite to the former, and appliances for rocking the carrier, substantially as specified.

291,610. MANUFACTURE OF BUFFING AND POLISHING DEVICES. LOUIS LEVETT, New York, N. Y., assignor of one-half to Alexander Levett, same place. Filed Mar. 21, 1883. (No model.)

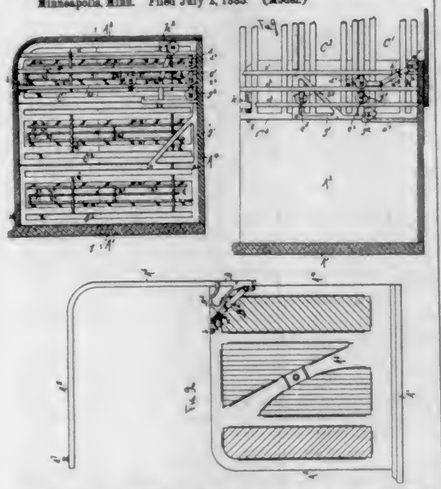
Claim.—1. The improvement in the art of making buffing and polishing devices, consisting of building up the wheel from sheets of material of hexagon shape, or of any multiple of such shape or similar shapes, by superposing such sheets on their centers, so that they will form a wheel, substantially as described.



2. A buffing or polishing device consisting of sheets of material of hexagon shape, or of any multiple of such shape or similar shapes, superposed on their centers, substantially as described.

291,611. SOLE AND HEEL PLATE. SOLOMON LEVY, Ware, Mass. Filed Nov. 9, 1883. (No model.)

Claim.—1. The herein-described plate for shoes, formed of a single piece of metal having the longitudinal slots *a a′*, projecting portions *c c′*, provided at their ends with lugs *d*, adapted to enter the sole of the shoe to aid in retaining the plate thereon, and spuds or spurs C C, formed integral with said plate, substantially as set forth.



2. The combination, with a shoe, of a plate adapted to be secured

291,611.

thereto, formed of a single piece of metal having the longitudinal slots *a a'*, projecting portions *c c'*, provided at their ends with lugs *d*, adapted to enter the sole of the shoe to aid in retaining the plate thereon, and spuds C C, formed integral with said plate, substantially as set forth.

291,612. SHOW-CASE. DAVID C. LOEWENSTINE and JAMES E. FOX, Minneapolis, Minn. Filed July 2, 1883. (Model.)

Claim.—1. A show-case having goods-supporting frames C' C² C³ contained therein, and provided with a front, A^1, and top A^2, formed in fixed relation to each other, the top being hinged at the rear of the case to the same, the said front and top being adapted to be raised and held with the top in a vertical position, and the front in a horizontal position at some distance above the case, whereby the said frames may be raised to and held in a vertical position partly above the case and beneath the said front, substantially as herein specified.

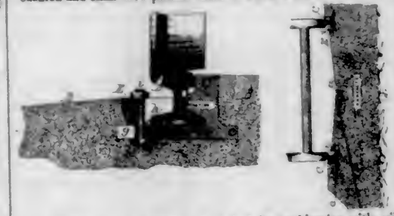
2. A show-case having a bottom, back, and sides in fixed relation to each other, and provided with the slotted pivoted bars B^2, in combination with a front and top in fixed relation to each other, and provided with brackets B', adapting the top, when raised, to slide back and drop down behind the back A^4, substantially as described.

3. A show-case having a bottom, back, and sides in fixed relation to each other, and provided with slotted pivoted bars B^2 and anti-friction grooved rollers *b*, in combination with the front and top in fixed relation to each other, and provided with brackets B', having curved portions B^3, substantially as and for the purpose herein specified.

4. The combination, in a show-case, of a case bottom, sides, and back, A' A^2 A^3 A^4, tracks *c' c² c³ c⁴*, and goods-supporting frames C' C² C³, provided with rollers adapted to run upon the said tracks, arranged and operating substantially as herein shown and described.

5. In a show-case, a series of goods-supporting frames or holders contained within the case in a horizontal position, one above another, and adapted to be raised to and independently sustained in a vertical position, one in front of another, and substantially on the same plane, without removal from the case, for the purpose herein specified.

6. In a show-case, a series of goods-supporting frames or holders contained within the case in a horizontal position, one above another, and adapted to be raised to and sustained in a vertical position, one in front of another, on substantially the same plane, each frame being partially above the sides of the case, in combination with a case having a connected front and top adapted to be raised and held away from the said frames, substantially as and for the purpose herein specified.



7. In a show-case, a goods-supporting frame adapted to be placed and held in both a horizontal and a vertical position, and provided with two sets of oppositely-located rods, D D, the respective sets of rods having pegs *u' u'*, adapted to be turned inward simultaneously toward each other and upward parallel with each other, substantially as herein specified, whereby each article is adapted to be held by two opposite pegs on opposite rods of the frame, the pegs being adapted to be thus turned inward toward each other to permit the full removal of the article, substantially as herein set forth.

8. The combination, in a show-case, of a frame having pivoted rods D and pegs *u'*, the connecting-arms *n'*, rods n^3, handle E^2, lever F', having a lug, *v'*, lever F^3, having a lug, v^3, catch *i*, lever *m*, and connecting cord or wire *t*, substantially as shown and described.

9. In a show-case, a bolding-peg, *u'*, formed of a flat plate of metal bent at one end around a rod, D, and held in place thereon by a portion of the metal cut in and bent from the plate into the rod, and having at the other end a lip, u^3, cut in and bent outward from the plate, in combination with the arms *n'* and n^3, straps n^2, and rod H, substantially as herein specified.

291,613. TRACK AND ROAD-BED FOR RAILWAYS. HARVEY C. LOWRIE, Denver, Colo. Filed Oct. 2, 1882. (No model.)

Brief.—The rails rest upon elastic cushions on chairs embedded in concrete, said chairs having an inward-projecting web which rests against the rail-web and upon top of the rail foot or flange. A locking-bar resting upon opposite rail-flange is secured to base of chair by vertical bolt. The cushion and chair-web permit vertical motion of rail.

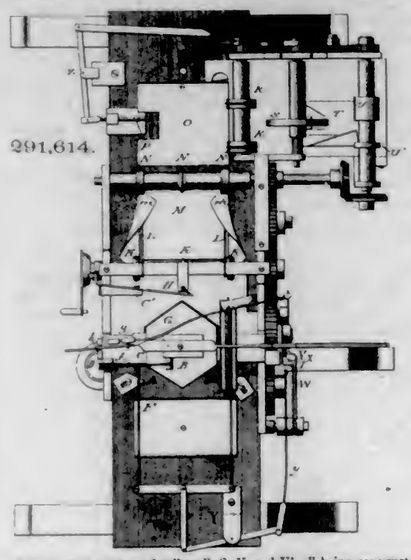
Claim.—1. A concrete road-bed, in combination with rail-chairs embedded therein, the rails, cushions, locking-bars, and bolts, substantially as described.

2. The combination, with a concrete road-bed, of rails, rail-chairs which are embedded in the concrete beneath the rails, are engaged with a rail-head on one side, and overlie the adjacent rail-foot, and means for clamping the rail and chair, substantially as described.

3. The combination, with a T-rail, of a rail-chair having a web which overlies the foot of the rail, and a vertical surface for supporting the side of the head of the rail against lateral displacement, and a cushion interposed between the chair and rail, substantially as described.

291,614. ENVELOPE-MACHINE. HENRY A. MANN, Jr., Ballston Spa, N. Y. Filed Sept. 30, 1882. (No model.)

Claim.—1. In an envelope-machine, the combination, substantially as hereinbefore described, of the cam I, lifting-strap X, lifting-lever G, lifting-strap W, right-angled lever V, guides *b*, and weight D, all operating the gummer B, the gummer B and its parts, the plate C, platform C', gum-box and roller E, pushing-fingers F, operated by the oscillating device composed of the oscillating lever Y and its attachments, drop-lever H, carrying-rollers K, and creasing-rollers K', folder M, and fingers L, carrying-rollers N, and flat rollers N', platform O, with its guard *o*, lever P, actuated by oscillating lever Z and its attachments, creasing-rollers R, carrying-rollers S, folder T, and rollers U and U', all being constructed and organized for operation as set forth.



2. In an envelope-machine, the combination and arrangement, as hereinbefore described, of the gumming apparatus B, gum-box and roller E, operating mechanism I, X, G, W, V, *b*, and D, and their attachments, all being constructed and organized as hereinbefore specified.

3. In an envelope-machine, the pushing-fingers F, with their projecting pins *f*, operated by the oscillating device, consisting of the oscillating lever Y and its attachments, in combination with gummer B, all constructed, arranged, and operating as hereinbefore specified.

4. In an envelope-machine, the combination and arrangement of the creasing-rollers K' and R, folder M, with its curved sides *m*, guiding-fingers L, platform O, and the lever P, operated by the oscillating device Z, all constructed, arranged, and operating as set forth and described.

5. In an envelope-machine, the combination and arrangement of the carrying mechanism, consisting of the pushing-fingers F, with pins *f*, platform C', carrying-rollers K, creasing-rollers K', and carrying-rollers N, with folder M between them, platform O, with guard *o*, lever P, and oscillating attachments, and rollers R, S, U, and U', all being constructed and organized for operation as set forth and described.

291,614.

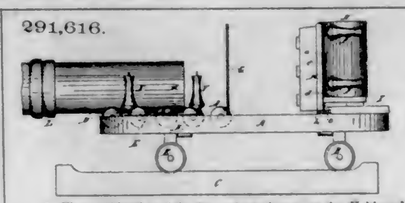
6. In an envelope-machine, the folder T, having curved or folded sides, as shown, and the rollers U and U', so that the lower flap is folded, pressed flat, and sealed, while the seal-flap is folded and its fold only is pressed without sealing the flap, all being constructed and arranged as hereinbefore specified.

7. In an envelope-machine, the combination and arrangement of the creasing-rollers R, the carrying-rollers S, the folder T, and the pressing-rollers U and U', so as to fold and press both flaps, and at the same time seal the lower flap of the envelopes, as set forth, and all constructed, arranged, and operating as hereinbefore shown and described.

291,615. PAPER BOX. THEODORE MARBURG, Baltimore, Md., assignor to Edward B. Munson and Harvey S. Munson, both of New Haven, Conn. Filed Nov. 22, 1883. (No model.)

Claim.—1. A slide-box consisting of a blank creased or scored upon the lines 2 4 6, whereby it may be folded to provide sides and ends, and upon the line 3, to provide said end or ends with a tucking-flap, H, and severed at *a*, to allow its end or ends to be turned down, substantially as described.

2. A slide-box consisting of a blank creased or scored upon the lines 2 4 6, whereby it may be folded to provide sides and ends, upon line 3, to provide said end or ends with a tucking-flap, which is severed at *a*, to allow said end or ends to be turned down, and creased on the line 5, to facilitate the latter movement, substantially as described.



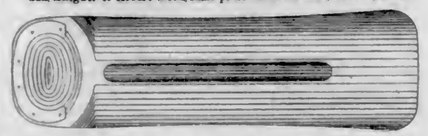
3. The means whereby a portion of the bottom of a trough-like slide-box is capacitated to be turned down to remove from it the contents of said slide-box, the same consisting of the severings *a*, dividing the sides of the slide from its bottom at one or both ends, substantially as described.

4. The combination, with a tubular cover, of a slide-box composed of upturned sides and ends, said ends having tucking-flaps, and said sides being severed near each end from the bottom, and all of said parts being unseited; so that the slide-box may be packed flat, substantially as described.

291,616. CUTTING-TABLE FOR TILE AND BRICK MACHINES. JOSEPH C. MCKENZIE, Adrian, Mich. Filed Dec. 11, 1882. (No model.)

Claim.—1. A cutting-table for a tile-machine, consisting, essentially, of a frame traveling upon a track, said frame being provided with a stationary section and a hinged section, all constructed and operating to the end that the table may be moved forward a limited distance, unloaded, and returned beneath the constantly-progressing column of clay.

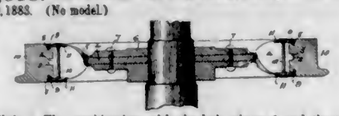
2. In a cutting-table for a tile or brick machine, the combination of the frame A, stationary section K, hinged section H, wheels B, and track C, substantially as shown and described.



3. The combination of the frame A, stationary section K, hinged section H, pallet-board I, wheels B, and track C, substantially as shown and described.

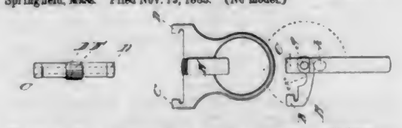
4. In a cutting-table for a tile or brick machine, the combination of the vertical rollers or guides F, and adjustable supports E, with the frame A, whereby said side rollers or guides can be adjusted to suit any size of tile-pipe, substantially as shown and described.

5. The combination of the frame A, stationary section K, hinged section H, pallet-board I, horizontal rollers D, side rollers, F, and adjustable supports E, cutting-wire G, wheels B, and track C, substantially as and for the purpose shown and described.



6. In a cutting-table for a tile-machine, the combination, with a frame traveling upon a track, and provided with a stationary and a hinged section, of a cutter arranged at one end of the hinged section, substantially as shown and described.

291,617. SURGICAL SPLINT. HENRY MCNAUGHTON, Erin, Ontario, Canada, assignor to Robert Wood, same place. Filed Oct. 12, 1883. (Model.)



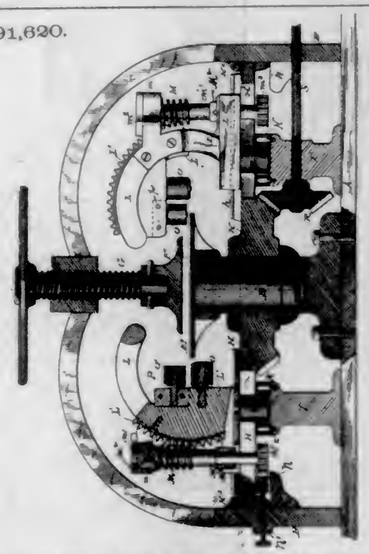
Claim.—In a splint for the forearm, wrist, and hand, constructed as shown and described, the combination, with the shell A B C D, of the longitudinal ridge E and the abrupt ridge E', for the purpose specified.

291,618. CAR-WHEEL. GEO. W. MILLMORE, Chicago, Ill. Filed Aug. 10, 1883. (No model.)

Claim.—The combination, with the hub-plates 6 and the twisted spokes 4, of the rim 10, provided with the grooves 8, the annular plates 11, provided with the flanges 9, and the bolts 12, passing through said plates 11 between the spokes, all substantially as described.

291,619. RING-EXTRACTOR FOR CARTRIDGES. JOHN MURPHY, Springfield, Mass. Filed Nov. 19, 1883. (No model.)

Claim.—The within-described cartridge-extractor, consisting of a convenient handle, two opposite rigidly-connected hooks, and a third hook hinged between the rigid ones, and adapted to swing between them from an operative position to a folded one, to leave an implement of no greater thickness approximately than the width of the face between the rigid hooks, as and for the purpose set forth.

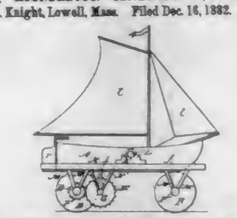


291,620. FLANGING-MACHINE. RICHARD C. NUGENT, Pittsburg, Pa., assignor of five-eighths to W. J. Armstrong, Thomas T. Wightman, John Farrell, and Jos. G. Walnwright, same place. Filed Feb. 5, 1883. (No model.)

Claim.—1. In a flanging-machine having revolving slotted arms, the combination of the guide-pattern K with the roller-bearing arms L, provided with pins *l*, substantially as described, whereby the rollers are made to describe the outline of the pattern, for the purposes set forth.

2. The combination, with the racks L', the arms L, and the shafts M', of the eccentrically-movable journal bearings with attached levers m^2, substantially as described, whereby the racks and worms are thrown out of gear, for the purposes set forth.

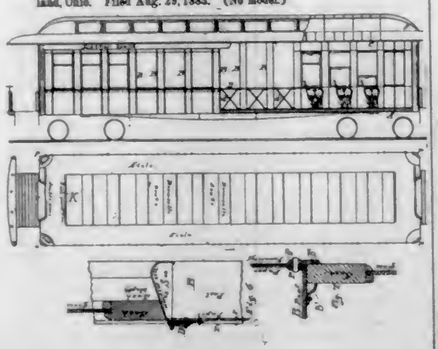
3. The combination, with the fixed rollers O and the racks L', of



291,620.

the movable rollers O', pivoted plates P, and pins *p*, substantially as described, whereby the rollers O may be locked or swung out of place, for the purposes set forth.

4. The within-described machine for flanging metal plates of regular or irregular form, consisting, essentially, of housings B, pillar D, wheel H, having slotted arms H', pillars I, guide-pattern K, arms L, toothed racks L', rack N, and clamp F, all provided with operating mechanism, and arranged in the manner and for the purposes set forth.



291,621. ROUNDABOUT. THOMAS OLDROYD, Tewksbury, assignor to William C. Knight, Lowell, Mass. Filed Dec. 16, 1882. (No model.)

Claim.—1. The combination of the frame *f*, axles F F' and wheels B B, pinion D, gear E, crank-shaft G, connecting-rod I, and the boat A, pivoted to said frame, as and for the purpose specified.

2. In combination with the frames *f f* and boats A A, the platform *g*, as and for the purpose specified.

291,622. RAILWAY PASSENGER-CAR. WILLIAM H. PAIGE, Cleveland, Ohio. Filed Aug. 29, 1883. (No model.)

Claim.—1. The combination, in a car constructed of iron and paper, of the wooden filling in the corners, and door-posts of a car, substantially as specified.

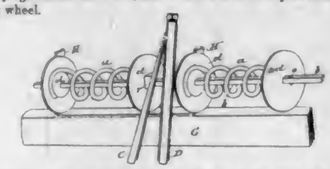
2. The arrangement of a central row of reversible back seats, and the partitions K, with side aisles in a car, as shown and described.

3. The T-iron posts B B, side rails, A, cap-rail C, bar D, and cross-braces *d*, substantially as described, and for the purposes set forth.

4. The T-iron posts B B, side rails, A, cap-rail C, bar D, and cross-braces *d*, the space below the window being filled with paper panels, all united and secured in the manner specified.

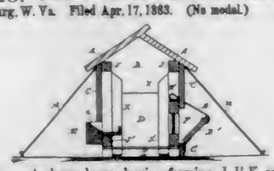
5. In a car, the seats placed transversely in the center thereof, whereby two side aisles are formed, in combination with the sash-partition K, as specified.

6. A railway-car the outer and inner paneling whereof are made of paper, substantially as set forth.



291,623. SCISSORS AND SHEARS. SALMON R. PLUMB, Cheshire, Conn., assignor of one-half to George J. Capewell, same place. Filed Aug. 1, 1883. (No model.)

Claim.—A pair of handles pivoted together at their inner ends, in combination with a pair of crossed blades or jaws, which are pivoted together, and have their rear ends pivotally connected to the middle parts of said handles, said handles being recessed, so that said blades may set flush in them, substantially as set forth.

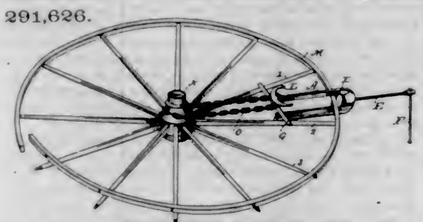


291,624. RAILWAY-SWITCH. BYRON RICE, West Schuyler, N. Y. Filed Aug. 29, 1883. (No model.)

Brief.—Through the bracket which is secured to the tie is passed a rod carrying thereon coiled springs and disks for holding the switch-point normally against one main rail, from which it is forced by the flange of a passing wheel.

Claim.—The combination, with sleeper G, the main rail, and the switch point rail, of the bracket H, the rod *b*, disks *d*, and springs *a*, substantially as set forth.

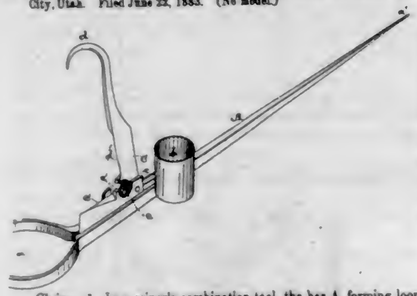
291,625. PORTABLE HOUSE FOR SHEEP. LEWIS ROBBINS, Parkersburg, W. Va. Filed Apr. 17, 1883. (No model.)



Claim.—A sheep-house having framing J J' K, roof A, ends B, sidings C, and slats F, and provided with hinged shutter D', to which is attached cord R, having loop R', substantially as described.

291,626. WHEEL OR FELLY SCREW. CHRISTOPH ROTHEN, Cuero, Tex. Filed Aug. 29, 1883. (No model.)

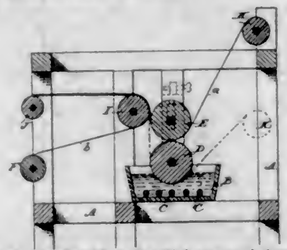
Claim.—1. The combination of an approximately U-shaped frame, a rest-bar extending across the end of one of the arms of the same, and adapted to rest on the spokes, a screw-bar exteoding longitudinally and working in the frame, and a follower on the end of said bar, substantially as and for the purpose set forth.



2. The combination of an approximately U-shaped frame, a hook at the end of one of the arms of the same, a screw-bar working through the frame and extending longitudinally, a follower on the end of said bar, and a chain engaged with the hook and adapted to encircle the hub of the wheel, substantially as and for the purpose set forth.

291,626.

3. The herein-described felly-screw, comprising an approximately U-shaped frame, having a screw-threaded perforation in its end portion, and having its sides formed with inner guide-edges, a transverse support-bar at the end of one of said sides, a double hook at the same end, a longitudinally-extending screw-bar working between said sides, and a follower journaled on the end of said bar, and having recesses in its sides, that receive the said guide-edges, substantially as and for the purpose set forth.



291,627. MINER'S COMBINATION-TOOL. JOHN RYAN, Salt Lake City, Utah. Filed June 22, 1883. (No model.)

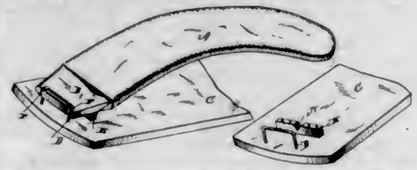
Claim.—1. In a miner's combination-tool, the bar A, forming loop *a* and point *a'*, and having socket *b* formed with or secured thereto, the pivoted bar C, having hook *d*, and ground to form a knife or cutter, *d'*, and the knife or cutter *c'*, substantially as herein described.

2. In a miner's combination-tool, the bar A, forming loop *a* and point *a'*, and having socket *b* formed with or secured thereto, the pivoted bar C, having hook *d* and notch or groove *c'*, and having its edge ground down to form a knife or cutter, *d'*, and the bearing *c*, having a notch or groove, *e*, and a cutting-edge or knife, *c'*, substantially as herein described.

291,628. ROOFING-FELT AND MECHANISM FOR MAKING THE SAME. AUGUSTINE SACKETT, New York, N. Y. Filed May 11, 1883. (No model.)

Claim.—1. A roofing-felt or other fabric composed of two layers of felt or paper previously saturated with coal-tar, united by a layer of pitch or other suitable cement, which is confined to the interior of the fabric in such a manner as to leave the edges dry and uncemented, as set forth.

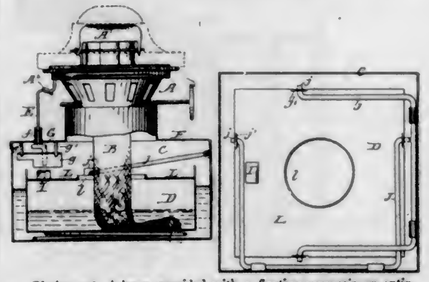
2. The method herein described of coating roofing felt or paper, the same consisting in bringing a traveling web or felt of fabric in contact with a partially-submerged roller or drum, which is somewhat shorter than the width of the felt, whereby a layer of pitch or cement is applied to the web on all portions of it, except in a narrow marginal line or space at each edge.



3. The method herein described of coating roofing felt or paper with pitch or cement, the same consisting in bringing a traveling web of felt or paper in contact with a rapidly-revolving and partially-submerged roller or drum, said drum being driven at a greater velocity than that at which the felt or paper is drawn through the machine, as set forth.

4. The method herein described of manufacturing roofing felt or paper or other material of like character, the same consisting in applying a layer of pitch or cement to a layer or web of paper or felt on all portions, except at the edges thereof, and then joining thereto by means of the cement thus applied another layer or web of felt or paper, as set forth, to form a completed fabric.

5. In a machine for coating paper or felt, the short power-driven roller D, mounted so as to be partially within the tank B, in combination with the adjustable roller E, roller H, and traveling web of felt or paper *a*, whereby a coating or layer of pitch somewhat narrower than the width of the web is applied thereto, as set forth.



6. A machine for coating or saturating paper or felt for roofing and other purposes, consisting of the following elements in combination: a heating or melting tank, a roller for applying cement to a traveling web of felt or paper mounted within said tank, an adjustable roller for pressing the web against the cementing-roll, a roller or drum for uniting the coated with an uncoated layer or web of paper or felt, and a drum or roller for winding into rolls the completed fabric, as set forth.

291,629. REVERSIBLE SLEEVE-BOARD. NICHOLAS SCHOLL, Chillicothe, Ohio. Filed Mar. 31, 1883. (No model.)

Claim.—The combination, with an ironing-board, C, having loop or staple D and supporting-block E, of the herein-described sleeve-board A, having eccentrically-curved sides, and provided with a shank, B, having notches F F and grooves G G, as and for the purpose set forth.

291,630. SELF-EXTINGUISHING LAMP. WALTER SCOTT, Hoosic Falls, N. Y., and MOSES W. MANWARING, Bridgeport, Conn. Filed Apr. 25, 1883. (No model.)

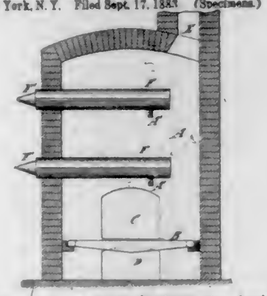
Claim.—1. A lamp provided with a floating reservoir, an extinguisher, and intermediate motion-conveying devices, whereby the consumption of oil from the reservoir causes it to rise and extinguish the flame of the lamp, substantially as herein set forth.

2. In a lamp, the combination of a floating reservoir, an extinguisher, and intermediate extinguisher-operating devices, substantially as specified.

3. In a lamp, the combination of a floating reservoir, an extinguisher, and an intermediate spring-locked or equivalent extinguisher-device-operating lever, substantially as specified.

4. The combination of a lamp-body and an internal floating reservoir with pivoted connecting-bails, to maintain it in proper relation to the extinguishing mechanism, substantially as specified.

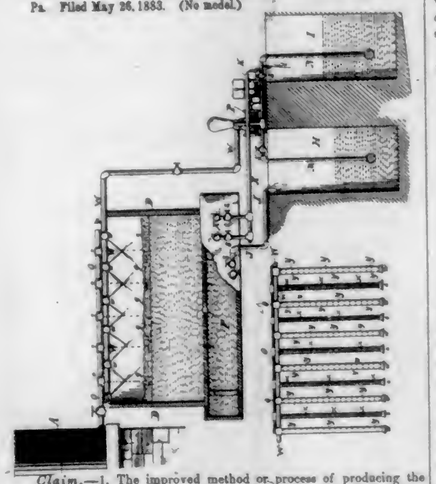
5. The combination, with a lamp, C, provided with extinguishing devices A' A^2, of a floating reservoir, D, and an intermediate push-bar and pivoted lever, G, substantially as specified.



6. The combination of the push-bar E, lever G, plate *g*, brackets *g'*, stop g^2, and spring H, substantially as shown and described.

7. The combination of the lamp-body C, reservoir D, and bails J J, pivotally secured to the body and to the reservoir in slots *j'* therein, substantially as shown and described.

8. The combination of the lamp-body C, reservoir D, having a centrally-perforated cover, L, and bails J J, substantially as shown and described.



9. The combination of the lamp-body C, reservoir D, having step I, lever G, push-bar E, and burner A, and operating-rod A^2, substantially as shown and described.

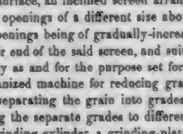
291,631. PROCESS OF OBTAINING ALUMINIUM. FREDERICK J. SEYMOUR, Wolcottville, Conn., assignor of one-half to William Henry Brown, New York, N. Y. Filed Sept. 17, 1883. (Specimens.)

Claim.—The improvement in the art of extracting aluminium from aluminous earths and ores, consisting in mixing aluminous ore or earth and an ore of zinc with carbonaceous material and a flux, and subjecting the mixture to heat in a close retort, whereby the zinc liberated is caused to produce or assist in the casting down of the aluminium in a metallic state, and an alloy of zinc and aluminium is obtained, substantially as herein described.

291,632. METHOD OF AND APPARATUS FOR REFRIGERATING PARAFFINE AND OTHER OILS. BENJAMIN F. SHAKESPEARE, Chester, Pa. Filed May 26, 1883. (No model.)

Claim.—1. The improved method or process of producing the congelation or cooling of paraffine and other oils, which consists in bringing together the oil and a refrigerating liquid, both in a spray or comminuted condition, substantially as and for the purpose set forth.

2. The improved method or process of rapidly reducing the temperature of oils, which consists in forcing against a small body or bodies of oil in motion a series of streamlets of a refrigerating fluid, whereby the said fluids are caused to be broken up into small particles, or into a spray, substantially as and for the purposes set forth.



3. An apparatus for congealing paraffine and other oils, consisting of the following elements, combined, constructed, and operating substantially as and for the purposes set forth, viz: An oil-supply pipe or pipes having a series of small orifices therein, a cold-water-supply pipe or pipes, also with a series of small orifices therein, the said oil and water pipes and their orifices being relatively located, as shown and described, so as to cause the streams of oil and water issuing from said pipes, respectively, to impinge against each other, together with means, substantially as described, for forcibly directing the one series of streams against the other.

4. In an apparatus for quickly congealing or reducing the temperature of paraffine and other oils, the combination of a system of oil-supply pipes provided with series of small orifices, and cold-water-supply pipes with similar orifices, the respective pipes and orifices therein being relatively located, as shown and described, a force-pump for forcing the water out of the orifices in the said water-pipes, and a receiving-tank beneath the system of oil and water pipes, all constructed, combined, and operating substantially as and for the purposes set forth.

5. In an apparatus for congealing or reducing the temperature of paraffine and other oils, the combination of a system of perforated oil-pipes and cold-water pipes, the perforations of the said pipes being combined and arranged with relation to each other as shown and described, whereby the opposite streams of water are caused to bisect each other, and also the intermediate streams of oil, together with means for forcibly ejecting the water from said water-pipes, the combination, arrangement, and operation being substantially as shown and described.

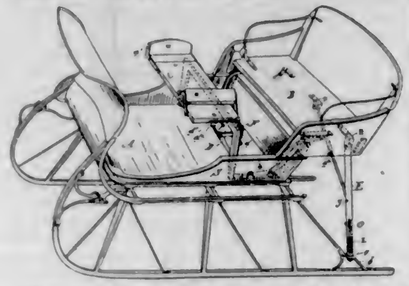
6. The oil-conduit, with lateral horizontal pipes *o*, the cold-water pipe with lateral horizontal branches *w*, alternating with pipes *o*, as shown, and provided with the orifices *x* and *y*, respectively, the receiver D, the well or wells, with pipes for conveying the water from the receiver to the wells, the pump P, with pipes communicating with said wells, all combined, constructed, arranged, and adapted to operate substantially as and for the purposes set forth.

291,633. CLOTHES-POLE. FRANK E. SHAW, South Attleborough, Mass. Filed Apr. 7, 1883. (No model.)

Claim.—The combination, with the bifurcated clothes-pole A, of the wire spring D, having one or two staples, *d*, inclined plane *e*, and shoulder *f*, formed of one piece of bent wire, and the lever A, pivoted on the staple *g*, constructed to operate the wire spring, as described.

291,634. GRAIN-BREAKER AND GRINDING-MILL. JOHN M. SPEER, Jr., Fort Branch, Ind. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination of the frame, the grinding-roller, guide-flanges upon the inner sides of the sides of the frame, a supporting-beam sliding between said flanges, clips upon the rear side of said beam, screws mounted in the rear part of the frame and journaled in said clips, and set-screws mounted in the sides of the frame, and adapted to bear against the ends of the supporting-beam, substantially as set forth.



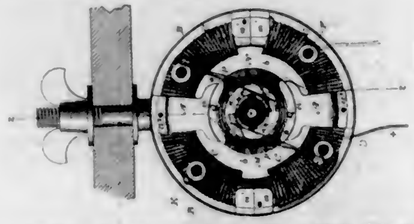
2. The combination, with the supporting-beam having an upwardly and rearwardly extending slotted plate, of the grinding-plate having screws on its under side that extend through the said slots, clamping-nuts, plates at the upper edge of the supporting-plate, lugs at the upper edge of the grinding-plate, and screws mounted in said lugs and journaled in said plates, whereby the grinding-plate may be adjusted, substantially as set forth.

3. The combination of the frame, the grinding-roller, the supporting-beam, mechanism for adjusting the ends of the latter independently with reference to the ends of the grinding-roller, an upwardly and rearwardly extending plate secured rigidly to the upper front edge of the supporting-beam, and the grinding-plate secured adjustably upon the said inclined plate, substantially as set forth.

4. In a machine for reducing grain, the combination of a frame, a grinding-cylinder, a grinding-plate, mechanism for adjusting the ends of the latter independently with reference to the grinding-cylinder, a hopper having several compartments arranged to discharge at various points of the grinding-surface, an inclined screen arranged above the said hopper, and having openings of a different size above each compartment of the latter, the openings being of gradually-increasing size from the upper toward the lower end of the said screen, and suitable operating mechanism, substantially as and for the purpose set forth.

5. An organized machine for reducing grain, the same comprising mechanism for separating the grain into grades of various sizes, mechanism for feeding the separate grades to different points of the reducing mechanism, a grinding-cylinder, a grinding-plate, mechanism for adjusting the ends of the latter independently with reference to the grinding-cylinder, an inclined delivery-plane, and vertical partitions upon the latter, whereby separate compartments are formed to receive the chop from various points of the reducing mechanism, substantially as and for the purpose set forth.

291,635. SHIFTING SEAT FOR SLEIGHS. WM. H. STEINBRECHER, Detroit, Mich. Filed Sept. 3, 1883. (No model.)



Claim.—1. In a sleigh-seat, the seat C, having hinged L-shaped end portions, said seat being secured to the frame F by hinges *d d*, said hinges having L-shaped extensions *d'*, with lugs d^3 and pintles *e'*, connecting bars P, reciprocating braces D, said braces pivoted to the frame F, the whole when arranged and combined substantially as specified.

2. The combination of the seat B, having jump-irons A pivoted thereto, the hollow braces E, pivoted to the lugs *n*, said braces containing pins O, coil-springs Z, internal bolts, and square openings *l*, said openings and internal bolts engaging with the offset and holes *e* of the runner-braces *b*, as and for the purposes set forth.

3. The combination of the seat B, having the rail R attached thereto, the hollow braces E, pivoted to the lugs *n n*, with jointed braces a^2, pivoted at Y, and to the lugs *r*, the lower portion of the braces a^2 adapted to fold within the longitudinal openings of the braces E, substantially as and for the purposes set forth.

4. In a sleigh, the seat B, having the jump-irons A attached thereto, the seat adapted to move backward over the sleigh-box, and supported by folding brace-irons attached thereto and to the runner-braces, as specified.

291,636. ELECTRIC MOTOR. LEVI W. STOCKWELL, Cleveland, Ohio. Filed Sept. 20, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the opposite adjacent field-magnet poles, the armature-magnets arranged transversely to each other and rotating between said poles, the field on each side of the armature being of uniform polarity, the armature-coils wound parallel with the poles of the field-magnet and with their axis of rotation and at right angles to their plane of rotation, the commutator-contacts with which the armature-coils are connected, and the brushes bearing on said contacts and connected with the source of electric energy.

2. The combination, substantially as set forth, of the opposite adjacent poles of the field-magnet, the armature-magnets arranged transversely to each other and rotating between the opposite effective faces of said poles, the polarity of the field on each side of the armatures being uniform, the commutator-contacts with which the armature-coils are connected, the brushes bearing on said contacts, and an electric circuit common to said brushes.

3. The combination, substantially as set forth, of the field-magnet having elongated radially-projecting poles, the armature-magnets which rotate centrally between the poles and are arranged transversely to each other and have their coils wound with the greatest length parallel with the elongated poles of the field-magnet, the commutator-contacts, and the brushes bearing thereon and arranged to send the current successively first through one of the armature-coils, then through both of the coils, and then through the other armature-coil, according to their positions relatively to the field-magnets, as described.

4. The combination, substantially as set forth, of the field-magnet, the armature-coils, a single commutator-ring, the commutator-contacts with which the coils are connected, and the commutator-brushes arranged in pairs, one pair on each side of the commutator-ring, to give an extended or double point of contact on each side of the commutator-ring to make connection with one contact before connection with the adjacent one is broken.

5. The combination, substantially as set forth, of the field-magnet, the armature-coils, the commutator-ring, and the commutator-brushes arranged to make contact first with the contact-plates with which one armature-coil only is connected, and then with both sets of contact-plates, for the purpose described.

6. The combination, substantially as set forth, of the field-magnet poles, the transversely-arranged armature-magnets, and electrical connections and contacts by which each armature-magnet is cut out of the circuit during a portion of a revolution.

7. The combination, substantially as set forth, of the field-magnet, the armature, the commutator ring and brushes, the switch or controlling device, and the contact buttons and plates by which, when the switch is in one position, the current is shunted from the armature-coils, and when moved in one direction from the neutral line sends the current through the armature-coils in one direction, and when put over to the opposite side sends the current in the reverse direction.

8. The combination, substantially as set forth, of the field-magnet, the armature-coils, the commutator-ring, a switch-lever pivoted concentrically with the commutator-ring, the brushes carried by said lever, the contacts through which the battery is shunted from the armature-coils but still flows through the field-magnet coils, and the contacts by which the direction of the current through the armature-coils may be reversed by moving the switch-lever to change the direction of the motor.

9. The combination, substantially as set forth, of the field-magnet, the armature, the commutator-ring, the switch-lever, the brushes carried thereby, and electrical contacts through which by the movement of the lever the commutator-brushes are adjusted on the ring and the direction of the current through the armature-coil simultaneously reversed.

10. The combination, substantially as set forth, of the casing or magnet-supports, the field-magnet, and the supporting-extensions of the magnets projecting from the neutral part.

11. The combination, substantially as set forth, of the field-magnet, the supporting-projections extending from the neutral part, the supporting-casing, and supporting-bars, of non-magnetic material, extending from the poles of the magnets to the casing.

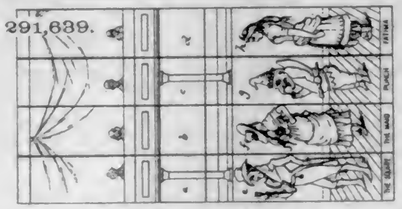
12. The combination, substantially as set forth, of an electric motor and a bolt or support, of non-magnetic material, connected with the pole or active part of the field-magnet for attaching the motor to its support.

291,637. GLASS BOTTLE-STOPPER. JOHN STORY, Castle Shannon, Pa. Filed July 9, 1883. (No model.)

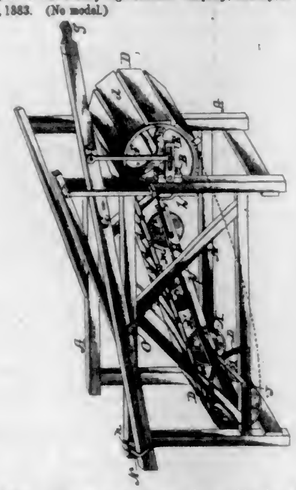
Claim.—1. A glass bottle-stopper provided with the flange which extends out over the neck of the bottle, and which has a cavity or well formed in its top, and provided with conduits *b*, which communicate with the surface of the plug portion of the stopper, substantially as shown.

2. The combination of a bottle having the inner edge of the upper end of the neck cut away, so as to form a cavity, *i*, in combination with the stopper having a flange which projects outward over the neck of the bottle, and which stopper is provided with a cavity, *a*, and the conduits *b*, which communicate with the cavity *i*, which is formed by the cut-away edge of the bottle, substantially as specified.

291,638. BOTTLE AND STOPPER. JOHN STORY, Castle Shannon, Pa. Filed Mar. 5, 1883. (No model.)



Claim.—The combination of a bottle having the lip of its neck inclined and flared upwardly and outwardly, with the stopper provided with the grooved flange, the shape of the groove being made to correspond to the shape of the lip and the different parts of the neck, and the stopper, being ground so as to form a tight joint, substantially as shown and described.



291,639. SLICED PICTURE. WALTER STRANDERS, New York, assignor to EDWARD I. HORSMAN, Brooklyn, N. Y. Filed Oct. 27, 1883. (No model.)

Claim.—A sliced picture composed of series of sections which are decorated on both sides, there being for each section a complementing section, which is adapted to take its place in either of the scenes which can be represented by the sections, all the sections being adapted to produce one picture, in which changes can be effected by interchanging the complementing sections, substantially as specified.

291,639.

291,640. ANIMAL-POWER. LEVI C. STRONG, Greenfield, Mass., assignor to the Albany Agricultural Company, Albany, N. Y. Filed Nov. 24, 1883. (No model.)

Claim.—1. In an animal-power, the combination of a main frame supporting a driving-pulley, a secondary frame supporting a following pulley, an endless tread, and a cam or cams journaled in the main frame and bearing directly upon or against said secondary frame, substantially as specified.

2. The vibrating bar of an animal-power, connected by suitable means to the crank of a driving-pulley, in combination with two links pivotally connected to said bar and to the main frame, one of said links being pivoted to said frame above and the other below said bar, substantially as specified.

3. The combination of a series of lags with a series of links alternately provided with webs having spurs and hinge-lugs, and with webs having similar hinge-lugs and a screw bole or recess, substantially as specified.

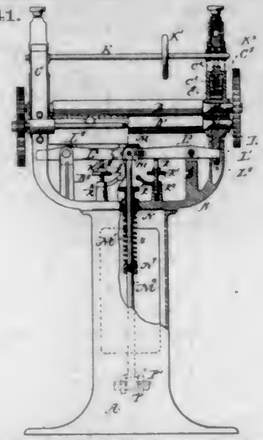
4. The combination of the bar G and the links N O, the frame A, pitman F, and a driving-pulley having a crank E, substantially as specified.

5. The combination of the endless tread D, pulley C, crank E, pitman F, bar G, supported by the hanging link N, and the link O, substantially as specified.

6. The combination of the main frame A, the secondary frame H, pivoted to the main frame, and carrying the following pulley C', with the shaft J, cam I, arm K, and sector L, substantially as specified.

7. A lag-link comprising the spurred or recessed web *m*, the stops m^2, jaws m^3, and hinge-lugs *m'*, substantially as specified.

8. The combination of a lag-link, as M, having spurs or points, as m^4, with a lag-link, as M', provided with a bored or recessed web, substantially as specified.



9. The combination of the lags *d d* with the links M M', having hinge-lugs *m'*, stops m^2, jaws m^3, and pintles m^4, substantially as specified.

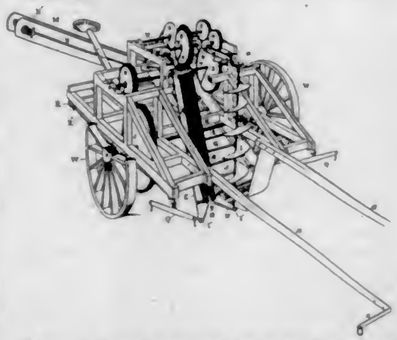
291,641. LEATHER-SPLITTING MACHINE. FREDERICK S. STRONG, East Bridgewater, Mass., assignor to the Carver Cotton Gin Company, same place. Filed Nov. 15, 1883. (No model.)

Claim.—1. In a leather-splitting machine, the combination of the upper roll, D, the boxes C' C', springs C^3 C^3, cams K^3 K^3, and shaft K, with the adjustable boxes H H and screws H' H', all operating substantially as described, and for the purpose set forth.

2. In a leather-splitting machine, the combination of the lower roll,

291,641.

D', boxes L L, having projections L' L', levers L^2 L^2, and adjusting-screws R R, with the link M, rods M' M^2, spring S, and foot-lever P, all operating together substantially as described, and for the purpose set forth.



3. The combination of the sunk head knife-holding bolt T, having a fixed collar, *t*, with the spring T', arranged to operate substantially as described, and for the purpose set forth.

291,642. NUT-LOCK. JOHN B. SUTCH and WILLIAM C. MCELHENY, Pittsburg, Pa. Filed Sept. 22, 1883. (No model.)

Claim.—A device for locking nuts on bolts, consisting of a bar formed into an open ring or washer, of which one end overlaps the other, the ring to be placed upon the bolt between the nut and the underlying surface, and having at its under side two or more pointed projections that are forced into the underlying surface during and by the process of screwing down the nut, the overlapping end of the ring, when bent upward, locking the nut, substantially as shown and described.

291,643. CORN HARVESTER AND HUSKER. JAMES W. TERMAN, Peoria, Ill., assignor to Josiah Cratty, same place. Filed Dec. 1, 1882. (No model.)

Claim.—1. In corn harvester and husking machines, the eccentric rollers A and B, substantially as and for the purpose set forth.

2. In a corn-husker, the polygonal, eccentric, and unequal rollers A and B, substantially as and for the purpose specified.

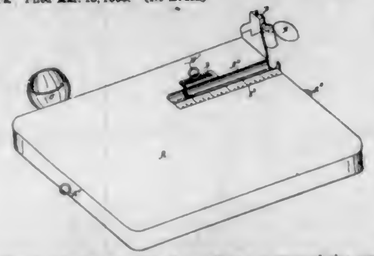
3. In a corn harvester and husker, two unequal rollers having the smaller set back farther than the other, as and for the purpose described.

4. In a corn harvester and husker, two polygonal, eccentric, and unequal rollers, A and B, having the smaller of the two set back partially in the rear of the larger, substantially as and for the purpose specified.

5. Two rollers, A and B, and means to rotate them, in combination with the parallel supporting-beams E E', having bearings thereon for said

rollers, the adjusting-plate P, and suitable frame-work, substantially as and for the purpose set forth.

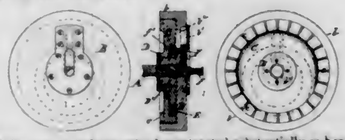
6. The rollers A and B, inclined laterally and rearwardly, in combination with the parallel beams E E', having bearings thereon for said rollers, the adjusting-plate P, rotating mechanism for said rollers, and suitable frame-work, substantially as described.



7. The rollers A and B, means to rotate them, supporting-beams E E', and ingatherers D D', in combination with the rods J J, having spiral webs I I, and rotating mechanism for the same, as set forth.

8. The rollers A and B, having tapering ends and spiral flanges F, the beams E E', and ingatherers D D', in combination with the rods J J, having lifters I I, substantially as set forth.

9. The shaft V, taking power from the drive-wheel shaft S, bevel-gears 5 and 6, and the parallel beams E E', having brace-rods L, in combination with the two inclined, eccentric, and unequal rollers A and B.



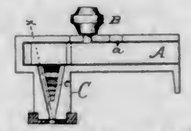
10. The shaft V, taking power from the drive-wheel shaft S, the bevel-gears 5 and 6, the rollers A and B, and beams E E', in combination with the adjusting-plate P, ingatherers D D', the lifters I I, bevel-gears 10, the shaft 14, and gears 9, as described.

291,644. CIGAR-MAKER'S BOARD. ALBERT THALHEIMER, Reading, Pa. Filed Mar. 13, 1883. (No model.)

Claim.—As a new article of manufacture, a stamped zinc metal facing for cigar-makers' boards, provided with the usual depressions and gage for the cigar, and, in combination therewith, a cigar-end cutter conveniently arranged thereon, said facing being filled out flush with the depth of the flanges with any suitable composition, whereby a surface preservative of the hand-knife edge is presented, and a light or heavy board produced, to adapt it to transportation or use, substantially as and for the purpose set forth.

291,645. CRANK ADJUSTMENT FOR BALANCE-WHEELS. JAMES B. THURSTON, Concord, N. H., assignor to John A. White, same place. Filed June 23, 1883. (No model.)

Claim.—1. A balance-wheel constructed substantially as hereinbefore described, provided with a hub projecting from its back side, a groove cut in its front side, of suitable dimensions to receive the sliding adjustable crank, and a cap-piece in which a slot is formed, through which the crank-pin passes, secured by screws to the outside of said balance-wheel, thereby holding said crank within said groove and partially concealing it from view, substantially as and for the purpose described.



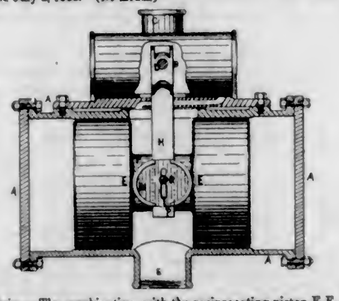
2. The independent revolving disk so fitted upon the hub of the balance-wheel as to be readily turned on said hub or held still while said balance-wheel is revolving, that side of the said disk which comes in contact with the balance-wheel being provided with an annular groove, the circle of said groove being eccentric with the circle of said disk, said disk being prevented from working off from the hub of balance-wheel by means of a collar secured to the hub of said wheel, substantially as and for the purpose hereinbefore described and set forth.

3. The combination of an eccentric ring revolving in a groove provided for its reception in one side of the independent revolving disk, and the sliding adjustable crank operating in groove upon the outside of the balance-wheel, connected together by means of a round pin, one end of which is permanently fixed in the side of said eccentric ring, the other end of which is turned so as to be a moderately loose fit for a hole in the outer end of said crank, substantially as described, and for the purpose set forth.

4. The combination of an eccentric ring revolving in a groove provided for its reception in one side of the independent revolving disk, and the sliding adjustable crank operating in groove upon the outside of the balance-wheel, connected together by means of a round pin, one end of which may be permanently fixed into and project from the back side of the outer end of said crank, the other end of which may be turned so as to be a moderately loose fit for a hole formed through the side of the eccentric ring, substantially as described, and for the purpose set forth.

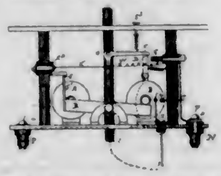
5. The sliding and adjustable crank depressed and partially concealed in the front side of the balance-wheel by means of a groove and a suitable cap-piece, the independent circular disk fitted to the hub of said balance-wheel, and secured thereon by means of a collar, and the eccentric ring fitted to and revolving in a groove formed upon the inside of said disk, and connected with the adjustable crank by means of a pin, so combined and arranged as to render the crank capable of being set at any given stroke from naught to six inch, more or less, and operating substantially as described.

291,646. LOCK. ANDREW B. TODD, Cheshire, Conn. Filed July 16, 1883. (Model.)



Claim.—1. A lock provided with a keyway for the insertion of a flat key, by the side of which keyway is a series of wards, in combination with a flat key notched at its edges, and adapted to throw the bolt or dog by a sidewise lever action, substantially as described, and for the purpose specified.

2. The combination of a longitudinally-moving bolt, the lock-case provided with a double keyway in V form, meeting each other at or near the outside, and the series of wards between said two keyways, substantially as described, and for the purpose specified.

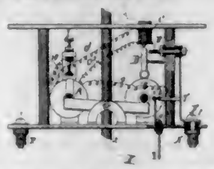


3. The combination of a longitudinally-moving lock-bolt having a drop-motion for locking it in its projected position, the double keyway having a single opening at the outer end, and the key having the beveled corner for raising the bolt preparatory to throwing it, substantially as described, and for the purpose specified.

291,647. WATER-METER. CHARLES W. VAN ALSTINE, Chelsea, Mass. Filed July 2, 1883. (No model.)

Claim.—The combination, with the reciprocating piston E F, of the actuating-arm H, having adjustable disk N, substantially as described, and for the purposes set forth.

291,648. ELECTRIC-CIRCUIT CLOSER. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Apr. 19, 1883. (No model.)

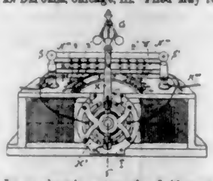


Claim.—1. In an electric-arc lamp, a circuit-closer formed of an expansible conductor normally out of circuit, in combination with the pivoted bell-crank C and detent D, each provided with tension-springs operating to liberate said detent upon the expansion or fusion of the expansible conductor, and thereby to short-circuit the lamp, as set forth.

2. In an electric-arc lamp, an expansible conductor normally keeping open a circuit-closer, D E, said conductor being out of circuit whenever the lamp is working normally, a shunt-magnet, and electrical connections between its armature and the circuit-closing device, whereby

the increased attraction of the shunt-magnet caused by abnormal conditions of the arc will operate to complete the main circuit through the said circuit-closer, substantially as described.

291,649. ELECTRIC SAFETY CUT-OUT. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Apr. 21, 1883. (No model.)



Claim.—1. In an electric-arc lamp, an electro-magnet located in a derivation between the carbons, and provided with a vibrating circuit-breaker operating to produce a pulsating current in the coils of said electro-magnet, in combination with a secondary helix wound thereon, but not electrically connected to the same, and connections, substantially such as described, whereby the induced current operates a safety cut-out for electric-arc lamps, as described and specified.

2. In an electric-arc lamp, a coil in which an induced current is produced by the pulsations or interruptions in an electro-magnet, the coils of which are in a derivation between the two carbons in the lamp and which is provided with vibrating circuit-breaking devices, said induced current being adapted to operate a circuit-closer in said lamp, as described and specified.

3. In an electric-arc lamp, an electro-magnet wound with two helices, one of said helices being in derived circuit, and provided with a rheotome adapted to produce therein a pulsating derived current, the other helix being well insulated from the former, and adapted to emit a secondary current under the influence of the pulsating derived current, and by means of devices, substantially such as described, to work a circuit-closer, as described, and for the purposes set forth.

4. In an electric-arc lamp, the contact-piece E, well insulated from the metallic parts of the lamp, and properly connected to the negative binding-post thereof, in combination with the detent D, held in place by catch C^3, the expanding wire C', and insulated eye G, all operated by the secondary current produced in a coil wound on the shunt electro-magnet of the lamp, as above described, and for the purpose set forth.

291,650. CURRENT-REGULATOR FOR ELECTRIC MOTORS. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed May 10, 1883. (No model.)

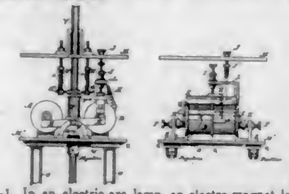
Claim.—1. In an electric motor, the field-magnets composed of a number of independent electro-magnets not magnetically connected together at their poles or active ends, while their opposite ends are all connected magnetically to one common cast-iron plate, a similar system of electro-magnets being placed at each side of the revolving armature, the active ends of the electro-magnets facing each other, their opposite end plates secured to a cast-iron base and top, substantially as described.

2. In an electric motor, the combination, with independent and separate field-circuits, of a centrifugal governor adapted to bring a larger or smaller number of said field-circuits in operation, so as to regulate the speed and power of the motor, as described and set forth.

3. In an electric motor, a number of independent field electro-magnets, in combination with an armature, each field electro-magnet coil of the motor having the same resistance as the armature-coils, substantially as described.

4. An electric motor having a number of electro-magnet cores provided with pole-pieces facing each other on opposite sides of an armature-core, said armature and field-magnets having equally resistant circuits around each of their cores, in combination with a source of electricity in which a constant potential is maintained to furnish current for said motor or motors, as described and set forth.

5. In an electric motor, and in combination with its revolving armature, a centrifugal governor receiving motion from said armature, and proper means connected to said governor to allow a larger or smaller number of electro-magnets to act upon the armature of the motor to regulate the power and speed of the same, substantially as described.



6. In an electric motor, a centrifugal governor driven by said motor, in combination with the bars N''' N''' and contacts n' n' n', &c., actuated by the centrifugal power of said governor, in order to regulate the power and speed of the motor, by allowing a larger or smaller amount of current to act upon the revolving armature of the motor, substantially as described.

7. In an electric motor, a face-plate of wood or other suitable non-conducting substance or material provided with two semicircular plates of conducting material connected with the poles P and N of a source of electricity, in combination with an oscillating hand-lever carrying brush-holders and brushes C' and C'', bearing upon the opposite side of a commutator so arranged and constructed that by the motion or oscillation of the lever from right to left, or vice versa, the brushes bearing upon said commutator can be made to be in contact either with the positive or negative poles of the source of electricity, and so to be able to reverse the motion of said motor or to stop the same when the brushes are placed between the opposite semicircular plates, as described, and for the purpose set forth.

8. In an electric motor, and in combination with the commutator of the same, two brushes placed diametrically opposite one another and in a straight line through the axis of rotation placed in a suitable holder coming very near the periphery of the revolving commutator, so as to be able to reverse the motion of the armature by changing said brushes from right to left without altering their inclination with respect to the axis of rotation of the commutator, substantially as described.

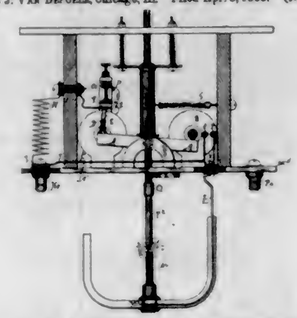
9. In an electric motor, the brush-holders C' and C'', placed diametrically opposite one another, and suitably secured to and insulated from the hand-lever H, and provided with contacts in the back of said hand-lever, so as to be able to place the opposite coils of the armature in circuit with the source of electricity necessary to run the motor by oscillating the handle H, so as to come in contact with the plates K and L.

291,651. ELECTRIC LAMP. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Apr. 3, 1883. (Model.)

Claim.—1. In an electric-arc lamp, an electro-magnet located in the main circuit, in combination with an electro-magnet having two independent coils wound in the same direction upon its core, both coils being in a derivation between the carbons, one of said coils having its circuit closed continuously, and the other having its current interrupted by a proper circuit-breaker or vibrator, both coils coacting upon said core to produce vibratory movements in the armature and feeding devices of the lamp, substantially as set forth.

2. In an electric-arc lamp, an electro-magnet in the main circuit and an electro-magnet having two independent coils wound in the same direction upon its core, both of said coils being located in a shunt around the arc, the circuit through one of said coils being closed continuously, and that through the other being continuously broken by a suitable circuit-breaker included therein, said electro-magnets acting upon a compound armature having a central shaft provided with pivots, upon which said armature will oscillate, actuating the carbon-feeding devices under the influence of the above-named electro-magnets, substantially as set forth.

3. In an electric-arc lamp, an electro-magnet located in a shunt around the arc, and having two independent coils upon its core, the circuit through one of said coils being closed continuously, and that through the other being continuously made and broken by a suitable circuit-breaker included therein, both said coils being wound in the same direction and coacting upon said core, substantially as set forth.



4. In an electric-arc lamp, a compound armature consisting of a central shaft of iron, D, having bars of soft iron, E, centrally attached to its extremities, and a seat provided upon its middle portion, upon which a sleeve rests, said sleeve supporting the carbon holding and feeding mechanism of the lamp, and operated by the oscillations of said shaft under the influence of the steady main electro-magnet A and pulsating shunt-magnet B upon the said bars E, the shaft D being provided with a circular opening in its center for the carbon rod, substantially as set forth.

5. In an electric-arc lamp, the compound armature E, in combination with the sleeve F, slipped loosely over the carbon rod V, the sleeve F, provided with a plate, F^3, and projecting studs supporting the lifter G G', and proper means for raising and lowering the sleeve F, so as to make the lifter either hold or release the carbon rods, substantially as described.

6. In an electric-arc lamp, the clutch or lifter G G', made of two parts, and united in its center by a flexible or elastic band of metal, adapted to hold the parts together, and provided with steel jaws *a b*, in combination with the trip-screws H, so disposed, in conjunction with the clutch, that when said clutch is raised from said screws the jaws *a b* will close upon the rod V, holding and raising the same during the upward movement of the sleeve F, when F moves downward the reverse taking place, the lifter striking the screws H, opening the clutch, and allowing the rod V to move downward, as above specified, and for the purposes described.

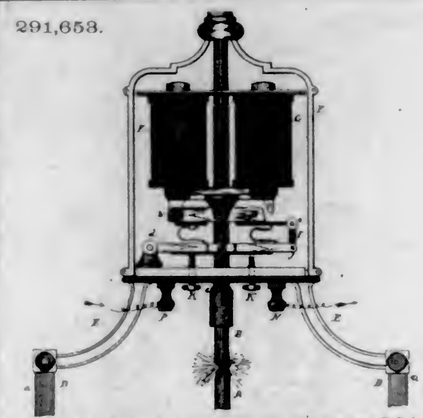
7. In an electric-arc lamp which is provided with a serrated carbon-carrying rod and devices for automatically feeding the same by means of the oscillations of a centrally-pivoted armature, actuated by the cores of a steady main and pulsating shunt magnet, a train of gear-wheels, and an escapement, substantially as and for the purposes set forth.

291,652. SAFETY CUT-OUT FOR SERIES OF ELECTRIC LAMPS. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Apr. 3, 1883. (No model.)

Claim.—1. An electric-arc lamp having three complete circuits—one through the carbons and electro-magnetic devices for separating the same, another through an auxiliary conductor, and a third through a shunt-magnet located in a derivation between the poles of the lamp—and means for cutting out of circuit the auxiliary conductor when the lamp at starting has its carbons in contact, as described, and for the purpose set forth.

2. In an electric-arc lamp, an auxiliary or by-pass circuit closed upon the main line when no current is passing through the carbons, suitable carbon-feeding devices, and connections whereby the auxiliary circuit is opened by the passage of the current through said carbons and their separating electro-magnets, as above described.

3. In an electric-arc lamp, a by-pass or auxiliary circuit of capacity equal to that of the main line, and always closed upon said main line when the lamp is started, and means, substantially as described, whereby the same is adapted to remain closed in case the carbons fail to feed, substantially as set forth.

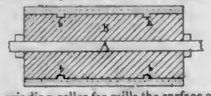


4. An electric-arc lamp having three channels for the current to pass, one being through the carbons and their electro-magnetic devices, another through a shunt of high resistance around the arc, and the other a by-pass or auxiliary circuit having a resistance somewhat higher than that of the carbons and working-circuit of said lamp when said carbons are in contact, and an arm or contact-point connected to the armature of said feeding devices, and adapted to complete the auxiliary circuit when no current is passing through the lamp, so that on completing the circuit through all the channels, if the carbons are in contact, the current will in preference pass through the electro-magnetic feeding devices of the lamp, and by moving the armature cut out the by-pass, and then separate the carbons to produce the arc, as and for the purpose set forth.

5. In an electric-arc lamp, and in combination with the armature operating the mechanism thereof, a contact-piece, D, rigidly attached to said armature, and adapted to follow the motion of the same, a spring, F, and an auxiliary resistance-coil, H, so arranged that when the lamp is not receiving current said contact-piece D will abut against the spring F and complete a short circuit between the positive and negative poles of the lamp through the conductor H, said conductor being of a resistance somewhat higher than the feeding mechanism and electro-magnets of the lamp when the latter circuits are completed through the carbons, whereby sufficient current is directed to said electro-magnets to operate the armature A A, thereby breaking contact between D and F before the carbons are separated, as set forth.

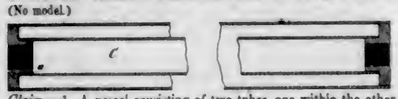
291,653. ELECTRIC-ARC LAMP. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Oct. 19, 1883. (No model.)

Claim.—1. In an electric-arc lamp, the electro-magnets F G, located in the main circuit, and provided with an armature, H, hinged at one end to one of the poles of said electro-magnet, the free end thereof coming in close proximity to the other pole, when it is free to move in a radius prescribed by the center of its articulation to the opposite pole of the said electro-magnet, in combination with the clamping mechanism carried and operated by said hinged armature, substantially as described.



291,653.

2. In an electric-arc lamp, the combination of the magnets F G, located in the main circuit, the armature H, lifter J, and suitable carbon-holder, with the coil L, of relatively-high resistance, located in a shunt around said main magnets, the vibrating armatures R R', and adjusting devices and connections, substantially as described, between said main and shunt circuits, as set forth.



3. In an electric-arc lamp, the flexible lifter J, in combination with adjusting-screws K K', adapted to be set at different heights, and thereby to forcibly open the descending clutch, substantially as set forth.

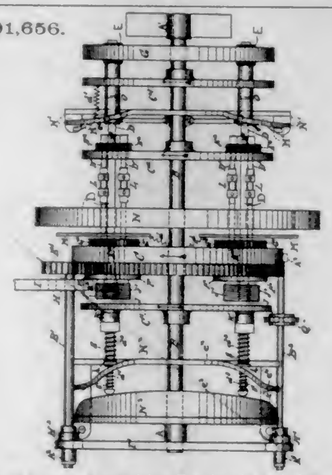
291,654. ROLLER FOR GRINDING-MILLS. GEORGE VAN NAME, St. Louis, Mo. Filed Apr. 26, 1883. (No model.)

Claim.—A grinding-roller for mills the surface of which is composed of alternate series of thin steel blades and softer material, secured in the cylinder by dovetailed grooves in the surface of the cylinder, and keyed together by key-blades lengthwise of the roller, substantially as and for the purpose described.

291,655. VESSEL OR RESERVOIR FOR LIQUIDS OR OTHER MATERIALS. MAURICE J. WALSH, New York, N. Y. Filed Mar. 26, 1883. (No model.)

Claim.—1. A vessel consisting of two tubes, one within the other, and two heads at the ends, common to both tubes, and to which the tubes are welded, so as to form two compartments, which are separated from each other and from the surrounding atmosphere by hermetically-sealed joints, substantially as specified.

2. A vessel consisting of heads of metal, a tube welded upon the exterior of the heads, and a tube welded upon flanges extending from the heads, substantially as specified.



291,656. MACHINE FOR THREADING SHEET-METAL SCREWS. WILLIAM WERTS, Camden, N. J. Filed May 31, 1883. (No model.)

Brief.—The cap-blanks are placed in buckets on an endless carrier, are thence delivered to hoppers on a revolving disk, and are ejected from the hoppers onto the central threader—the two outside threaders having moved laterally away from the central threader—by a double plunger. The outer plunger holds, by spring-fingers, the blank by its periphery, and the inner plunger bears on its top. As soon as the blank is on the central threader, the outer plunger retracts and the outside threaders move toward the central threader and operate on the blank. When the operation is complete, the outside threaders again move away from the central threader and a spring-stripper removes the blank.

Claim.—1. The combination of the central revolving shaft, B, face-plate C, and disks C', C^2, and C^3, C' carrying the hoppers R', shafts D D D, and pairs of shafts D', having chocks J J' J', the said shaft B being revolved by means of the driving-shaft B', having a pinion, E', geared into teeth of the face-plate C, or by other suitable mechanism, substantially as described.

2. In a screw-threading machine having a central revolving shaft, B, provided with a face-plate, C, disks C' C^2 C^3, and shafts D, having

291,656.

chucks J at one end and pinions E at the other end, the combination therewith of stationary rim G, having internal gear-teeth for revolving the said shafts D, substantially in the manner and for the purpose set forth.

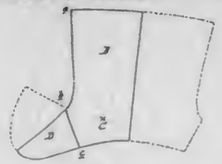
3. The combination of series of shafts D and D′, having threaded chucks J and J′ J′, respectively, the shafts being geared together by means of pinions E^3 and E^3, respectively, whereby the chucks J′ J′ are caused to revolve in opposite direction to the chuck J, for threading sheet-metal blanks, substantially as described.

4. In a screw-threading machine having pairs of shafts D′, provided with chucks J′ J′, and central shafts, D, having chucks J, the combination, with said shafts D′, of universal joints I, to admit of the shafts D′ being moved from and toward the shafts D, to produce a like movement of the chucks J′ toward and from the chucks J, substantially in the manner and for the purpose set forth.

5. The combination of eccentrics F F, having wheels G′ G′, with the shafts D′ D′, and with the shaft D, having a pinion, E^4, the wheels G′ G′ being pivoted to the face-plate C for moving the chucks J′ J′ toward and from the chuck J, substantially as described.

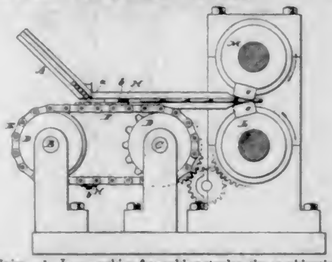
6. The hoppers R′, having fingers *g*, in combination with the revolving disk C, and endless chain P, having buckets R, with slots *f* in their bottoms, substantially in the manner and for the purpose set forth.

7. The combination of the stationary cam c^4 and spring d^3, for giving a reciprocating movement to the plunger S, substantially in the manner and for the purpose set forth.



8. The plunger S′, in combination with the plunger S, for holding the blanks K on the chuck J as the plunger S is withdrawn, substantially as described.

291,657. HOBBY-HORSE. JOHN R. WHARRY, Moundsville, W. Va. Filed Nov. 19, 1883. (No model.)

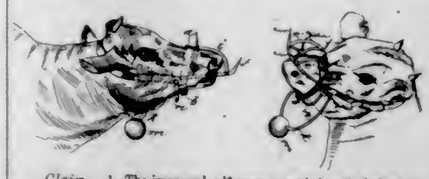


Claim.—The combination of the hobby-horse A, the ferrule B, applied to its lower end, the arms C, projecting therefrom, and the rollers D, substantially as shown and described.

291,658. BOOT. MELVILLE J. WOOD and WILLIAM H. BOND, Athens, Mich. Filed Aug. 1, 1883. (No model.)

Claim.—As an improved article of manufacture, a boot-upper made from a single piece of leather having a seam running straight down the center of the front of the leg to a point in the center of the instep, and thence substantially straight down one side of the foot to the sole, as set forth.

291,659. MACHINE FOR MAKING STAPLES. JOHN ADT, New Haven, Conn. Filed Sept. 10, 1883. (No model.)



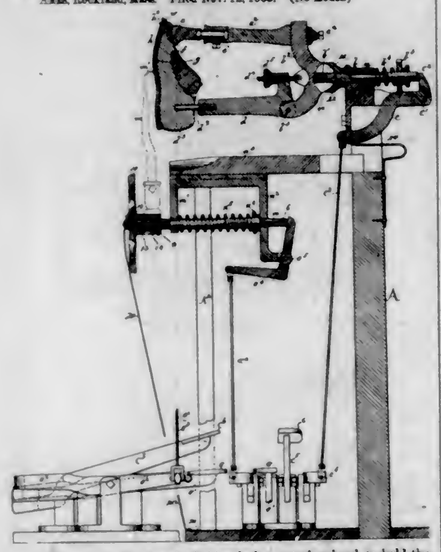
Claim.—1. In a machine for making staples, the combination of the endless band or bands E E, carrying the bending-stud *b*, stationary benders *d* at each side the path of the bending-stud, and mechanism, substantially such as described, to point the blank as it is delivered from between the benders, substantially as described.

2. In a machine for making staples, the combination of the endless band or bands E E, carrying the bending-stud *b*, stationary benders *d* at each side the path of the bending-stud, and between which the stud will bend the blank and force it forward, a pair of rolls carrying dies *e*, and arranged to receive each blank as it is presented by the bender, the dies constructed with cavities operating to point the blank as it passes between the dies, substantially as described.

3. In a machine for making staples, the combination of the endless band or bands E E, carrying the bending-stud *b*, stationary benders *d* at each side the path of the bending-stud, mechanism, substantially such as described, to point the blank as it is delivered from between the benders, and the chute A to receive the blanks and deliver them successively in advance of the bending-stud, substantially as described.

4. In a machine for making staples, the combination of the endless band or bands E E, carrying the bending-stud *b*, stationary benders *d* at each side the path of the bending-stud, and between which the stud will bend the blank and force it forward, a pair of rolls carrying dies *e* and arranged to receive each blank as it is presented by the bender, the dies constructed with cavities operating to point the blank as it passes between the dies, and the chute A, to receive the blanks and deliver them successively in advance of the bending-stud, substantially as described.

291,660. CALF-WEANER. MAX JOHN AHLGRIM, Rose Lawn, Ind. Filed Aug. 14, 1883. (Model.)



Claim.—1. The improved calf-weaner consisting of a half-muzzle, made of wire or other suitable material, armed with barbs and arranged over the nose on pivots *d* of a halter, located at the cheeks, and provided with a balance-weight, holding said muzzle above the nose, except when raised to suck, substantially as described.

2. The combination, in a calf-weaner, of the yoke *e*, nose-bow *g*, stays *i*, balance-yoke *k*, and weight *m*, with a halter having pivot-studs *d*, said yoke *e* and nose-bow *g* being provided with barbs, substantially as described.

3. The combination, in a calf-weaner, of the yoke *e*, nose-bow *g*, stays *i*, balance-yoke *k*, weight *m*, and the throat-yoke *n*, forming pivot-studs *d* and fastening to halter, said yoke *e* and bow *g* being provided with barbs, substantially as described.

4. In a calf-weaner, the combination, with the yokes *e k*, having eyes *l*, of the throat-yoke *n*, having studs *d* passing through said eyes from the inside, as shown and described.

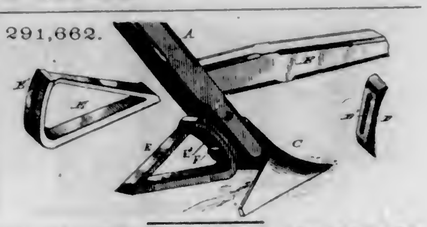
291,661. STITCHING-JACK FOR BOOTS OR SHOES. JOSHUA F. AMES, Rockland, Mass. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a hand stitching-jack, a rotating head to hold the upper and sole, combined with the sole-presser to enter the channel in the outer sole, substantially as described.

2. In a hand stitching-jack, a rotating and vibrating head and sole-presser to bear against the outer sole, combined with means, substantially as described, to force the head and sole-presser toward each other to clamp the sole and welt closely together at the point where the holes are opened for the reception of the thread, substantially as described.

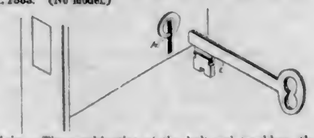
3. In a hand stitching-jack, the rotating head to hold the last, with the upper and sole thereon, combined with the sole-presser, and means, substantially as described, to support the same, whereby its position may be changed with relation to the axis of rotation of the head to enable the said presser to bear upon the sole near its edge as the last and shoe are rotated, as set forth.

4. In a hand stitching-jack, the rotating and vibrating jack, and the loosely-pivoted sole-presser, combined with the slide-rod, a spring to move it in one direction, and means, substantially as described, to move it in the opposite direction to enable the said presser to be held in the channel of the outer sole or to be removed therefrom, substantially as described.



5. In a hand stitching-jack, the spindle *b*, its spring, the head pivoted upon the said spindle and adapted to hold the last with upper and soles thereon, and means, substantially as described, to move the said spindle longitudinally, combined with the slide-rod, the movable sole-presser supported thereon, and with means to move the said slide-rod, as and for the purposes set forth.

291,662. PLOW GAGE AND GUIDE. WILLIAM HENRY AMMONS, Little Rock, S. C. Filed Dec. 4, 1883. (No model.)



Claim.—1. As an improvement in plow gages and guides, a gage and guide provided with a slotted convex bearing side, and a slotted wedge-block having a concave side adapted to serve as a seat for the convex side of the gage and guide, as set forth.

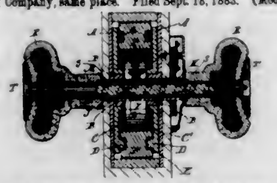
2. The combination of the gage E, having a convex side provided with a longitudinal slot, E′, with the wedge-block D, provided with a longitudinal slot, D′, and having one of its sides made concave to form a seat for the gage and guide, the whole adapted to be secured to the plow-standard by the same bolt which secures the plowshare, as set forth.

291,662.

291,663. LOCK. WILLIAM H. ANDREWS and HENRY H. SPARKS, New Haven, Conn., assignors to Mallory, Wheeler & Co., same place. Filed June 11, 1883. (No model.)

Claim.—The combination of the bolt and tumblers, the barrel D, arranged in bearings in the opposite plates of the lock, the said barrel constructed with a longitudinal slot, *e*, corresponding to the key-hole in the lock-plates, a projection, *h*, in the key-hole in the lock-plates at the bearings of the barrel, and the flat key, the bit constructed with a longitudinal groove, *i*, at its junction with the spindle, substantially as and for the purpose described.

291,664. VEHICLE-SPRING. GEO. L. ARTZ, Columbus, Ohio. Filed Sept. 17, 1883. (No model.)

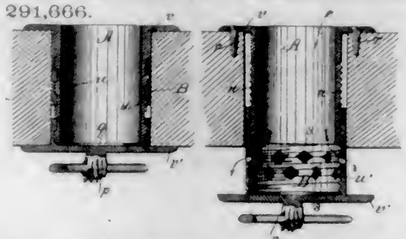


Claim.—1. The combination of the four separate and independent quarter-elliptic springs, A B, A′ B′, connected together in pairs, the upper spring of each pair having its foundation upon the inner end of the lower spring, with a bearing, C, to which each pair is secured, substantially as described, for the purpose specified.

2. The combination, with the body and side bars of a vehicle, of a spring composed of four separate and independent quarter-elliptic springs connected together in pairs A B, A′ B′, the upper spring of each pair having its foundation upon the inner end of the lower spring, the bearing-plate C, the clips I, and the bolts G, whereby each pair of superimposed springs is secured to allow for separate and independent adjustment of each spring of each pair, substantially as described.

3. As a new manufacture, a vehicle-spring composed of four separate and independent quarter-elliptic springs connected together in pairs, the upper spring of each pair having its foundation upon the inner end of the lower spring, a bearing-plate to which each pair of springs is separately secured in superimposed relation side by side, and suitable attachments, whereby said separate pairs of springs are connected to the body and to the running-gear, substantially as described.

291,665. PERMUTATION-LOCK. WILLIAM BROWNLOW ATKINSON and JOHN HOWE FOSTER, Franklin, Ky., assignors to the American Combination Door Lock Company, same place. Filed Sept. 18, 1883. (Model.)

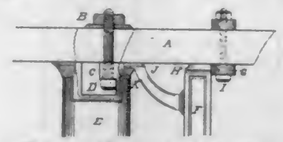


Claim.—The combination of the knobs, the slotted sleeve, the spindle having the spiral groove, the sleeve carrying the tumbler and having means for engaging with the said groove, and means for rotating the spindle to shift the tumbler, substantially as shown and described.

291,666. VENTILATOR. JOHN M. AYER, Chicago, Ill. Filed Sept. 29, 1883. (No model.)

Claim.—1. In a ventilator, the combination of two hollow cylinders, one open at both ends to serve as the air-passage and to fit within an opening in a window-sash, wall, or the like, and the other closed at

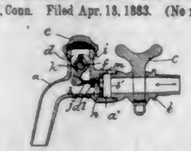
291,666.



one end, and provided with side perforations, each being provided with screw-threads, and fitting one into the other, whereby the turning of the perforated cylinder carries it back and forth with relation to the other and opens and closes the perforations, substantially as described.

2. In a ventilator, the combination of a cylinder, A, screw-threaded on its outer surface and open at both ends, and a cylinder, B, closed at one end and screw-threaded on its interior surface, and adapted to fit upon the said cylinder A, and provided with apertures *s*, substantially as described.

3. In a ventilator, the combination, with a cylinder, A, screw-threaded on its outer surface, and provided with a flange, *v*, screen C, and lugs *t*, of the cap B, provided with apertures *s*, and adapted partly to inclose the cylinder A, and screw-threaded upon its interior surface, and closed at one end, and provided with a handle to permit it to be turned upon the cylinder A, substantially as described.



4. The combination, with a window-sash, of the cylinder A, provided with a flange, *v*, and screen C, and lugs *t*, for securing the cylinder in position, cylinder B, provided with apertures *s* and flanged over *v'*, and handle *p*, attached to the cap B and projecting outward from the sash, substantially as described, and for the purpose set forth.

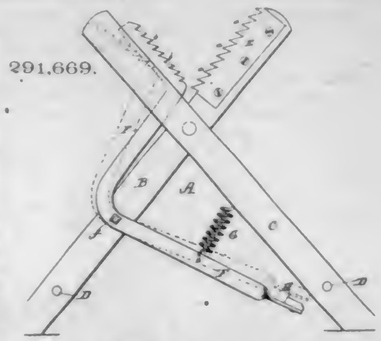
291,667. PLOW. ALBERT BALL, Canton, Ohio. Filed Apr. 24, 1883. (No model.)

Claim.—The standard E, provided with the recess C, shoulders D, and semicircular recess K, in combination with the jointer-arm F, provided with a semicircular recess, J, and arm H, substantially as and for the purpose set forth.

291,668. SELF-CLOSING FAUCET. SILAS BARKER and SAMUEL L. BARKER, Hartford, Conn. Filed Apr. 18, 1883. (No model.)

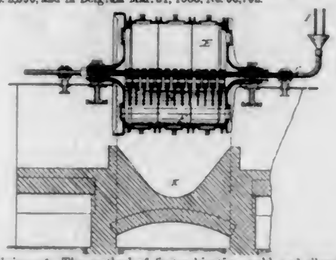
Claim.—1. In combination, the faucet-body *a*, having the valve-chamber *a''* and the seat *n*, the disk-shaped loose valve *m*, and the valve-operating mechanism, all substantially as described.

2. In combination, in a self-closing faucet, the body *a*, loose valve *m*, rod *j*, with adjustable arm *l*, and valve-operating mechanism, all substantially as described, and for the purpose set forth.



3. In a self-closing faucet of the kind herein described, in combination, the faucet-body *a*, provided with guide *a'*, spindle *f*, bearing crank *h*, and the rod *j*, having stop *k*, all substantially as described.

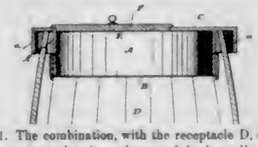
4. The loose valve *m*, having a mortised face, in which annular packing *m'* is secured by means of radial pins or the like, all substantially as described, and for the purpose set forth.



291,669. SAW-BUCK. THOMAS BEARD, Kokomo, Ind., assignor of one-half to Alfred B. Walker, same place. Filed Nov. 13, 1883. (No model.)

Claim.—The combination, with a metallic toothed plate fixed to the horn of one brace of a saw-buck, of a crooked lever pivoted to the same brace at a point below the juncture of two crossing braces, and having a toothed arm opposing said toothed plate, a treadle fixed to said lever, and a spring to act thereon, substantially as and for the purpose specified.

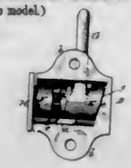
291,669.



291,670. PROCESS OF AND APPARATUS FOR OBTAINING GOLD AND SILVER FROM THEIR ORES BY COMBINED ELECTROLYTIC AND AMALGAMATING PROCESSES. MICHEL BODY, Liége, Belgium. Filed June 26, 1883. (No model.) Patented in England May 10, 1883, No. 2,390, and in Belgium Mar. 31, 1883, No. 60,762.

Claim.—1. The method of first subjecting gold and silver ores to the action of ferric salts, in combination with the electrolytic process, and the subsequent amalgamation of the metals with mercury under the continued action of the electric current.

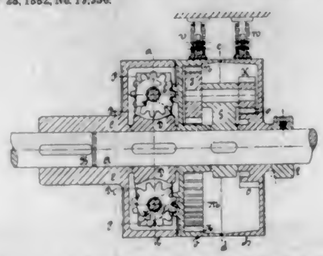
2. Apparatus for effecting the separation of gold and silver from their ores, and the amalgamation of the metal with mercury, consisting of the drum E, containing iron balls F, and connected to the negative pole of an electric machine, the hollow perforated shaft G, insulated from the drum and connected to the positive pole of the electric machine, which shaft serves for the introduction of the lye, and has suspended from it the carbon precipitating-plates H, arranged and operating substantially as herein described with reference to the accompanying drawing.



291,671. CINDER-SIFTER. HENRY W. BOOTH, Windsor, Ontario, Canada. Filed Oct. 1, 1883. (No model.) Patented in Canada Oct. 15, 1883, No. 17,872.

Claim.—1. The combination, with the receptacle D, of a cover, C, resting on and constructed to be reciprocated horizontally over said receptacle, and a sieve, A, having its rim A' made fast to and supported directly by the cover, substantially as described.

2. The combination, with the receptacle D, of a cover, C, resting on and constructed to be reciprocated horizontally over said receptacle, and having a flange, *a*, and the sieve A, having its rim A' made fast to and directly supported by the cover, substantially as described.

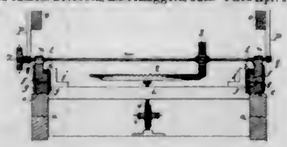


291,672. SASH-HOLDER. MARTIN BOURKE, Youngstown, Ohio. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, in a sash-holder, of a bottomless diagonally-slotted casing and a bolt consisting of two sections, one of said sections being provided with a lever and a shank carrying a pin, and the other section being formed hollow, and having a T-shaped slot, by which means the two sections are detachably connected together, substantially as and for the purpose described.

2. A sash holder consisting of a bottomless diagonally-slotted housing containing a horizontal bolt formed in sections, having a handle, and a shank with pin upon one of said sections, and the other section having a T-shaped slot formed with an inclined shoulder to assist the pin in riding over and preventing it from falling in the straight or horizontal portion of the slot when the section is turned, substantially as and for the purpose specified.

291,673. FRICTION-COUPLING FOR SHAFTS. FRANZ BRAUN, Berlin, Germany. Filed June 7, 1883. (No model.) Patented in Germany July 28, 1882, No. 19,936.

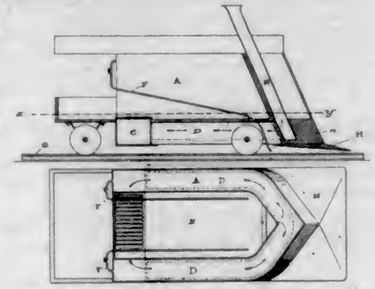


Claim.—1. A shaft-coupling made substantially as herein shown and described, and consisting of a flanged disk or cap mounted on the driven shaft, a collar rigidly mounted on the driving-shaft, and carrying brake-blocks located within the cap or flanged disk on the driven shaft, and of disks mounted loosely on the driving-shaft, and engaging with cog-wheels mounted on the end of an arm on the driving-shaft, one of which disks is provided with a spiral ridge adapted to engage with cog-wheels mounted on screw-threaded shafts journaled in the ends of arms of the collar on the driving-shaft, substantially as herein shown and described, and for the purpose set forth.

2. In a shaft-coupling, the combination, with a cap or flanged disk mounted on the driven shaft, of a collar mounted on the driving-shaft, and provided with brake-shoes contained in the cap or flanged disk on the driven shaft, and of disks loosely mounted on the driving-shaft, and adapted to force the brake-shoes against the flange of the cap on the driven shaft or withdraw the brake-shoes from the said flange, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the driven shaft B and the driving-shaft A, of the flanged disk or cap C, mounted on the driven shaft B, the collar D, mounted on the shaft A, the right and left hand threaded shafts X X', mounted in arms of the collar D, the cog-wheels E E', mounted on the shafts X X', the brake-shoes P P', held loosely on arms of the collar D, the disk F, provided with a spiral ridge, M, and with a toothed flange, the disk H, provided with a toothed boss, the arm G, rigidly mounted on the shaft A, and the cog-wheels J K, journaled on the arm G, and engaging with the toothed flange of the disk F and the toothed boss of the disk H, respectively, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the driven shaft B and the driving-shaft A, of the flanged disk or cap C, mounted on the driven shaft B, the collar D, mounted on the shaft A, the right and left hand threaded shafts X X', mounted in arms of the collar D, cog-wheels E E', mounted on the shafts X X', the brake-shoes P P', held loosely on the arms of the collar D, the disk F, provided with a spiral ridge, M, and with a toothed flange, the disk H, provided with a toothed boss, the arm G, rigidly mounted on the shaft A, the cog-wheels J K, journaled on the arm G, and engaging with the toothed flange of the disk F and the toothed boss of the disk H, respectively, and of the brakes *v w*, located above the flanges of the disks F H, respectively, substantially as herein shown and described, and for the purpose set forth.

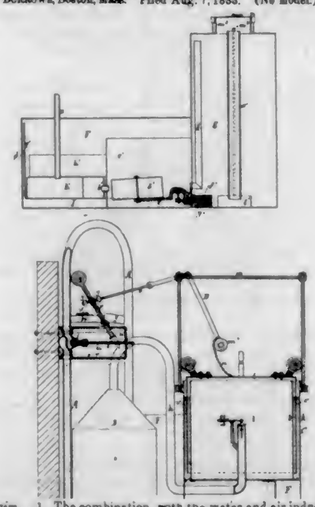


291,674. STRAW-STACKER. EMANUEL F. BROWN and SAMUEL M. MILLER, Nebraska, assignors of one-third to Wilson S. Dresbach, Frank P. Dresbach, and Charles Dresbach, East Ringgold, Ohio. Filed Apr. 13, 1883. (No model.)

Claim.—The combination of the turn-table *h*, having rim *f*, with flanges *l* and *g g*, the brackets *j*, the cross-beam *k*, and the rollers *i*, substantially as shown and described.

291,675. SNOW-PLOW. PIERRE BRUNET, Toronto, Ontario, Canada. Filed June 14, 1883. (No model.) Patented in Canada Aug. 20, 1883, No. 17,529.

Brief.—A melter consisting of a hollow bifurcated tank having longitudinal flues and a vertical flue, a furnace, and a shovel-faced front. From the steam-space of the tank pipes extend in front of the wheels over the rails.



Claim.—1. A hollow bifurcated chamber or tank, A, shaped substantially as shown, and having flues D and E arranged within it, as described, in combination with the furnace C, substantially as and for the purpose specified.

2. In a snow-plow, and in combination with the furnace C and the bifurcated tank A thereof, having flues D and E arranged within it, as described, the pipes F, connected with and extending one from each side of the bifurcated tank through the plow to a point immediately above the rails, substantially as and for the purpose specified.

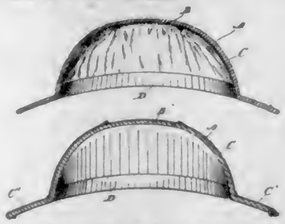
3. The combination of the bifurcated tank A, having pointed front *a*, flues D and E, furnace C, and shovel H, all constructed and arranged and operating substantially as and for the purpose specified.

4. In a snow-plow, the tank A, provided with a suitable furnace and flue, and having its sides constructed to act as a snow-plow, in combination with a pipe taking steam from the steam-space of said tank and directing it upon the rails, substantially as described.

291,676. APPARATUS FOR CARBURETING AIR. WILLIAM FREEMAN BURROWS, Boston, Mass. Filed Aug. 7, 1883. (No model.)

Claim.—1. The combination, with the water and air induction pipe, its stop-cock, the air-trap, and aerometer, as explained, of mechanism, substantially as described, for opening and closing the said cock through the action of the airometer-bell, as specified, such mechanism consisting of the knee-lever, sliding connection-rod and its stops, the bifurcated and weighted lever, and the pins, all being adapted to the valve-stem of the cock and to the guide-frame of the bell, essentially as set forth.

2. The combination of the shallow chamber I and vertical space *p'* with the carbureted-air receiver and the carburetor arranged therein, as set forth.



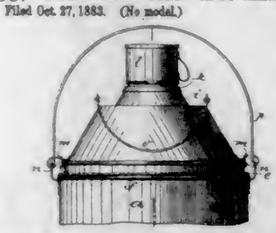
291,677. PAINT. ANTONIO BUDOLICH, North Carlton, and T. KING SMITH, Prahran, Victoria. Filed Sept. 18, 1882. (No specimens.) Patented in Victoria May 11, 1883, No. 3,220; in South Australia Aug. 24, 1883, No. 271; in Tasmania Aug. 30, 1882, No. 246; in India Sept. 6, 1883; in England Sept. 16, 1882, No. 4,423; in France Sept. 19, 1882; in New South Wales Sept. 25, 1883; in Italy Sept. 30, 1882; in Queensland Oct. 5, 1882; in Canada Oct. 16, 1882, No. 15,634; in Belgium Oct. 16, 1882; in Sweden Nov. 25, 1882; in New Zealand Dec. 27, 1882, No. 754; in Western Australia Feb. 2, 1883, and in Spain Mar. 15, 1883.

Claim.—The composition herein described for a varnish or vehicle for paint, consisting, substantially, of the following elements, viz: linseed or nut oil, hydrochloric acid, phosphoric acid, shellac, resin, chromate of potash, beeswax, and garlic, substantially in the proportions set forth.

291,678. PAINT. ANTONIO BUDOLICH, North Carlton, and T. KING SMITH, Prahran, Victoria. Filed Oct. 11, 1883. (No specimens.)

Claim.—A paint composition the basis whereof is linseed or nut oil combined with chrysophanic acid, sulphate of zinc, sulphate of copper, and chromate of potash, substantially as set forth.

291,679. HAT LINING AND COVER. JAMES H. CANNING, Danbury, Conn. Filed Nov. 5, 1883. (No model.)



Claim.—1. A detachable hat-lining which is also adapted for use as a cover to the hat, substantially as described.

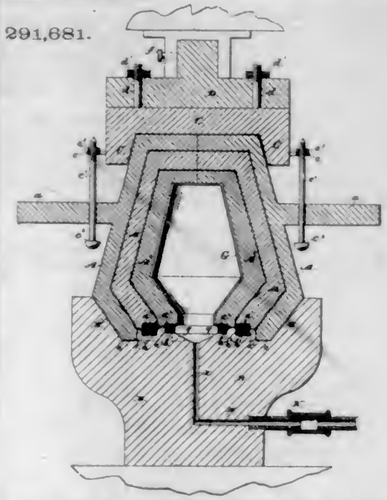
2. A detachable hat-lining constructed of water-proof material, for the purpose described.

3. A hat-lining the inner side of which is made ornamental, and serves the ordinary purposes of a hat-lining, and the outer side of which is water-proof to adapt it for use as a hat-cover in bad weather.

4. A hat lining and cover in which the ordinary crown and side lining are adapted to serve as a cover for the hat-body, and which has an additional piece made integral therewith or attached thereto in any suitable way, to serve as a cover for the brim, substantially as described.

291,680. DINNER-PAIL. WILLIAM HENRY CARRAUGH, Columbus, Ohio. Filed Oct. 27, 1883. (No model.)

Claim.—1. The combination, with the pail *a*, of the pan *b*, turned over on a line, *f*, having below *f* a rib, *e*, and below *e* provided with a downward extension or flange, *d*, whereby said pan may be secured in the pail, as described.



2. The pot *c*, having catches *m* above the rim *g*, in combination with the pan *b*, having links *n* at its top, whereby the pot and pan may be united to form a cover, as described.

291,681. APPARATUS FOR DIE-SHAPING. HENRY A. CHAMBERLAIN and WILLIAM L. MARTIN, Middletown, Conn. Filed Sept. 7, 1883. (No model.)

Claim.—1. The die or matrix casing, divided into sections vertically and made tapering at each end, in combination with the cap and base, both provided with depressions having flaring sides to fit closely upon the tapering ends of the casing, and means for pressing the cap upon the casing and holding it there, substantially as and for the purpose set forth.

2. The casing divided into sections longitudinally, adapted to receive

291,681.

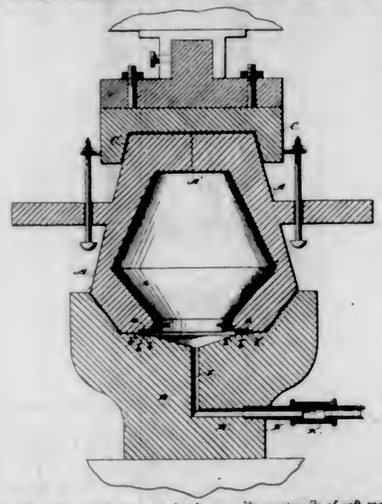
and hold within it a matrix or an inner reducing-casing and matrix, and formed tapering at each end, in combination with a cap and base adapted to fit closely over and confine the ends of the casing, substantially as and for the purpose set forth.

3. The base formed with a bowl-shaped depression having flaring sides, and provided with a circular recess, in combination with a die-casing divided vertically into sections, and adapted at its lower end to fit within the depression and the circular recess, and the cap formed to fit the tapering upper end of the casing, substantially as and for the purpose set forth.

4. In combination with the base provided with a recess around its central portion, the matrix provided with a corresponding recess adapted to receive the flange of the blank or form to be shaped or ornamented, the elastic washer or gasket in the recess in the base, means for pressing and holding the matrix down upon the base, so that the flange of blank shall rest upon and compress the washer, and suitable connecting-passages opening into the center of the upper face of the base, so as to admit fluid to the interior of the blank, substantially as shown and described.

5. The matrix divided into sections longitudinally, and provided at its lower end to receive the flange of the contained form or blank, in combination with the base having a corresponding recess in its upper face, the elastic packing in this recess, suitable passages in the base opening upward within the line of the recess, and means for forcing and holding the matrix-sections together and down upon the base, so that the flange of the blank shall rest upon and compress the elastic washer or packing and form a tight joint, substantially as shown and described.

6. The base provided with a bowl-shaped depression having flaring sides, and a series of concentric recesses in its bottom, the outer one adapted to receive the lower end of the divided matrix-casing, made tapering at its lower end to fit in the base, and the others adapted to receive and hold elastic washers, the divided reducing-shell within the casing, having a recess in its lower end to receive the upper portion of the outer washer, the divided matrix fitting within the shell, and also provided with a recess corresponding with the inner recess in the base, and adapted to receive the flange of the blank, the passages in the base opening in the upper face thereof within the inner recess, and the cap fitting over the end of the casing, all combined and operating substantially as and for the purpose described.



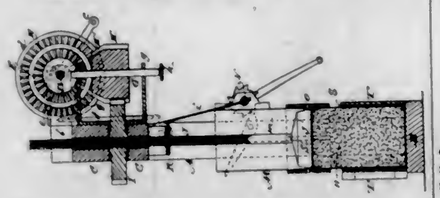
7. The die-casing divided into two sections vertically, the cap fitting upon the upper end thereof, the eyebolts on the cap, the arms attached to the casing-sections, and the headed rods provided with screw-nuts and passing through eyebolts and arms, all combined and operating substantially as and for the purpose set forth.

8. The press, the cap connected with the press head or plate, the die-casing, made in sections, and loose connections between the cap and sections, which will allow the cap to be raised clear of the sections before the latter are moved, and then will cause the sections to be raised by the further movement of the cap, all in combination, substantially as and for the purpose set forth.

9. The combination of pipe K, connected with a suitable source of supply of fluid under pressure, the base B, provided with passages H and I, and having the bowl-shaped depression with flaring sides, the divided casing having its lower end correspondingly shaped to fit within this depression, and being adapted to receive and hold a divided die or matrix

the cap fitting over the tapering top of the casing, and suitable means for pressing the cap downward upon the end of casing, substantially as and for the purpose described.

291,682. PROCESS OF DIE-SHAPING. HENRY A. CHAMBERLAIN and WILLIAM L. MARTIN, Middletown, Conn. Filed Nov. 26, 1883. (No model.)



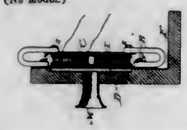
Claim.—1. The process of shaping vessels or utensils of soft metal or alloy, which consists in placing a blank or form for the same within a suitably-shaped matrix and forcing into the blank water heated and under pressure, whereby the material of the blank or form is softened, rendered more pliable, and forced to conform to the shape and size of the matrix, substantially as shown and described.

2. The process of shaping vessels or utensils of soft metal or alloy, which consists in placing within a suitably-shaped matrix a blank spun to conform as nearly as possible to the general shape of the matrix, and forcing into such blank water heated and under pressure, whereby the material of the blank is softened, made more pliable, and forced to conform to the shape and size of the matrix, substantially as set forth.

3. The process of shaping and ornamenting vessels or utensils of soft metal or alloy, which consists in placing within a suitably shaped and ornamented matrix a blank or form and forcing into such blank water heated and under pressure, whereby the material of said blank is softened, rendered more pliable, and forced to conform to the size, shape, and ornamentations of the matrix, substantially as and for the purpose set forth.

4. The process of shaping and ornamenting vessels or utensils of soft metal or alloy, which consists in placing within a suitably shaped and ornamented matrix a blank or form spun to conform as nearly as possible to the general shape of the matrix, and forcing into such blank or form water heated and under pressure, whereby the material of said blank is softened, rendered more pliable, and made to conform accurately to the size, shape, and ornamentations of the matrix, substantially as described.

291,683. COMPRESSOR FOR COMPRESSING BRAN AND OTHER SUBSTANCES INTO PACKAGES. GEORY A. CHAPMAN, Strawberry Point, Iowa. Filed June 5, 1883. (No model.)

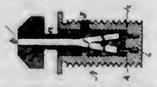


Claim.—1. In a compressor, the combination, with the sides A, base B, and reciprocating piston J', of the filler-tube M, receiving within it the piston, the sack S, receiving the tube extended to its bottom, a detachable cover, S', and the clamp T, substantially as shown and described.

2. In a compressor for compressing bran and other substances into or within packages, and in which the material to be compressed is supplied to and compressed within the package without coming in contact with or straining on its sides, the combination, with a raising and lowering filling-tube, and a piston arranged to work within and in and out of the charging end of the same, of different speeding-gearing for operating the piston at different velocities in either or both directions of its travel, essentially as described.

3. The combination of the sliding gears E E' F F', the rising and falling gear or gears H H', the wheel I, constructed to operate as a nut, the screw-threaded piston-rod J, the piston J', the filling-tube M, made capable of being raised and lowered, and the clamp T, substantially as and for the purposes herein set forth.

291,684. TELEPHONE. JOS. H. CHEEVER, Somerville, Mass. Filed Feb. 15, 1883. (No model.)



Claim.—In a telephone, the combination, with two diaphragms one of which constitutes a common north pole-piece and the other a common south pole-piece of a number of electro or permanent magnets, of a coil of insulated wire placed between said diaphragms or pole-pieces, and to be inclined in the line-circuit, substantially as and for the purpose described.

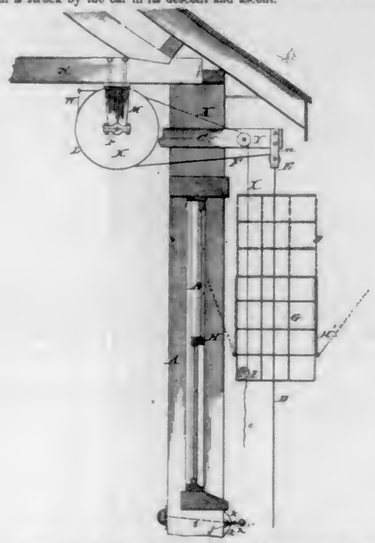
291,685. ICE-CREAM FREEZER. VALENTINE CLAD, Philadelphia, Pa. Filed Mar. 31, 1883. (No model.)

Claim.—An ice-cream freezing-vessel comprising a cylindrical body and a corresponding cap or lid, both of sheet metal, and having each a cast-metal rim, one of said rims being formed with a lug integral therewith and the other a corresponding notch adapted to receive said lug and to prevent the lid from turning on the body, substantially as described.

291,686. LOCK. FREEMAN P. CLARK, New Haven, Conn. Filed Oct. 1, 1883. (No model.)

Claim.—The combination of the socket A, the cylindrical body B, arranged in said socket free for rotation, but prevented from axial movement, the body constructed with a head, C, to engage the thing to be locked, the longitudial central hole, *b*, through the body divided within the body into two parts, *d e*, bolts *h h*, corresponding to the divisions of the hole *d e*, and arranged in the socket with springs the tendency of which is to force the bolts into the holes in the body, and a key constructed with two elastic legs, *l m*, together corresponding to the key-hole *b*, and which, when introduced into the hole, will be divided and pass, respectively, into the divisions *d e* of the hole and upon the bolts *h h*, substantially as described.

291,687. DOOR-KNOB. JOHN K. CLARK, Buffalo, N.Y. Filed Sept. 18, 1883. (Model.)



Claim.—1. The combination of a knob, a tubular shank, and a stud or post entering the shank from the face of the knob, and having its inner end bifurcated and the bifurcations spread laterally and engaged with the shank, substantially as described.

2. The combination, with a knob having a central opening countersunk upon its rear face, of a tubular shank entering said countersink, and having its body cut away to form recesses opening into the central aperture, and a stud or post entering said shank through the face of the knob, the end of said post being split and bent or spread into the said recesses in the shank, substantially as described.

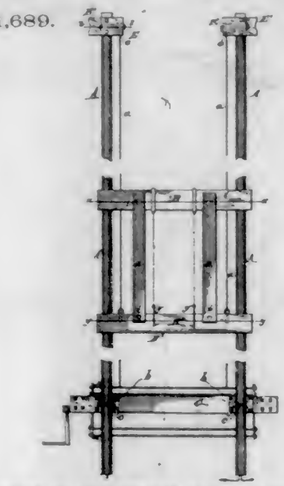
291,688. PERMANENT FIRE-ESCAPE. THOMAS CLARKE, Truro, Nova Scotia, Canada. Filed Apr. 16, 1883. (No model.)

Brief.—A car with a collapsible top is fastened to a rope wound upon a spring-actuated reel-shaft. The brake-rope is connected to a spring-roller in the bottom of the car. An alarm having a projecting arm is struck by the car in its descent and ascent.

Claim.—1. The combination, with a building, of parallel ways or stays attached permanently thereto, a cage or car traveling upon said ways or stays, and provided with ropes for hoisting it up or down, a spring-actuated windlass adapted to hoist the car by the tension of the spring when wound, a brake mechanism actuated by a cord, the lower end of which is connected to a spring-roller inside of or attached to the outside of the traveling car or cage, and a rope or chain attached to the bottom of the same, by means of which it may be drawn down to the bottom of the building, the whole constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

2. The combination, with a building, of parallel ways or stays attached permanently thereto, a cage or car traveling upon said ways or stays, and provided with ropes for hoisting it up or down, a spring-actuated windlass adapted to hoist the car by the tension of the spring when wound, a brake mechanism actuated by a cord, the lower end of which is connected to a spring-roller removably attached to the traveling car or cage, a rope or chain attached to the bottom of the same, by means of which it may be drawn down to the bottom of the building, and an alarm adapted to be operated automatically by the car as it travels up or down, the whole constructed and arranged to operate substantially in the manner and for purpose shown and set forth.

3. The combination, in a permanent fire-escape, of a cage or car adapted to travel up or down in front of the windows of a building, with alarm devices located at the said windows, and having projecting arms engaging with the passing cage, operating the alarm, as and for the purpose shown and set forth.



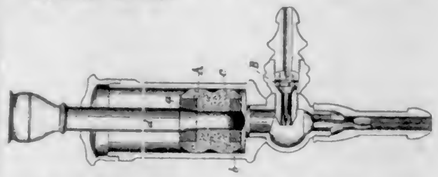
4. The car or cage G, provided with a collapsible top, *g*, eyes *i*, for guiding it upon the ways, and doors H, adapted to open in a vertical plane, so as to form a platform connecting the windows of the building with the car when the apparatus is in use, substantially as and for the purpose shown and set forth.

291,689. PORTABLE FIRE-ESCAPE. THOMAS CLARKE, Truro, Nova Scotia, Canada. Filed Apr. 16, 1883. (No model.)

Brief.—The car, which is moved upon the way formed by the poles by hoisting-ropes, pulleys, and a spring-windlass, is composed of top and bottom bars connected by upright bars, and arranged to hold thereon and carry a folding cab upon the bottom bar.

Claim.—1. In a portable fire-escape, the combination of the extensible poles A, having snatch-blocks E at their upper ends, hoisting-ropes *a*, car or tram B B' *d d*, adapted to travel upon the parallel poles A, and provided with ways *s'*, and friction-rollers *h*, a spring-actuated windlass fastened removably to the lower end of the poles A A, and connecting the same, and a cord or chain, T, attached to the lower part of the traveling tram or car, for drawing the same back to the lower end of

291,689.

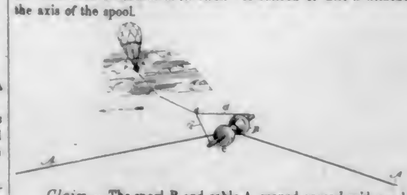


the apparatus, the whole constructed and arranged substantially as and for the purpose shown and set forth.

2. The traveling tram or car, consisting of two or more horizontal bars, B, and bottom bar, B', having the projecting stop or ledge B^3, said horizontal bars being connected by swiveled arms or bars *d d*, to admit of a limited play or motion of the top and bottom of the car, substantially as and for the purpose shown and set forth.

3. The combination, with the traveling tram or car composed of the parts B B' B^3 *d d*, of the removable folding cage D, having hooks *f*, bottom pins, H, and hinged door J, substantially as and for the purpose shown and set forth.

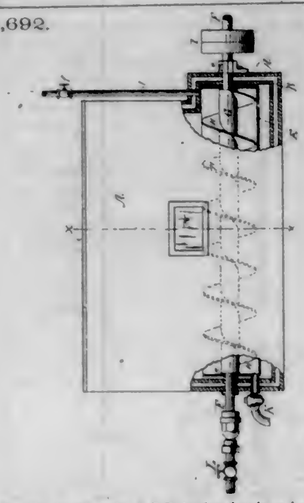
291,690. SYRINGE. JOSEPH H. CLARKE, Springfield, Ohio. Filed July 2, 1883. (No model.)



Claim.—1. In a syringe, a valve therefor provided with a projecting perforated part, *e*, to serve as a filter, substantially as described.

2. In a syringe, a piston for the cylinder thereof, composed of the elastic portion *c*, having its upper and lower edges beveled and its sides recessed, in combination with the washer *a* and nut *b*, set into opposite faces of the portion *c*, and the threaded and shouldered rod *d*, passed through the three parts, substantially as described.

291,691. SINGLE-CABLE-TRACK RAILWAY. JOSEPH J. CLEHAN, San Diego, Cal. Filed Feb. 28, 1882. (No model.)

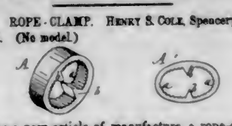


Brief.—A single cable having a spool with the cable wound around it. The cable is secured at its ends. A balloon or kite is attached to the axis of the spool.

Claim.—The spool B and cable A, wound around said spool, and secured at its ends, in combination with a balloon or kite attached to the axis of the spool, substantially as shown and described.

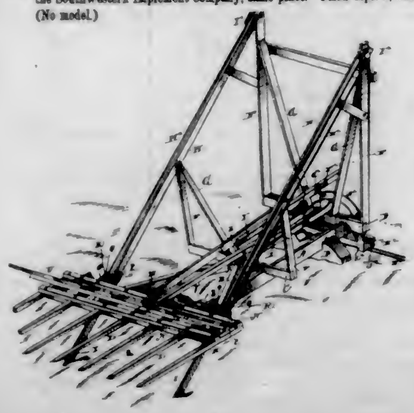
291,692. COOLER FOR UNITING OILS IN THE MANUFACTURE OF LARD, &c. SAMUEL H. COCHRAN, Everett, Mass. Filed June 30, 1883. (No model.)

291,692.



Claim.—1. In the cooler A B D, having therein an ice-box, C, the combination of the conveyer E, the hollow shaft F, the sleeve G, the screw H, the pipe J, and the cock K, substantially in the manner and for the purpose shown and described.

2. The combination of the cooler A B D, having therein an ice-box, C, the conveyer E, the shaft F, the sleeve G, the screw H, the pipe J, the cock K, the stuffing-boxes *e*, and the pulleys I, substantially in the manner and for the purpose shown and described.



3. The method or process of tying and permanently uniting oils and fats by means of dry cold air, which consists of passing the oils and fats, drawn by a tube from the oil reservoir or tank, into a conveyer arranged in a cooler having therein an ice-box filled with ice, in which conveyer revolves a screw, which moves along and constantly agitates said oils and fats, while they are subjected to a current of dry cold air flowing from said ice-box over and around said oils and fats, until they are permanently set and tied, substantially as shown and described.

291,693. ROPE-CLAMP. HENRY S. COLE, Spencerport, N. Y. Filed Nov. 5, 1883. (No model.)

Claim.—As a new article of manufacture, a rope-clamp consisting of a metal ring corrugated or ribbed on its inner side, and provided with wedge-shaped spurs which serve as dividers or clamps to the rope when the ring is bent or crushed together, as herein shown and described.

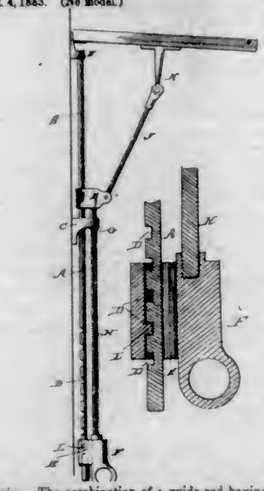
291,694. HAY-STACKER. JOHN COOMBS, Springfield, Mo., assignor to the Southwestern Implement Company, same place. Filed Apr. 6, 1883. (No model.)

Claim.—1. The combination of suitable inclined track-rails, the carrier moving upon the same, an arm or lever extending rearwardly from said carrier, guides for said arm or lever, a compressor-frame hinged to the carrier, an arm pivoted to said frame, and suitable guides for said arm, as set forth.

2. In a hay-stacker, the combination of the guide-rail X, the trough-shaped guide secured to the side of the same, and the pivoted compressor-arm moving in said guide, as set forth.

3. The combination of the carrier, the hinged compressor-frame, the arm pivoted to the same, a stud or stop projecting laterally from the rear end of said arm, a trough-shaped guide, and a hook at the front end of the same, as set forth.

4. The combination of the carrier, the hinged compressor-frame, an arm pivoted to the same, a stud or stop projecting laterally from the rear end of said arm, a trough-shaped guide, a slot at the rear end of said guide, and a stop or bracket secured under the said slot, as set forth.

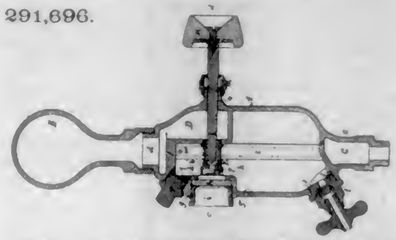


5. The combination of the carrier, the hinged compressor-frame, an arm pivoted to the same, a stud or stop projecting laterally from the rear end of said arm, the guide-rail Y, supported by suitable brackets, and the catch F^2 G^2, secured to said guide-rail, as set forth.

6. The combination of the carrier, the hinged compressor-frame, an arm pivoted to the same, a stud or stop projecting laterally from the rear end of said arm, a trough-shaped guide, a hook at the front end of the same, a slot at the rear end of the said trough, a stop or bracket secured under the said slot, the guide-rail Y, supported by suitable brackets, and the catch F^2 G^2, secured to said guide-rail, as set forth.

7. The combination of suitable inclined track-rails, the carrier, an arm or lever extending rearwardly from the same, a wheel or pulley at the rear end of said arm, the track or guide-rails X Y, the curved or segmentally-slotted guide A^2, the compressor-frame hinged to the carrier, the arm pivoted to the same, a stud or stop projecting laterally from the rear end of said arm, a trough-shaped guide, a hook at the front end of said guide, a slot at the rear end of said trough, a stop or bracket secured under said slot, and the catch F^2 G^2, secured to the guide-rail Y, as set forth.

8. The combination of the base-frame, the inclined tracks, the carrier, the hoisting-ropes, a frame extending downwardly from the rear end of the base-frame, and pulleys journaled at the lower corners of the said frame, and serving to guide the hoisting-ropes, the draft upon which is thereby lowered, as set forth.

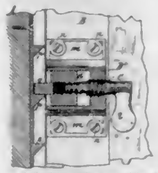


291,695. TRANSOM-LIFTER. FRANK A. CORTIS, Meriden, Conn. Filed Sept. 4, 1883. (No model.)

Claim.—The combination of a guide-rod having its lower free end notched, an upper bracket or socket-piece securing the upper end of the guide-rod, a bracket or socket-piece having two vertical perforations securing the guide-rod a distance from its upper end in the inner perforation, a sliding spring-rod having a vertically-perforated block at its upper end sliding upon the upper end of the guide-rod, a transom-operating rod hinged to the sliding block, and a handle secured to the lower end of the sliding spring-rod, having a perforation oblong in cross-section, and provided with a projection upon its inner side, and sliding upon the lower end of the guide-rod, as and for the purpose shown and set forth.

291,696. LUBRICATOR FOR STEAM ENGINES. WARREN HILLIARD CRAIG, Lawrence, Mass. Filed Oct. 24, 1883. (No model.)

291,696.



Claim.—1. The oil-reservoir having in and forming an integral part of it the projection *z*, provided with the passage *v*, leading from its upper part and down one side of it to its bottom and to open into the neck *s*, all being substantially as set forth.

2. The oil-reservoir provided with the steam-receiving chamber arranged in its lower neck and separate from the oil-receiving space of said reservoir, and also with a pipe leading up through the said reservoir into the condenser and opening out of or communicating with such chamber, all being substantially as set forth.

3. The oil-reservoir provided with the water-trap and observation-mouth, and its glass pane arranged, as represented, in the upper part of such oil-reservoir, in combination with the separate educt of the water-trap, arranged with the trap and pane, and having a valve-seat and plug, all substantially as specified.

4. The oil-reservoir provided with the steam-chamber in its lower neck, and with the oil-discharge passage leading into such from the upper part of such reservoir, and also with the pipe to extend up within the condenser and communicate with the said steam-chamber, all being substantially as described or represented.

291,697. SASH-HOLDER. HENRY CUTTING, Buffalo, N. Y., assignor of one-half to Thomas J. De Laney, same place. Filed Oct. 2, 1883. (No model.)

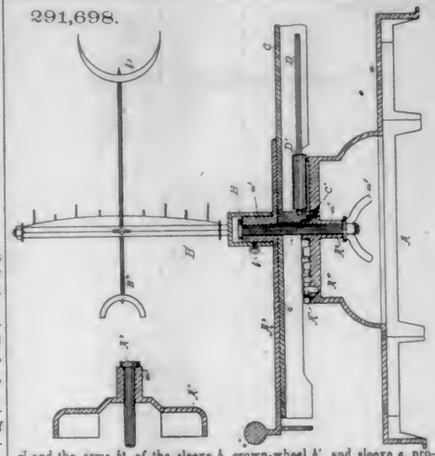
Claim.—1. In a sash-holder, the combination, with a screw-bolt having a right-hand and a left-hand screw-thread, of a fixed screw-nut receiving one of said screw-threads, and a movable bearing-piece working on the other screw-thread, substantially as set forth.

2. The combination, with a screw-bolt, C, provided with a right-hand and a left-hand screw-thread, of a screw-nut, D, provided with a screw-thread, *e*, and a cavity, *f*, and a bearing-piece, G, provided with a screw-thread, *h*, and guided in the cavity *f*, substantially as set forth.

3. The combination, with a screw-bolt, C, having right and left hand screw-threads *i* and *j*, of a fixed nut, D, having a screw-thread, *e*, a recess, *f*, and a longitudinal groove, *l*, and a bearing-piece, G, constructed with a screw-thread, *h*, and rib *k*, and arranged in the recess *f*, substantially as set forth.

291,698. ASTRONOMICAL APPARATUS. JOHN DAVIS, Allegheny, Pa. Filed May 14, 1883. (No model.)

Claim.—1. In an astronomical instrument, the combination, with the stand A, having revolving cover A^2, and provided with eccentric guide-channel A^4, of the earth-bearing arm C, provided with leg C', substantially as described, whereby the earth is made to describe an elliptical orbit, as set forth.



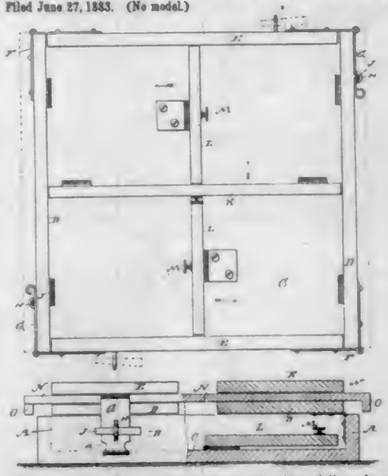
2. In an astronomical instrument, the combination, with the revolving shaft D and the shaft F, of the wheel *f*, pinion *f'*, worm f^3, and wheel f^4, substantially as described, whereby the change in the direction of the axial inclination of the earth is effected, as set forth.

3. In an astronomical instrument, the combination, with the globe F', of the bent revolving shaft F, said shaft forming two axes of revolution, intersecting each other outside of the globe at an angle of twenty-three degrees and thirty minutes, substantially as and for the purposes described.

4. In an astronomical instrument, the combination, with the revolving shaft D and the earth F', of the wheels *g g' g³*, sleeve g^4, provided with crown-wheel g^5, and sleeve g^7, provided with crown-wheel g^6, substantially as described, whereby the revolution of the earth upon its axis is effected, as set forth.

5. In an astronomical instrument, the combination, with the sleeve

291,698.



g^7 and the arms h^4, of the sleeve *h*, crown-wheel *h'*, and sleeve *a*, provided with crown-wheel *c'*, substantially as described, whereby the arms h^4 are prevented from revolving with the sleeve g^7, as set forth.

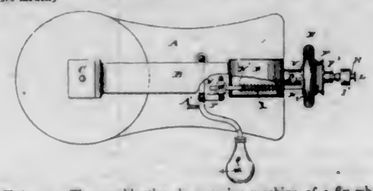
6. In an astronomical instrument, the combination, with the line of illumination H, provided with means for journaling it upon the plane of the ecliptic and the axis F, of the arm H', provided with bifurcated swivel H^3, substantially as and for the purposes described.

7. In an astronomical instrument, the combination, with shaft g^7, provided with means for revolving it, the moon K, and rod k^3, of the wheels *k k'*, substantially as described, whereby the moon is revolved about the earth, as set forth.

8. In an astronomical instrument, the combination, with the stand A, provided upon its top with a circular toothed rack, and having a revolving cover, A^2, the earth-bearing arm C, having means for reciprocating it, and the revolving shaft D, having bearings in said arm, of an elongated pinion carried by said shaft D, and adapted to gear with the cogs of the circular toothed rack while the arm C is being simultaneously revolved and reciprocated, substantially as and for the purposes set forth.

291,699. FOLDING EGG-CASE. JESSE D. DE JERRY, Smithville, Mo. Filed June 27, 1883. (No model.)

Claim.—1. A folding egg-case constructed, substantially as herein shown and described, with low side and end pieces secured to the bottom, side boards hinged to the upper edges of the side pieces, and end boards hinged to the ends of the side boards, as set forth.



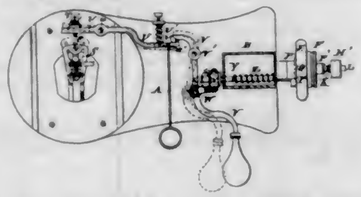
2. A folding egg-case constructed with low side and end pieces secured to the bottom, side boards hinged to the upper edges of the side pieces, end boards hinged to the ends of the side boards, and folding partitions hinged to the bottom of the case, substantially as herein shown and described, and for the purpose set forth.

3. In a folding egg-case, the combination, with the side and end pieces, A B, secured to the bottom C, of the side boards, D, hinged to the upper edges of the side pieces, the end boards, E, hinged to the ends of the side boards, the hinged hasps G, secured to the free ends of the end boards, and the staples H on the side boards, substantially as herein shown and described, and for the purpose set forth.

4. In a folding egg-case, the combination, with the side and end pieces, A B, secured to the bottom C, of the side boards, D, hinged to the upper edges of the side pieces, the end boards, E, hinged to the ends of the side boards, and the cover N, having the upper surface beveled at the end edges, substantially as herein shown and described, and for the purpose set forth.

5. In a folding egg-case, the combination, with side and end pieces, A B, secured to the bottom C, of the side boards, D, hinged to the side pieces, the end boards, E, hinged to the ends of the side boards, the partition K, hinged to the partition K', and extending from side to side, and the partitions L, hinged to the bottom and extending from the ends to the partition K, substantially as herein shown and described, and for the purpose set forth.

291,700. BRAKE MECHANISM FOR SEWING-MACHINES. JEROME B. DESNOYERS and CHARLES SINNING, St. Louis, Mo. Filed Oct. 31, 1883. (No model.)



Claim.—1. The combination, in a sewing-machine, of a fly-wheel having a notch therein, and a brake constructed to enter said notch, substantially as and for the purpose set forth.

2. A sewing-machine brake having the following elements: a brake-lever with a spring-brake S T working therein, and a fly-wheel with inclined jaws U upon its face, substantially as and for the purpose set forth.

3. The combination, in a sewing-machine, of fly-wheel E, with jaws U, friction drive-wheel F, lever I, with arm I', with push-pin H, brake-arm I^2, with brake S T, arm I^2, rod N, spring R, hand-lever Q, connected to rod N, and catch A', substantially as set forth.

291,701. BUTTON-HOLE SEWING-MACHINE. JEROME B. DESNOYERS and CHARLES SINNING, St. Louis, Mo. Filed Aug. 7, 1883. (No model.)

Brief.—When the button-hole is finished, the projection on the clamp comes in contact with the end of the screw in the adjacent lever, thus causing the lever-catches to become disengaged, whereupon the springs act to release the friction drive-wheel and to brake the fly-wheel, thus stopping the machine.

Claim.—1. The combination, with a moving clamp, S, of a sewing-machine, of levers U and V, with engaging-catches, a spring connecting-rod Y Z, forked lever H, with pressure-arm H' and brake-arm H^2, and a friction-clutch actuated by the pressure-arm H' and a relieving-spring, R.

2. The combination, in a button-hole sewing-machine, of a work-clamp, S, levers U V, with catches *u' v*, springs U' Z, forked lever H, spring pressure-pin K L, friction-wheel F, relief-spring R, balance-wheel E, jaws P, and spring-brake N O, substantially as set forth.

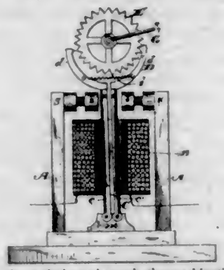
291,702. ANIMAL-POKE. JOHN E. DEUPREE, Edinburg, Ind. Filed June 27, 1883. (No model.)

Claim.—The combination of a common halter, a flat T-shaped metallic bar forming a curved T-head secured upon the throat-strap, having a bail for the chin-strap, and a slotted eye at its lower end, and a bar provided with a flat eye having shoulders upon its edges, as described, upon its upper end hinged in the slotted eye, and having its lower end curved forward, as and for the purpose shown and set forth.

291,703. BILLIARD-CUE TIP. HENRY EARTHOPE and GEORGE C. SCHNEIDER, St. Louis, Mo. Filed Feb. 28, 1883. (No model.)

Claim.—The combination of cue C, having outwardly-flaring rear end, D, leaving shoulder E, and the rubber tip A, having sides B flush with the cue, and inwardly-flaring socket fitting the rear end of the cue, as set forth.

291,704. KNIFE HOLDER AND PACKAGE. GEO. E. FELCH, Ayer, Mass. Filed Nov. 12, 1883. (No model.)



Claim.—1. The improved knife-holder composed of the radially-slotted plates united by a bar, as set forth.

2. The improved knife-holder composed of the plates *a*, connected by the bar *b*, and provided with alternating radial slots *c c'*, the slots *c* of the one plate corresponding with the slots *c'* of the other, as set forth.

3. In a knife-holder, the combination of the radially-slotted plates or disks *a a*, the connecting bar or rod *b*, and the cylindrical inclosing-box, as set forth.

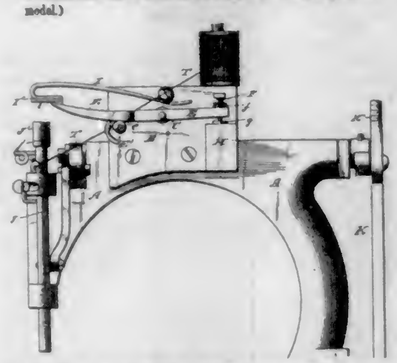
291,705. ESCAPEMENT AND UNISON MECHANISM FOR PRINTING-TELEGRAPHS. STEPHEN D. FIELD, New York, N. Y., assignor to the Commercial Telegram Company, same place. Filed Oct. 3, 1883. (No model.)

Claim.—1. In a printing-telegraph, the combination of a permanent magnet, an electro-magnet, a core for the latter pivoted upon or at the neutral point of the permanent magnet, and with its free end playing between the poles of the permanent magnet, and an anchor-escapement and type-wheel, substantially as set forth.

2. The combination of a coil, a permanent magnet embracing the coil, and a core, movable therein, and pivoted at or near the neutral point of the permanent magnet, substantially as set forth.

3. The combination of a coil, a permanent magnet embracing the coil, a core for the coil, movable therein, and pivoted at or near the neutral point of the permanent magnet, and playing at its free end between the poles of the permanent magnet, and adjustable stops on the poles of the permanent magnet, for regulating the motion or vibration of the core, substantially as set forth.

4. The combination of a coil, a permanent magnet embracing the coil, a core for the coil, movable therein, and pivoted at one end at or near the neutral point of the permanent magnet, and playing at the free end between the poles of the permanent magnet, adjustable stops on the poles of the permanent magnet, for regulating the motion or vibration of the core, and an escapement, anchor, and type-wheel, substantially as set forth.



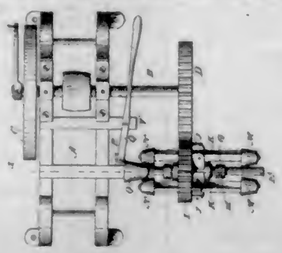
5. The combination, with a single coil and a permanent magnet, of a divided core for the coil, each division carrying one part of an anchor, and normally held together by a spring, substantially as set forth.

6. The combination of a divided anchor, a stop carried thereby, and

an arm on the type-wheel shaft, so arranged that the arm shall contact with the stop when the divided anchor is forced apart, substantially as set forth.

7. A combined escapement and unison device, consisting of a divided armature and an anchor normally held together, and a stop on the type-wheel shaft, arranged to contact when the divided anchor is forced apart, and stop the type-wheel shaft at a predetermined point, substantially as set forth.

291,706. AUTOMATIC TENSION FOR SEWING-MACHINES. DANL. P. FITZGERALD and WM. LYON, Newark, N. J. Filed Aug. 4, 1883. (No model.)



Claim.—1. In an automatic tension device for sewing-machines, a thread-clamping device composed of a stationary thread-rest or thread-bearing, a lever bearing with one of its arms against the thread-rest, a spring adapted to operate continuously with a gentle or moderate pressure against the lever, a spring adapted to operate with a strong pressure against the lever, and means for intermittently raising said spring, releasing its pressure, constructed and combined substantially as and for the purpose shown and set forth.

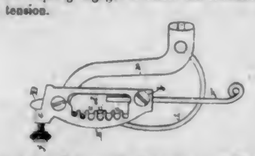
2. In an automatic tension device for sewing-machines, a thread-clamping device composed of a stationary thread-rest or thread-bearing, a lever bearing with one of its arms against the thread-rest, a spring adapted to operate continuously against the lever, means or mechanism for regulating the tension of said spring, a spring adapted to operate with a strong pressure against the lever, and means for intermittently raising said spring, releasing its pressure, constructed and combined substantially as and for the purpose shown and set forth.

3. The combination of a supporting-frame secured upon the machine-frame, a thread-bearing lug projecting from said supporting-frame, a lever of the first class, pivoted upon the supporting-frame and resting against the thread-bearing lug, a set-screw turning vertically in one end of the lever, a capped spring bearing against the lower end of said screw, a spring secured at one end to the supporting-frame and bearing with its other end against the other end of the lever, and means from the mechanism of the machine for intermittently raising said spring after the loop has been drawn up, as and for the purpose set forth.

4. In an automatic tension device for sewing-machines, the combination of a stationary thread rest or bearing, a lever bearing with one arm against the thread-rest, a spring bearing continually with a gentle pressure against the lever, means for adjusting said pressure, a spring bearing against the lever with a strong pressure, means from the mechanism of the machine for intermittently raising said spring after the loop has been drawn up, and means for adjusting the throw of said mechanism as and for the purpose shown and set forth.

291,707. FLUE AND PIPE WELDER AND FITTER. JOHN COALMAN FLECK and WILSON HERRING, Stewartsville, Ind. Filed June 20, 1883. (No model.)

Claim.—1. In a machine for fitting and welding boiler-tubes, the combination of a shaft or mandrel, a wheel mounted to revolve upon the same, arms or levers mounted in boxes upon the face of said wheel and extending rearwardly through slots in the same, welding-rollers upon the front ends of said levers, friction-rollers upon the rear ends of the same, a conical sleeve adjustable upon the shaft or mandrel beneath the friction-rollers, and suitable operating mechanism, substantially as set forth.

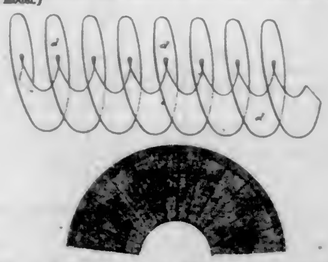


2. In a machine for fitting and welding boiler-tubes, the combination of a shaft or mandrel, a wheel mounted upon the same, and having arms or levers provided with welding-rollers at their front ends, mechanism for forcing the same against the mandrel, and a sleeve or collar adjustable upon the said mandrel, substantially as and for the purpose set forth.

3. The combination of the shaft or mandrel, the wheel journaled upon the same, and provided with arms or levers having friction-rollers at their inner ends, the conical sleeve having an arm or bracket at its inner end, and a lever connected pivotally with the said arm or bracket, and fulcrumed upon a bracket extending laterally from the frame, as set forth.

4. In a machine for fitting and welding boiler-tubes, the combination of a frame, a main shaft extending laterally from said frame and carrying a gear-wheel, a shaft or mandrel extending laterally from the frame, parallel to the main shaft, a pinion mounted upon the said mandrel and meshing with the gear-wheel upon the main shaft, arms or levers mounted in the said pinion, and having welding-rollers at their front ends and friction-rollers at their rear ends, a collar adjustable upon the mandrel in front of the pinion, a conical sleeve adjustable in rear of the pinion beneath and between the friction-rollers, and a lever arranged to operate the said sleeve, substantially as and for the purpose set forth.

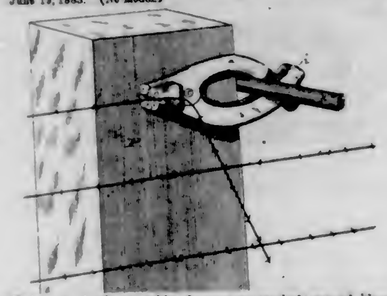
291,708. TAKE-UP MECHANISM FOR SEWING-MACHINES. LOUISA FOSS, East Boston, Mass., Administratrix of George Fox Foss, deceased. Filed July 25, 1883. (Model.)



Brief.—The device is intended for use with a single wax-thread sewing-machine. The vibratory arm carries a thread-guide, which is adjustably secured to it. The arm is crowded away from the head of the machine by a spring, the tension of which is resisted by the thread. The upper end of the spring engages in either one of a series of notches for varying the tension.

Claim.—1. A bar, E, in combination with a rod, F, which is vertically adjustable therein, and provided with an eye for the wire, a bracket, to which said bar is pivoted, and a spring, which bears against said bar to cause it to apply tension to the thread, substantially as set forth.

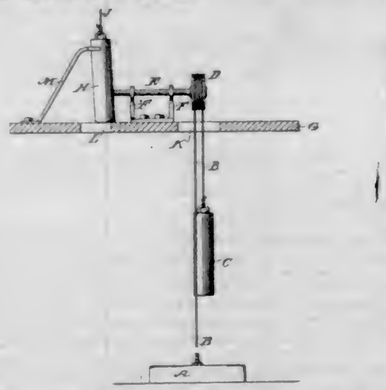
2. A pivoted tension-arm provided with a series of notches at different distances from the pivotal point of said arm, in combination with a spring which engages with any one of said notches, and which may have its end or operative part shifted from one of them to any other, for the purpose of lessening or increasing the tension, substantially as set forth.



291,709. BUFFING-WHEEL. HERBERT E. FOWLER, New Haven, assignor to the Fibrous Buff Company, Hartford, Conn. Filed Sept. 26, 1883. (No model.)

Claim.—1. In combination with a mandrel and the clamping ends of a buffing-wheel, a fabric for the same having one edge longer than the other, so as to be coiled as a flat spiral around the mandrel, the threads of the warp following a circular direction, and the threads of the weft crossing the same in radial lines from the center or axis, substantially as set forth.

2. A fabric for buffing-wheels having one edge longer than the other, so as to be adapted to being coiled up into a flat circular form of numerous layers, substantially as set forth.



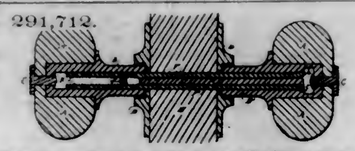
291,710. WIRE-STRETCHER. WALTER G. GARTH, Lodebar, Va. Filed June 19, 1883. (No model.)

Claim.—1. A wire-stretching forceps composed of parts *a b*, hinged together at *c*, and having their ends crossed, as shown, to constitute a loop, *g*, adapted to receive a lever, *h*, and provided with wire-gripping jaws *d e*, graduated to grip wires of different sizes, as set forth.

2. A wire-stretching forceps composed of parts *a b*, hinged together at *c*, and having their ends crossed, as shown, to constitute a loop, *g*, adapted to receive a lever, *h*, and provided with wire-gripping jaws *d e*, extending laterally, so that the wire may pass through said jaws and along the side of the forceps, as shown.

291,711. BILGE-WATER ALARM. GEORGE W. GILMORE, Webster, Pa. Filed Oct. 15, 1883. (No model.)

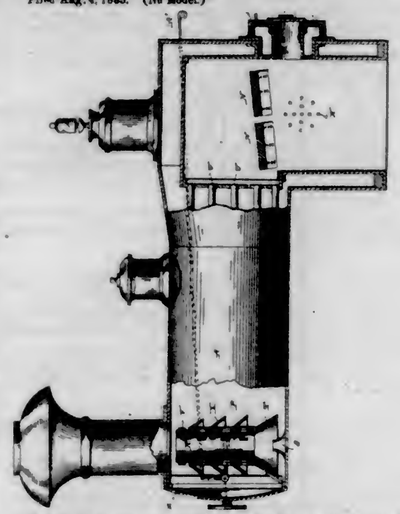
Claim.—1. In a bilge-water alarm, the combination, with a drop-weight, of a screw supported in bearings and abutting against said weight, and provided with a pulley and a float and weight on the opposite ends of a rope passing around said pulley, substantially as herein shown and described.



2. In a bilge-water alarm, the combination, with the drop-weight H, the screw E, supported in bearings and abutting against the same, and the pulley D on said screw, of the rope B, passing over said pulley, and provided with the float at one end and the weight C at the other, the float being heavier than the weight, substantially as herein shown and described.

3. In a bilge-water alarm, the platform G, provided with the holes K L, the drop-weight H, and the brace M, for supporting the weight upon said platform, in combination with the screw E, provided with the pulley D, the rope B, passing over said pulley, and the float A and weight C on opposite ends of the rope, substantially as herein shown and described.

291,712. KNOB ATTACHMENT. WILLIAM H. GOUIN, Chatham, Ontario, Canada, assignor of one-half to Charles H. Wood, same place. Filed Sept. 25, 1883. (No model.)

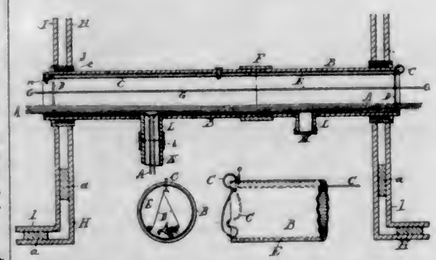


Claim.—In a door-knob attachment, a spindle consisting of two flat metal plates, each having one end bent slightly outward and the inner side of the other end serrated for a portion of its length, and a shorter similar straight plate adapted to separate the first-named plates, whereby

291,712.

a fastening-pin may be passed between said plates to engage with the serrated portion thereof, substantially as herein shown and described.

291,713. DRAFT-REGULATOR. WM. F. GRAESLER, Williamsport, Pa. Filed Aug. 4, 1883. (No model.)



Claim.—The combination, with the boiler-furnace of a locomotive, of the slotted or perforated exhaust-flue or draft-regulating pipe located in the smoke-box thereof, the similarly slotted and skirted jacket surrounding said flue, its slots and skirts being in a plane with the series of horizontal flues of the boiler, and the mechanism for operating the skirted jacket from the cab, substantially as and for the purpose specified.

291,714. MEDICAL COMPOUND. DANIEL A. GREEN, Scott, N. Y. Filed Mar. 24, 1883. Renewed Oct. 10, 1883. (No specimens.)

Claim.—The medical compound for the purposes described, the same consisting of mutton-tallow, honey, pine-pitch, beeswax, linseed-oil, saltpeter, borax, alum, salt, hen's oil, skunk's oil, castile soap, laudanum, spirits of turpentine, oil of origanum, ether, and oil of sassafras, combined in about the proportions specified.

291,715. UNDERGROUND ELECTRICAL CONDUCTOR. JOHN GREEVES and JOHN H. BLEDO, Paterson, N. J. Filed May 11, 1883. (No model.)

Claim.—1. The means herein shown and described for discharging the induced electricity from the insulating-coating of a series of electrical conducting-wires, consisting of the naked wire C, laid parallel with the said series of conductors, and the connections D, united to the wire C at intervals and brought into contact with the several insulating-coat-

ings, the whole being closed in a metallic pipe, and the wire C being connected to the pipe at intervals, substantially as herein set forth.

2. The combination, with the well-hole lining H, of the wooden chamber I, insulated therein, substantially as shown and described.

3. The combination, with the well-hole lining H and wooden chamber I, of the sleeves J and the pipes B, secured therein, as and for the purpose set forth.

291,716. ELECTRICAL INSULATING MATERIAL. JOHN GREIVES, Paterson, N. J. Filed Apr. 30, 1883. (No specimens.)

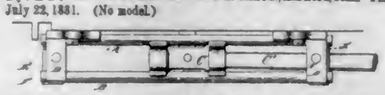
Brief.—Improvement on Letters Patent No. 278,536, dated May 29, 1883.

Claim.—1. The electrical insulating material composed of caustic lime in powder, hydrated or otherwise, united with common rosin in a fused state, substantially in the manner and proportions specified herein.

2. The electrical insulating material composed of caustic lime in powder, common rosin, and a fixed oil, the whole combined substantially in the manner and proportions herein specified.

291,717. ELECTRICAL INSULATING MATERIAL. JOHN GREIVES, Paterson, N. J. Filed Aug. 2, 1883. (No specimens.)

Claim.—1. The composition herein described for an electrical insulating material, consisting in rosin and natural silicate of magnesia—as talc or soapstone—united or combined by fusion, substantially as and for the purpose set forth.

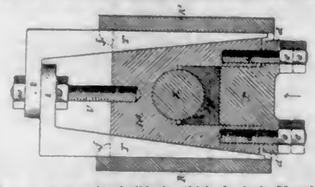


2. The electrical insulating material consisting in rosin and natural silicate of magnesia tempered by an admixture of fat or oil, substantially as and for the purposes set forth.

291,718. ELECTRICAL INSULATING MATERIAL. JOHN GREIVES, Paterson, N. J. Filed Aug. 15, 1883. (No specimens.)

Claim.—1. The insulating material composed of crystalline lime carbonate, as marble, spar, &c., reduced to powder, and combined with rosin, by fusion of the latter, substantially as herein set forth.

2. The composition of rosin and crystalline lime carbonate, prepared substantially as described, and modified by the addition of asbestus, substantially in the proportions set forth.



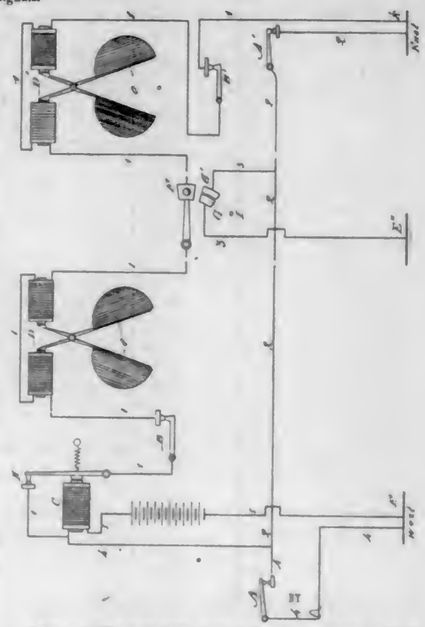
291,719. SEWING-MACHINE. JOHN H. GRIFFIN, Hartford, Conn. Filed July 22, 1881. (No model.)

Claim.—1. The combination, with the bed of a sewing-machine, of a fixed standard and a movable jaw and screw forming a clamp, and adjustable guide-bars forming the shuttle-race, said guide-bars being held in position by the clamp, substantially as stated.

2. The combination, with a sewing-machine bed, of the fixed standards or brackets, movable posts, and set-screws, the same forming clamping devices, the round guide-rods and adjusting-screws forming the shuttle-race, the shuttle-carrier having concave bearing-surfaces, and suitable driving mechanism, substantially as described.

291,720. CRANK-PIN SLIDE OF DIRECT-ACTING STEAM-PUMPS. JNO. P. GRISCOM, Pottsville, Pa. Filed Nov. 16, 1883. (No model.)

Claim.—1. A cross-head slide in which the body M and block N are combined with the follower P, and with bolts for confining the follower to the body and for adjusting the said block N, substantially as set forth.



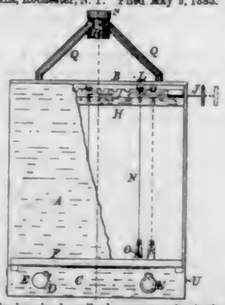
2. The combination of the body M, the plates R R', and taper keys T T' with devices for the adjustment of the said keys, substantially as specified.

3. The combination of the body M of the slide and the plates R R' with the taper keys T T', having heads *t*, that of one key overlapping the other, and with a stud-bolt, U, substantially as described.

4. The combination of the body M of the slide, the adjustable taper keys adapted to grooves in the edges of the body, and the plates R R', having lugs between which fit the said keys, substantially as set forth.

291,721. RAILWAY-SIGNAL SYSTEM. WILLIAM HADDEN, Brooklyn, N. Y. Filed Feb. 19, 1883. (No model.)

Brief.—Normally-closed circuit-signals at "safety." Train entering section from the left operates circuit-closer A, effecting nothing, but immediately thereafter opens B, breaking the signal-circuit at H by de-energizing C. As train leaves section, it opens B', effecting nothing, but on closing A' re-energizes C, closes signal-circuit at N, and returns signals to "safety." Manual key F, for use of station master, also controls signals.



Claim.—1. The main signal-circuit and its signal-magnets, as herein specified, in combination with the switch F, contact-plates G G', circuit-wires 3 2 4, magnet C, battery, wires 5, and earth, as and for the purpose specified.

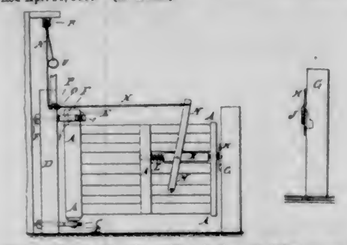
2. In an electric railroad-signal system, the circuit formed of the wire 4, circuit-closing track-instrument A, magnet C, and wire 5, including main-line battery, in combination with the circuit formed of the wire 1, contact-points H, circuit-breaking track-instruments B B', and signal-magnets D D', the said wire 5 and battery forming a part of the main-line circuit when the contact-points H are closed, as herein specified.

3. In an electric railway-signal system, the circuit formed by the earth-connection E', circuit-closing track-instrument A', wires 2 and 4, magnet C, battery, wire 5, and earth-connection E, the contact-points H, in combination with mechanism for operating the semaphores, as specified.

291,722. APPARATUS FOR DRYING PHOTOGRAPHIC PAPER. BENJAMIN F. HALE, Rochester, N. Y. Filed May 9, 1883. (No model.)

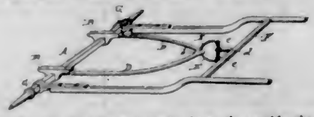
Claim.—1. The herein-described apparatus for drying photographic paper, consisting of the box A, provided with suitable air inlet and outlet passages, the reciprocating frame I, bars K, having paper-clips L L, and one or more heating devices, T T, substantially as and for the purposes set forth.

2. The combination, with the box A, provided with suitable air inlet and outlet passages, of the reciprocating frame I, adapted to support the paper during the drying operation, the removable screen G, and a suitable heating device, T, substantially as and for the purposes set forth.



291,723. PEN-HOLDER. JOHN SMITH HALSEY, Buena Vista, Colo. Filed Nov. 10, 1883. (No model.)

Claim.—1. The combination of the holder, the finger-block having the central bore and the spring-recess, and the spring, substantially as set forth.



2. The combination of the holder having a serrated barrel, the finger-block having the central bore, and the spring-recess and the spring, substantially as set forth.

291,724. GATE. WILLIAM JAMES HAMILTON, New Boston, Iowa. Filed Apr. 11, 1883. (No model.)

Claim.—The combination, with a horizontal sliding spring-pressed gate-bolt, K, of the stationary post-plate H, having the slot I, and along its inner edge the flange J, adapted to receive, guide, and stop said bolt, as described.

291,725. TWO-WHEELED VEHICLE. WILLIAM M. HAMILTON, Euclid, Ohio, assignor of two-thirds to Frank E. Tracy and Fred H. Oviatt, both of same place. Filed Sept. 22, 1883. (No model.)

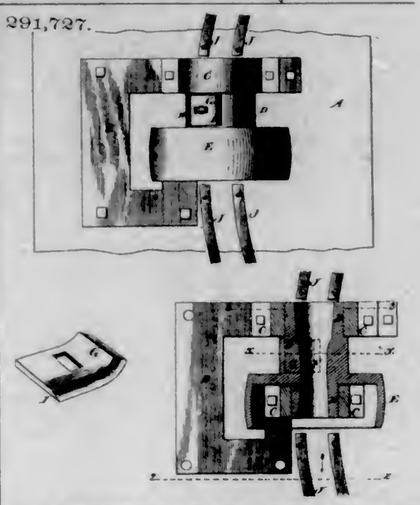
Claim.—1. In a two-wheeled vehicle, the combination, with a box, B, mounted loosely on the axle, and adapted to support the vehicle-body, of a rod rigidly secured thereto, and a spring device connecting the rod to the shafts, said spring device operating vertically, substantially as set forth.

2. In a two-wheeled vehicle, the combination, with the boxes loosely mounted on the axle, of the two rods respectively extending forward therefrom, and a spring device adapted to operate in a vertical plane connecting the forward extremities of said rods indirectly to the shafts, substantially as set forth.

3. In a two-wheeled vehicle, the combination, with the boxes loosely mounted on the axle, and the two rods having their rear extremities respectively secured to said boxes, and their forward extremities united in a joint, of a spring device adapted to operate in a vertical plane and connecting said joint to the cross-bar of the shafts, substantially as set forth.

4. In a two-wheeled vehicle, the combination, with boxes B, rods D, and arms E, of a bolt, *c*, springs *e*, and arm *d*, substantially as set forth.

291,726. BUCKLE. IGNATZ HARTMANN, St. Louis, Mo. Filed Oct. 22, 1883. (No model.)

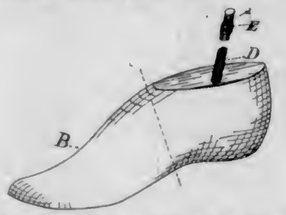


Claim.—A double loop hinged at its center to the tongue-bar of a buckle, and extending from the tongue-bar directly upward and downward, for the purpose of binding the strap directly opposite and against the tongue-bar, as described.

291,727. TUBULAR CUTTER-LATHE. LEWIS S. HAYES, Cortland, N. Y. Filed Nov. 21, 1882. (No model.)

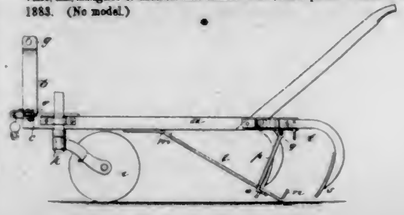
Claim.—1. In a machine for turning curved pieces of wood, or straight pieces with curved portions, a revolving hollow knife-holder having a slit in which a curved knife is secured, said holder curving outwardly in both directions from the knife-bearings, combined with said curved knife and with curved and straight guides, as and for the purposes set forth.

291,727.



2. The combination, with the holder D, having knife-bearing F, and curved outwardly as shown, the knife G, adjusting-screw H, and interchangeable straight or curved guides J, as set forth.

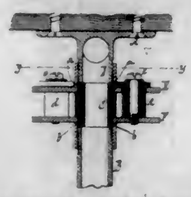
291,728. JOINER'S MARKING-GAGE. EBENEZER HEWES, Unionville, Conn. Filed Nov. 26, 1883. (No model.)



Claim.—The combination, in a marking-gage, of a block or fence having a transverse perforation and a vertical perforation intersecting the periphery of the transverse perforation, a rod sliding in the transverse perforation and having a marker at its end, a screw fitting in the vertical perforation having a concave or recess in its side, and a thumb-nut fitting upon the end of the screw, as and for the purpose shown and set forth.

291,729. METHOD OF EXHIBITING BOOTS AND SHOES. CHAS. L. HIGGINS, Montreal, Quebec, Canada, assignor to John E. Wheeler, Trustee, Lynn, Mass. Filed July 28, 1883. (No model.)

Claim.—The improvement in the art of exhibiting boots and shoes, consisting in distending and holding distended the uppers thereof by means substantially as described, whereby their symmetrical form and shape are exposed and maintained by elastic pressure, all substantially as and for the purpose set forth.



291,730. CULTIVATOR. FREDERICK LAWRANCE HILSABECK, Shelbyville, Ill., assignor to himself and James Ward, same place. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination, with the beam *a*, of the two bars *l p*, the former passing through a hole near the end *o* of the latter, as shown and described.

2. The supporting device having its bars *l p* hinged at *m q* to the beam, one passing through a slot at the angle end *o* of the other, to enable said bars to be swung up or down together, as described.

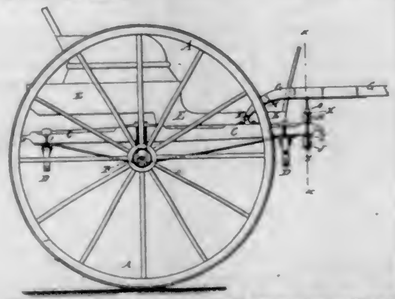
291,731. INSULATING-CONNECTION FOR ELECTRIC-LIGHT FIXTURES. CHARLES H. HINDS, New York, N. Y. Filed June 26, 1883. (No model.)

Claim.—1. In an electric-light chandelier-fixture, the combination of the suspending-bracket A, constructed to be attached to the ceiling, the chandelier-suspending pipe B, the screw-flanges E and F, the connecting-bolts *c*, and an insulating material interposed between the flanges, substantially as described.

2. In an electric-light chandelier-fixture, the combination of the suspending-bracket A, constructed to be attached to the ceiling, the chandelier-suspending pipe B, the screw-flanges E and F, the insulating-plug C, means for connecting the flanges, and an insulating material arranged between the flanges, substantially as described.

291,732. COMBINED SHOVEL AND SHIELD. JOHN J. HOLLAND, New Orleans, La. Filed May 23, 1883. (No model.)

Claim.—1. A combined shovel and shield constructed with a sectional handle and a removable blade secured in a slot of the handle, substantially as shown and described.



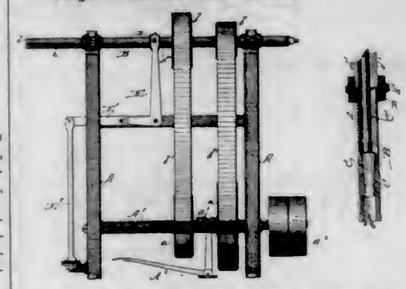
2. The combination, with the blade A and handle B, formed of hollow sections *b b'*, of the pouch C, for the handle-sections, and the pouch D D', for the blade, substantially as shown and described.

3. The combination, with the handle-section *b*, slotted to receive the blade A, of the fixed pin *c'* and the thumb-screw c^3 and nut c^3, substantially as shown and described.

4. The sectional tubular handle, constructed of section *b*, having bottom plug, *e*, slotted to receive the shovel-blade, and fitted with a removable stopper, *d*, and the section *b'*, having a rigid bottom, *e*, and a cap, *d'*, substantially as shown and described.

5. The pouch D D', combined with the strong strap *h*, having hook-connections *g* which pass through the apertures a^3 of the blade A when it is adjusted as a shield, substantially as shown and described.

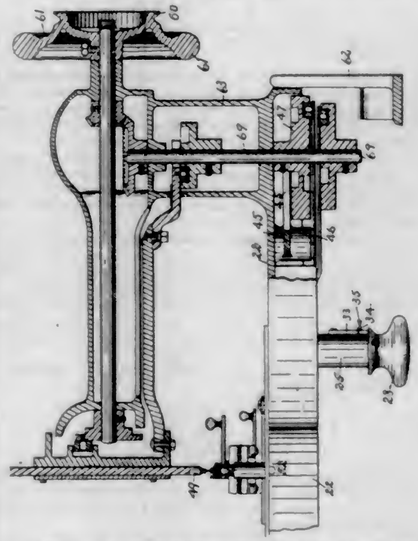
291,733. ROAD-CART. HENRY HORTOP, Rutherford, Cal. Filed Sept. 25, 1883. (No model.)



Claim.—1. A road-cart constructed with springs above and below the forward ends of the side bars, and kept in place by staples attached to the thills, as set forth.

2. In a road-cart, the combination, with the side bars, C, and the thills G, of the staples H, the yokes J M, the nuts K O, the guide-eyes I, and the springs L, substantially as herein shown and described, whereby a certain amount of play will be given to the thills, to prevent the unpleasant motion of the cart-body, and the cart can be readily adjusted for large and small horses, as set forth.

291,734. ARTIFICIAL STONE. WILLIAM HOWELL, Philadelphia, Pa. Filed Nov. 19, 1883. (No specimens.)



Claim.—The herein-described composition of matter to be used as artificial stone, consisting of muriatic acid, flour of sulphur, molasses, iron scale, sand, and cement, prepared and combined substantially as specified.

291,735. BROOM-MACHINE. FRANK S. HOTT and PETER L. STORCH, Chicago, Ill. Filed June 1, 1883. (No model.)

Claim.—In a broom-machine, the frame A, having a driving-shaft with suitable driving and belt pulleys, hollow mandrel B, formed with a slitted and notched end, having a conical interior surface, plug B', and grooved collar D, secured by pin *d*, passing through slots in the mandrel, in combination with the cone-headed follower C, with shank C', and spring C^2, yoke-lever E, lever E', and foot-lever E^2, all constructed and arranged to operate substantially as and for the purpose set forth.

291,736. BUTTON-HOLE STITCHING-MACHINE. DANIEL W. G. HUMPHREY, Chelsea, Mass., assignor to the Rapid Button-Hole Machine Company. Filed June 18, 1883. (No model.)

Claim.—1. In a button-hole stitching-machine, a slotted work-plate, a cloth holding and feeding clamp, and a feed-wheel having a double feeding-groove, a pivoted driver and two concentric sets of teeth, the outer set forming a complete circle and the inner set an arc of a circle only, combined with a recessed hub, around which said feed-wheel may rotate, and mechanism for imparting an intermittent rotary motion to said feed-wheel, substantially as described.

2. A slotted work-plate, a cloth holding and feeding clamp, and a feed-wheel having a feeding-groove and two concentric sets of teeth, as described, combined with two driving-pinions of unequal diameters, mounted on a common axis, the smaller pinion being connected with the larger pinion, but adapted to rotate independently thereof in one direction, and a driving mechanism constructed to operate the larger pinion directly and the smaller pinion indirectly through its connection with the larger pinion, substantially as described.

3. A slotted work-plate and a cloth holding and feeding clamp, combined with a feed-wheel adapted to operate said clamp, said feed-wheel being provided with two concentric sets of teeth, as described, the inner set forming an arc which is provided with yielding teeth at both ends, substantially as set forth.

4. Feed-wheel 16, having two sets of teeth, as described, in combination with two pinions of unequal diameters, having a common axis rotated at a uniform speed, and respectively engaging the teeth of the feed-wheel, as specified, and so arranged that the smaller pinion, when operative as the driver of the wheel, is actuated through a pawl mechanism carried by the larger pinion, substantially as specified.

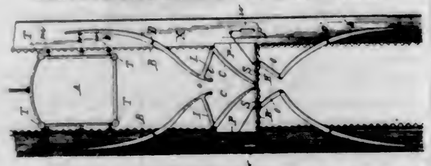
5. In combination, feed-wheel 16, pinions 23 and 30, mounted upon a common axis, and having a capability of movement transverse to the plane of said wheel, and pinion 31, provided with two sets of teeth, and arranged to be driven at times by said wheel as an idler, and at times to serve as an intermediate between pinion 23 and wheel 16 to reverse said wheel, substantially as specified.

6. Pinions 23 and 30, mounted upon a spindle or arbor, 24, journaled in the machine-bed, spring 27, arranged to uphold said arbor and pinions, and knob 28, attached to the end of said arbor, whereby said pinions may be depressed by the hand of the operator to disengage them from the feed-wheel and engage them with the intermediate pinion, and be turned to reverse or move said wheel backward, as and for the purposes specified.

7. In a button-hole stitching-machine, a needle-bar and mechanism for reciprocating the same vertically and horizontally, combined with a traveling cloth-clamp and means for moving the said cloth-clamp continuously forward during a period of time greater than that occupied by the needle-bar in making one complete vertical reciprocation, substantially as described.

8. In a button-hole stitching-machine, a needle-bar and mechanism for reciprocating the same vertically and horizontally, combined with a traveling cloth-clamp and means for moving the said clamp continuously forward during a period of time approximately equal to three-fourths of the time occupied by the needle in making two complete vertical reciprocations, substantially as hereinbefore set forth.

9. The combination of the hub 25, pinion-arbor 24, spring 27, and hand-knob 28, with a gravitating latch adapted to fall into its operative position automatically when said knob is depressed, substantially set forth.



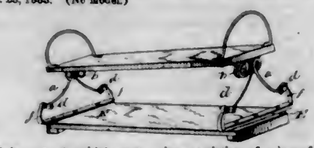
10. The combination of the hub 25, pinion-arbor 24, spring 27, and hand-knob 28, with a gravitating latch adapted to fall into its operative position automatically when said knob is depressed, and a stop for limiting the movement of the said latch, substantially as described.

11. The work-plate 70, formed with a recess, 71, and the spreaders 72 and 74, pivoted to said work-plate, and having their loop-spreading points arranged within said recess, in combination with an under needle and looper, substantially as described.

12. The work-plate 70, having the recess 71, the pivoted spreaders 72 and 74, having offset spreading-points arranged within said recess close against the under side of said work-plate, combined with an under needle and looper, substantially as described.

13. The work-plate 70, having the recess 71, the pivoted spreaders 72 and 74, having spreading-points arranged in the said recess, and the upholding-plates 78 and 79, for sustaining said spreaders, combined with an under needle and looper, substantially as described.

291,737. SELF-OPENING AND SELF-CLOSING HATCHWAY. DAVID HUMPHREYS, Norfolk, Va. Filed Nov. 7, 1883. (No model.)

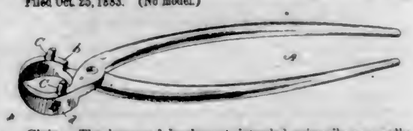


Claim.—1. In an elevator-way, the combination, with the uprights provided with sectional tracks, of the hinged doors provided with track-sections on their under faces adapted to join the track-sections on the uprights when the doors are opened, and levers connected with the doors and fulcrumed to the uprights, whereby the doors may be automatically closed by the ascent and descent of the car, substantially as specified.

2. In an elevator, the combination, with the uprights having the sectional notch-track and the hinged doors having track-sections on their under faces, of the upper levers fulcrumed to the uprights above the doors, provided at their lower ends with rigid outwardly-extending arms connected by inwardly-extending arms hinged to the rigid arms and to the upper faces of the hinged doors, substantially as specified.

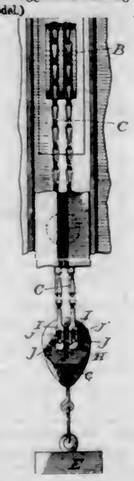
3. In an elevator, the combination, with the uprights having the sectional notched tracks, and the hinged doors in the elevator-well, provided with the notched track-sections on their under faces, of the lower levers fulcrumed to the uprights and connected at their upper ends by hinged arms connected by hinges to the under faces of the hinged doors, substantially as specified.

4. In an elevator, the combination, with the uprights having the sectional notched tracks and the recesses for the reception of the hinged doors above the floor-levels, and the hinged doors having the track-sections on their under faces, of the upper levers fulcrumed to the uprights, provided at their lower ends with nibs or projections for engaging and holding the doors open, and with rigid arms connected by hinged arms to the upper faces of the doors, substantially as specified.



291,738. VEHICLE-SPRING. SAMUEL HUNT, Lockport, N. Y. Filed Oct. 23, 1883. (No model.)

Claim.—1. A vehicle-seat spring consisting of a loop for securing it to the vehicle-seat by means of metallic straps, and a double-coil spring articulated to a bracket by means of hinge-joints for securing it to the wagon-bed, and flaring supports terminating in eyes, substantially as shown and described.



2. In a vehicle-seat spring, the combination of the double-coil spring A, having flaring supports *a*, and eyes *d*, loop B, metallic straps C, hinge-joints A, and bracket E, substantially as shown, and for the purpose described.

291,739. STAPLE-PULLER. JAMES C. IRVIN, Sand Spring, Iowa. Filed Oct. 25, 1883. (No model.)

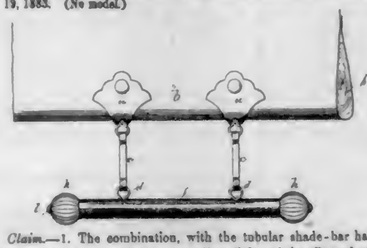
Claim.—The improved implement, intended primarily as a puller for staples, consisting of the handles A A, pivoted to each other and provided in front of their pivoted portion with wedge-shaped jaws, the points of which abut against each other, said jaws being provided upon their plane surface with downwardly-projecting lugs, the parts being organized substantially as shown, and for the purpose set forth.

291,740. SASH-BALANCE. GEORGE M. JEWETT, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed Aug. 4, 1883. (Model.)

Claim.—1. In a device for hanging sashes, the double-chain attached to rotating side plates, in combination with the weight attached to the central plate, substantially as set forth.

2. The combination, with a pulley and two chains attached to the sash, of a weight and a device for equalizing the strain on the chains, constructed substantially as set forth.

3. In a device for hanging sashes, loops I and horizontally-slotted plates F, in combination with vertically-slotted plate G and pins J.



4. A sash-pulley having flanges B′ B′, for retaining and separating the chains, and ledges *b*, upon which the wide portion of the chain rests, and between which the thicker portion rests, as described, and for the purpose set forth.

5. In a device for hanging sashes, plug or thimble D, having lugs *d*, over which the chains are passed, in combination with bracket *d′*, having arms which pass through the ends of the chains, whereby each chain is given a double attachment to the sash.

6. A plate having vertical slots and plates riveted thereto, and having horizontal slots, in combination with two chains attached to loops, and pins passing through said loops and the plates, whereby unequal strain upon the chains is equalized, and they are always kept at an exact distance apart.

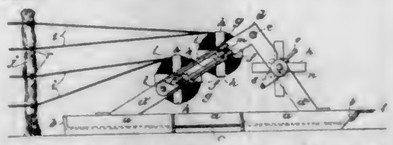
7. Loops I, having slots with an enlargement, as described, in combination with plates F and G and pins J, whereby the parts may be adjusted to different lengths of chains.

291,741. SHADE-BAR. HUBERT L. JUDD, Brooklyn, N. Y. Filed Nov. 19, 1883. (No model.)

Claim.—1. The combination, with the tubular shade-bar having mortises and the eyes for the suspending-links, of the slip end pieces slotted to retain the said eye, substantially as specified.

2. The combination, with the shade-bar, of the slip end pieces, the end ornaments, and the headed pins passing through said ornaments and connected to the slip end pieces, substantially as set forth.

3. The combination, with the tubular shade-bar, of the globular ornament, one side of which is in contact with the end of the shade-bar, and means for attaching the said globular ornament in place, substantially as set forth.



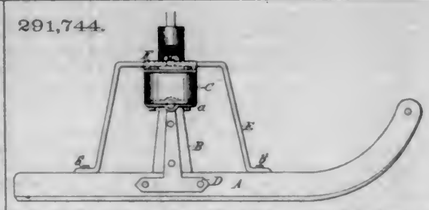
4. The combination, with the globular end ornament, of a pin passing through the same, and a tubular shade-bar, substantially as set forth.

5. The combination, with the end ornament, of a pin passing through the same, the slip end piece to which the pin is soldered, and the tubular shade-bar, substantially as set forth.

6. The combination, with a tubular shade-bar, of suspending-eyes, slip end pieces slotted to retain the suspending-eyes, the corrugated globular end ornaments, and the attaching-pins, substantially as set forth.

291,742. WITHDRAWN.

291,743. MACHINE FOR STRETCHING AND REMOVING FENCE-WIRES. JOHN N. KILLOUGH, Aurora, Tex. Filed July 25, 1883. (No model.)

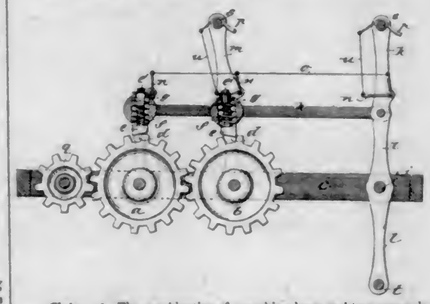


Claim.—1. In a machine for stretching and removing fence-wires, the combination of the sled *a b*, frame *d e*, spool-carrying shafts *g*, brake device *k l m*, windlass *n*, carrying lever-arms *o*, spool *h*, crank *s*, ratchet *p*, and pawl *q*, substantially as shown and described.

2. The combination, with the shaft *g*, spools *h*, and frame *d*, of the jaws *k*, pivoted together, pivoted to the frame at *l*, and provided with the screw *m* at their free ends, as and for the purpose specified.

291,744. SOB-SLED. PIRMIN KOEPPER and HERMAN KOEPPER, Fond du Lac, Wis. Filed Sept. 10, 1883. (No model.)

Claim.—1. In a sleigh-bob, the combination, with the runners A

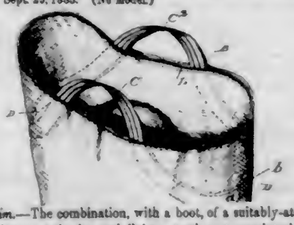


291,744.

and knees B, of the mortise cross-beam C, provided with the bearings *a* on the under side, and the metal braces D, securely bolted to the runners and to the knees, and having trunnioned ends fitted within said bearings, substantially as set forth.

2. In a sleigh-bob, the raves E, having long hole or slot in about their center, in combination with the cross-beam C, having flanged metal plates F, in center of which lug *c* is formed for said hole or slot in raves E, substantially as shown and described, and for the purpose set forth.

291,745. MECHANICAL MOVEMENT. FREDERICK KUBEL, Riverside, Iowa. Filed Nov. 6, 1883. (No model.)

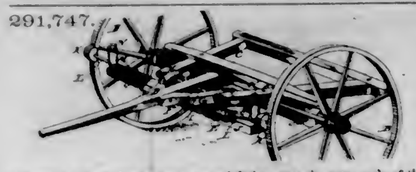


Claim.—1. The combination of a working-lever and two reversely-acting pawls and pawl-levers with a pair of toothed wheels, *a b*, geared together, said pawl-levers being connected to the working-lever, substantially as described.

2. The trip-levers *n* and a hand-lever, *p*, combined with the pawls *s*, pawl-levers *d*, and pair of toothed wheels *a b*, said wheels being geared together and the pawls being reversely arranged, substantially as described.

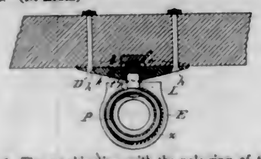
3. The pawl-stems *d′* and springs *g*, arranged in the sockets *f* of the pawl-levers *d*, in combination with wheels *a b* and trip-levers *n*, said pawl-stems being slotted for the connection of the trip-levers *n* with them, substantially as described.

291,746. BOOT-STRAP. CHARLES BURNHAM LANE, Plainwell, Mich. Filed Sept. 29, 1883. (No model.)



Claim.—The combination, with a boot, of a suitably-attached strap inserted between the leg and lining, starting at a point about midway between the sides, extending upwardly and above one side, forming a loop, C, thence down around the boot-leg and up at the other side, forming a loop, C^2, and thence down and terminating adjacent to the starting-point, substantially as set forth.

291,747. WAGON-BRAKE. SAMUEL W. LEE, Litchfield, Pa. Filed May 10, 1883. (No model.)

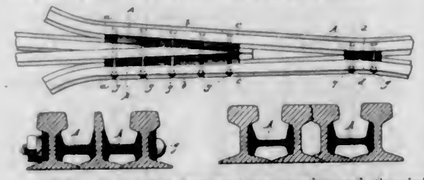


Claim.—In an automatic wagon-brake, the combination of the cross-bar fastened upon the tongue, having a slight longitudinal play, extending to near the periphery of the wheels, and having the bails upon its upper surface near its outer ends, the beat rods, having the brake-shoes upon their outer ends, and hinged with their inner bent ends in the bails upon the upper surface of the cross-piece, and the upright guides fastened upon

291,747.

the outer ends of the cross-piece, and fitting over the outer ends of the brake-arms inside the brake-shoes, as and for the purpose shown and set forth.

291,748. NECK-YOKE. MILTON V. LONGWORTH, Delphos, Ohio. Filed Jan. 4, 1883. (No model.)

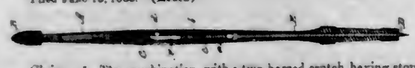


Claim.—1. The combination, with the pole-ring, of the D-shaped leather covering-pieces E and the filling *z*, of stouter leather, substantially as specified.

2. The combination, with the centrally-recessed yoke-bar, A, having the packing *c* in the recess, of the circular pole-ring P, covered with leather, the threaded eyebolt L, directly engaging the pole-ring by its eye, and extending into the recess of the yoke-bar through the aperture of the internally-shouldered yoke-plate D, the washer B, and securing-nut, all constructed and arranged as specified.

291,749. FILLING FOR RAILROAD-FROGS. GEORGE C. LUCAS and JOHN A. PATTERSON, Cleveland, Ohio. Filed May 3, 1883. (No model.)

Brief.—A filler for railroad-frogs, made of wrought iron or steel bars, consisting of two heads or flanges made to fit the sides of the rails, and connected by a web sufficiently thin to be slightly elastic.



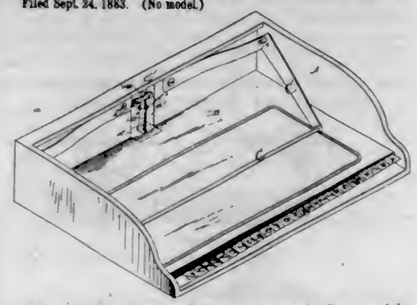
Claim.—1. As a filler for railroad frogs, crossings, and other similar purposes, wrought iron or steel bars rolled in the shape described, substantially as shown, and for the purpose set forth.

2. As a filler for railroad frogs, crossings, and other similar purposes, wrought iron or steel bars rolled in the desired shape, consisting of two heads or flanges adapted to fit the sides of the rails and connected by a web sufficiently thin to be slightly elastic under such pressure as would usually be brought to bear by passing trains, substantially as and for the purpose set forth.

3. As a filler for railroad frogs, crossings, and other similar purposes, wrought iron or steel bars rolled into the proper shape, consisting of two heads or flanges adapted to fit the sides of rails and connected by a thinner portion or web adapted to be heated and upset or compressed at any desired point when the rails should approach each other nearer than the ordinary width of the filling will admit, substantially as shown and described.

4. A filler for railroad frogs, crossings, and other similar purposes, of wrought iron or steel bars rolled in the proper shape, as described, and adapted to be heated, bent, and upset into the required shape and dimensions without planing, chipping, filing, or other similar fitting, substantially as and for the purpose set forth.

291,750. CRUTCH. WILLIAM H. D. LUDLOW, La Porte City, Iowa. Filed June 13, 1883. (Model.)



Claim.—1. The combination, with a two-barred crutch having stop projections *d d* thereon, of a rotary adjustable hand-hold and a bail or yoke, F, connected eccentrically to the ends of the hand-hold above, and connected at its lower end to an extensible prod, as and for the purpose described.

2. The combination of the two-barred crutch, the rotary adjustable hand-hold, the bail F, screw-stem *b*, jam-nut *c*, and prod-bar E, with screw-socket *a*, substantially as shown and described, and for the purpose set forth.

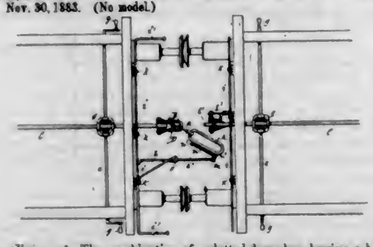
291,751. MEDICAL COMPOUND. NETTIE A. LUM, Carneiro, Kans. Filed June 4, 1883. (No specimens.)

Claim.—The herein-described compound, consisting of alcohol, oil of peppermint, oil of sassafras, oil of spearmint, oil of origanum, oil of hemlock, oil of turpentine, oil of capsicum, and gum-camphor, in substantially the proportions specified.

291,752. LETTER OR BILL FILE. OSCAR C. MACKENZIE, Chicago, Ill. Filed Sept. 24, 1883. (No model.)

Claim.—1. In a letter or bill file, a box or case having a retaining pin or stud recessed in its rear side, in combination with a series of index separating-sheets, each of which is provided with a projecting tag having an elongated hole, substantially as and for the purpose set forth.

2. In a letter or bill file, a box or case provided with a series of index separating-sheets, in combination with a hinged retaining pin or stud, and means, substantially as described, for confining the free end of said pin at will, substantially as and for the purpose set forth.



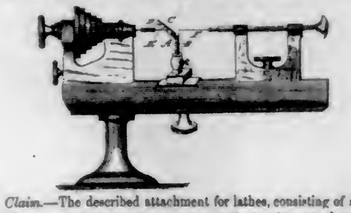
3. In a letter or bill file, a series of separating-sheets having index-letters upon their forward edges, and their rear edges provided with a projecting tab formed with an elongated opening, substantially as and for the purpose set forth.

4. In a letter or bill file, a box or case formed with a recess in its rear side, and having its retaining pin or stud hinged at its lower end in said recess, and its upper end confined in a slotted plate by means of a latch, substantially as and for the purpose set forth.

5. In a letter or bill file, the case A, having a pin, D, hinged in a recess in its rear side, and the index-sheets B, each provided with a projecting tab having an elongated hole, in combination with a guide-tube having a flange or projection on one end passed through the tabs and over the hinged pin, substantially as and for the purpose set forth.

6. In a letter or bill file, the box A, provided with spring-clamp C, and having a pin or stud, D, hinged at its lower end in a recess, *a*, in the back of the box, and its upper end confined in an open slotted plate, *b′*, by means of the latch C′, in combination with the separating index-sheets B, provided with the tabs *d*, having elongated holes *d′*, and the flanged guide-tube D′, all constructed and arranged to operate substantially as and for the purpose set forth.

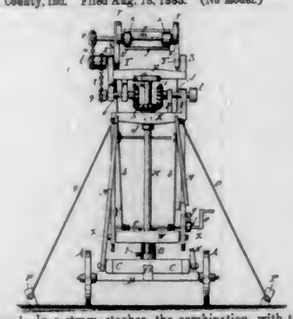
291,753. CAR-COUPLING. PETER MADSEN, Berlin, Germany. Filed Nov. 30, 1883. (No model.)



Claim.—1. The combination of a slotted draw-bar, having a hook-shaped end, a coupling-chain composed of several links, the rear link being pivoted to a slide-piece of the draw-bar, means connected to the slide-piece for adjusting the same in forward or backward direction on the draw-bar, and a lever mechanism connected to the outermost link, whereby the coupling-chain is raised or lowered and shifted laterally, substantially as and for the purpose set forth.

2. The combination of a slotted draw-bar, C, having a hook-shaped end, slide-piece *b*, coupling-chain B *a* A, pivoted by link B to the slide-piece *b*, screw-spindle *c*, turning on bearings of the draw-bar, a worm-wheel, *d*, transverse crank-shaft *e*, guided in slotted side straps, *d'*, and having a central worm, *f*, and cranks *g* at the ends, substantially as set forth.

3. The combination of a slotted draw-bar, C, having a hook-shaped end, and slide-piece *b*, a coupling-chain, B *a* A, pivoted to the slide-piece *b*, pivoted levers *h h'*, having connecting-piece *m m'* at the outer end, the latter being guided along the rod *n* of the main link A, and a laterally-sliding and auxiliary turning rod, *i*, having handles *i'*, substantially as set forth.

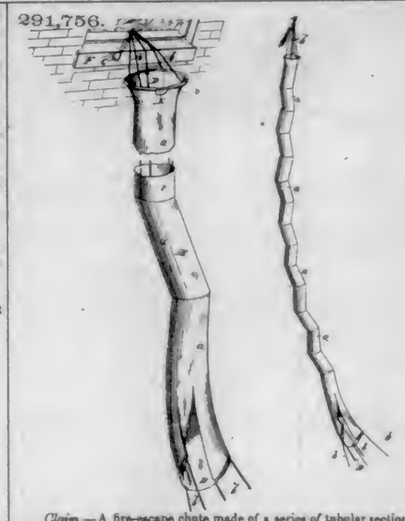


4. The combination of a slotted draw-bar having a fork-shaped end, a coupling-chain pivoted to the slide-piece of the draw-bar, a coupling-hook, also pivoted to the slide-piece, means to adjust the coupling-chain and coupling-hook forward or backward, and means whereby the same are raised or lowered for coupling or uncoupling, substantially as described.

291,754. ATTACHMENT FOR WATCH-MAKERS' LATHES. OSCAR F. MAIN, Marion, Iowa. Filed Aug. 7, 1883. (No model.)

Claim.—The described attachment for lathes, consisting of a shank adapted to be adjusted in or in proximity to the hand-rest, and provided with an arm extending at right angles and having a series of apertures countersunk on one side, substantially as shown, and for the purpose set forth.

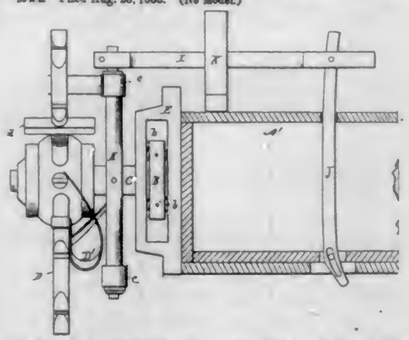
291,755. STRAW-STACKER. THOMAS MAJOR, Jackson Township, Clinton County, Ind. Filed Aug. 18, 1883. (No model.)



Claim.—1. In a straw-stacker, the combination, with the upright or vertical shaft and upper cross-bar, provided with two independent shafts, geared to the upright shaft, of the uppermost cross-bar, resting upon a collar or plate on the upper end of the vertical shaft, and connected to one of the independent shafts, the carrier, and its hangers, connected to the uppermost cross-bar, substantially as and for the purpose set forth.

2. In a straw-stacker, the combination, with the upright shaft and the lower cross-bar, of the carrier-frame superposed above the said shaft, the side brace-bars connected to the lower cross-bar, and having rolls at its upper end, upon which the carrier-frame rests, the pulleys *c d*, one set arranged on the carrier-frame and the other set on the brace-bars, the crank-shaft *e*, and the cords *b*, with their upper ends connected to the said brace-bars, thence passed over the pulleys on the carrier-frame and back over the pulleys on the brace-bars, and connected to the crank-shaft *e*, substantially as and for the purpose set forth.

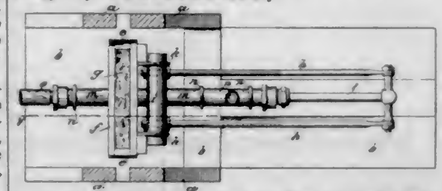
3. In a straw-stacker, the combination, with the cross-bar K, having standards *k*, the cross-bar R, having hangers *p* and standards S, the carrier-frame V, having hangers U, and the hinging bolts T, of the gear-wheels *h i n*, the shafts *j o*, and the chain-wheels and chains *q s t u r v*, substantially as herein shown and described, whereby the carrier can be adjusted vertically and laterally without affecting the driving mechanism, as set forth.



291,756. FIRE-ESCAPE. OTIS G. MOORE and MORRIS H. MARCUS, Edenburg, Pa. Filed Mar. 22, 1883. (No model.)

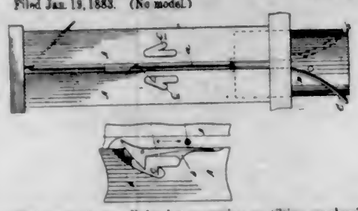
Brief.—The tubular sections are secured to each other in such manner as to incline to each other alternately in opposite directions.

Claim.—A fire-escape chute made of a series of tabular sections attached to each other in such manner as to be inclined to each other alternately in opposite directions, substantially as herein shown and described, and for the purpose set forth.



291,757. CORN-PLANTER. WILLIAM PARKS MARSHALL, Integ Grove, Iowa. Filed Aug. 28, 1883. (No model.)

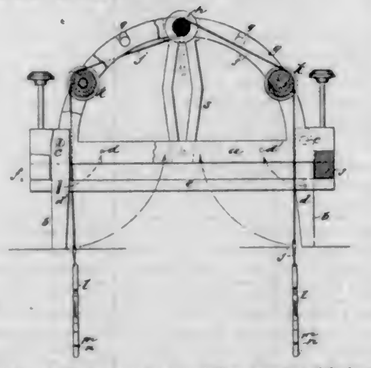
Claim.—The combination, with a seed-planter, of a beam or bar pivotally connected at its forward end, and provided at its rear end with anti-friction rollers, the loop for supporting the rear end of the bar, the spoke-wheel, with the cams and markers, the pivoted lever, and connecting-bar and seed-slide, substantially as and for the purpose set forth.



291,758. WAVE-POWER. THOMAS MAYER, Albany, N. Y. Filed Aug. 22, 1883. (No model.)

Brief.—A wave-power consisting of a triangular frame, to which is suspended a dash-board having a connecting-rod for giving motion directly or by crank to connected machinery.

Claim.—A wave-power consisting of a frame, *a b c*, and a dash-board, *f*, suspended from bar *c*, and having a connecting-rod, *h*, for imparting motion either directly or by a crank to connected machinery, substantially as shown and described.



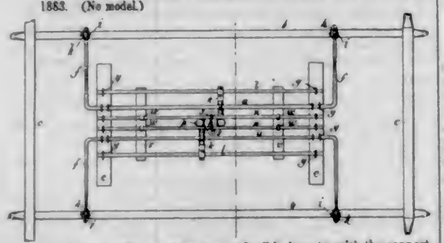
291,759. WATER-ELEVATOR. JAMES F. MCCALMONT, Wayne, Nebr. Filed Jan. 19, 1883. (No model.)

Claim.—1. In a well-bucket operating or tilting mechanism, the combination, with the bucket having studs or projections at its sides, of the cam-levers set in recesses in suitable supports, and adapted to guide the bucket to one side of its line of elevation when the hoisting-rope is slackened.

2. In a well-bucket-tilting device, the combination, with the bucket having opposite studs or projections at its sides, of the tilting cam-levers and uprights having recesses, substantially as and for the purpose set forth.

291,760. BURIAL-WINDLASS. JOHN P. MCDONALD, Litchfield, Ill., assignor to himself and Elijah Benjamin Jordan, same place. Filed Nov 13, 1883. (No model.)

Claim.—1. The improved burial-windlass, consisting of the bench *a b*, arch *g*, cranked drum *h*, cords *j*, guide-rollers *k*, and the grappling-tongs *l*, combined and arranged substantially as described.



2. The combination of the tongs *l*, having detaching springs *n*, bar *m*, and pins *p*, with the suspending-cords *j*, drum *h*, arched supporting-frame *g*, and bench *a b*, substantially as described.

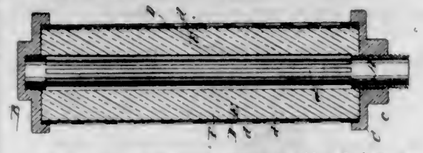
3. In a burial-windlass, the combination of arch *g*, bench *a*, legs *b*, skids *c*, and the thumb-screws *d*, said legs being pivoted to the bench, substantially as described.

4. The combination, in a burial-windlass, of the bench *a*, legs *b*, skids *c*, thumb-screws *d*, arch *g*, cranked drum *h*, cords *j*, guide-rollers *k*, and the grappling-tongs *l*, substantially as described.

5. The combination of the bar *m*, having pins *o*, springs *n*, pins *p*, and a series of holes for said pins *p*, with the grappling-tongs, substantially as described.

291,761. CARRIAGE-SPRING. BENJAMIN PIERCE MORRISON, Abingdon, assignor of one-third to Lock & Lincoln, Marion, Va. Filed May 12, 1883. (No model.)

Claim.—1. The combination of flexible bars *l n* with the supporting-bars *a*, having arms *f*, and being connected to the bed-frame *e* and side bars, *b*, substantially as described.



2. The combination, in a carriage or other spring, of supporting-bars *a*, having arms *f*, and being connected to the side bars, *b*, and bed-frame *e*, elastic bars *l n*, arranged on the opposite sides of the supporting-bars *a*, and the cross-arms *k*, rigidly connected to the supporting-bars *a*, and also connected to elastic bars *l n*, substantially as described.

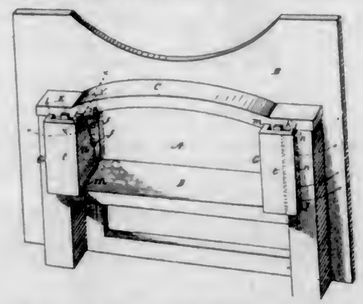
3. The combination, in a carriage or other spring, of a pair of supporting-bars, *a*, having arms *f*, and being connected to the side bars, *b*, and the bed *e*, elastic bars *l n*, arranged with each of said supporting-bars *a*, and cross-arms *k*, connecting said supporting-bars *a* and elastic bars *l n* together, and said cross-arms being also connected together by the double shackle *o*, and thereby connecting the two supporting-bars and their elastic bars, and forming one compound equalizing-spring, substantially as described.

4. The combination of adjusting-bars *v* with the supporting-bars *a* and elastic bars *l n*, substantially as described.

5. The combination of the double shackle *o*, cross-arms *k*, and the elastic bars *l n* and supporting-bars *a*, the said arms *k* being connected to said shackle and said elastic bars, substantially as described.

291,762. NOISELESS STEAM-NOZZLE. CARLETON W. NASON, Montclair, N. J. Filed Oct. 2, 1883. (No model.)

Claim.—1. In a steam-nozzle, a filling or packing of asbestus, applied substantially as and for the purpose set forth.



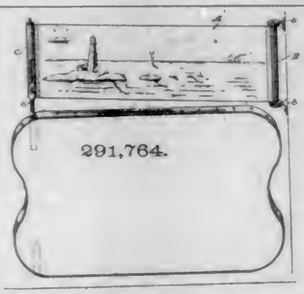
2. A steam-nozzle made substantially as herein shown and described, and consisting of a slotted tube surrounded by asbestus fiber, and a cylinder surrounding the latter, as set forth.

3. In a steam-nozzle, the combination, with the slotted tube A, of the asbestus fiber F, and the slotted cylinder D, substantially as herein shown and described.

4. In a steam-nozzle, the combination, with the slotted tube A, of the asbestus fiber F, a slotted cylinder, D, and a layer of asbestus cloth on the inner surface of the cylinder D, substantially as herein shown and described.

5. In a steam-nozzle, the combination, with a slotted tube, of a closed cap screwed on one end and closing the said end, a centrally-apertured cap screwed on the other end, a cylinder held between the caps, and asbestus fiber filled in between the slotted tube and the cylinders, substantially as herein shown and described.

291,763. FURNACE-MOUTH. TIMOTHY O'BRIEN, Boston, Mass. Filed June 11, 1883. (No model.)

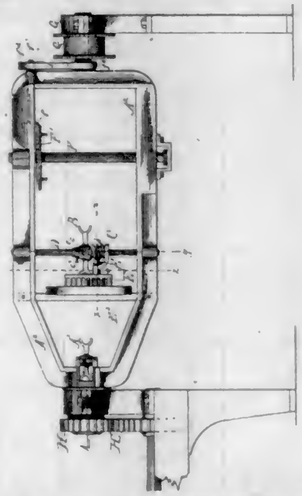


Claim.—1. In a furnace-mouth substantially such as described, the guards or jambs G, provided with the perforations *n*, in combination with the plate B, provided with the perforations *f*, constructed, combined, and arranged to operate substantially as set forth.

2. In a furnace-mouth substantially such as described, a guard for protecting the jamb, so constructed and arranged as to form a flue for conducting a current of air around said jamb on its outer side, and discharging the same into the corner of the furnace to produce more perfect combustion of the fuel in that locality, substantially as specified.

3. The guard G, consisting of the body *a*, end piece, *t*, and flange *l*, for protecting the jamb of a furnace, substantially as set forth.

291,764. RAILWAY PASSENGER-CAR. EDWIN P. OSGOOD, Malden, Mass. Filed Nov. 12, 1883. (No model.)



Claim.—1. A flexible and extensible partition adapted to be con-

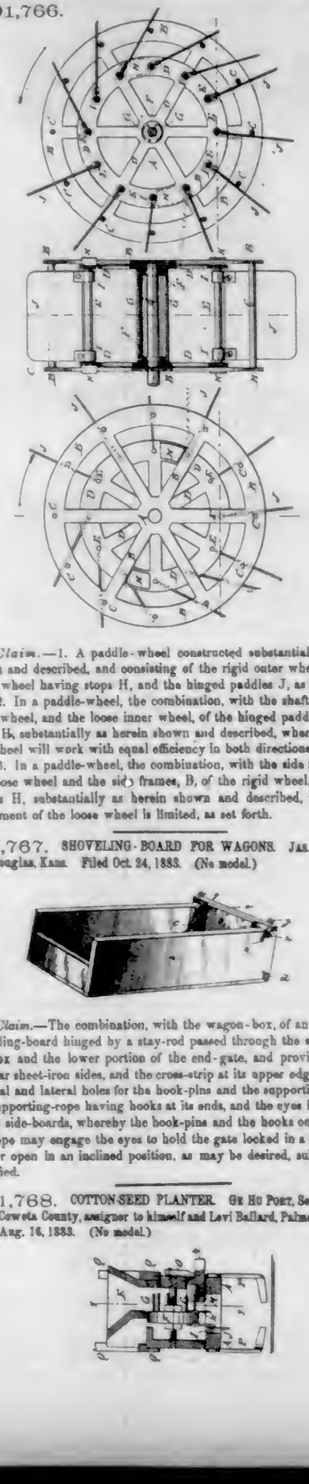
nected to the car in line with the back of the seat, and to be held extended upon said back, whereby the occupants may be secluded or protected, substantially as described.

2. A curtain, A, in combination with the roller B, attached to the car, the rod C, and means, substantially as described, for connecting the rod C to the back of the car-seat, as set forth.

291,765. WIRE-TWISTING MACHINE. MARK A. PENNEY, Des Moines, Iowa, assignor to William L. Carpenter, same place. Filed Apr. 16, 1883. (No model.)

Claim.—1. The combination, with a distributing-wheel adapted to be actuated by the wire passing over it, and a plain shaft for supporting the same, of devices actuated from the distributing-wheel, for imparting a to-and-fro movement to said wheel, substantially as specified.

2. The combination, with the rotating distributing-wheel and a plain shaft for supporting the same, and upon which it slides to and fro, of the frame, the rack stationary therein, and a pinion traversing said rack, and connected to said wheel, so as to be actuated thereby, substantially as specified.



3. The combination, with the frame and distributer-wheel of a twister, of a device for imparting a traversing movement to said wheel, consisting of the rack, the pinion traveling around said rack in an endless path, and the intermediate devices connecting the wheel and pinion, substantially as specified.

4. The distributer-wheel, in combination with the rack, the surrounding guide, the pinion and collar traveling around said rack and guide, and the intermediate devices, whereby the motion of the wheel is communicated to said pinion and collar, substantially as specified.

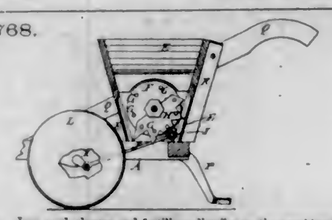
5. The combination of the distributer-wheel, the worm on the hub thereof, the arm provided with the sleeve on which the wheel rotates, and said sleeve, with the shaft D, the worm-wheel, the pinion, the rack, the surrounding guide, and the collar, acting in conjunction with the guide, substantially as specified.

291,766. FEATHERING PADDLE-WHEEL. CHRISTIAN J. PETERSEN, Boston, Mass. Filed May 31, 1883. (No model.)

291,766.

Claim.—1. A paddle-wheel constructed substantially as herein shown and described, and consisting of the rigid outer wheel, the loose inner wheel having stops H, and the hinged paddles J, as set forth.

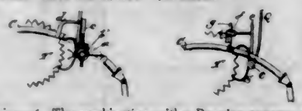
2. In a paddle-wheel, the combination, with the shaft A, the rigid outer wheel, and the loose inner wheel, of the hinged paddles J and the stops H, substantially as herein shown and described, whereby the paddle-wheel will work with equal efficiency in both directions, as set forth.



3. In a paddle-wheel, the combination, with the side frames, D, of the loose wheel and the side frames, B, of the rigid wheel, of the stop-blocks H, substantially as herein shown and described, whereby the movement of the loose wheel is limited, as set forth.

291,767. SHOVELING-BOARD FOR WAGONS. JAS. I. PLUMMER, Douglas, Kans. Filed Oct. 24, 1883. (No model.)

Claim.—The combination, with the wagon-box, of an end-gate or shoveling-board hinged by a stay-rod passed through the side-boards of the box and the lower portion of the end-gate, and provided with the angular sheet-iron sides, and the cross-strip at its upper edge, having the vertical and lateral holes for the hook-pins and the supporting-rope, and the supporting-rope having hooks at its ends, and the eyes in the outside of the side-boards, whereby the hook-pins and the hooks on the supporting-rope may engage the eyes to hold the gate locked in a vertical position or open in an inclined position, as may be desired, substantially as specified.



291,768. COTTON-SEED PLANTER. GE HU POST, Seventh District, Coweta County, assignor to himself and Levi Ballard, Palmetto, Ga. Filed Aug. 16, 1883. (No model.)

291,768.

Claim.—In a seed-planter and fertilizer-distributer, the combination, with the frame A and seed-box E, provided with a circular opening in one side to receive the feed-wheel, and having an adjustable concaved bottom, M, of the feed-wheel F, fitting in the opening in the seed-box and provided with horizontal pins G and serrated wheel H, drive-wheel L, having an axle provided with a crank, K, connecting-rod J, and crank I, substantially as and for the purpose set forth.

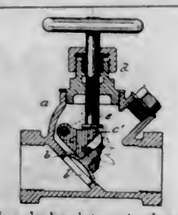
291,769. STEAM GAGE AND ALARM. AUGUSTUS PORTILLO, Lowell, Mass. Filed Oct. 18, 1883. (No model.)

Claim.—1. The combination, with a Bourdon pressure-gage and its primary index-hand, of a secondary index-hand adapted to be set at a predetermined pressure, an alarm, means for connecting both hands with the extensible steam-tube of the gage, and means for releasing the striking mechanism when the primary index-hand registers the pressure at which the secondary index-hand has been set, whereby the movement of the primary index-hand and the sounding of the alarm are controlled from the expansible steam-tube, substantially as described.

2. The combination, with a Bourdon pressure-gage and its primary index-hand, of the movable post provided with a secondary index-hand adapted to be set at a predetermined pressure, a pinion mounted loosely on said post and meshing with the sector-rack of the gage, a cam operated from the loose pinion, an alarm and mechanism for striking the same, a plate engaging with a portion of the alarm mechanism to prevent its movement, and a projection for the said cam to operate on to release the alarm mechanism and cause the alarm to be sounded when the predetermined pressure is reached, substantially as described.

3. The combination, with the primary index-hand, its pinion, steam-tube, and sector-rack of a pressure-gage, of a post, a projection extending laterally therefrom, a secondary index-hand mounted on the post over the said projection, a pinion fitted loosely on the said post, a cam between the pinion and projection of the post, adapted to vary the distance between the pinion and said projection, a spring-plate beneath the pinion, provided with a pin at one end, a post carrying a hammer, verge, and arm engaging with the pin on the spring-plate, the gong, and the train of clock-work mechanism, substantially as described.

4. The post provided with the lateral projection and secondary index-hand adapted to be set to a predetermined pressure, the pinion mounted loosely on the post and carrying the cam, and the spring-plate, in combination with the primary index-hand, an alarm, and mechanism for operating the several parts when the predetermined pressure is reached, substantially as described.



5. The combination of the sector-rack, the primary index-hand and its pinion meshing with the rack, the post carrying the secondary index-hand, the pinion mounted loosely on said post and meshing with the sector-rack, the cam operated from the pinion, and a projection for the cam to operate to slide the said pinion for the purpose of operating an alarm-striking mechanism, substantially as described.

6. The combination, with a Bourdon steam-gage, of the post provided with the hammer and tripping-arm, an alarm-gong, a scape-wheel operating the verge, a secondary index-hand adapted to be set at a predetermined pressure, a primary index-hand connected with the expansible tube of the gage, and means operated from the said expansible tube for tripping the arm to cause the alarm to be sounded at a predetermined pressure, indicated by said secondary index-hand, substantially as described.

7. The combination, with a Bourdon steam-gage, of an alarm, a primary index-hand to indicate the varying pressure of the steam, a secondary index-hand to designate the point at which the alarm shall be sounded, means for connecting the primary index-hand with the steam-gage tube, and means operated from said expansible tube for releasing the striking mechanism of the alarm, whereby the expansion and contraction of said tube will control the sounding of the alarm, substantially as described.

291,770. STEAM-VALVE. RUFUS N. PRATT, Hartford, Conn., assignor to the Pratt & Cady Company, same place. Filed Mar. 27, 1883. (No model.)

291,770.

Claim.—1. In a check and stop valve, in combination, body *a*, having valve-seat *b*, swinging flap *c*, having stop *c'*, with the curved surface, and the screw-spindle *e*, the said curved surface forming a bearing for the foot of the screw-spindle *e*, whereby the play of the flap is limited, all substantially as described.

2. In a check and stop valve, in combination, the screw-spindle and the swinging flap, bearing a curved stop, the surface of which at all points in the path of the flap in swinging bears on the spindle in line of its axis, all substantially as described.

291,771. COVER FOR OPENINGS IN STOVE-PIPES. GABRIEL RASCORAVEK, Plattsmouth, Nebr. Filed Aug. 24, 1883. (Model.)

Claim.—1. As a cover for an opening in a pipe or cylindrical vessel, the cap bent to fit the outside of the pipe or vessel and provided with a spring-pressed turn-button having its cross bar or head adapted to overlap the edges of the opening and bear against the inside of the pipe, substantially as shown and described.

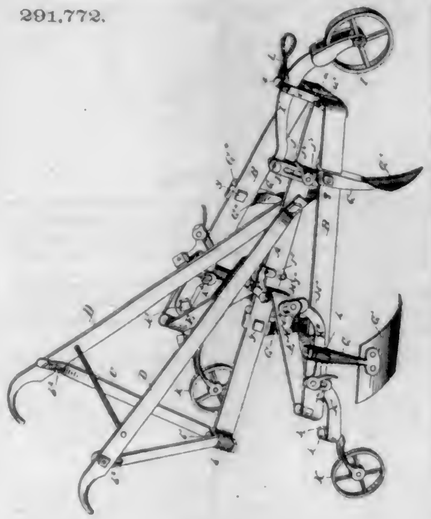
2. As a cover for openings in pipes or cylindrical vessels, the cap bent to fit the pipe or vessel, in combination with a turn-button whose shank passes through a central aperture in the cap and is capable of sliding and turning therein, and which is provided at its inner end with a cross-bar adapted to overlap the edge of opening on both sides, and a spring adapted to force the button-shank outward, substantially as and for the purpose set forth.

3. The cover or cap for openings in stove-pipes, consisting of a plate curved to fit the pipe, overlapping the opening, provided with a flange fitting closely therein, and with a spring-pressed turn-button, the ends of whose cross-bar bear against the inside of the pipe and ride up the concave sides thereof as the button is turned at right angles to the pipe, substantially as and for the purpose described.

4. The combination of the curved plate adapted to fit the pipe or vessel, the turn-button consisting of the hand-piece, the shank sliding and turning in a central aperture in the plate, and the cross-bar on the shank adapted to overlap the edges of the opening in the pipe, and the spring surrounding the button-shank and adapted to force said shank and button outward, substantially as and for the purpose described.

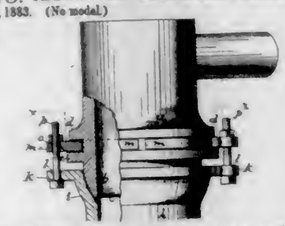
5. The combination of the cap curved to fit the pipe and overlapping the opening therein, with the turn-button having its hand-piece and shank made of one piece of doubled and bent metal rod or wire passing through and adapted to slide and turn in an aperture in the plate, and its cross-bar attached to the two ends of the bar or wire forming the shank, and the spring surrounding the shank and bearing against the cap and thumb-piece, substantially as shown and described.

291,772. COMBINED PLOW AND CULTIVATOR. HUGH REA, Village Green, Pa. Filed Sept. 5, 1883. (No model.)



Claim.—1. In a cultivator, the combination of the saddle-plate F, having parallel plate *d*, partition or flange f^5, bolts f'' f', arms or plates E, having hooked bolt f^2, thumb-nut f^3, central beam, A, and lateral or swinging beam B, substantially as shown, and for the purpose described.

2. In a cultivator, the combination, with the central beam, the side hinged beams, and the hinged arms of the latter, of the saddle-plate composed of an upper and lower plate bolted together, and one having a depending flange and hooked bolt, substantially as and for the purpose set forth.



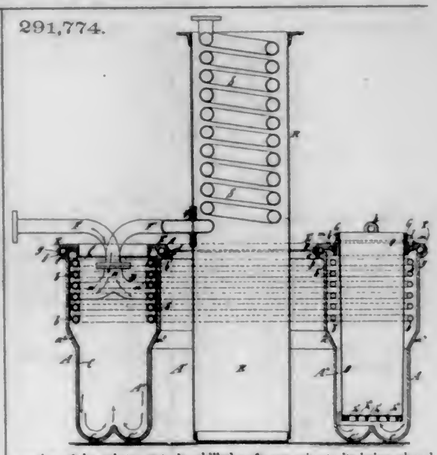
3. In a cultivator, the combination of the T-shaped plate-lever H'', having sleeve h' and cross-piece H^3, handled nut H^4, pivoted plate H, having slots h^2, screw-bolts h^3, having adjusting-nuts h^4, and plows G', substantially as shown, and for the purpose described.

4. In a cultivator, the combination, with its beam and plow-standard, of the plate-lever, with an eye or sleeve about its middle, a slot at one end and turned upward at its opposite end, the T-plate having an angular eye or apertare at one end, a middle diagonal portion, and a horizontal transverse slot at its other end, and adjusting or securing nuts, substantially as and for the purpose set forth.

291,772.

291,773. PIPE-COUPLING. ROBERT M. REILLY, Baltimore, Md. Filed May 5, 1883. (No model.)

Claim.—The combination, with the male pipe *a*, provided with the ball *b*, having an orifice, *c*, in its bottom, and flanges *d e*, and female pipe *h*, rounded out internally at its upper end, and provided with the flange *k*, having opening *l*, of the horseshoe-pieces *m*, each provided with a lug, *n*, having a hole, *o*, and pins *p*, substantially as described, and for the purpose set forth.



291,774. APPARATUS FOR ICE-MAKING AND REFRIGERATING. GEORGE H. REYNOLDS and LEICESTER ALLEN, New York, N. Y., assignors of one-half to Cornelius H. DeLamater, George H. Robinson, and William DeLamater, and the Allen Cycle Non-Chemical Refrigerating Company, all of same place. Filed Sept. 8, 1883. (No model.)

Claim.—1. The process involving, first, the placing of the substance to be chilled or frozen in a non-congealable liquid; second, the passage of the cooling medium through the non-congealable liquid for transferring the negative heat from the cooling medium to the substance to be chilled or frozen; and, third, the passage of the cooling medium through a secondary apparatus containing a portion of the substance to be subsequently chilled or frozen, substantially as and for the purpose described.

2. The process involving, first, the placing of the substance to be chilled or frozen in a non-congealable liquid; second, the passage of the cooling medium through the non-congealable liquid for transferring the negative heat from the cooling medium to the substance to be chilled or frozen in such a direction that the cooling medium enters the non-congealable liquid where it is coldest and leaves the non-congealable liquid where it is warmest; and, third, the passing of the cooling medium, after leaving the non-congealable liquid, through a secondary apparatus containing the substance which is to be subsequently chilled or frozen, substantially as and for the purpose described.

3. The process involving the passing of a cooling medium through pipes from a point of entrance to a point of exit, the said pipes being immersed in a non-congealable liquid, the placing of cans or molds containing a substance to be chilled or frozen in the non-congealable liquid, the movement of said cans or molds step by step from the point of exit of the cooling medium to the point of entrance thereof, and the subsequent passing of the cooling medium through an apparatus containing a

291,774.

portion of the substance to be chilled or frozen prior to its being placed in said cans or molds, substantially as and for the purpose described.

4. The combination, with a tank for non-congealable liquid and pipes extending through the same for the passage of a cooling medium, of a secondary tank and a pipe extending through the latter for the passage of the cooling medium, and connected with the pipes in the first-mentioned tank, whereby the cooling medium may be employed to chill the non-congealable liquid and then chill the contents of said secondary tank, substantially as described.

5. The combination, with a circular tank for non-congealable liquid and means for imparting cold to said liquid, of a turn-table placed above the tank, and upon which cans or molds containing water or other substance to be chilled or frozen may be supported, substantially as described.

6. The combination, with an annular tank for non-congealable liquid and pipes extending around the inner sides of the walls thereof for the passage of a cooling medium, the said pipes being interrupted or having a gap between their ends, of entrance and exit pipes for the cooling medium connected with the ends of said pipes, and a septum or partition dividing the tank between the point of entrance and point of exit, substantially as described.

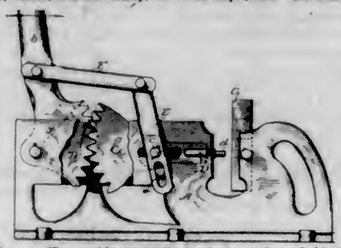
7. The combination, with the tank having the annular space A^2 for non-congealable liquid, of the two series of pipes *b b'*, the supply and exhaust headers B B', connected, respectively, with the ends of said pipes, and a turn-table arranged above the tank, and on which cans or molds containing the substance to be chilled or frozen may be placed, substantially as described.

8. The combination, with an annular tank for non-congealable liquid made widest at the upper portion, and having the walls of the wider upper portion joined to the lower portion by inclines, of circular series of pipes for the passage of a cooling medium, arranged in the wider upper portion of the tank, near the walls thereof, substantially as described.

9. The combination, with the annular tank A^3, having in its bottom the channels *c c'*, of means for cooling the liquid in the tank adjacent to the sides thereof, whereby a downward circulation is produced adjacent to the walls of the tank, and an upward circulation at the center thereof, substantially as described.

10. The combination, with an annular tank for non-congealable liquid, and a secondary tank arranged in the space surrounded by the said annular tank, of circulating-pipes arranged in both said tanks for the passage of a cooling medium, and connected together, a supply-pipe connected with the pipes in the annular tank, and an escape-pipe connected with the pipe or pipes in said secondary tank, substantially as described.

11. The combination, with an annular tank for non-congealable liquid and means for cooling the same, of a turn-table supported and adapted to turn on the upper edges of the walls of said tank and to receive through it and support ice cans or molds, substantially as described.

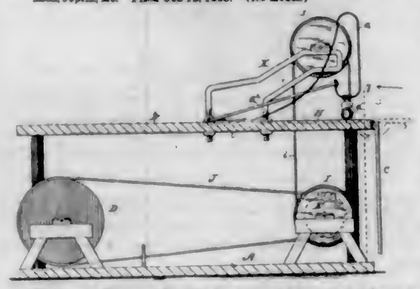


12. The combination, with an annular tank and means for cooling the same, of ice cans or molds, of segmental or wedge shape in horizontal section, adapted to be supported in said tank, and an annular turn-table placed above the tank for supporting said cans or molds, substantially as described.

13. The combination, with an annular tank for non-congealable liquid and means for cooling the same, of inner and outer turn-table rings supported independently of each other on the walls of said tank, and ice cans or molds constructed to interlock or engage with said rings, so that the rings and the circular series of cans or molds supported thereby may be turned together, substantially as described.

14. The combination, with an annular tank for non-congealable liquid and means for cooling the same, of ice cans or molds of segmental or wedge shape, arranged in the tank, and removable partitions fitted to the tank between the ice cans and molds, substantially as described.

15. The combination, with an annular tank for non-congealable liquid and means for cooling the same, of a turn-table placed above the tank, the frames G, provided with lugs or projections *l* for engaging with said turn-table, whereby said frames are caused to move with the turn-table, and two or more cans or molds secured in and depending from each of said frames, substantially as herein described.



291,775. COMPOUND METAL-WORKING MACHINE. NICHOLAS J. RICK, Vernon, Crawford County, Pa. Filed May 9, 1883. (No model.)

Claim.—1. The combination, with the frame having suitable fixed die or tool, of the eccentric B, provided with a handle, the eccentric C, pivoted on sliding bolt, the tool-holder connected also to said bolt, and suitable connecting devices, whereby the holder and eccentric C are drawn back, all substantially as described.

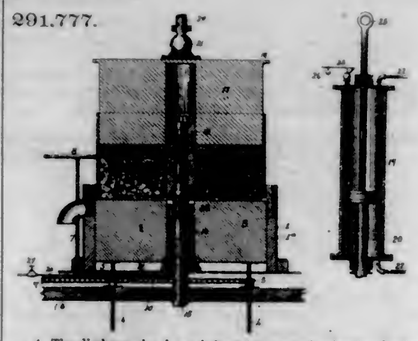
2. The combination, with the frame having suitable die or tool, G, of the eccentric B, having handle, eccentric C, pivoted with holder D on sliding bolt, the levers E, and connecting-bar F, all substantially as described.

291,776. MACHINE FOR CUTTING OUT GARMENTS. SOLOMON RICE, Joplin, Mo. Filed Oct. 12, 1883. (No model.)

Claim.—1. The plate H, with slots *j j* and back-thrust roller *a*, in combination with the table, the flexible belt-knife *i*, having sharpened edge and the distending-polleys, as and for the purpose described.

2. The combination, with the table, the endless flexible knife *i*, and its distending-pulleys, of a press-roller bearing upon the table in front of the knife to smooth wrinkles and prevent the formation of plaits, as described.

3. The bent spring G, carrying roller G' at its lower end, in combination with the link-brace G^2 and the cutting-table, as and for the purpose described.



291,777. MACHINE FOR THE REDUCTION OF WOOD AND OTHER MATERIALS TO PAPER-PULP. FREDERIC G. RITCHIE, Wallingford, Vt. Filed Oct. 1, 1883. (No model.)

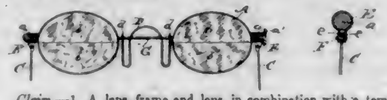
Claim.—1. In a machine for the reduction of wood or other material to paper-pulp, the combination, with a rotary wood box or hopper, of a grinding-stone fixed as to horizontal movement, a vertical driving-shaft fixed to said wood-box, and a stuffing-box within said grinding-stone, wherein the said shaft has bearing, substantially as and for the purpose set forth.

2. In combination with the grinding-stone and follower of a machine for the reduction of wood to paper-pulp, the water-supply pipe set in a groove in the stuffing-box of the driving-shaft and gland, and adapted to supply water to the grinding-surface from below, substantially as set forth.

3. The water-supply pipe having annular discharge-head adapted to supply a continuous sheet of water to the grinding-surface, substantially as set forth.

291,777.

4. The discharge-head consisting of a reservoir-chamber having apertures at top, and a concave annular plate above said chamber, adapted to receive the water and distribute it to the grinding-surface in a continuous stream, as set forth.



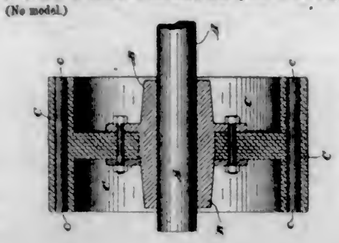
5. The combination, with the water discharge head and supply pipe, of the supporting-rods for said head, received into grooves in the gland and the stuffing-box of the driving-shaft, as set forth.

6. In combination with the core 12, having recessed or hollow portion 34, the water-supply head or nozzle covered by said core and protected from the wood in the feed-box, as set forth.

7. In combination with the rotary feed-box and the grinding-stone fixed as to horizontal movement, the adjusting screw or screws, sprocket-chain and pinions, and hand-wheel and shaft, arranged to act simultaneously to lift the stone for taking up wear, as set forth.

8. In a machine for the reduction of wood to paper-pulp, the combination, with the grinding-stone, feed-box, and follower, of the cylinder and piston above said follower, adapted to be operated by hydrostatic, steam, or other pressure, and provided with an automatic valve for regulating the force of pressure of the follower, as set forth.

291,778. SPECTACLES. FRANK K. ROBERTS, Philadelphia, Pa. Filed Nov. 26, 1883. (No model.)

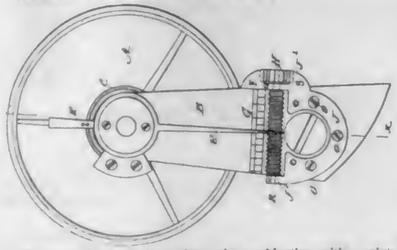


Claim.—1. A lens-frame and lens, in combination with a temple or arm, and a clamping device connecting said frame and said temple, said device being adapted to adjust said frame and hold it at different angles of inclination, substantially as set forth.

2. A lens-frame provided with a stem, *a*, in combination with a temple having an eye in its upper and forward end, a clamping collar or sleeve, which is divided and constructed with perforated lugs, and a screw which passes through said lugs and said eye, and causes said collar to clasp said stem tightly, said screw also serving as a pintle for attaching said temple, substantially as set forth.

3. A pair of spectacles having the lens-frames connected by a bar, arranged wholly between said frames and attached at its ends thereto, the bridge or bow being attached to said bar, but allowing the latter to turn with said frames while the bridge remains stationary.

4. A divided lens having the line of division coincident with its longitudinal central line, in combination with a frame inclosing said lens and devices arranged at its ends, but above or below the central line thereof, whereby said lens may be turned upon a longitudinal axis above or below said central line, substantially as set forth.

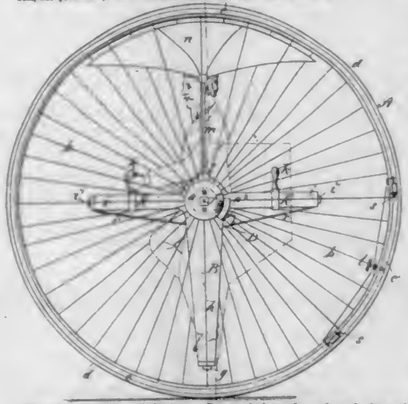


291,779. PULLEY. WM. E. ROCKWOOD, Indianapolis, Ind., assignor of one-half to Horatio C. Newcomb, same place. Filed Aug. 25, 1883. (No model.)

Claim.—1. In a pulley the web and rim of which are composed of layers of paper, pins *c*, extending through said rim from side to side, substantially as described, and for the purposes specified.

2. The combination of the hub B, the web and rim C, composed of layers of paper secured together by pasting and pressing, and wooden pins *c*, extending through the rim, substantially as set forth.

291,780. WATCH-REGULATOR. ERNEST JACQUES ROUX and LOUIS URIEL FATIO, Geneva, Switzerland, assignors to Vacheron & Constantin, same place. Filed Oct. 19, 1883. (No model.)



Claim.—1. In a watch-regulator, the combination, with a pointer-lever, of the screw-spindle, with its ends held between the semicircular plates, said spindle having a toothed head or wheel arranged in a recess of one of said plates, substantially as and for the purpose set forth.

2. In a watch-regulator, the combination, with a pointer-lever, of the plate J, the plate L, provided with hooks M M, and the screw-spindle R, having its ends held between the plate J and the hooks M, substantially as herein shown and described, and for the purpose set forth.

3. In a watch-regulator, the combination, with the plate J, having two prongs, J' J², of which the latter is provided with a recess, *a*, of the plate L, provided with the hooks M, the screw-spindle R, held between the plate J and the hooks M, and the toothed wheel or head H, mounted on the end of the screw-spindle, and fitting in the recess *a* in the plate J, substantially as herein shown and described, and for the purpose set forth.

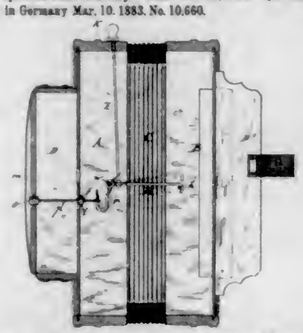
4. In a watch-regulator, the combination, with the pointer-lever E, of the plate J, provided with the prongs J' J², of which the latter has a recess, *a*, the pins K, projecting from the plate J, the plate L, provided with hooks M, of the screw-spindle R, held between the plate J and the hooks M, and of the toothed wheel or head H on the end of the spindle R, substantially as herein shown and described, and for the purpose set forth.

291,781. VELOCIPEDE. CHARLES M. SCHAFFER, Louisville, Ky., assignor to himself, JAMES T. RITCHIE, Cornelius C. Allen, and George W. Allen, all of same place. Filed June 16, 1883. (No model.)

Claim.—1. The saddle-frame B, consisting of portions A, formed with flanges *h'*, and curved arms *i*, provided with adjustable handles, substantially as described.

2. The combination, with the wheel A, of the hinged hub-segment a^2, felly-segment c', and the connecting-spokes, substantially as shown and described.

3. In a unicycle-velocipede, the swinging or suspended saddle-frame B, having the curved horizontal arms *i*, extending backward and forward of the center axis of the machine, and carrying and adapted to permit the adjustment of the hand-holds *k* along the frame, in combination with the seat D, supported upon rods *r*, connected to the outer ends of the arms *i*, and extending inward about centrally of the machine, substantially as and for the purpose set forth.

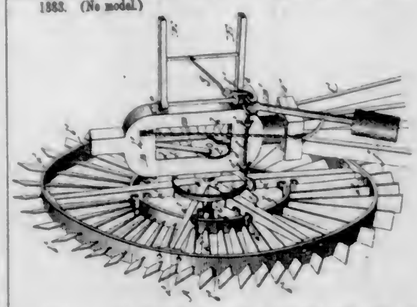


4. The combination, with wheel A, of the separable felly-section *c'* and the latches *s s*, capable of simultaneous operation by a common hand-wheel, *t*, substantially as and for the purpose set forth.

5. The combination, with wheel A, of the hinged hub-segment a^2, felly-segment, and latches *s s*, connected to and adapted to be operated by the hand-wheel *t*, substantially as and for the purpose set forth.

6. The combination, with the saddle-frame B, having flanged grooved bars *h h'*, of the treadle-bars *p*, provided with projections *p'*, adapted to slide in the flanged grooved bars *h h'*, said treadle-bars being connected by rods *q* to the disks *e* of the wheel-hubs *a*, substantially as and for the purpose set forth.

7. In a unicycle-velocipede, the combination, with wheel having the spokes connected to hubs *a*, secured to inner disks, *e*, by bolts *f*, of the saddle-frame B, with its upper ends hung on the bolts *f*, and having grooved flanges *h'*, and the treadle-bars *p*, having projections *p'*, adapted to slide in said grooved flanges of the swinging frame, said treadle-bars *p* being connected to the disks *e* of the wheel, substantially as and for the purpose set forth.



291,782. ACCORDION. ERNST SCHREYER, Hamburg, assignor to Wilhelm Spaethe, Gera, Germany. Filed Nov. 26, 1883. (No model.) Patented in GERMANY Mar. 10, 1883, No. 10,660.

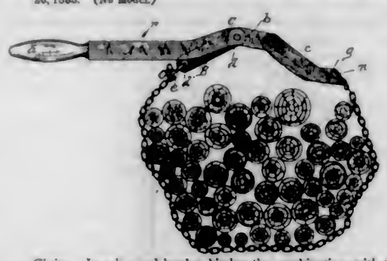
Claim.—1. In an accordion, the combination of the ends and intermediate bellows with an interior locking device adapted to connect the ends, and means whereby the locking device is applied to or released from the ends from the outside of the instrument, substantially as set forth.

2. The combination of a bottom case having a fixed transverse rod, an intermediate bellows, a top case having a fixed transverse rod, a locking-hook applied to the transverse rod of the bottom case, and means whereby the locking-hook can be applied to or released from the rod of the top case from the outside of the instrument, substantially as specified.

291,783. WINDMILL. ELI J. SCHROCK, Goshen, Ind. Filed Feb. 3, 1883. (No model.)

Claim.—1. In a windmill, the wheel A, provided with a ring, *c*, and pivoted to the head or turn-table B, in combination with a crank-rod, *f*, journaled in lugs *c' c'*, and formed with a brake at one end, adapted to engage with the ring *c*, and leaving its extreme outer end bent up, as seen at f^3, and formed with an eye connected to the vane, whereby when the rod is turned the wheel is thrown out of the wind and the brake applied, substantially as shown and described.

2. In a windmill, the combination, with the wheel A, having a ring, *c*, and journaled on the swiveled head B, and connected by a pitman, c^3, with the pump-rod D, of the rod *f*, formed with a brake, *f'*, on one end, and connected by the link *g* with the vane E, the weighted arm F, rigidly secured to the brake-rod, and the operating-cord *h*, and pulley *h'*, all constructed and arranged to operate substantially as described and shown, and for the purpose set forth.



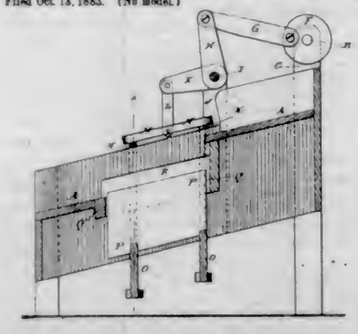
291,784. TAWING HIDES AND SKINS. AUGUSTUS SCHULTZ, New York, N. Y. Filed May 31, 1883. (No specimens.)

Claim.—The within-described process for tawing hides and skins, said process consisting in subjecting the hides or skins to the action of compounds of metallic salts—such as a solution of bichromate of potash—and then treating the same with a compound containing hyposulphurous acid, (or as it is otherwise called "thiosulphuric" acid,) such as a solution of hyposulphite of soda or of potash in the presence of hydrochloric acid.

291,785. TAWING HIDES AND SKINS. AUGUSTUS SCHULTZ, New York, N. Y. Filed July 18, 1883. (No specimens.)

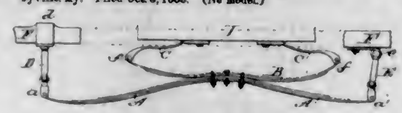
Claim.—The within-described process for tawing hides and skins, said process consisting in subjecting the hides or skins to the action of a bath prepared from a metallic salt—such as bichromate of potash—and then to the action of a bath capable of evolving sulphurous acid—such as a solution of sulphite of soda—in presence of another acid—such as hydrochloric acid—substantially as described.

291,786. LUMBER-BINDER. JAS. SEALEY, Chase, Mich. Filed Sept. 26, 1883. (No model.)



Claim.—In a log and lumber binder, the combination, with the lever A, having the concavo-convex portion *b*, of the arm C, of a similar contour and shape, provided with the groove *g*, to receive the upper edge of the lever, and a short perforated arm to receive a chain-link, the straight arm B, pivoted at its upper end to the said concavo-convex portion of the lever A, and provided at the opposite end with an eye to receive a chain-link, and the binding-chain, substantially as specified.

291,787. HORSE-DETACHER. NOAH R. SHEALY, Pine Ridge, S. C. Filed Oct. 10, 1883. (No model.)

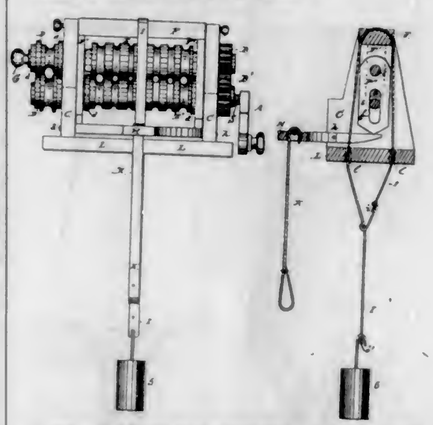


Claim.—The combination, with the ferrule B, having the spindle *b*, of the slide-cuff D, constructed as described, the stop-pin *f*, latch C, spring *d*, and spring E, substantially as specified.

291,788. COAL-CLEANER. WILLIAM HENRY SHEPHERD, Pittston, Pa. Filed Oct. 13, 1883. (No model.)

Claim.—The combination, with the chute A, having opening Q, of the stationary grate-bars R, the movable grate-bars P, the connecting-bars O, the sliding rods N, the connecting-bars M L G, the rock-shaft I, provided with crank-arms K H, and the revolving crank-shaft B, substantially as herein shown and described, whereby the pieces of slate will be made to pass out between the grate-bars, as set forth.

291,789. SIDE SPRING FOR VEHICLES. WILLIAM SHINNICK, Shelbyville, Ky. Filed Oct. 3, 1883. (No model.)



Claim.—1. The springs A, having the body connected to them by springs B and jacks C, and being connected to the side bars, F, by the rigidly-attached cranked bar D and the pivoted cranked bar E, substantially as described.

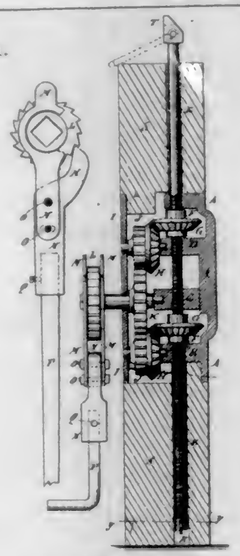
2. The vehicle side springs, A A, each having an upward convexity nearer to the rear than the front end thereof, in combination with superposed body-supporting springs made fast to said convexities, whereby the strain of the load may be equalized on the springs, where the greatest weight is rearwardly beyond the middle of the vehicle-body, as described.

3. The springs A, shackled to the front cranked bar, D, rigidly attached to the side bars, and also shackled to the cranked bar E, that is pivoted to the side bars, in combination with springs B, jacks C, and the body I, substantially as described.

291,790. MACHINE FOR ROUNDING STRAPS. ALBERT C. SIMS, Burlington, Kans. Filed Jan. 16, 1883. (Model.)

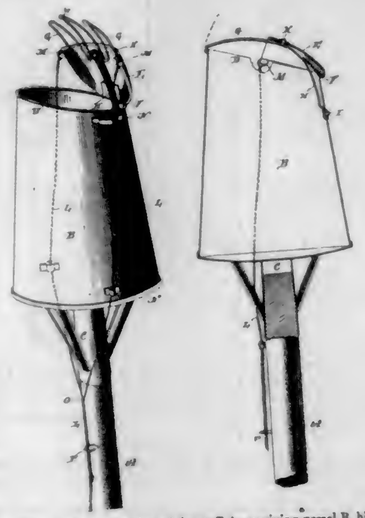
Claim.—In a machine for the manufacture of harness, the combination of roll E, having removable roll D, and thumb-nut G, and bearings in guides F'' F''', with roll E', having removable roll D', adapted to be held in position by roll D, and yoke H, with suitable operating mechanism, as shown and described.

291,791. SCREW-DRIVING MECHANISM FOR BALING-PRESSES AND OTHER USES. PATRICK SLATTERY, Charleston, S. C. Filed Aug. 23, 1883. (No model.)



Claim.—1. A screw-driving mechanism constructed substantially as herein shown and described, and consisting of the box A, the screw E, the two nuts F, the two sets of gear-wheels G H J, the intermediate gear-wheel, K, and the ratchet-wheel and pawl-lever L M N P, as set forth.

2. In a screw-driving mechanism, the combination, with the box A and the screw E, of the two nuts F, the two sets of gear-wheels G H J, and the intermediate gear-wheel, K, substantially as herein shown and described, whereby power applied to the said intermediate gear-wheel will be applied to the said screw at two points, as set forth.



3. In a screw-driving mechanism, the combination, with the intermediate gear-wheel, K, of the ratchet-wheel L, the connecting-plates M, and the pawl-lever N P, substantially as herein shown and described, whereby power can be readily applied to the said gear-wheel, as set forth.

4. The ratchet pawl-lever constructed substantially as herein shown and described, and consisting of the ratchet-wheel L, the connecting-plates M, and the pawl-lever N P, as set forth.

291,791.

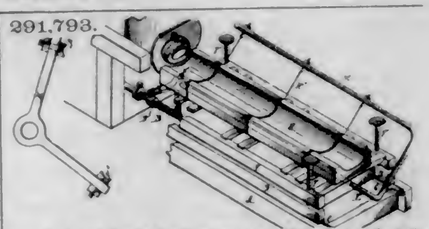
291,792. FRUIT-PICKER. GILBERT A. SMITH, Davenport Centre, N. Y. Filed Nov. 27, 1883. (No model.)

Claim.—The combination of the staff A, receiving-vessel B, hinged cover E, having the jaws G, spring H, and operating cord or wire L, all combined and arranged to operate substantially as shown and described.

291,793. TILE-MACHINE. JOHN S. SMITH, Jackson, Mich., assignor of one-half to Theodore G. Bennett, same place. Filed Nov. 30, 1883. (No model.)

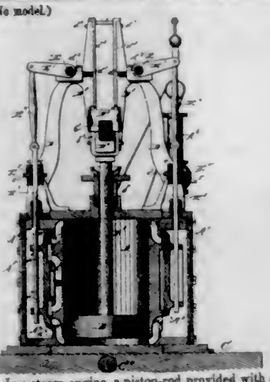
Claim.—1. In combination with a tile-machine, a table the reciprocating portion of which is moved automatically from and toward the tile-forming dies by the power which actuates the tile-machine, and by means substantially such as is set forth.

2. In combination with the reciprocating portion of a tile-machine table, the threaded shaft B and connecting mechanism for giving the table motion toward the tile-forming dies automatically, substantially as set forth.



3. In combination with the reciprocating portion of a tile-machine table, the threaded shaft B and oscillating arm H, attached to the table and connected with the thread on the shaft B, substantially as set forth.

4. In combination with the reciprocating portion of a tile-machine table, the oscillating arm and threaded shaft B, constructed with a groove to receive the arm and stop the movement of the table automatically, substantially as set forth.



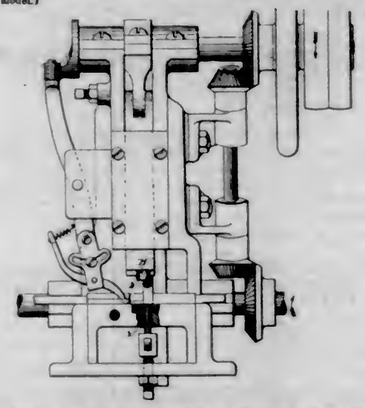
5. In combination with the reciprocating portion of a tile-machine table, the oscillating V-shaped arm H, with sectional threads H^2 at each end of the arm, so that the threaded shaft B may be engaged by shifting the cutter from one side to the other, passing once through the tile, substantially as set forth.

6. In combination with the reciprocating portion of a tile-machine table, which receives motion from the tile-forming dies by the forward thrust of the tile, a cutter moving with the table, a detent which disengages the table when the cutter is to be moved across the tile, and automatic mechanism for retracting the table when the cut is complete, substantially as set forth.

291,793.

291,794. STEAM-ENGINE. JOHN B. SMITH, Chicago, Ill. Filed June 18, 1883. (No model.)

Claim.—1. In a steam-engine, a piston-rod provided with a boxing upon its outer end, having a circular recess therein opening upon either side, in combination with a cross-head or equalizing-bar, having its center formed to fit the interior of the boxing, and tapered toward either end, substantially as shown and described.



2. In a steam-engine, the piston-rod B', formed with the socketed head B^2, and provided with a removable cap, B^3, in combination with the cross-bar or equalizer G, having the semicircular enlargement g, and tapered toward each end, the slides G' and pitmen G^2 connecting it with the cranked driving-shaft, substantially as and for the purpose set forth.

3. In a steam-engine, the sliding blocks G', formed with a recess, g', in either end, connected to the outer edges by oil-leads g^2, substantially as and for the purpose set forth.

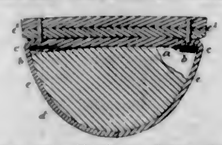
4. In a steam-engine, a steam-chest and valve, for admitting steam to the engine, located on one side of the cylinder, in combination with an exhaust-steam chest upon the opposite side, having small steam-leads connecting the ends of the cylinder, and provided with a slide-valve, adapted to open one of said leads when closing the corresponding exhaust-passage, whereby sufficient live steam is admitted behind the valve to keep it properly seated, substantially as shown and described.

5. A steam-engine consisting, essentially, of a cylinder, bed-plate, and two steam-chests, cast in one piece, and placed directly over the driving-shaft, two slide-valves, one for admitting and the other for exhausting the steam, a piston and rod provided with a swiveled equalizing-bar, having slides working in guides supported upon the main casting, and connected by pitmen with the cranked driving-shaft, and two rock-shafts journaled in boxes on the guides and provided with arms connected to the supply and exhaust valves, and operated by eccentrics on the main shaft, all combined, constructed, and arranged to operate substantially as and for the purpose set forth.

291,795. METHOD OF AND MACHINE FOR MAKING LACING-HOOKS. STEPHEN N. SMITH, Providence, R. I. Filed Aug. 4, 1883. (No model.)

Claim.—1. The hereinbefore-described method of forming lacing-hooks, consisting in first taking a strip of stock provided with tubular necks alternating with plain spaces, then cutting therefrom the blank for a hook, next indenting the end of the blank, and finally bending the blank into the form of a hook, all substantially as described.

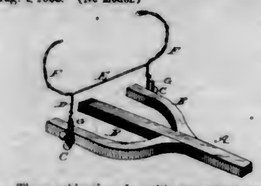
2. The machine for forming lacing-hooks, having in combination the punch and the die adapted to cut out the blank from the strip, a die mechanism for forming the indentation on the end of the blank after it is severed from the strip, the carrier, the holder for moving the blank from the cutting-die, indenting and holding mechanism, and mechanism for bending the book, all substantially as described.



3. In combination, in a machine for making lacing-hooks, the die D, the carrier beneath said die, adapted to receive the blank upon its face with a part extending beyond the edge, and with the neck in a slot, the holder for the blank corresponding in shape thereto, dies for indenting the blank, the mechanism to operate them immediately after the blank is carried to their position, and the bending mechanism, all substantially as described.

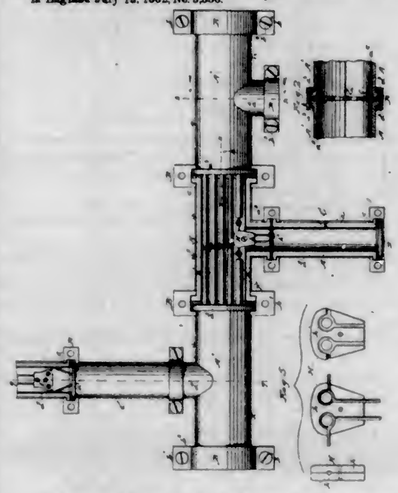
4. In combination, in a machine for making lacing-hooks, the punch for cutting out the blank, the carrier A, the holding device M, indenting-die 2, indenting and bending die 1, and the former N, all constructed to operate substantially as described.

5. In a machine for making lacing-hooks, and in combination with the punch, carrier, holding devices, the former, the pair of indenting-dies 1 and 2, the die 2 being combined with mechanism, substantially as described, whereby it is moved away from the blank after indenting, and the die 1 being combined with mechanism, substantially as described, whereby it is moved upward to bend the blank and then returned to its original position, all as described.



6. In a machine for making lacing-hooks, and in combination, the cutting-die, the carrier adapted to hold the blank with the neck in a slot, and the end projecting over its edge, the holder, and the former, indenting-dies 1 and 2, the die 1 being also combined with mechanism, substantially as described, whereby it is moved upward to bend the blank, and the slide d, the parts being combined with mechanism, all substantially as described, whereby they are returned after the slide d acts, as set forth.

291,796. MANUFACTURE OF BOOTS AND SHOES. EDWIN L. SPRAGUE, Boston, Mass. Filed Oct. 17, 1881. (No model.)



Claim.—In the art of making boots and shoes, the method of uniting the soles and upper and concealing the lasting-tacks and metal sole-fastenings, which consists in channeling the inner sole, placing a metallic clinching-surface in the said channel between the main part of the inner sole and the lip of its channel, applying the inner sole to the bottom of the last, drawing the upper over the inner sole, driving the lasting-tacks through the same and into the inner sole opposite the clinching-surface, applying a second or an outer sole to the lasted shoe, driving or inserting metal fastenings through the latter and the upper and into the inner sole against the clinching-surface, which stops or turns the points of the said fastenings, and after the clinching of the fastenings and the removal of the last removing the clinching-surface, substantially as described.

291,797. REIN-PROTECTOR. SAMUEL J. SPURGEON, Houstonia, Mo. Filed Aug. 4, 1883. (No model.)

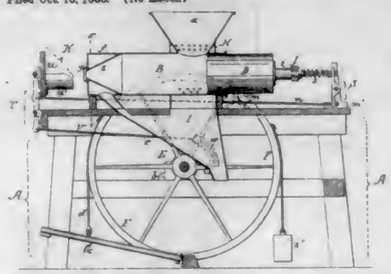
Claim.—The combination of a cultivator-tongue, set screws or bolts forming in the sides of the same, and a rein-supporter consisting of one piece of metal rod having its ends doubled and twisted around the straight upright portions, forming slots for the reception of the securing-screws, having its central portion straight and horizontal, and having the ends of the said straight portion and of the upright portions doubled, twisted, and curved upward and inward, as and for the purpose shown and set forth.

291,798. CONDUIT FOR UNDERGROUND ELECTRIC CONDUCTORS. ELI T. STARR, Philadelphia, Pa., assignor of one-half to William J. Peyton, Washington, D. C. Filed May 25, 1882. (No model.) Patented in England July 13, 1882, No. 3,330.

Claim.—1. A longitudinally-divided conduit-section, the ends of which have coupling-flanges, and the edge of one of the divided conduit portions having a longitudinal interlocking flange or connection for the edge of the other portion thereof, which flange terminates before reaching the coupling-flanges at the ends of the conduit-section, in combination with a sectional internally-grooved or recessed clamp-coupling which receives the coupling-flange of the conduit-section and snugly fits around the end of said section to clamp the divided portions thereof together, substantially as described, whereby a tight joint between the edges of the divided portions of the conduit-section may be attained and a close fit between the coupling and conduit-section secured.

2. A longitudinally-divided two-part conduit-section, the edge of one portion of said section being provided with an external longitudinal flange and a seat to receive the edge of the other portion thereof, and said flange being terminated before reaching the ends of the section, so as to afford a plain surface for the fitting of the coupling-connection between the adjacent sections of the conduit, substantially as described, whereby a tight joint may be made between the longitudinal edges of the section, and a close fit between the coupling-connection and the surface of the conduit-section be insured.

3. The combination of a conduit for electric conductors, cast with a tubular union-piece having a plain coupling-flange, a removable stopper to close the opening of said union-piece, and a sectional clamp-coupling having a plain internal recess or groove embracing said coupling-flange



and said stopper, substantially as described, whereby the stopper is securely locked in place while readily removable in making a branch connection with the conduit, and whereby also the branch pipe may be coupled to the union-piece by the same device that secures the stopper in position when said stopper is removed.

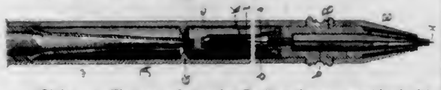
4. The combination of an underground conduit having branch openings with one or more electric conductors inclosed and supported thereby, having insulating-couplings in their lengths opposite said branch openings to facilitate making branch circuit-connections, substantially as described.

5. The combination of an electric conductor divided, and having its ends connected by an insulating-coupling, substantially as described, which permits said conductor to be kept taut or suspended between its supports with a conducting-connection, substantially as set forth, between the insulated ends of said conductor, capable of being severed without mechanically separating the ends of the conductor, substantially as described.

6. A cast-metal longitudinally-divided pipe-section having interlocking edges and a vertical central division-plate supporting horizontal supports for the conductors, substantially as described.

291,799. CAN-FILLING MACHINE. JOHN STEVENS, Woodstown, N. J. Filed Oct. 18, 1883. (No model.)

Claim.—1. The combination of the cylinder B and its hopper a and plunger D with the movable can-holder K, and with mechanism, substantially as described, for moving the said plunger and can-holder longitudinally to and from each other, as set forth.



2. The combination of the cylinder, provided with a hopper, and having perforations below the hopper, with the plunger D and mechanism for operating the same, as set forth.

3. The combination of the cylinder B, plunger D, can-holder K, levers S and T, rods *n* and *p*, and springs *s*, as set forth.

4. The combination of the cylinder B, plunger D, wheels F, can-holder K, levers S and T, rods *n*, *p*, and *v*, springs *s*, and slotted segments *w*, as set forth.

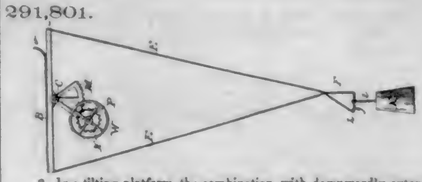
5. The combination of the cylinder B with nozzle *e*, the casing *f*, and the perforations *h*, as set forth.

291,800. FOUNTAIN STYLUS-PEN. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Feb. 27, 1882. (No model.)

Claim.—1. The pen-point section B of a stylus-pen, combined with the inclosing-jacket E, to provide a capillary space between, substantially as set forth.

2. In a reservoir-pen holder, an ink space or reservoir, combined with an agitator, S, of non-absorbent material and polished surface, inserted in said reservoir, and called by me an "irritant," for the purpose of preventing the accumulation of fluid in the center of the holder and the consequent division of the column of ink.

3. In a reservoir-pen, an ink space or reservoir, combined with an irritant composed of horse-hair, gold, or other non-absorbent material, the ends whereof are fixed, substantially as and for the purpose set forth.

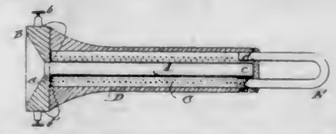


4. In a reservoir-pen, the reservoir or ink-space provided with one or more diaphragms or partitions, G, partly separating said ink-space into separated chambers, as and for the purpose set forth.

5. In a stylus fountain-pen, a stylus-point of horse-hair or other non-absorbent substance, substantially as set forth.

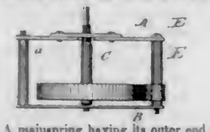
291,801. CAR-DUMPER. THOMAS S. STEWART, Saltsburg, Pa. Filed Nov. 26, 1883. (No model.)

Claim.—1. A tilting platform for coal wagons or cars, having the downwardly-extending brace-rods securely connected at their lower ends, and carrying a counterbalancing-weight which moves in an arc-shaped path, substantially as specified.



291,801.

2. In a tilting platform, the combination, with downwardly-extending braces E and the loop-connection F, having the adjusting-bearings *g*, of the weight K and its connection *l*, substantially as specified.

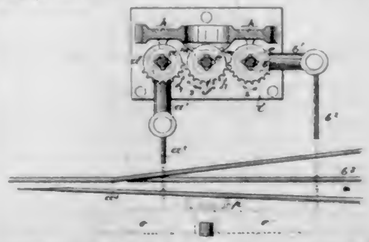


3. The tilting platform having a rock-shaft and downwardly-extending braces connected at their lower ends and carrying a weight, the segment-gear of the shaft, the gear-wheels engaging the same, and the operating-shaft, substantially as specified.

291,802. RECEIVING-TELEPHONE. LYMAN W. SUTTON, Jr., Newton, assignor to John F. Phillips, Jersey City, N. J. Filed Feb. 15, 1883. (No model.)

Claim.—A magneto-electric telephone consisting of the combination of a resonant magnetic tube, open at both ends, a magnet, and a helix, all in inductive relation to each other, substantially as described.

291,808. DEVICE FOR REMOVING MAINSPRINGS FROM CLOCKS. DAVID SWITZER, Mount Pleasant, Mich. Filed Aug. 28, 1883. (No model.)

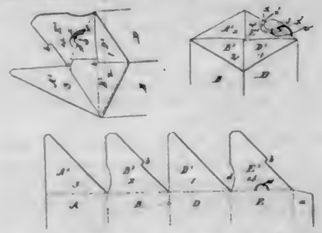


Claim.—1. A mainspring having its outer end secured to a sleeve adapted to be held between the upper and lower plates of a clock-mechanism frame by means of a bolt or rod, substantially as and for the purpose specified.

2. The combination, with the lower plate, B, provided with means to seat the arbor carrying the mainspring, of the upper plate, A, provided with means to receive and hold the upper end of the said arbor, and the spring having its outer end secured to the tube or sleeve, which is held between the upper and lower plates by a bolt or rod passing through its bore, substantially as specified.

291,804. RAILROAD SWITCH-STAND. CHARLES H. TALMAGE, Atchison, Kans. Filed Mar. 16, 1883. (No model.)

Brief.—The movable rails of a three-throw split switch are shiftable from a single lever by means of a wheel carried on the lever-shaft and mutilated to gear alternately with wheels—one on each of two shafts—which are provided with cranks for moving the switch-rods. Said cranks are set at right angles to each other, the lever-shaft is adapted to carry a semaphore, and a suitable frame for supporting the shafts and operating parts is provided.



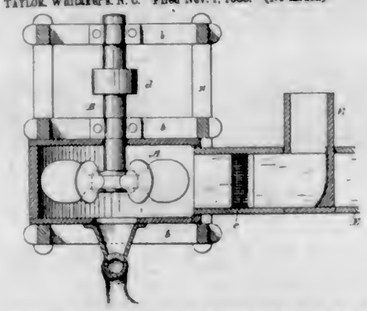
Claim.—1. The combination, with a pair of crank-shafts set at right angles to each other, and adapted to be connected to the switch-rails, and gear-wheels on said shafts, of a lever-shaft provided with a mutilated gear-wheel, substantially as herein shown and described.

2. The combination, with the rails a^2 b^2, of the crank-shafts *a* *b*, the wheels *d* *e*, the mutilated wheel *f*, and operating-lever *g*, substantially as herein shown and described.

3. The supporting-frame for a switch-stand, consisting of uprights *h*, base *i*, and top *j*, and being provided with sockets *k* and *l*, and the shaft-bearings *n*, substantially as described.

291,805. PAPER BOX. JOHN W. TATUM, Chester, Pa. Filed Dec. 8, 1883. (Model.)

Claim.—1. A paper box having a series of end flaps folded in succession around the box, the end of each flap being retained by the body of that on the side adjoining and at right angles thereto, as set forth.



2. A paper box having interlocked end flaps folded in succession around the box, the end of each flap being retained by the body of that on the side adjoining and at right angles thereto, and one or more of the flaps having a locking-notch, *b*, as set forth.

3. A paper box having end flaps halved so as to form a double series of flaps, the flaps of each series being folded in succession, so that the end of each flap is overlaid by the base or body of that on the adjoining side, thereby forming a double locked end on the box, as set forth.

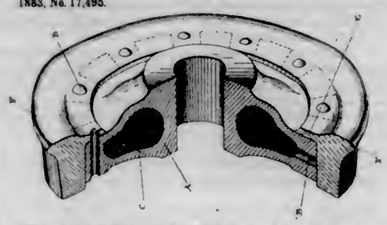
4. The combination of the handle-strip J, having enlarged ends *x*, with a paper box having segmental slots *w* in opposite end flaps, the strip being adapted to the slots and each enlarged end of the strip confined between two end flaps, as set forth.

5. The combination of the handle-strip J, having enlarged ends *x*, with abrupt shoulders *x'*, with a paper box having in opposite end flaps segmental slots *w*, the bases of which are on the line of fold of the flaps, as set forth.

291,806. SEED-COTTON ELEVATOR AND CLEANER. WILLIAM T. TAYLOR, Whitaker's, N. C. Filed Nov. 1, 1883. (No model.)

Claim.—1. A cotton elevator and cleaner consisting of an exhaust-chamber provided with inlet-opening and an outlet-tube, said outlet-tube being provided with cleaning devices, substantially as described.

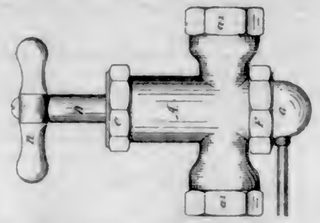
2. A cotton elevator and cleaner consisting of an exhaust-chamber having inlet-opening and outlet-tube, said outlet-tube being provided with the grated opening *c*, as and for the purpose described.



3. A cotton elevator and cleaner consisting of an exhaust-chamber provided with inlet-opening and an outlet-tube, said tube being provided with the perforated partition, for directing the course of the cotton and providing for the escape of the dust, substantially as described.

4. The combination, in a device for elevating and cleaning cotton, of the exhaust-chamber, provided with inclined floor and an inlet-opening, and the fan, substantially as described.

5. A cotton elevator and cleaner consisting of an exhaust-chamber having inlet and outlet tubes, the outlet-tube being provided with the grated opening *c* and openings in the sides of the tube, to admit of the discharge of the cotton at any desired point, substantially as described.



6. The combination, with the tube E, having openings, as described, of the tube G, adapted to be joined to the said tube E and form a continuous conduit for the cotton, the tube G being provided with the perforated extension G', for directing the course of the cotton and allowing the escape of the dust, substantially as described.

291,807. CAR-WHEEL. HARRISON G. TAYLOR, Toronto, Ontario, Canada. Filed July 18, 1883. (No model.) Patented in Canada Aug. 15, 1883, No. 17,495.

Claim.—As an improved article of manufacture, the truck or car wheel herein described, consisting of the cast-metal center A, having an inner circular hollow core, C, extending to near its outer edge, forming two solid disks extending from the hub to the tire, and having cored passages B, leading from said inner core to the periphery of said center A, at regular intervals, leaving solid spaces between each passage, as shown, and the tire having internally-projecting flange E, formed integral therewith and immediately below the inner edge of the outer flange, F, said tire being securely fastened to the center A by bolts passing horizontally through the flange E and center, substantially as set forth.

291,808. STOP-AND WASTE COCK. HENRY TAYLOR, RICHARD B. SHARP, and THOMAS J. CAIN, Cleveland, Ohio; said Cain assignor to said Sharp and Taylor. Filed Jan. 15, 1883. (No model.)

Claim.—1. The combination, with the valve B, having screw-stem E, and lugs *e*, playing in grooves e^2 of chamber *a*, of the hollow internally-screw-threaded stem D, provided with collar *d*, operating as and for the purpose specified.

2. In a stop and waste cock, the lower detachable chamber, G, provided with collar F for attaching it to the shell of the valve, and containing the flexible disk K, having the hollow stem N, in combination with and operated upon by the lower end of valve B, whereby the waste-outlet O is opened and closed, as and for the purpose specified.

291,809. GRAIN-DRILL. HANSON P. TEVANT, Dublin, Ind., assignor to the Dublin Agricultural Company, same place. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a grain-drill, the combination, with a frame carrying the hopper, of a spring-bar having one end attached to the frame and extending longitudinally beneath the hopper to a point in rear thereof, a seat secured to the rear end of the spring-bar, and a transverse support for the rear of said bar, substantially as described.

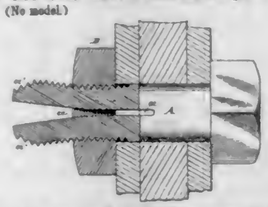
2. In a grain-drill composed, essentially, of a frame supporting the hopper, the combination therewith of a spring-bar secured at its forward end to the frame, and extending longitudinally below the hopper to the rear thereof, a seat rigid on the rear end of the bar, and a transverse spring-support connected with the frame and sustaining the spring-bar at a point between the seat and the hopper, substantially as described.

3. The combination, with the grain-drill frame carrying a hopper, of a bar, F, secured at its forward end to the frame, and extending longitudinally under the hopper to the rear thereof, a seat on the rear end of said bar, and an arched spring connected at its ends with the sides of the drill-frame, and sustaining the spring-bar between its forward end and the seat, substantially as described.

4. In a grain-drill composed, essentially, of a frame carrying a hop-

per, of a spring-bar having its forward end secured to the frame, and extending longitudinally under the hopper to the rear thereof, a seat mounted on the rear end of the bar, and a transverse spring having its ends connected with the frame and attached to the spring-bar between the seat thereon and the hopper, substantially as described.

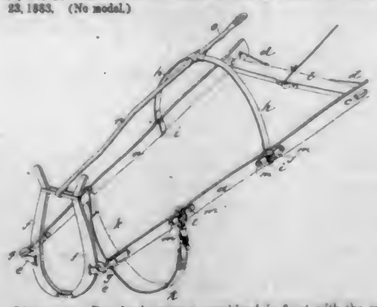
5. The combination, with a grain-drill composed, essentially, of a frame and a hopper thereon, of a longitudinal spring-bar extending in rear of the hopper and carrying a seat at its rear end, and a transverse spring arched over the bar in rear of the hopper and in front of the seat, and a bolt suspending the rear portion of the bar beneath the arched spring, substantially as described.



291,810. MANUFACTURE OF TURNED SHOES. ANDREW J. TEWKSBURY, Haverhill, Mass. Filed Aug. 1, 1883. (No model.)

Claim.—1. The method of securing steel shanks to turned boots, consisting, essentially, in first securing the shank at one or both ends to an inner sole, and then securing the inner sole to the boot, substantially in the manner described.

2. In a turned boot, the combination, with the outer sole and the insole thereof, of a spring-shank interposed between the two soles and having its ends attached to the insole, and nails located near the center of the instep, and arranged to secure the two soles together, and to prevent the lateral displacement of the spring, substantially as set forth.



291,811. NUT-LOCK. LEWIS C. TRATCHER, Chicago, Ill. Filed Nov. 22, 1883. (No model.)

Claim.—1. As an improved article of manufacture, a bolt formed with a tapering screw-threaded point, *a'*, and longitudinal slit or slits *a*, essentially as described, and for the purpose set forth.

2. The combination, in a nut-locking device, of the nut B and bolt A, having longitudinal slit or slits *a* and a tapering screw-threaded point, *a'*, as described, and for the purpose set forth.

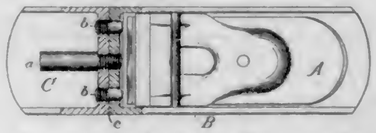
291,812. HARNESS. GREEN THOMPSON, New Salem, Ind. Filed Oct. 23, 1883. (No model.)

Claim.—1. The back-strap *n*, combined in front with the cross-strap which connects the upper ends of the hames, as shown and described.

2. The back-strap *n*, connected to the cross-strap of the hames, in combination with the hip-straps *A A* and bars *a a*, substantially as and for the purpose set forth.

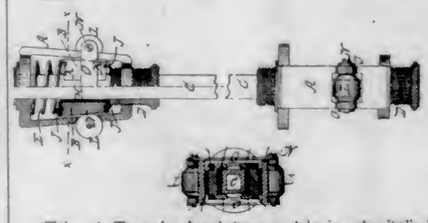
291,813. TAG. EDWARD W. THOMPSON, Lowell, Mass. Filed Sept. 12, 1883. (No model.)

Claim.—The combination of a tag slotted longitudinally and transversely, and provided with longitudinal grooves and transverse holes, and one or more spring-wires, each of said wires being bent near one end into a hook, and near the other end bent at about right angles, and driven through one of said transverse holes and headed, as and for the purpose specified.



291,814. VEHICLE-SPRING. ILLIUS AUGUSTUS TIDDER, London, County of Middlesex, England. Filed Nov. 6, 1883. (No model.) Patented in England Mar. 1, 1879, No. 831.

Claim.—1. A spring for railway and other vehicles, consisting of a bar of metal of unequal cross-section, grooved in the direction of its length and reduced in diameter from the center toward the ends, said spring having its normal axis straight, substantially as and for the purpose set forth.



2. A spring for railway and other vehicles, consisting of a bar of metal of unequal cross-section, and grooved in the direction of its length, said spring having a straight axis, substantially as described.

291,815. BENCH-PLANE. JUSTUS A. TRAUT, New Britain, Conn. Filed Nov. 23, 1883. (No model.)

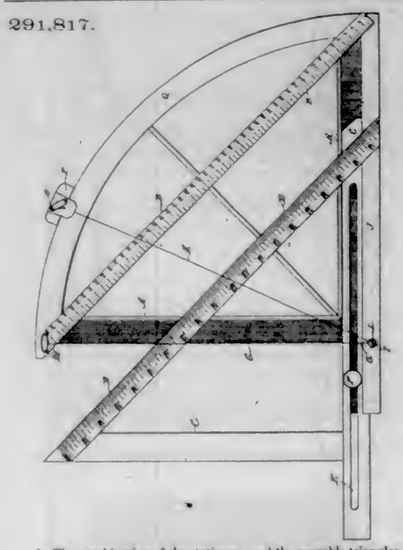
Claim.—The herein-described convertible plane, consisting of the stock B, adapted to receive and hold the cutting-bit, and provided with the attachable and detachable stock-extension C, substantially as described and for the purpose specified.

291,816. FRICTION-CLUTCH FOR DROP-LIGHTS. JAMES F. TRAVIS and WILLIAM H. FREANEY, New York, N. Y. Filed Aug. 25, 1883. (No model.)

Claim.—1. The wedge-shaped clamps, each having a longitudinal recess in the acting surface and longitudinal channels in the body thereof, and having a packing, of felt or other suitable material, in such recess, fastened by a cord or the like, passing through the channels, in combination with the supporting-frame and the adjusting-screw.

2. The wedge-shaped clamps, each having a longitudinal recess in the acting surface, longitudinal channels in the body, and grooves in the ends thereof, and having a packing, of felt or other suitable material, in the recess, fastened by cords which extend through the channels and together with the end portions of the packing sink into the grooves, in combination with the supporting-frame and the adjusting-screw.

3. The combination of the frame, the wedge-shaped clamps therein, the two cross-bars arranged outside the frame, and the friction-rollers journaled to the opposite ends of the cross-bars, and projecting into the frame to form the bearings for the clamps, substantially as described.



291,817. PERCENTAGE-CALCULATOR. SYLVESTER J. TUCKER, Richmond, Va. Filed Nov. 17, 1883. (No model.)

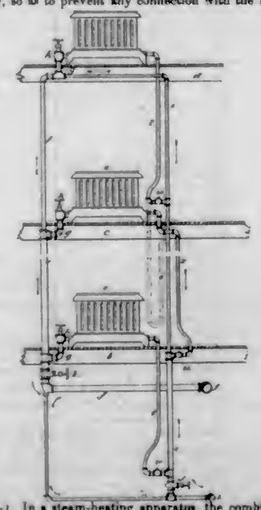
Brief.—As shown, the instrument indicates that seventy per cent. of 1,400 is 980.

Claim.—1. The combination of the stationary and the movable triangles having graduated scales and numbers, as described, and the movable marker, substantially as shown and described.

2. The combination of the stationary and the movable triangles having graduated scales and numbers, as described, and the movable marking-cord and segmental guide for the same, substantially as shown and described.

291,817.

3. The combination of the stationary and the movable triangles having graduated scales and numbers, as described, and the movable and the stationary markers, substantially as specified.



4. The combination, with the triangles, of the movable marking-cord, the loose collar and pin for securing it at one end, and the slide and segmental guide at the other end, substantially as shown and described.

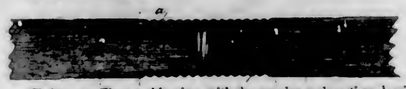
5. The combination of the stationary triangle, the movable triangle having a longitudinal slot in its base, and the set-screw for adjusting and holding said triangles in any desired relation to each other, substantially as shown and described.

6. The combination of the stationary triangle having the percentage-scale B arranged along its hypotenuse, the movable triangle having the number-bearing scale D arranged along its hypotenuse, and the markers, substantially as specified.

291,818. STEAM-HEATING APPARATUS. FREDERIC TUDOR, Boston, Mass. Filed Dec. 16, 1882. (No model.)

Brief.—The spring-actuated valve opens under sufficient pressure and permits the steam to pass to the radiators. It may, however, be closed manually, so as to prevent any connection with the radiators.

Claim.—1. In a steam-heating apparatus, the combination, with two or more radiators placed at different levels, a steam-supply pipe, and a pipe to return the water of condensation, common to all the radiators and extending vertically downward, of a short seal or trap pipe connecting the radiators with the said return-pipe, constructed and arranged to accumulate a column of water of condensation to equal or nearly equal the steam-pressure used in the apparatus, substantially as and for the purpose set forth.



2. In a steam-heating apparatus, the combination, with a series of radiators and pipes and valves to supply steam thereto, of a common pipe to return the water of condensation therefrom, with short seal-pipes proceeding down from the radiators, and connecting with the main return-pipe at a distance below the radiator corresponding to the height of a water-column which will balance the steam-pressure, with check-valves at their connection opening in the direction of flow from the radiator into the return-pipe, and closing in the reverse direction, substantially as and for the purpose set forth.

3. In a steam-heating apparatus, the combination, with a series of radiators placed on different levels or stories, of a common steam-supply pipe, *f*, and controlling-valves *h*, connecting each radiator individually thereto, with a common return-pipe, *i*, and seal-pipes *l*, proceeding downward from the radiators near the floor of one story, and connecting with the return-pipe at or near the floor of the next story, with check-valves *u* at their connection, substantially as and for the purpose herein shown and described.

4. In a steam-heating apparatus, the combination, with one or more radiators, each connected with pipes to supply steam and return water of condensation, and provided with a manual valve or means for manually controlling the flow of steam thereto, with a yielding valve in the connection between the steam-pipe and the radiator, normally forced to its seat by a spring with a force equal to or exceeding the normal steam-pressure, but adapted to yield and permit the flow of steam into the radiator independently of the manual device when the steam-pressure is increased above the normal pressure, substantially as and for the purpose set forth.

5. In a steam-heating apparatus, the combination, with one or more radiators, each connected with pipes to supply steam and return water of condensation, of a valve normally forced to its seat by a yielding pressure with a force equal to or exceeding the normal steam-pressure, but adapted to yield and permit the flow of steam into the radiator when the steam is increased above its normal pressure, which valve is provided with means for manually controlling the flow of steam when desired, substantially as described.

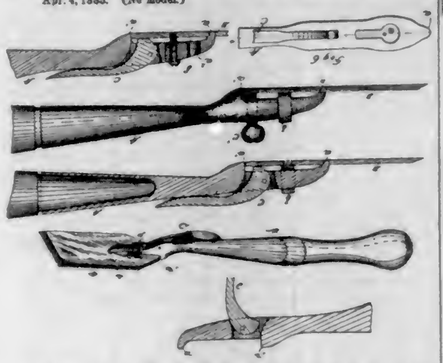
291,819. COUPLING FOR RODS. GEORGE B. TORRELL, South Orange N. J., assignor to the Union Hardware Company, Torrington, Conn. Filed Oct. 18, 1883. (No model.)

Claim.—1. The combination, with the wooden rod-sections having screw-threads at their ends, of a tubular coupling of sheet metal, with the end portions cylindrical, or nearly so, and a screw-thread bent inwardly, so as to be of less diameter than the end portions, substantially as set forth.

2. The combination, with the wooden gun-rod sections, of a coupling-tube of sheet metal slightly smaller than the exterior of the wooden sections, and having a screw-thread bent inwardly, substantially as set forth.

3. The sheet-metal coupling-tube having the screw-thread bent inwardly, in combination with the wooden rod-sections fitting the interior of such couplings, and having screw-threads upon the wood, substantially as set forth.

4. The sheet-metal coupling-tube having a screw-thread bent inwardly in the middle portion, and plain portions at one or both ends of larger diameter than the threaded portion, in combination with the rod-sections, the ends of which slide into the plain portions of the coupling before the screw-threads engage, substantially as specified.

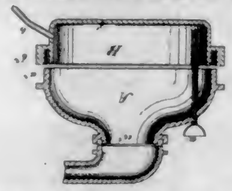


5. The combination, with the wooden gun-rod section, of a tubular coupling adapted to receive the wooden sections into its reepective ends, and having a screw-thread bent inwardly in such tubular coupling, the ends of the gun-rod sections not touching, so as to be tightened by screwing the sections into the coupling, substantially as set forth.

6. The combination, in a jointed rod, of a tubular coupling having an internal screw-thread in the middle portion, and wooden sections having screw-threaded ends and plain tapering portions between such ends and the plain portions of the rod, so that the tapering portions are drawn into the ends of the coupling by the action of the screw, substantially as set forth.

7. In a jointed rod, the combination, with a tubular coupling having an internal screw-thread, of the wooden rod-section of larger diameter than the exterior of the coupling, and having a bearing-surface that is brought forcibly against the coupling-tube, at or near the end, to prevent looseness from shrinkage, substantially as set forth.

8. The combination, with the wooden rod-sections, of a tubular coupling, into which the end portions of the wooden sections are directly received, such coupling having an internal screw-thread, so that, however closely screwed together, the sections may be separated by unscrewing one of the sections from the coupling, substantially as specified.



291,820. COMBINATION-TOOL. EDWIN WALKER, Erie, Pa. Filed APR. 4, 1883. (No model.)

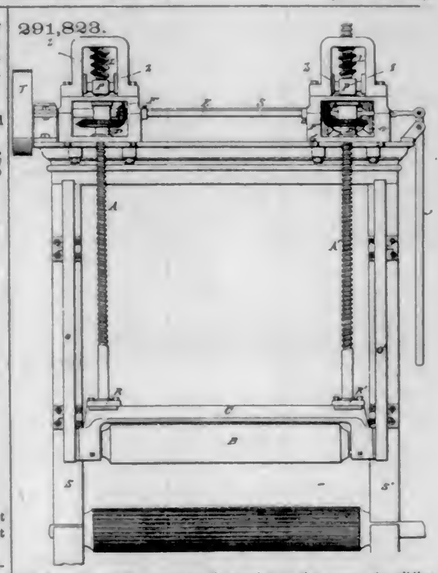
Claim.—1. In a tool, the combination of a handle having a point and a cam-lever, and a tool having a bolding device between the point and cam-lever of the handle, substantially as described.

2. In a tool, the combination of a handle having a point, *a*, cam-lever C, and shoulder *a'*, and a tool, B, having a loop, *b*, and perforation for the point *a*, substantially as described.

291,821. PROCESS OF CONCENTRATING SULPHURIC ACID. MOSES A. WALSH, Camden, N. J. Filed JUNE 12, 1883. (No specimens.)

Claim.—The method of making monohydrated sulphuric acid by first concentrating in the usual way till the acid contains about ninety-three per cent. of monohydrated acid, and then transferring it to iron or steel vessels, in which the concentration is completed.

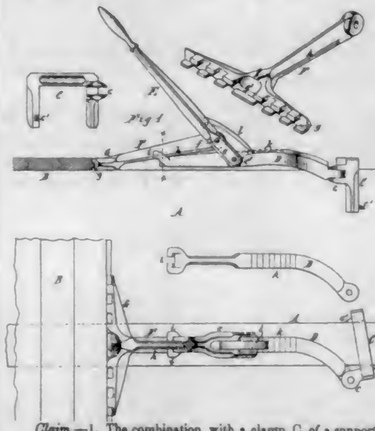
291,822. HAY-ELEVATOR. PHILIP WERUM, Stryker, Ohio. Filed Nov. 13, 1883. (No model.)



Claim.—1. In an elevator, the combination, with the car, of the pawl C, pivoted between the forward pulley-arms of or within the car, and having a slot, C', extending through its length, including that portion in the same plane and inside of its fulcrum, substantially as shown and described, and for the purpose set forth.

2. In an elevator, the combination, with the car having the lower forward edge of its bottom piece beveled, as at *b'*, of the angular or bent pawl C, pivoted between its pulley-arms, and having a slot, C', extending through its greater portion, including that in the same plane with and inside of the fulcrum of the pawl, substantially as shown and described, and for the purpose set forth.

291,823. PRESS-ROLLER MECHANISM FOR GANG-SAW MILLS. HENRY D. WEEKS and EDWARD N. WEEKS, East Saginaw, Mich. Filed Sept. 6, 1883. (No model.)

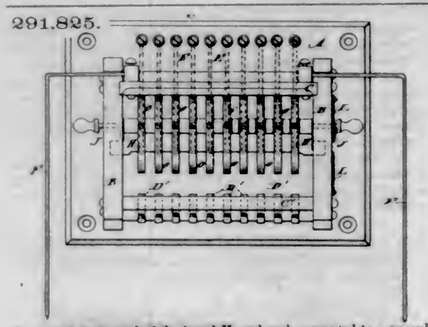


Claim.—In a gang-saw mill, the combination, with the frame carrying the pressure-roller B and its bail C, of the right-hand and left-hand screws A A', attached at their lower ends to said frame, the bevel-gears at their upper ends operated upon by bevel-gears and power-shaft.

291,823.

the friction-gear for reversing the motion of the screws, the sliding boxes I, levers J, for operating the same, spiral springs L L', and nuts P P', arranged upon the screws within the grooved bearings *z*, substantially as specified.

291,824. FLOOR-JACK. THOMAS L. WILKER, Scio, N. Y. Filed MAY 21, 1883. (No model.)

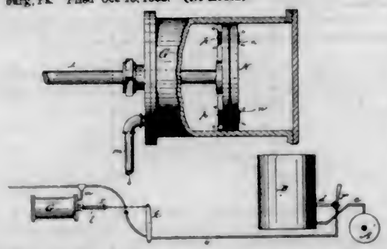


Claim.—1. The combination, with a clamp, C, of a supporting-bar, D, pivoted to said clamp, an actuating-lever, E, pivoted to the supporting-bar D, a pressure-bar, F, pivoted to the actuating-lever E, and resting on the supporting-bar, and a detent whereby the actuating-lever is held on the supporting-bar, substantially as set forth.

2. The combination, with a clamp, C, of a supporting-bar, D, pivoted to said clamp, and provided at its front end with guides *i*, an actuating-lever, E, pivoted to said supporting-bar between the clamp and the guides *i*, and a pressure-bar, F, pivoted to the actuating-lever and guided in the guides *i* of the supporting-bar, substantially as set forth.

291,825. CUT-OUT FOR TELEPHONES. AUSTIN WILLIAMS and JOSEPH M. GANNON, Negaunee, Mich. Filed Sept. 22, 1883. (No model.)

Claim.—1. In a telephone cut-out, the combination, with the side pieces, C C', having curved slots K, and the end pieces, B, having metal strip secured to them, and connected, respectively, to a ground and line wire, of the board H, pivoted to the side pieces, and provided with pintles working in the curved slots of the end pieces, and the curved strips



291,825.

O, secured to the end of the board H, and each connected to a ground-wire, substantially as herein shown and described.

2. In a telephone cut-out, the combination, with the sides C C', and the end pieces, B, of the plate D, strips D', the spring-clips G G', the line-wires E E', ground wires F, the swinging board H, the curved metal strips O thereon, the pintles J, passing through slots on the end piece, B, and of the latches L, substantially as herein shown and described.

291,826. FLUID-PRESSURE CAR-BRAKE. ROBERT J. WILSON, Pittsburg, Pa. Filed Oct. 13, 1883. (No model.)

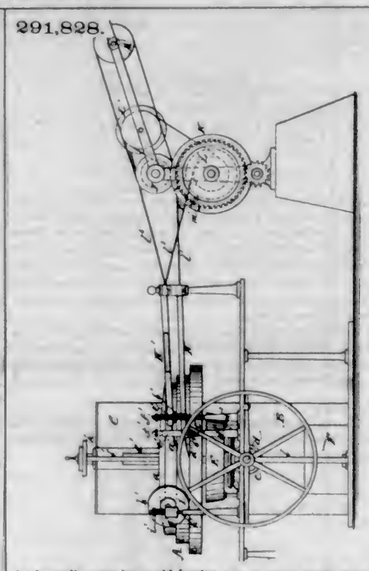
Claim.—1. An automatic vacuum-brake having a steam vacuum-pump, a train-pipe, and a brake-cylinder provided with a brake-operating piston, said cylinder being connected to the train-pipe directly, and provided with means for equalizing the vacuum on both ends of said piston while in connection with said vacuum-chamber, and to become sealed at one end only upon admission of air to said train-pipe, substantially as described.

2. An automatic vacuum-brake having a steam vacuum-pump, a reservoir or vacuum-chamber, a train-pipe, and a brake-cylinder provided with a brake-operating piston, said cylinder being connected to the train-pipe directly, and provided with means for equalizing the vacuum on both ends of said piston while in connection with said vacuum-chamber, and to become sealed at one end only upon admission of air to said train-pipe, substantially as described.

3. In an automatic vacuum-brake, the combination, with the steam vacuum-pump A, reservoir B, and train-pipe *s*, of the brake-cylinder G, having piston H, adapted to operate the brakes, said cylinder being in communication directly with pipe *s*, and having one or more check-valves adapted to subject both ends of said cylinder to the influence of the reservoir B, and to subject one end only of said cylinder to atmospheric pressure when admitted to pipe *s*, substantially as described.

291,827. WASHING-SOAP. RICHARD HALL WITHINGTON, Sacramento City, Cal. Filed Aug. 18, 1883. (No specimens.)

Claim.—A washing-soap consisting of tallow, rosin, caustic soda, borax, beef-gall, spirits of turpentine, benzine, spirits of ammonia, alcohol, and oil mirbane, combined in the proportions substantially as specified.



291,828. MACHINE FOR MAKING WIRE OR OTHER SOLDER. EDMUND L. YOUNG and LUCIUS DYER, Millbridge, Me. Filed Oct. 5, 1883. (Model.)

Claim.—1. In wire-solder machines, the combination, with a round melting-chamber, C, of a side chamber, C', tubes D D', and spout *g*, arranged as shown and described.

2. In apparatus for running solder, the regulating discharge-tubes D D' for the molten solder, or either of them, constructed of an outer straining-tube, *k*, receiving and discharge nozzle *l m*, and a hollow screw-valve, *n*, essentially as shown and described.

3. In apparatus for running solder wire, the combination, with a

291,828.

horizontally-rotating mold having one or more upper exposed grooves in or around its rim, of one or more knives, *a'*, and conductors H or H', for picking up and passing off the wire from the mold, and one or more spring-pressure rollers, I, for bearing down on the wire in the mold in proximity to the knife or knives, substantially as specified.

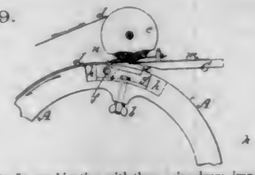
4. In combination with the horizontally-rotating mold or pan A, having one or more upper exposed grooves, *f*, in or around its rim, one or more conductors, H or H', each fitted with a knife or knives at its receiving end and constructed to rise and fall at said end, and spring-adjusting means for giving an easy contact of the knife or knives with the bottom of the groove or grooves in the mold, and for relieving the knife or knives from such contact when required, substantially as specified.

5. The combination of the posts *d'*, the springs *c'*, the sleeve-arms *b'*, and adjusting-nut *f'*, with the raising and lowering conductor H or H', having an attached knife or knives, *a'*, and the horizontally-rotating mold or pan A, having one or more upper exposed grooves in or around its rim, essentially as and for the purposes herein set forth.

6. In apparatus for running solder wire, the horizontally-rotating rim-flanged pan A, adapted to hold water, having a central upwardly-projecting boss on its bottom for reception of its shaft, an overflow-pipe, *q*, and a series of upper exposed grooves, *f*, in its flanges *s*, substantially as specified.

7. In apparatus for running solder wire, the combination, with a rotating mold and means for picking up and passing off the molded wire, of the rolls J K, having attached knives or cutters *m'*, and means for throwing said knives in and out of action during the rotation of the rolls for cutting the wire or wires into measured lengths, essentially as described.

8. The combination, with the wire-delivering rolls J K, of the lever-knives *m'*, arranged within recesses in the sides of the lower rolls, K, the springs *n'*, and the rollers or stops *o'*, substantially as specified.

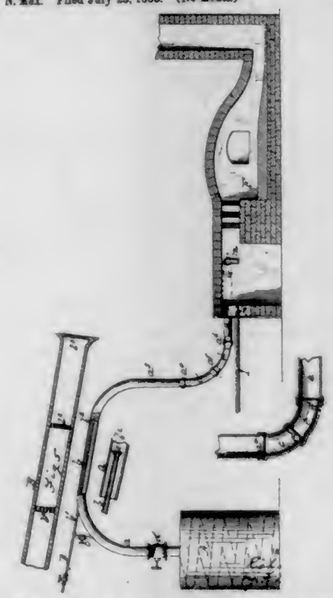


9. In apparatus for making solder wire, the combination, with the rotating grooved mold or pan A, and devices for passing off the wire therefrom, of one or more take-up reels, L or L', and means for driving the same by friction, with provision for slipping as the roll of wire increases in diameter on the reels, and whereby undue strain is taken off the solder wire, essentially as described.

10. In take-up devices of apparatus for casting solder wire, the combination, in a take-up reel, L or L', of the sectionally-constructed and concentrically-arranged body parts d^3 e^3, having the reel-heads respectively attached to them, and a fastening device for holding said sections in place, substantially as and for the purpose herein set forth.

11. The combination, in a take-up reel for the wire in an apparatus for making solder wire, of the concentric body parts d^3 e^3, having the reel-heads respectively attached to them, the spring-catch f^3, the friction-producing spring b^3, and adjusting-nut c^3, substantially as and for the purposes herein described.

291,829. PAPER-FEEDING DEVICE. JAMES ARKELL, Canajoharie, N. Y., assignor to Arkell & Smiths, same place. Filed July 21, 1883. (No model.)



291,829.

Claim.—1. In combination with the carrier-drum, impression-cylinder, or equivalent device of a bag-bottoming machine, a paper-folder, printing-press, or other analogous machine, and the carrier-tapes coacting with said drum or its equivalent, one or more sets of adjustable spring fingers or feeders, *e*, or their described equivalents, adapted to press the leading end of the blank to be carried against the carrier-tapes, and to cause the said blanks to be carried along with the drum, tapes, and spring-feeders, substantially as set forth.

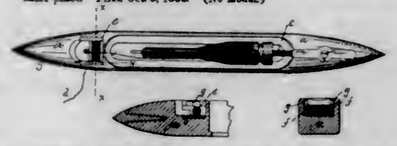
2. In combination with the carrier-drum and carrier-tapes of a machine similar or analogous in these parts to that shown, spring-feeder devices that are adapted to be set or adjusted so as to act at different points circumferentially in the periphery of the drum, as and for the purpose set forth.

291,830. HYDROCARBON-FURNACE. RICHARD B. AVERY, Washington, D. C., assignor of one-fourth to Dewitt Stearns, Albuquerque, N. Mex. Filed July 23, 1883. (No modal.)

Claim.—1. In devices for generating hydrocarbon vapors and gas, the combination, with a superheated-steam pipe, of an oil-pipe arranged therein and delivering thereinto, said oil-pipe provided with a series of perforated diaphragms, substantially as and for the purpose specified.

2. In a device for generating hydrocarbon vapors and gas, the combination, with a superheated-steam pipe, of an oil-pipe arranged therein and delivering thereinto, said oil-pipe having a series of perforated diaphragms of gradually-decreasing mesh, substantially as and for the purposes specified.

3. In a device for generating hydrocarbon vapors and gas, the combination of a superheated-steam pipe, having one or more perforated diaphragms, and an oil-pipe arranged within and delivering into the superheated-steam pipe, said oil-pipe also provided with one or more perforated diaphragms, substantially as and for the purposes specified.



4. In a device for generating hydrocarbon vapors and gas, the combination, with a superheated-steam pipe having a series of perforated diaphragms of gradually-decreasing mesh, of an oil-pipe arranged therein and delivering thereinto, said oil-pipe also having a series of perforated diaphragms of gradually-decreasing mesh, substantially as and for the purposes specified.

5. In a device for generating hydrocarbon gas or vapors, the combination, with a superheated-steam pipe having one or more perforated diaphragms, of an oil-pipe arranged within and delivering into the superheated-steam pipe, substantially as and for the purposes specified.

6. In a device for generating hydrocarbon vapors and gas, the combination, with a superheated-steam pipe, of an oil-pipe arranged within and delivering into the superheated-steam pipe, and a branch pipe which connects the superheated-steam pipe with the oil-pipe, substantially as and for the purposes specified.

7. The combination, with a burner for hydrocarbon vapors and gas, of a fan-shaped or fish-tail air-blast nozzle having a series of perforations, or a gauze diaphragm, which divides the air-blast into a series of fine jets, substantially as and for the purposes specified.

291,831. TENSION-REGULATING DEVICE FOR LOOM-SHUTTLES. GEORGE BALDWIN, Buckland, Conn., assignor of one-half to Thomas Clark, same place. Filed Oct. 5, 1882. (No modal.)

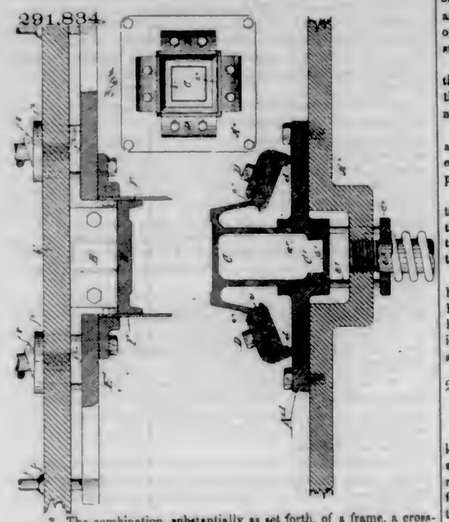
Claim.—1. A hollow tension-roll provided with an opening for the insertion and removal of weights, in combination with a shuttle-body having sockets for the reception of the roll, substantially as and for the purposes set forth.

2. The hollow gravity tension-roll provided with a removable trunnion, substantially as described, and for the purpose set forth.

291,832. VEHICLE-SPRING. CHRISTIAN W. BARRINGER, Evansville, Ind., assignor of one-half to John H. Meeker, same place. Filed Nov. 3, 1882. (No modal.)

Claim.—The combination, with the side bar, A, its hangers or shackles *h*, and slide bearing-plate B, of the pair of double-curved oblique springs D D′, having the eccentric band-connections *k l*, engaging the plate B, and being connected to the shackles or hangers by their opposite upper ends, substantially as specified.

291,833. STILL. PETER N. BARDO, Newport, Ky., assignor to the Bourbon Copper and Brass Works, Cincinnati, Ohio. Filed July 9, 1883. (No model.)

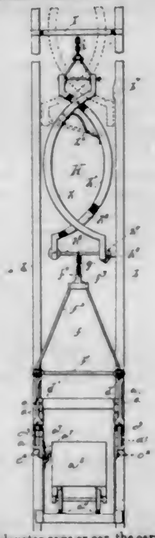


Claim.—The herein-described boiling or vapor pipe, consisting of the tube having the laterally-projecting flange at or near its middle, on which are arranged the projecting lugs, and having the screw-threaded portion, the bonnet or cap secured to the said projecting lugs and arranged over the upper end of the tube, and the clamping-nut working upon the screw-threaded portion of the tube, the whole applied to the bottoms or partitions of the still-chambers in the manner set forth.

291,834. MACHINE FOR WIRING SHEET-METAL PANS. CHAS. F. BEAMAN, Chicago, Ill., assignor to the Wellsville Plate and Sheet Iron Company, Wellsville, Ohio. Filed Oct. 29, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of a fixed table or bed, a supporting-die which is movable therein, said die having a longitudinal groove or recess on each of its lower edges, and a segmental bearing below and exterior thereto, and a series of swage-blocks or formers, each having a turning-edge on one of its sides, and a socket or segmental recess, fitting one of the bearings of the die, below and in advance of said turning-edge, and having on its opposite side a bearing or support adapted to rest upon the bed-plate.

2. The combination, substantially as set forth, of a reciprocating cross-head or platen, a fixed bed-plate, a supporting-die fitted to traverse in a guide in the bed-plate, and to be moved in one direction by the platen, a spring which imparts movement to the supporting-die in the opposite direction, and a series of swage-blocks or formers pivoted at one end to the supporting-die, the opposite end resting freely on the fixed table, said swage-blocks having turning-edges which are alternately advanced toward and retracted from the sides of the supporting-die by the movements thereof in opposite directions, respectively.



291,834.

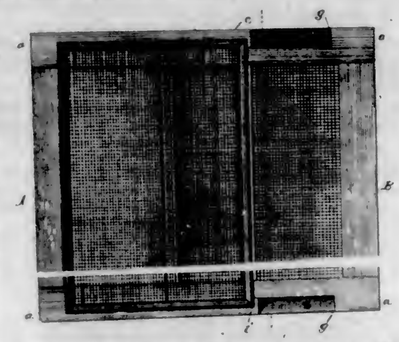
3. The combination, substantially as set forth, of a frame, a cross-head or platen reciprocating therein, a series of holding plates or fingers connected to a plate having a limited degree of traverse upon said platen, a spring bearing at one end against an abutment fixed upon the platen, and at the other against the plate which carries the fingers, a rod which is secured to said plate and passes freely through a bearing on the platen, said rod having a collar or projection which limits its traverse in the direction induced by the spring, and a stop-arm fixed upon the frame and adapted to abut against a nut or projection on the rod.

4. The combination, substantially as set forth, of a swage-block or former having a turning-edge on one of its sides and a segmental recess below said edge, and a carrier-block having a recess adjoining and of similar curvature to that of the swage-block at one side, and a lower bearing or support at the other.

291,835. ELEVATOR. LOUIS BEROUD and EMMA WALSH, Elizabeth, N. J.; said Walsh assignor of one-half her right to Henry Ahrens, same place. Filed Apr. 30, 1883. (No model.)

Claim.—1. In an elevator cage or car, the carrying-frame and locking device, consisting of the hoisting-bail arranged above the cage, the series of depending rods having their upper ends pivoted to the hoisting-bail and their lower ends extended downward along the sides of cage, and pivoted to the arms of the safety-dogs, and the safety-dogs pivoted on gudgeons fixed to the cage and supporting the weight of the latter, substantially as and for the purposes set forth.

2. The combination of the elevator-car, the hoisting mechanism, the guy-rods, the pawls *c*, connecting-rods *e*, bail *f*, and pins *d′*, fixed on the side of the elevator-car in position to guide the descent of the connecting-rods *e*, substantially as and for the purposes set forth.



3. The combination of an open-ended elevator-car, a truck, a^2, and a rod, a^3, journaled in the sides of the car and provided on its opposite ends with cams a^4, adapted to operate substantially as and for the purposes set forth.

4. In an elevator, the combination of the elevator-car, the connection H, consisting of bars *h h′*, cross-bar h^3, and key h^4, and connecting the elevator-car and the hoisting mechanism, the guy-rod provided with trip b^2, and the compression-ring I, all arranged and operating substantially as set forth.

5. In an elevator, the combination, with the hoisting-chain and the bail supporting the elevator-car, of an interposed detaching mechanism, H, having the hoisting-chain secured to its upper end and the bail of the hoisting-car secured to its lower end, and means whereby the mechanism H may be operated and the car-bail detached therefrom, substantially as set forth.

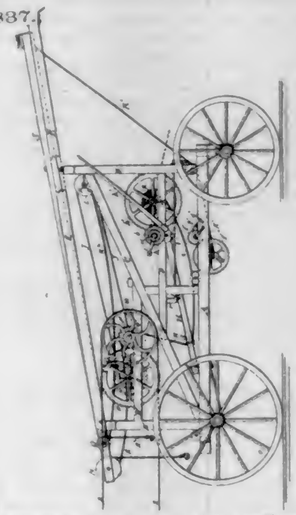
291,836. WINDOW-SCREEN. GEO. W. BOYNTON, West Oakland, Cal., assignor of one-half to Joseph H. Baker, same place. Filed Oct. 10, 1883. (No modal.)

Brief.—A window-screen consisting of two frames, the upper and lower rails of which are rectangularly recessed in parts diagonally opposite in such a manner that the rail of one frame is the complement of the rail of the other, the two rails where they lap conforming in bulk and figure to the non-recessed part of either rail. The inner or free ends of the slide-rails are connected by a staple.

Claim.—The window-screen consisting of the sections A and B, having the upper and lower rails slotted and recessed, as shown, and provided with the shoulders *g*, the staples *e*, secured in the free ends of the recessed slide-rails to travel in the slots *d*, and the stop-rails E, with the wire connected to sections, substantially as specified.

291,837. WELL-DRILLING MACHINE. WM. E. BROWN, Elbridge, N. Y. Filed May 16, 1883. (No model.)

Claim.—1. In combination with the supporting-frame and the shears or mast hinged to the top of said frame and extended to the base thereof, as shown, a windlass pivoted on the frame, and a rope connecting the foot of the mast with the windlass for hoisting and lowering the mast, substantially as described and shown.

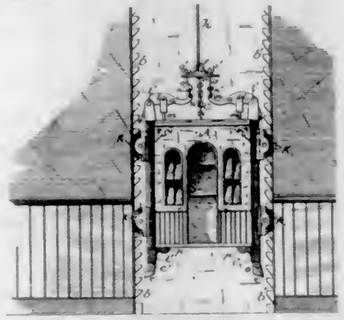


2. The combination of the base A, provided with the upright frames B B′, braces C C, and girders D D′, the shears S, hinged on the frame B, the braces E, hinged on the side of the shears, the shaft F, provided with the pinion *f* and crank *g*, the drum or shaft F′, provided with the gear *f′*, and the rope R′, wound on said drum and connected with the foot of the shears, substantially as described and shown.

3. In combination with the shears S, rope-drum *a′*, and cam G, the lever H, pivoted in proximity to and nearly in the same horizontal plane with the said rope-drum, substantially as described, and for the purpose set forth.

4. The lever H, formed with a longitudinal slot, the sheave *d*, arranged in said slot, and the roller *e*, pivoted on the end of the lever, in combination with the rope-drum *a′*, cam G, and shears S, substantially as described and shown.

5. In combination with the rope-drum *a′*, the gears *b′*, counter-shaft *a*, pinions *b*, crank *c*, brake-pulley A, and brake-lever *h′*, substantially as shown and set forth.



291,837.

6. In combination with the rope-drum a', the gears b', counter shaft a, pinions b, pulley i, ratchet k, dog k', brake-pulley h, and brake-lever h', all substantially as described and shown.

7 In combination with the driving-belt J, the slush-pump drum K, provided with the pulley L, the box M', having the elongated bearing l, and a lever for shifting the shaft of the drum K in said bearing, substantially as described and shown, for the purpose set forth.

291,838. SAFETY AUTOMATIC STOP ATTACHMENT FOR ELEVATORS. OSCAR BRODGER, Washington, D. C. Filed Nov. 13, 1883. (No model.)

Claim.—1. Automatic stop mechanism consisting of an upper and lower combined catch-dog and lever-arm arranged in and secured by suitable journal-bearings on each side of the elevator-car, connecting-rods and tension-springs, also secured by and operated in suitable bearings, as shown, and the whole attached to and held in abeyance by a common hoisting-cable, and so arranged that in event of being released, through accident or otherwise, the catch-dogs will severally and simultaneously be thrown automatically into position for arresting the descent of the elevator-car, substantially as shown and described.

2. Automatic stop mechanism for arresting the descent of elevator-cars, in the event of accident, comprising sets of combined upper and lower lever-arms and catch-dogs arranged in and secured by suitable journal-bearings on each side of the elevator-car, and united by connecting-rods, and actuated by tension-springs, as shown, the whole attached to and held in abeyance by the hoisting-cable and the catch-dogs, so constructed and arranged, on being set free, as to engage with toothed racks on each side, as indicated, substantially as shown and pointed out.

3. In an automatic safety stop mechanism for arresting the descent of elevator-cars, catch-dogs a and c and a' and c', connecting-rods m, spiral springs q, spring-rests m' and r, connecting-links n, toggle o, and cross-beam B, constructed and arranged substantially as shown and described.

4. In an automatic safety stop mechanism for arresting the descent of elevator-cars, catch-dogs a and c and a' and c', connecting-rods m, spiral springs q, spring-rests m' and r, connecting-links n, toggle o, and cross-beam B, in combination with the elevator-car and connecting-link cable C, the whole constructed and arranged substantially as shown and described.

5. In an automatic safety stop mechanism for arresting the descent of elevator-cars, catch-dogs a and c and a' and c', connecting-rods m, spiral springs q, spring-rests m' and r, connecting-links n, toggle o, and cross-beam B, in combination with toothed racks b b' and ways g, constructed and arranged substantially as shown and described.

6. In an automatic safety stop mechanism for arresting the descent of elevator-cars, in combination, catch-dogs c c' and bearings i' i' on the lower edges, catch-dogs a a' and bearings on the upper edge of an elevator-car, connecting-rods m, spiral springs q q, spring-seats m' r, links n, toggles o, adjusting-screws o' o', cross-beam B, suspending-cable A, link-cable C, and elevator-car, the whole constructed and arranged substantially as shown and described.

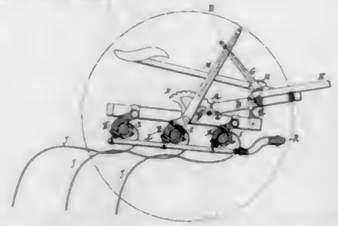
7. The method of suspending elevator-cars by a free-link cable or chain from a suspended cross-beam, substantially as shown and described.

8. The method of mounting, connecting, and operating the catch-dogs in a device for automatically arresting the descent of elevator-cars, substantially as shown and described.

9. The truncated catch-dog a, continued into a long curved arm, forming an obtuse angle therewith, and provided with suitable journal-bearings for making necessary connections, and so constructed as to receive the shock of a fall in a line nearly vertical to its axis, substantially as shown and described.

10. The catch-dog c, having a short lever-arm, and provided with suitable journal-bearings for making connections, and constructed to receive the shock of a fall at nearly a vertical line, substantially as shown and described.

11. The connecting-rod m, having a spring-seat, m', and provided with a screw, m^2, at one end, by and through which the relative position of the several sets of catch-dogs can be regulated, substantially as shown and described.

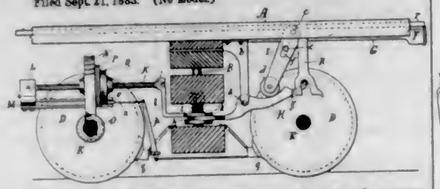


12. Cross-beam B, having toggle-connections f f', for suspending and hoisting elevator-cars, and with toggle-connections o, provided with adjusting-screws o', for engaging and holding neutral safety catch-dogs, as shown, substantially as and for the purpose set forth.

291,839. LEAD AND CRAYON HOLDER. WILLIAM L. BUTTERFIELD, Providence, R. I., assignor to Henry Berolzheimer, New York, N. Y. Filed Oct. 1, 1883. (No model.)

Claim.—The combination, in a lead and crayon holder, with the lead-grasping jaws, of a movable clamping-sleeve, a spring which normally holds the sleeve in a position where it will not clamp the jaws upon the lead, and a detent by which the sleeve can be locked in clamping position on said jaws against the stress of its controlling-spring, substantially as hereinbefore set forth.

291,840. SPRING-TOOTH HARROW. EBEN C. COMSTOCK, Springport, Mich., assignor to himself and Charles J. Comstock, same place. Filed June 9, 1883. (No model.)



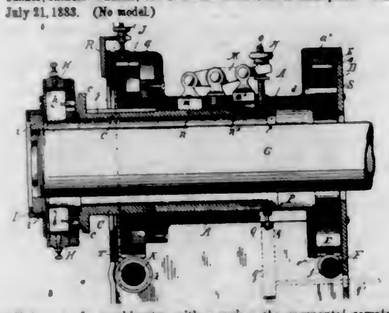
Claim.—1. In a spring-tooth harrow, and in combination with a main frame supported on a main shaft having stub-axles, a supplemental tilting frame carrying a series of pivoted brackets, having rolling heads provided with spring-teeth, and connected by rods, as L, having pivoted connections with the draft, means upon the supplemental frame for manipulating said roller-heads simultaneously, and means upon the main frame for tilting the supplemental frame to relieve the teeth from trash, as set forth.

2. The combination, with the main frame B and main shaft A, having stub-axles C, of the supplemental frame F, having rolling heads I, with spring-teeth J, the clips K, connecting-rods L, lever M, and toothed segment N, as and for the purposes set forth.

3. The combination, with the main frame B and supplemental frame F, having rolling heads I, with spring-teeth J, as shown, of the clips K, connecting-rods L, lever M, the lever G, link d, and toothed segments H and N, as and for the purposes set forth.

4. In combination with the supplemental frame F, rolling heads I, connecting-rods L, and lever M, the clips K, composed of the castings pivoted at one end to the frame and at the other to the said rods L, the U-shaped bolts g, nuts h, and semicircular bearing-plates i, as and for the purposes set forth.

291,841. CAR-BRAKE. SIMON FAIRMAN, Baltimore, Md., assignor of one-half to John G. Mitchell and William S. Taylor, both of same place. Filed Sept. 21, 1883. (No model.)

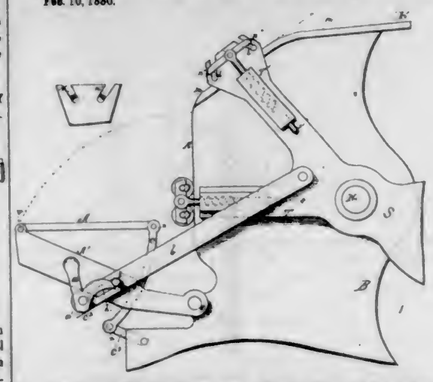


Claim.—1. In a car-brake, the combination of a car-axle, a worm secured to the said axle, an independent shaft carrying a worm-wheel and susceptible of being moved toward and from the worm, a sheave on the independent shaft, a chain to connect the said sheave with the ordinary brake mechanism, a longitudinally-moving draw-bar, and means to communicate movement from the said draw-bar to the said independent shaft and its attachments, substantially as specified.

2. In a car-brake, the combination of a car-axle, a worm secured to the said axle, an independent shaft carrying a worm-wheel with teeth on a portion only of its circumference, and adapted to have movement toward and from the said worm, a sheave on the said independent shaft, a chain to connect the said sheave with the ordinary brake mechanism, a longitudinally-moving draw-bar, and means to communicate movement from the said draw-bar to the said independent shaft and its attachments, substantially as specified.

3. The vibratory shaft K, carrying the worm-wheel N, pivoted to a part of the collar k on the swivel-bolt B, combined with mechanism which receives its movement from the longitudinal motion of the draw-bar, substantially as specified.

291,842. APPARATUS FOR SCREW-THREADING TUBES. HERMANN BERNHARD FELDMANN, Philadelphia, Pa., assignor to Stephen P. M. Tasker, Charles Wheeler, and T. Wistar Brown, all of same place. Filed July 21, 1883. (No model.)



Claim.—1. In combination with a casing, the segmental serrated and toothed cams, the rack-provided annulus, and means for imparting a rotary movement to said annulus for the actuation of the cams, substantially as set forth.

2. In combination with the casing and with the die-carrying sleeve provided with circumferential threads on its exterior circumference, the segmental nuts, the pivoted balance-lever, and means for operating said pivoted balance-lever, whereby either of said nuts can be thrown into engagement with the threads on the sleeve, or both retained out of engagement, substantially as set forth.

3. In an apparatus for threading rods or tubes, the combination, with the casing, the die-carrying sleeve provided with circumferential threads on its exterior circumference, the segmental nuts, and means for throwing either of said nuts into engagement with the threads on the sleeve, or for retaining them both out of engagement, of the yoke and means for occasioning the longitudinal movement of said yoke, whereby through the instrumentality of the segmental nuts the die-carrying sleeve can be slowly moved, and through the instrumentality of the yoke rapidly moved, substantially as set forth.

4. As a device for operating the segmental nuts, the pivoted balance-lever, in combination with the thumb-nut and stem upon the casing.

291,843. PRINTING-PRESS. MERRITT GALLY, New York, N. Y. Filed Feb. 10, 1880.

Claim.—1. The combination, in a printing-press, of a distributing-table in a different plane from the plane of the bed, of ink-distributing rolls, arranged, substantially as described, to move over the table in lines oblique to the table and oblique to each other, and suitable operative mechanism, substantially as described.

2. The combination, with the distributing-table of a printing-press, of ink-distributing rolls which move over a part of the table in lines parallel to the edge thereof, and over part of the table in lines oblique to the edge thereof, and suitable operative mechanism, substantially as described.

3. The combination, with the distributing-table of a printing-press, having its surface in more than one plane, of ink-distributing rolls which move over said table in oblique lines, and suitable operative mechanism, substantially as described.

4. The combination, with the distributing-table of a printing-press made up of more than one plane, of ink-distributing rolls which move over the plane surfaces in an oblique direction, but which pass over the line of junction of said planes in a line parallel therewith, and suitable operative mechanism, substantially as set forth.

5. The combination, with an ink-distributing-table made in a plurality of planes, as described, of the rocking-frame carrying ink-distributing rolls, said rocking-frame being provided with inclined slots, the slots in one end of the frame being inclined in the opposite direction from those in the other end, substantially as set forth.

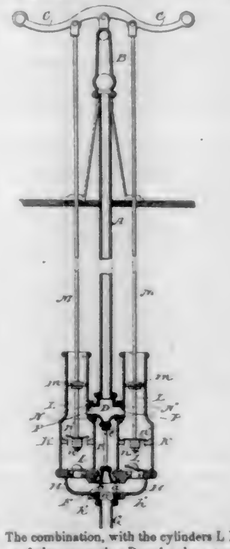
6. The combination, with the distributing-table in a plurality of planes, the rocking-frame, and the ink-distributing rolls carried by said frame in slots inclined as described, of the form-inking rolls connected with said frame so as to pass upon a portion of the distributing-table, substantially as described.

7. The combination, with the roller-frame, a movable part of the press, and mechanism substantially as described connecting said parts, of an adjustable connection, substantially such as described, whereby the roller-frame may be made to move a greater or lesser distance with each movement of the moving part, substantially as set forth.

8. The combination, with the roller-frame, of the draw-bar connecting said frame to the platen, a slot and stud connection between the bar and platen, and a stop to open or partially close the slot, as set forth.

9. The combination, with the pivoted or hinged platen, of a tympan hinged thereto at the front or upper edge thereof, and connected at the other edge by link mechanism to the frame of the press, as set forth.

10. The combination, with the hinged platen A', of the tympan A, pivoted thereto at v, the link c, pivoted to the tympan at x, and the link c^2, pivoted to link c and to the frame, all substantially as described.



291,844. POSITIVE SHUTTLE-MOTION FOR LOOMS. HARVEY H. GREENMAN, Cortlandville, N. Y. Filed Feb. 14, 1882. (No model.)

Claim.—The shuttle-body A, having recesses a', and the reciprocating arms C C', having spring-catches D, provided with hooks d d^2, combined with the shifting trigger-frame B, as and for the purposes specified.

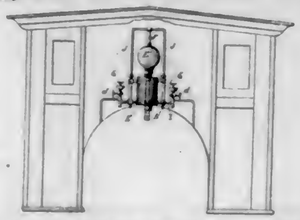
291,844.

291,845. FORCE-PUMP. FERDINAND GROTE, Evansville, Ind. Filed Sept. 24, 1883. (No model.)

Claim.—1. The combination, with the cylinders L L, having bosses N N, and ears o o, of the connection D and rods p, as and for the purpose set forth

2. The combination, with the standard A, connection D, and cylinders L L and K K, of the screw-threaded rod E, elbows H, and casting F, substantially as set forth.

3. The combination, with the cylinders K K, having lugs *t t*, of the elbows H H, having lugs *k k* and A' A', and the casting F and bolts V and A, and their nuts, as and for the purpose set forth.



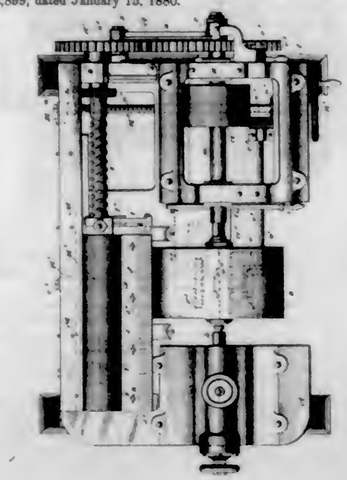
291,846. GUARD FOR HARNESS-BUCKLES. FRANK G. HARRISON, Newburyport, Mass., assignor of one-half to Richard S. Dodge and Paul Adams, both of same place. Filed Sept. 4, 1883. (No model.)

Claim.—1. A buckle-guard consisting of a bulged guard-plate having a loop at one end and a transverse slot at the other end, and a perforated tongue-securing plate having a loop at one end, perforated at the other end, and adapted to be inserted through the slot in the guard-plate, as and for the purpose shown and set forth.

2. The combination of two straps, a buckle, a bulged guard-plate having a loop at one end and a transverse slot at the other end, and a tongue-securing plate having a loop at one end, a perforation in the other end, and adapted to pass through the slot in the guard-plate and into the buckle, fitting with its perforation over the tongue of the buckle, as and for the purpose shown and set forth.

291,847. LUBRICATOR FOR LOCOMOTIVES. CLARENCE B. HODGES and CHARLES H. HODGES, Detroit, Mich., assignors of one-half to Henry C. Hodges and Charles C. Hodges, both of same place. Filed Nov. 7, 1883. (No model.)

Claim.—1. In a locomotive-lubricator, the combination, with the visible feed-chamber G and the condensing-chamber E', of an exterior steam-pipe connection between the upper portion of the condenser, the top of the visible feed-chamber, and the steam-space of the locomotive-boiler, substantially as described.



2. The combination, with a locomotive, of a lubricator having a steam-inlet pipe connected with the steam-space of the boiler, an oil-exit pipe leading from the top of the visible feed-chamber into the tallow-pipes, and a steam-conduit connecting the top of the visible feed-chamber with the steam-inlet pipe or steam-space above the water-level of the condenser, substantially as described.

3. A lubricator combining the following elements: first, an oil-reservoir, a condenser, a steam-inlet pipe, a visible feed-chamber, in which the oil rises through the water, a conduit connecting the top of this chamber with the steam-inlet or steam-space above the water-level of the condenser, an oil-exit pipe leading from the top of the feed-chamber, and a throttling-valve located in the said oil-exit pipe, substantially as described.

4. In a locomotive-lubricator, the combination, with the condenser E' and visible feed-chamber G, of an exterior steam-pipe connection between the upper end of the visible feed-chamber and the steam-space of the boiler, and a connection between the upper part of the condenser and the said steam-pipe connection, substantially as described.

291,848. MACHINE FOR MAKING WOOD FIBER. PHILIP H. HOLMES, Gardiner, Me. Filed Nov. 26, 1883. (No model.)

Brief.—Improvement on the invention in Letters Patent No. 228,899, dated January 15, 1880.

Claim.—1. In a machine for making wood fiber, the combination, with devices for supporting and rotating a block or pieces of wood, of a knife arranged to be moved and sever the fiber by a drawing cut, substantially as set forth.

2. In a machine for making wood fiber, the combination, with devices for supporting and rotating a block or pieces of wood, of a series of knives and suitable devices for reciprocating said knives and severing the fiber by a drawing cut, substantially as set forth.

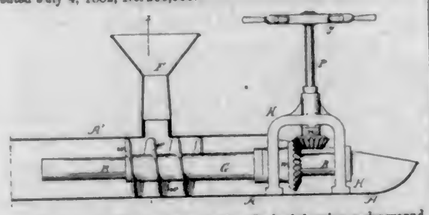
3. In a machine for making wood fiber, the combination, with devices for supporting and rotating a block or pieces of wood, of a series of knives and devices for feeding the knives to their work and for reciprocating them and severing the fiber by a drawing cut, substantially as set forth.

4. In a machine for making wood fiber, the combination, with devices for supporting and rotating a block or pieces of wood, of a blade provided with grooves that subdivide the blade into a series of knives, substantially as set forth.

5. In a machine for making wood fiber, the combination, with devices for holding a block of wood, of a series of knives adapted to convert the wood into fiber, and means for sharpening the knives while the machine is in operation, substantially as set forth.

6. In a machine for making wood fiber, the combination, with devices for supporting and rotating a block or pieces of wood, of a series of knives, devices to feed and reciprocate said knives, and means for sharpening the knives while the machine is in operation, substantially as set forth.

7. In a machine for making wood fiber, the combination, with devices for rotating a block or pieces of wood, of reciprocating knives, a reciprocating knife-sharpener, and means for adjusting the angle of inclination of said sharpener, substantially as set forth.



8. In a machine for making wood fiber, the combination, with devices for rotating a block or pieces of wood, of reciprocating knives, a reciprocating slide having a knife-sharpener removably secured thereto, and means for varying the angle of inclination of said slide, substantially as set forth.

9. In a machine for making wood fiber, the combination, with devices for rotating a block or pieces of wood, of reciprocating knives and reciprocating knife-sharpener, located at opposite sides of the transverse center of said knives, substantially as set forth.

10. In a machine for making wood fiber, the combination, with devices for rotating a block or pieces of wood, of reciprocating knives for severing the fiber by a drawing cut and a trough for conveying away said fibers, substantially as set forth.

291,849. MODE OF AND MECHANISM FOR FORMING UNDERGROUND CONDUITS. HENRY HOWSON, Philadelphia, Pa., assignor to Calvin Detrick, New York, N. Y., and Ephraim Ward Bond, Springfield, Mass. Filed Nov. 26, 1883. (No model.)

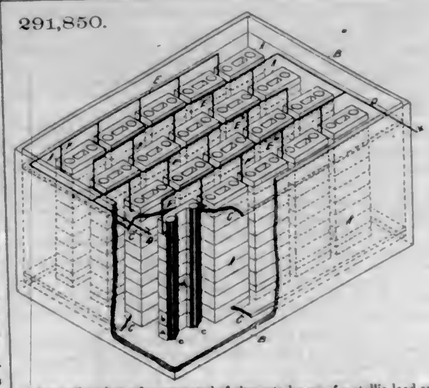
Brief.—Improvement on the invention of Wm. M. Campbell, patented July 4, 1882, No. 260,533.

Claim.—1. The mode herein described of forming underground conduits, the said mode consisting in the continuous packing of cement round a former within a tube, which retreats as the continuous packing proceeds, substantially as set forth.

2. A conduit-making machine in which the following elements are combined, namely: first, a base, A, tube A', and hopper communicating therewith; second, a shaft carried by the base, and having a spiral rib or screw-thread adapted to the interior of the tube; third, a former round which the cement is packed; and, fourth, mechanism for operating the said screw-shaft, all substantially as set forth.

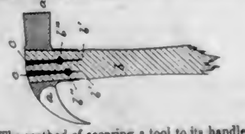
291,850. STORAGE-BATTERY. EDWD. R. KNOWLES, Brooklyn, N. Y., assignor of one-half to Byron A. Brooks, same place. Filed June 2, 1882. (No model.)

Claim.—1. In a storage-battery, the combination of positive electrodes composed of alternate plates of metallic lead and compressed sponge-lead, and negative electrodes composed of alternate plates of metallic lead and compressed oxide of lead, the said plates being mechanically united by means of rivets, substantially as described.



2. In a storage-battery, the combination of positive electrodes composed of alternate layers of metallic lead and compressed sponge-lead and negative electrodes composed of alternate layers of metallic lead and compressed oxide of lead, all of which, both metals and oxides, are perforated, substantially as described, for the purpose specified.

3. In a storage-battery composed of compound electrodes, the combination of rivets c c with the alternate layers of metallic lead and compressed sponge-lead, forming one electrode of the battery, and also with the alternate layers of metallic lead and compressed oxide of lead, forming the other electrode of the battery, substantially as described.

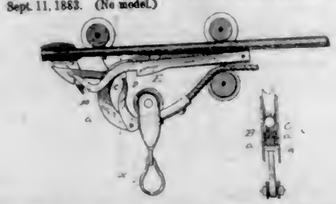


4. A storage-battery composed of compound electrodes, the positive electrodes being composed of alternate layers of metallic lead and compressed sponge-lead, and the negative electrodes being composed of alternate layers of metallic lead and compressed oxide of lead, all being immersed in the electrolytic liquid, and perforated, united, and electrically connected, substantially as described.

5. In a storage-battery consisting of a series of separate electrodes, the combination of a false bottom, C, and a cover, C', each of which is perforated to receive and support the electrodes, substantially as described.

291,850.

291,851. SECURING TOOLS TO HANDLES. DANIEL H. MURPHY, Hartford, Conn., assignor of one-half to John E. Smiledge, same place. Filed May 10, 1883. (No model.)



Claim.—1. The method of securing a tool to its handle, which consists in slitting the end of the handle, compressing in said slitted end a wedge of elastic material, as india-rubber, and then inserting the slitted end of the handle into the handle-socket in the tool, all substantially as described.

2. In combination, a tool having a handle-socket, a handle having a slitted end, and a wedge of elastic material compressed in said slitted end of the handle, whereby the handle is wedged in the socket in the tool, all substantially as described.

3. In combination, tool *a*, handle *b*, having the end slits, *b'*, with enlargement *b''*, and wedge *c*, of rubber or its equivalent, compressed in the slit, all substantially as described, and for the purpose set forth.

291,852. HAY-CARRIER. PHILIP A. MYERS, Ashland, Ohio. Filed Sept. 11, 1883. (No model.)

Claim.—1. A hay-carrier consisting of two bent side bars properly connected with hangers and supporting-sheaves, a bell-crank lever pivoted on the bent ends of the bars and connected to the hoisting-rope passing over a pulley on the carrier, a latch adapted to catch over a detent on the way, and a dog to hold the bell-crank lever, the latch and dog

being constructed to operate in connection with the detent, substantially as described.

2. The combination, in a hay-carrier, of a latch and dog pivoted within the carrier, a bell-crank lever connected to the hoisting-rope and having an arm adapted to operate a latch and dog and be held by the dog, and a pulley for the hoisting-rope adapted to throw the lever-arm against the dog and latch, all substantially as described.

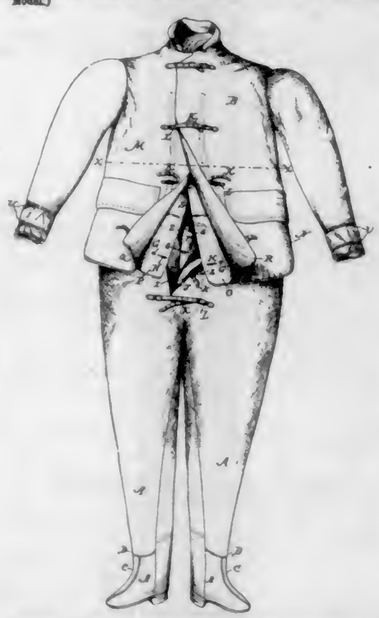
3. The combination, in a hay-carrier, of a bell-crank lever connected to the hoisting-rope, which is arranged to run over an elevated pulley, 5, an arm of the bell-crank lever, and a dog, E, fitted to be lifted by the arm and by the detent on the way, all substantially as described.

4. The combination, in a hay-carrier, of hoisting devices and a dog, E, adapted to be lifted by the hoisting devices, and a detent adapted to raise the dog, all substantially as described.

5. In a hay-carrier, the latch and dog pivoted between the bars of the carrier, combined with a detent, D, and adapted to operate in connection with the detent, substantially as described.

6. The combination, with the described hay-carrier, of the latch B and dog E, both having inclines, whereby it is lifted by the hoisting devices and by the detent, all substantially as described.

7. The combination of the latch and dog with the hay-carrier supported by sheaves on a track, and the detent D, having semicircular bar, all substantially as described.

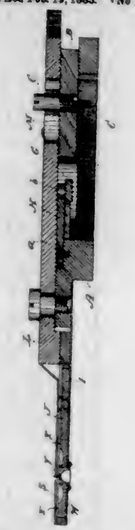


8. In combination with the latch and dog of the described carrier, the separating-strap F, substantially as described.

291,853. TORPEDO. CONRAD PILGRIM, East New York, N. Y. Filed Nov. 19, 1883. (No model.)

Claim.—A torpedo having the fulminate located between suitable wrappers separate from the sand or gravel filling, the whole being infolded and hermetically inclosed in a water-proof wrapper, substantially as and for the purpose specified.

291,854. RUBBER CLOTHING. GEO. PLATT, Butte, Mont., assignor of one-half to Patrick A. Largey, same place. Filed July 26, 1883. (No model.)



Claim.—1. The combination of the boots and trousers made in one, and having the inner and outer sets of flies, the inner set being secured to the inside of the trousers and the outer set being formed integral therewith, and the coat having two sets of flies constructed in like manner with those of the trousers, and the buckles and straps arranged, as described, for closing the flies and suspending the trousers from the coat.

2. The boots and trousers made in one garment, the trousers being provided with a double fly on each side, substantially as shown, and having buckles and straps for fastening the flies.

3. The coat having a double fly on each side, and buckles and straps for fastening the flies, substantially as shown and described.

291,855. MACHINE FOR STITCHING EYELETS. CARL J. A. SJOBERG, Bridgeport, Conn. Filed Feb. 19, 1883. (No model.)

Claim.—1. In an eyelet-hole attachment or similar machine, the combination, with a jog-link and two sliding devices loosely connected therewith for actuating the feeding and oscillating mechanisms, of an adjustable lever to which said jog-link is pivoted, whereby the connections of said sliding devices relative to the pivotal point of the jog-link may be varied, substantially as set forth.

2. In an eyelet-hole attachment or similar machine, the combination, with the bed-plate, of a lever pivoted thereto, a jog-link pivoted to said lever, mechanism for operating said jog-link, a carrier-wheel for rotating the fabric, and connecting mechanism for imparting intermittent rotary motion to said carrier-wheel from said jog-link, substantially as set forth.

3. The combination, in an eyelet-hole or similar attachment for sewing-machines, of a carrier-wheel for rotating the fabric, an oscillating plate by which said wheel is carried, a sliding plate adapted to be reciprocated from the driving-shaft of the sewing-machine, and mechanism for imparting a vibratory movement to said oscillating plate and an intermittent rotary movement to said carrier-wheel from said sliding plate, substantially as shown and described.

4. In a eyelet-hole attachment for sewing-machines, the combination, with a bed-plate of an oscillating plate pivoted thereto, a carrier-wheel arranged to rotate in said oscillating plate, a sliding device adapted to be reciprocated from the driving-shaft of the sewing-machine, mechanism for imparting vibratory movements to said oscillating plate and an intermittent rotary movement to said carrier-wheel from said sliding plate, and means for varying the movements of said oscillating plate and carrier-wheel, substantially as hereinbefore set forth and described.

5. The combination, with the oscillating plate L and slotted disk mounted therein, of means for adjusting the position of said slotted disk, substantially as set forth.

6. The combination, with the bed-plate A, of the lever H, pivoted to said bed-plate, a jog-link, G, pivoted to said lever, and thus adapted to be varied in its position thereby, the sliding bar or pawl-carrier D, loosely connected to said jog-link, the oscillating plate L, and mechanism for operating the said plate L and the jog-link, substantially as set forth.

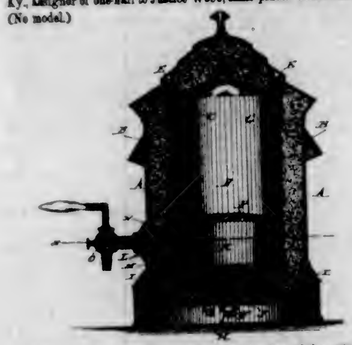
7. In an eyelet or similar machine, the carrier-wheel S, having a raised central portion on its upper face, in combination with the presser-foot X, with its under surface beveled inward, whereby the fabric may be confined between the raised central portion and the inwardly-extending bevel, substantially as set forth and described.

8. The link G, pivoted, as shown, to the lever H, and adapted to slide at its extreme ends upon pins or projections attached to the lug F and bar D, substantially as set forth and described.

9. The sliding plate B, having lug F, in combination with the link G, lever H, and bar D, substantially as set forth.

10. The sliding plate B, in combination with the adjustable jog-link G and bar D, substantially as set forth.

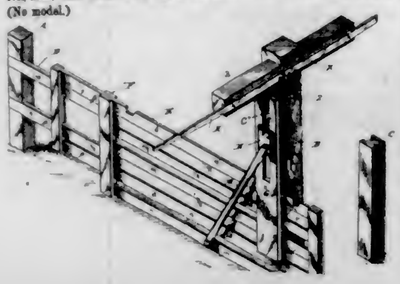
11. The rotary disk M, having slot N, in combination with the lever O, having slot Q and set-screw R, substantially as described.



12. The combination, with the bed-plate A, the ratchet-wheel J, pivoted thereto, and the sliding pawl-carrier D, having the spring-pawl E, and adapted to reciprocate in suitable ways in said bed-plate, of the cap-plate I and the carrier-wheel S, adapted to rotate in said cap-plate, substantially as set forth.

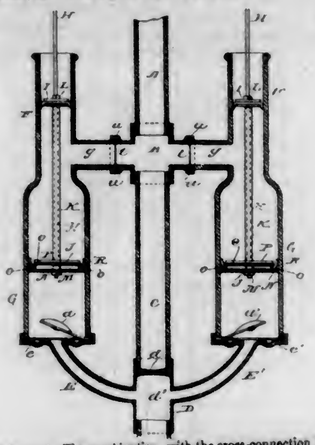
291,856. WHIP-SOCKET. JAMES WEATHERS, Indianapolis, Ind., assignor of one-half to John A. Robbins, same place. Filed Nov. 8, 1883. (No model.)

Claim.—The combination, with a whip-socket, of a tubular extension having a threaded gland, and the threaded shank having a swiveled head and a squared or angular end to receive a key whereby it may be operated to lock and unlock the whip, substantially as specified.



291,857. WATER-COOLER. JOHN EDWARD WELLING, Georgetown, Ky., assignor of one-half to Justice Webb, same place. Filed Oct. 31, 1883. (No model.)

Claim.—1. In a water-cooler, the combination of the outer shell or casing, A, having the downwardly-projecting inside flange, C, and annular shoulder I near its bottom, removable water-tank D, having flange E and central bottom screw, F, removable bottom G, having the central aperture, J, and nut H, constructed and combined substantially as and for the purpose shown and set forth.

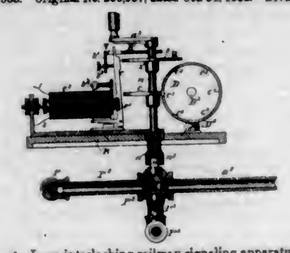


2. In a water-cooler, the combination of the outer shell or casing, A, having the downwardly-projecting inside flange, C, and annular shoulder I near its bottom, removable water-tank D, having flange E and central bottom screw, F, removable bottom G, having the central aperture, J, nut H, removable faucet-tube L, connecting tank D with the faucet in the outer shell, washers M and N, and removable nut K, all constructed and combined substantially as and for the purpose shown and set forth.

291,858. GATE. THOMAS WILLIAMS and WILLIAM A. PRESTON, Princeton, Ind.; said Williams assignor to said Preston. Filed June 5, 1883. (No model.)

Claim.—The combination of the parallel bars and their supporting-posts, the gate adapted to slide thereon, the slotted board and sliding block and bolt adapted to sit in notches in the gate, the levers connected to said block, and the pivoted rod connecting the block and gate, the whole arranged to operate substantially in the manner specified.

291,859. DOUBLE-ACTING FORCE-PUMP. ALEXANDER CRAWFORD, Evansville, Ind. Filed Sept. 20, 1883. (No model.)



Claim.—1. The combination, with the cross-connection B, having ears T, of the cylinder F, having outlet *g*, provided with lugs S, and the taper key V, as and for the purpose set forth.

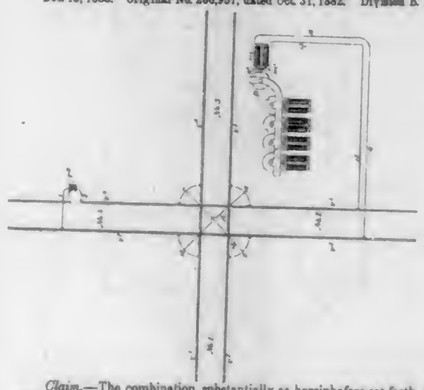
2. The combination, with the casting D, having partition *d*, and arms E E', provided with foot-pieces *e e'*, having ears e^2 e^2, of the cylinders G G, provided with ears *c c* and bolts *i i*, as and for the purpose set forth.

3. The combination, with the double cylinders F G, F G and means for operating the same, substantially as described, of the cross-connection B, the pipe C, and the casting D, having partition *d*, as and for the purposes set forth.

REISSUES.

10,434. HYDRAULIC AND ELECTRIC INTERLOCKING APPARATUS. OSCAR GARRETT, Boston, Mass., assignor, by mesne assignments, to Robert Pitcairn and George H. Christy, Trustees, Pittsburg, Pa. Filed Dec. 13, 1883. Original No. 266,957, dated Oct. 31, 1882. Division A.

Claim.—1. In an interlocking railway signaling apparatus, a rotary cylinder having in its periphery a series of two or more slots or recesses, arranged out of line with each other, both circumferentially and longitudinally, in combination with a corresponding number of rotary disks adapted to be rotated into and out of the cylinder-slots, substantially as set forth.



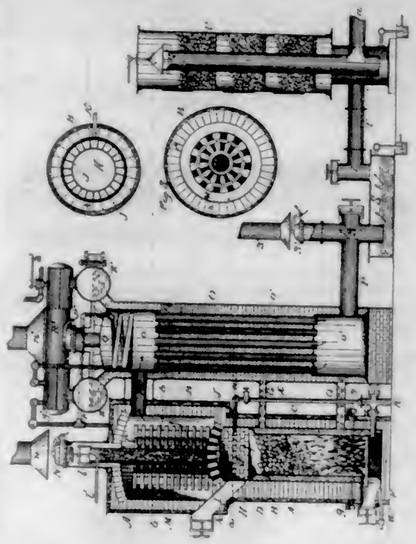
2. The combination of slotted cylinder D, two or more locking-disks, *c*, and two or more fluid-pressure cocks, P^2, substantially as set forth.

3. In combination with slotted cylinder, locking-disks, and fluid-pressure cocks, a fluid-pressure supply-pipe, P, a waste-pipe, P', and a series of two or more transmitting-pipes leading to the signals to be actuated, substantially as set forth.

4. In combination with a slotted rotating cylinder, two or more locking-disks, *c*, and cocks P^2, a notched disk, *z*, on the shaft of one or more of the disks *c*, and an armature-lever and electro-magnet for each disk *z*, the same being included in a train-actuated electric circuit, substantially as set forth.

5. A system of apparatus for railway-crossing signals, having in combination a slotted rotary cylinder, a series of two or more rotary disks to enter or clear the slots of the same, fluid-pressure cocks with pipe-connections to actuate the signals, and one or more electro-magnets, the circuit-wires of which are connected with an insulated track section or sections, substantially as set forth, whereby the short-circuiting of a track-section shall drop an armature-lever and lock the cylinder.

10,435. HYDRAULIC AND ELECTRIC INTERLOCKING APPARATUS. OSCAR GASSETT, Boston, Mass., assignor, by mesne assignments, to Robert Pitcairn and George H. Christy, Trustees, Pittsburg, Pa. Filed Dec. 13, 1883. Original No. 266,957, dated Oct. 31, 1882. Division B.



Claim.—The combination, substantially as hereinbefore set forth, of four independently-insulated sections of railway-track extending radially in different directions from a crossing or intersection, a battery having one of its poles connected with one insulated line of rails of each of said sections and its remaining pole with the other insulated line of rails of each section, and an electro-magnet having its opposite terminals connected with the respective lines of rails of each section in the same manner as the poles of the battery, whereby a continuous electric current from said battery will traverse said electro-magnet, except when diverted therefrom by the establishment of a direct electric connection between the opposite insulated lines of rails of one or more of said insulated sections.

10,436. APPARATUS FOR MANUFACTURING GAS. JOHN L. STEWART, Philadelphia, Pa. Filed Nov. 15, 1883. Original No. 282,399, dated July 31, 1883.

Brief.—The body of fuel in the decomposing-chamber is highly heated by combustion. The resulting gaseous products are burned and used to heat the superheating or fixing chamber and a steam-boiler. Steam is decomposed in the incandescent fuel, and the resulting water-gas is combined with oil-vapor from the oil-retort and the mixture is converted into a fixed gas in the superheater. The water-jacket of the generator is connected by circulating-pipes with the steam-boiler. Products of combustion from the generator and gas to be stored pass through the steam-boiler. A steam-superheating coil is placed in the smoke-box of the boiler in the path of the passing hot gas.

Claim.—1. In an apparatus for producing heating and illuminating gas, the generator provided with a water-jacket and supply-pipes, in combination with the superheating and fixing chamber having an eduction-pipe, and the vertical retort open at the bottom, having an oil-inlet pipe near the top, and containing suitably-disposed refractory material, whereby oil may be vaporized and the resulting vapors mixed with gas rising from the generator, and the mixture converted into a fixed gas in the fixing-chamber, substantially as set forth.

2. In an apparatus for manufacturing heating and illuminating gas, the combination of the generating-chamber, the water-jacket and the superheater or fixing-chamber, located as described, whereby the use of a

clinker-bar is avoided and the heat is economically utilized in the fixing-chamber.

3. In an apparatus for manufacturing heating and illuminating gas, the combination of the generator, the water-jacket therein, and the superheater or fixing-chamber, containing refractory material, located as described, and having an oil-vaporizer therein, for the purpose described.

4. In an apparatus for producing heating and illuminating gas, the generator provided with a water-jacket and supply-pipes for air and steam, in combination with the superheating and fixing chamber, the steam-boiler, and pipes connecting the water-space of the boiler with the water-jacket of the generator, as and for the purpose described.

5. In an apparatus for producing heating and illuminating gas, the generator provided with a water-jacket and supply-pipes for air and steam, in combination with the superheating-chamber, an oil-vaporizer, the steam-boiler, a pipe connecting the smoke-flue thereof with the superheater, and pipes connecting the water-space of the boiler with the water-jacket of the generator, as and for the purpose described.

6. In an apparatus for producing heating and illuminating gas, in combination, a gas-generating chamber provided with an inclosing water-jacket, and a steam-boiler, the smoke-flues of which at one extremity communicate with said generating-chamber and at the other extremity with a discharge-conduit, and the water-space of which communicates with said water-jacket, as and for the purpose specified.

PHOTO-LITHO. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES, &c.

DECISIONS OF THE CANADIAN PATENT OFFICE.

BARTER v. SMITH.

Decided February 15, 1877.

1. MANUFACTURE AND CONSTRUCTION WITHIN TWO YEARS.

The Canadian patent law requiring "construction or manufacture of the invention or discovery patented within two years of the date of the patent" does not contemplate forcing, on penalty of forfeiture, the patentee to actually fabricate his invention with his own capital within specific establishments, with his own tools, and to keep stock for every moment of the existence of his privilege throughout the Dominion.

2. SAME.

The real meaning of the law is that the patentee must be ready either to furnish the article himself or to give license of using on reasonable terms to any person desiring to use it. The words "carry on in Canada the construction or manufacture," with their context, mean that any citizen of the Dominion has a right to exact from the patentee a license for using the invention patented, or obtain the article patented for its use at the expiration of the two years' delay, on condition of applying to the owner for it and on payment of a fair royalty.

3. IMPORTATION.

The words "imports or causes to be imported into Canada," section 28 of the patent act of 1872, mean the importation of patented inventions to the injury of home labor, and do not cover the actual importation of a few machines as models or for the purpose of bringing the usefulness of the invention before the Canadian public.

Messrs. Edgar, Fenton & Ritchie, of Toronto, counsel for the disputant.

Messrs. Grahame, Howland & Ryerson, of Toronto, counsel for the respondent.

BEFORE the Deputy of the Minister of Agriculture.

This case is one in which a dispute is raised against the existence of three patents granted to the respondent in 1873, for alleged forfeiture on the ground of non-manufacturing, within two years of the date of each patent, and on the ground of importing after twelve months, in the terms of section 28 of the patent act of 1872.*

The petition addressed to the honorable the Minister of Agriculture (bearing date October 10, 1876) by the disputant represented that Patents No. 2,409, for a process of milling; No. 2,257, for a flour-dressing machine, and No. 2,258, also for a flour-dressing machine, granted to George Thomas Smith in 1873, are null and void, and should be so declared for non-compliance with the provisions of the twenty-eighth section of the patent act of 1872, requiring manufacturing within two years and forbidding importation after twelve months.

The petition asked that the patentee should be required, in case he should state that his inventions have been manufactured, to furnish the particulars. The petition, furthermore, alleged that importations of the said inventions had taken place on the 25th day and on the 29th day of April, 1876.

The following is a list and an analysis of the proof adduced:

DOCUMENTARY EVIDENCE.

1. The exemplification of Patent No. 2,257, granted to respondent, George Thomas Smith, for a flour-dressing machine, under date of April 18, 1873.

2. The exemplification of Patent No. 2,258, granted to respondent, for a flour-dressing machine, under date of April 18, 1873

3. The exemplification of Patent No. 2,409, granted to respondent, for a process of milling, under date of June 4, 1873.

These three patents have on their face the conditions of forfeiture prescribed by the twenty-eighth section of the patent act, hereinbefore quoted.

4, 5, 6. Three petitions, addressed to the Commissioner of Patents in the month of August, 1876, in relation to the three above-named patents, by the patentee, George Thomas Smith, representing, generally, that he has been unable to dispose of his inventions for want of demand or acceptance on the part of the public; that he believes he has fulfilled the spirit of the law, but as doubts and disputes have arisen, he prays for a further extension of delay, and for a declaration that the offering of his inventions for public use upon payment of a reasonable royalty is sufficient compliance with the statute.

(The office answer to the petition was that from the allegations of the patentee it did not appear that the said patents had been voided.)

7. A letter of Messrs. Grahame, Howland, & Ryerson, of Toronto, attorneys-at-law of the patentee, Smith, inquiring about the mode of obtaining a conclusive decision in the matter of the said disputes, and suggesting that parties questioning the existence of their client's patents should be cited to appear and prove their case, and in default that the decision be given on the showing of the patentee.

(The official answer was to the effect that the Patent Office could not undertake to initiate a case of dispute.)

8. A letter of Messrs. Edgar, Fenton, & Ritchie, of Toronto, attorneys-at-law of the disputant, Benjamin Barter, raising the present dispute against the three hereinabove-mentioned patents of the respondent.

(*) SECTION 28. Every patent granted under this act shall be subject and expressed to be subject to the condition that such patent and all the rights and privileges thereby granted shall cease and determine, and the patent shall be null and void at the end of two years from the date thereof, unless the patentee, or his assignee or assignees, shall within that period have commenced, and shall after such commencement continuously carry on in Canada the construction or manufacture of the invention or discovery patented, in such manner that any person desiring to use it may obtain it, or cause it to be made for him at a reasonable price, at some manufactory or establishment for making or constructing it in Canada; and that such patent shall be void if, after the expiration of twelve months from the granting thereof, the patentee, or his assignee or assignees, for the whole or part of his interest in the patent, imports or causes to be imported into Canada the invention for which the patent is granted; and provided, always, that in case disputes should arise as to whether a patent has or has not become null and void under the provisions of this section, such disputes shall be settled by the Minister of Agriculture or his deputy, whose decision shall be final.

2. Whenever a patentee has been unable to carry on the construction or manufacture of his invention within the two years hereinbefore mentioned, the Commissioner may, at any time not more than three months before the expiration of that period, grant to the patentee a further delay, on his adducing proof to the satisfaction of the Commissioner that he was, for reasons beyond his control, prevented from complying with the above-mentioned condition. (Patent act of 1872, as amended in 1875.)

9. A certified copy of an invoice, dated April 21, 1876, from Charles Rakes, of Lockport, in the United States, to Messrs. Howland & Spink, of Thorold, in the Province of Ontario, as attested by William Leggett, collector of customs.

10. A printed circular, addressed to millers, by Benjamin Barter, the disputant, not dated, but posterior to July 25, 1876, offering for sale the original middlings-purifier. This circular contains certificates of millers having made use of Mr. Barter's machines. Of these certificates ten indicate that they are from the Province of Ontario, the oldest of which is dated December 1, 1875, and four are dated July, 1876. The others are from the United States, the oldest being dated December 2, 1872.

11. An authenticated copy of a bill of complaint filed in chancery, in Toronto, on September 9, 1876, on behalf of George Thomas Smith, (the respondent in this case,) against James Lawson, (a witness in this case,) concerning an alleged infringement of his (Smith's) patent for a process of milling.

DECLARATORY EVIDENCE.

I. A statutory declaration made by the disputant, Benjamin Barter, of the city of Toronto, miller, dated October 30, 1876, stating that he (Barter) during the summer of the year 1876 visited the mill of Messrs. Howland & Spink, at Thorold, and saw machines branded G. T. Smith, patentee, and Rakes, of Lockport, manufacturer; that the said machines were imported machines, and covered the material portions of the inventions claimed by Patents No. 2,257 and No. 2,258; that these machines were ascertained to have been made in the State of New York, by Rakes, for the patentee, Smith, who caused the said machines to be imported during the month of April, 1876; that these machines were imported, two on April 25 aforesaid, as Smith's purifier-machines, on which $109 duties were paid, and two on the 29th, on which same amount of duties was also paid; that these machines are constructed and adapted for the performance of material and substantial portions of the process patented by Patent No. 2,409; that diligent inquiries have led him (Barter) to believe that Smith's inventions were not manufactured in Canada until about August, 1876, with the exception of one machine, manufactured during the winter months of the year 1876.

II. The statutory declaration of Thomas Laurie, of the city of Hamilton, mill-wright, dated November 22, 1876, accompanied with two exhibits, marked "*a*" and "*b*," the first being copy of specifications of Smith's patents, and the other a printed circular from Thomas Pringle, of Montreal, dated March 21, 1873, advertising middlings-purifiers, stating that on November 6, 1876, he called, in company with disputant, on Charles Rakes, at Lockport, State of New York, for the purpose of making inquiries; that the said Rakes informed them that he had manufactured for the patentee, Smith, the machines erected in Messrs. Howland & Spink's mill, at Thorold; that he (Rakes) had nothing to do with selling these machines to Howland & Spink; that the said Rakes told further that Smith was charging for his machines considerably more than the cost of manufacturing; that being asked to make an affidavit of these facts, Rakes refused to do so; that he (Laurie) had visited during the then current month of November, 1876, the mill of Howland & Spink at Thorold, and as a practical mill-wright of forty years standing says that these machines are the machines and the putting into operation of the process described in Smith's specification; that Smith's machines do not require a large expenditure, but could be readily manufactured at any mill with ordinary tools; that for at least three years past there has been a great demand among millers in Ontario for middlings-purifiers of the description patented by Smith; that he is aware that many machines as advertised in the annexed circular were sold in Ontario during the years 1873, 1874, and 1875; that he is not aware of any of Smith's machines having been manufactured, sold, or offered for sale in Canada for more than two years after the date of Smith's patents, and that if any active effort had been made to introduce them he (Laurie) should have become aware of it.

III. The statutory declaration of James Lawson, of the town of Thorold, miller, dated November 14, 1876, stating that he knows the respondent, Smith, who, in company with one Charles Rakes, of Lockport, New York, visited him at his (Lawson's) mill in May, 1876, to ask him (Lawson) to purchase the same machines as he (Smith) was putting up in Messrs. Howland & Spink's mill; Smith informed Lawson that Rakes was making these machines for him (Smith) at the price of $350, to which price Smith was adding $250 additional; that he (Lawson) asked to be furnished with the said machines at a lower price, to which proposal Smith's answer was that this was his lowest price; that before that interview Rakes had told about Smith coming to Thorold, and expressed his hopes that Lawson might purchase the machines from Smith to give Rakes the job of building them; that he (Lawson) is acquainted with Smith's machines and knows they are not of expensive manufacture, but could be built with ordinary tools and materials at any mill. He (Lawson) having been a miller for about twelve years on his own account, is aware that for at least four years past there has been an active demand among millers in Ontario for these middlings-purifiers. Mr. Spink had told him (Lawson) that he had been negotiating with Smith for the purchase of his machines, and afterward that he had purchased them from Smith; that in the early part of last summer he (Lawson) saw Smith, who was regulating the purifiers at Spink's mill, and, on having remarked about the workmanship, Smith told that he was not to have any more constructed by Rakes; that Mr. Spink told that he had a written contract with Smith for the purifiers, but being asked by Barter on November 14, 1876, in his (Lawson's) presence to give affidavit on the subject Spink declined to do so.

IV. A second statutory declaration of Benjamin Barter, dated November 16, 1876, accompanied with an exhibit marked "*a*," being letters exchanged between the said Barter and the firm of Howland & Spink, stating that he, in company with Thomas Laurie, visited Charles Rakes at his place of business, at Lockport, where they were informed by said Rakes that he (Rakes) had manufactured the machines at Messrs. Howland & Spink's mill for G. T. Smith, who made the bargain for them; that the said Rakes informed them that he (Rakes) "never saw the said Messrs. Howland & Spink, or any one on their behalf, until he went to Thorold, at the request of and for the said Smith, to make arrangements about putting the said machines into the said mill;" that Rakes told Laurie in Barter's presence that Smith charged considerably more than the cost of manufacturing; that Rakes refused to make affidavit of his said statements; that Smith admitted to him (Barter) that the machines put in Howland & Spink's mill are his (Smith's) purifiers; that Smith's machines do not require much expenditure, but can be built with ordinary tools and machinery at any mill; that for several years past there has been an active demand among millers in Ontario for machines of that description; that the letter annexed is in the handwriting of Mr. Spink, of the firm of Howland & Spink, and was received by him (Barter;) that he (Barter) was informed by Mr. Spink, on February 26, 1876, that Smith had been telegraphed to come over to close the bargain for the purchase of the said machines; that later Mr. Howland told him (Barter) that he was too late, their firm having bought from Smith, who had come to Toronto to sell his machines; that Messrs. Howland & Spink have declined to give evidence in the case.

The letter of the firm of Howland & Spink, dated February 9, 1876, annexed to the above declaration and referred to, is to the effect that Mr. Spink has just returned from the United States; that he has found Smith's process of milling the best he has ever yet seen; that Smith's purifiers are sold for less money than Barter's machines; that Smith's machines have such a reputation that American millers will have no other; that they expect Smith to come soon, and in the meantime should like to see Barter, as their machines will have to be ordered from some manufacturer in a few days, and that he (Barter) had better call on them at once.

The answer of Mr. Barter to this letter is dated Feb-

ruary 12, 1876, and is to the effect that he purposes soon going to Thorold; that the (so-called in the States) Smith's plan of milling is good, meaning the mode of milling at present adopted there; but that "as the means by which it is effected belong to myself, (Barter,) the mode of milling for which the means were invented must also of necessity belong to me," (Barter;) that he is anxious for the patronage of the firm and should be most sorry if they do not come to terms.

V. A third statutory declaration of Benjamin Barter, dated November 20, 1876, stating that he (Barter) had been informed, in February, 1876, by Mr. Spink, that G. T. Smith had had one of his machines manufactured at Dexter, in the county of Elgin; that he (Barter) went, in the month of May, 1876, at Dexter and St. Thomas, to inquire about the fact; that he, having inquired from millers around, he "could not find any one who knew of any such machine as a middlings purifier having been made or offered for sale in that neighborhood;" that he verily believes that no such machine as patented under No. 2,257 was ever constructed there previous to May, 1876.

VI. An affidavit (in the form and manner in practice in the United States) from the respondent, George Thomas Smith, made and signed in Jackson county, State of Michigan, and dated November 23, 1876, stating: That he (Smith) has never imported into Canada any of the machines manufactured under his Canadian patents; that he has offered to millers in Canada, personally and through agents, to sell the right to use his inventions for a reasonable compensation; that he never refused to furnish his machines manufactured in Canada; that he did not purchase nor import the machines placed in Messrs. Howland & Spink's mill at Thorold; that the sale of said machines and the payment thereof was a transaction between the millers and Rakes, in which he (Smith) had no interest; that he (Smith) sold to Messrs. Howland & Spink the right of using his process under Patent No. 2,409, and superintended the arrangements of the machinery for carrying the said process; that his (Smith's) royalty for the use of his process and machine No. 2,257 was the only profit and emolument which he received in connection with the said Howland & Spink's mill at Thorold.

VII. The statutory declaration made in Toronto on November 22, 1876, by Charles Rakes, machinist, of Lockport, in the State of New York, stating: That he has constructed at Lockport the machines put up in Messrs. Howland & Spink's mill at Thorold; that such machines are after American patents of which G. T. Smith is the patentee, and are nearly equivalent to the Canadian Patent No. 2,257, and that the distinguishing feature of No. 2,258—namely, the grading-reel—does not appear in the machines set at Thorold; that the first opening in connection with this transaction was the meeting of Mr. Spink, in December, 1875, at the North Buffalo Mills; that the said Mr. Spink told there to him (Rakes) that he had been visiting that part of the State of New York to inquire into the relative merits of the various middlings-purifiers, and that he (Rakes) had been recommended to him (Spink) by M. A. Chester, of the firm of Thornton & Chester, millers, of Buffalo; that previous to that interview with Mr. Spink he had not had any communication with G. T. Smith, nor with any person on his behalf, in regard of putting purifiers in the said mill of Messrs. Howland & Spink, and that he (Rakes) never said that he had had such previous communication with G. T. Smith, "the assertion contained in Benjamin Barter's declaration to that effect is false;" that on the occasion of the said first interview Mr. Spink visited Rakes's factory at Lockport; that he (Rakes) visited Thorold on or about February 11, 1876, and met there George T. Smith and Mr. Spink, arranging for the sale of the right to use Smith's inventions. They all three went to Toronto to meet the other member of the firm, and it was when returning to Thorold that he (Rakes) finally bargained with Mr. Spink to build the said machines for him at the price of $350 apiece, free on board at Lockport; that he was to be paid by Messrs. Howland & Spink; was paid $1,100 by them, and looks to them for the balance still due; that he (Rakes) has had for about two years an agreement with Smith to furnish millers with Smith's inventions in the United States at stated prices, but not for use in Canada; that at the time that he (Rakes) was putting up the machines in Messrs. Howland & Spink's mill at Thorold the said Smith proposed to him (Rakes) to undertake the manufacture in Thorold of machines to be used in mills in Canada; that it was expressly proposed by the said Smith that if Mr. James Lawson should purchase the right of using his inventions, that he (Rakes) should manufacture the necessary machines at Thorold, in Canada; that the said Lawson did not purchase the said right; that he (Rakes) does not recollect having told Barter, in the terms of Barter's declaration, that the bargain for the machines had been made by Smith. If anything were said on the subject, it must have been that Smith had concluded an agreement for the sale of the right to use his inventions; that to the best of his (Rakes's) knowledge Smith has had no interest or commission or profit on the sale of machines manufactured by him (Rakes) in any case; that he had traveled a good deal in Canada during the last four or five years for the purpose of selling mill machinery, and that until within the last year or two he saw very little use of and heard of very little demand for middlings-purifiers; that the connecting machinery to apply Smith's process at Messrs. Howland & Spink's mill at Thorold were made by the mill-wrights at the said mill at Thorold, under direction of said Smith; that he (Rakes) declined to give an *ex parte* affidavit, but expressed his willingness to Barter to appear before any judicial authority to be examined on oath; that he (Rakes) has made the present declaration on account of having been informed by Messrs. Grahame, Howland, & Ryerson that the conversation he (Rakes) had with Barter was to be made use of to influence the decision of the Commissioner of Patents, and because the statements reported as contained in Barter's declaration "were misrepresentations and tended to give a false impression of the facts of this case."

FACTS ADMITTED OR ASCERTAINED.

a. The disputant admits that nothing is proved as regards the alleged importation of the invention patented under No. 2,258.

b. The disputant admits that he has never made any request to George Thomas Smith for the use of Smith's patented machines and process.

c. It is ascertained by the records of the Patent Office that the disputant, Benjamin Barter, has obtained a patent for a "flour-dressing machine" on January 20, 1874, numbered 3,014; another patent for "the original middlings-purifier" on April 8, 1876, numbered 5,942, and another patent for "middlings-purifier" on July 17, 1876, numbered 6,325. These three patents are for the same object as respondent's inventions, and therefore competing with them.

DECISION.

TACHÉ, *Deputy Minister of Agriculture.*

The importance of this case, serious in itself, is enhanced by the circumstance that it is the first of its kind in Canada, and that the legal interpretation and the appreciation of facts which it involves apply to very many patents granted, and eventually to all patents to be in future granted. For these reasons ample time has been devoted to the study of the question, and it has been thought not only desirable, but almost necessary, to enter at some length into the explanation of the principles and construction of facts upon which the present decision is based.

It seems proper to take up first the preliminary points raised in the case, which were at once decided, as stated in the report of the proceedings hereinbefore given. It was asked that it be ruled that the *onus probandi* lies with the respondent, inasmuch as this tribunal, being an exceptional one, not restrained by any form of proceedings or subjected to any special kind of evidence,

and having no power to compel witnesses to appear, is bound to exact from the respondent proof that he has complied with the requirements of the law, and, furthermore, inasmuch as to rule otherwise would be imposing upon the disputant the duty of proving a negative. The constitution of this tribunal is not of an unknown character. Such jurisdiction is given to the administration in many countries, and in some, in the Austro-Hungarian Empire, for instance, that jurisdiction extends so far as to vest in the executive officer the exclusive power of deciding all cases concerning invalidity or lapsing of patents. The tribunal is not devoid of all means of getting at the truth, the fact of not being restrained by fixed rules of procedure and stringent modes of evidence being a compensation for the want of power to compel witnesses. It is self-evident that it was the intention of the law-makers to exact only one condition in the judge's mind in delivering his decision—that he be convinced of the substantial justice of such decision on sufficient information, no matter how obtained. Notwithstanding that this tribunal is not restricted by fixed rules of practice, it is nevertheless bound to abide by the rules of common justice, by the dictation of common reason, and to be enlightened by such decisions as may be held to embody the common consent of mankind.

It is apparent that this case, being one in which the disputant urges the forfeiture of an acquired right, which the respondent is presumed not to have lost nor alienated, the burden of proof cannot be admitted to lie on him who holds a public title, which must be taken as good so long as nothing to the contrary is established, even if the evidence involved the proof of a negative. In this case the evidence does not rest on establishing a negative, but on ascertaining the existence of positive facts. It would not be right, however, to say, and this ought not to be taken as meaning, that in no case should the respondent be forced to make discovery. There might be cases in which, from the position of the parties and the aspect of affairs, this tribunal might be compelled to make use of all the latitude left to it by the statute in order to attain the ends of justice. The nature of the twenty-eighth section of the patent act, both in providing against certain mischiefs with certain remedy and in establishing a special tribunal to mete out the remedy, involves a policy which goes, on public grounds, beyond the limits of any particular case to be adjudicated upon. This is evidently the reason why the legislature has selected the Minister of Agriculture to constitute the tribunal to decide such questions in which it will avail of the practical knowledge of and acquaintances with the nature and bearings of such matters acquired in the daily working and dealings of the Patent Office.

It has been hinted in the arguments that should a decision intervene declaring a patent null and void, it ought to specify that the patent was voided at the date of the expiration of the delay mentioned in the law, and has stood null since to all intents and purposes. As this incidental question touches rights which do not come within this jurisdiction, it appears clear that, in duty and through respect for the higher courts, this tribunal is forbidden from entering such domain, even by expressing an opinion, being bound to restrict its investigations and decisions within the narrowest possible limits. The law orders that the Minister of Agriculture should say "whether a patent has or has not become null and void;" consequently the judgment is simply to decide it has or it has not, as the case may be. All the consequences that may follow are to be adjudicated upon by the ordinary judges of such disputes between citizens.

There is a view of the subject-matter of patents for inventions invoked in this case which it is of great importance to examine as bearing in a marked manner on the interpretation and construction to put upon both law and facts connected with the working of patents. The question comes to whether a patent should be held as an embarrassing privilege, a kind of onerous monopoly which constitutes the patentee as a sort of adversary to the liberty of the subject, and as opposed to public interest, by the very fact of his holding a position which then, it is argued, should be jealously watched, and which ought to be made to terminate at the first opportunity. It is universally admitted in practice, and it is certainly undeniable in principle, that the granting of letters patent to inventors is not the creation of an unjust or undesirable monopoly nor the concession of a privilege by mere gratuitous favor, but a contract between the State and the discoverer. In England, where letters patent for inventions are still in a way treated as the granting of a privilege, more in words, however, than in fact, they, from their beginning, have been clearly distinguished from the gratuitous concession of exclusive favors, and, therefore, were specially exempted from the operation of the statute of monopolies. Invention being recognized as a property, and a contract having intervened between society and the proprietor for a settlement of rights between them, it follows that, unless very serious reasons, deduced from the liberal interpretation of the terms of the contract, have happened the patentee's rights ought to be held as things which are not to be trifled with, as things sacred, in fact, confided to the guardianship and to the honor of the State and of the courts. As it is the duty of society not to destroy on insufficient grounds a contract thus entered upon, so it is the interest of the public to encourage and protect inventors in the enjoyment of rights legitimately and sometimes painfully and dearly acquired. The patentee is not to be looked upon as having interests in direct opposition to the public interest—an enemy of all, in fact.

"The gain made by the inventor when his invention is known will be," says Agnew, "proportionate to the amount of benefit which the public derive from the use of it."[a]

"It is almost self-evident," says an able American author, "or at any rate readily susceptible of proof, that the magnificent material prosperity of the United States of America is directly traceable to wise patent laws and their kindly construction by the courts."[1]

"The increasing development," says Armengaux, "which inventive genius undergoes is principally due to the protection, very insufficient as yet, which is granted by most governments to those who are the real promoters of arts and industry."[2]

[a] Agnew. The Law and Practice Relating to Letters Patent for Inventions. London, 1874. Page 4.

[2] Armengaux. Guide Manuel de l'Inventeur et du Fabricant. Paris, 1853. (Preface.)

These short quotations, which might be easily multiplied almost *ad infinitum*, are to show what view is taken of the matter by writers who have devoted a great deal of their life to the study and practice of the laws relating to the very important subject of inventions and in the consideration of the influence on public prosperity of patents granted to inventors as the price paid for their discoveries. The manner in which this tribunal should construe the law was argued in the sense of a strict literal interpretation of words, and quotations were made in support of this view. The soundness of the doctrine propounded in those quotations is undeniable and undenied. In order that no doubt should exist on the rules of interpretation adopted in the present decision, it is well to express them in terms of its own. It is held that the words of the law constitute the body of the law in which dwells the spirit of the law, and that to separate one from the other would be the death of the law. The legislature cannot adequately provide for the administration of the statutes; it cannot see into the details necessary to attain the object in view; it cannot foresee the combination of circumstances appertaining to each case; it does not go into the technicality of specific subjects, and it cannot prophesy what uses might be made of the language of the law. Hence the necessity of legislation being followed step by step by jurisprudence. The very words which may be invoked in a certain sense as applicable to certain points in one case might serve to defeat the object of the legislature in another case. This tribunal, like all others, has to make sure of the intention of the legislature. A certain public advantage is sought for and a mischief provided against by the patent act as applied to this case. The duty of the tribunal is therefore to see whether the advantage has been virtually and effectually denied, and whether the mischief has been actually committed, and to apply the remedy, if need be to attain the object in view, without undue and inadequate detriment to acquired and vested rights.

The dispositions of the twenty-eighth section (hereinbefore quoted at length) of the patent act of 1872, were introduced into Canadian legislation *pari passu* with the extension of the privilege of obtaining patents for inventions, first, to all residents, and, second, to all comers. Such provisions as to manufacture and importation do not exist in the patent laws of England or in the present patent laws of the United States, but they do exist in the patent laws of other nations. The patent act of 1869, removing other disabilities, extended the right of obtaining patents to every resident of one year in Canada, and subjected all patented inventions to the condition of manufacturing within three years and of not importing after eighteen months. The decision of the question as to whether or not a patent had lapsed for reason of non-compliance was left to be pleaded and to the ordinary courts to adjudicate. The law of 1872 extended the right of obtaining patents to all comers, and provided a special tribunal to apply the law in the manner mentioned in the twenty-eighth section, hereinbefore quoted. So far the intention of the legislature, as shown by the history of the legislation, is evidently to guard against the danger of Canadian patents granted to aliens being made instrumental to secure the Canadian market in favor of foreign patents to the detriment of Canadian industry, for, in the measure that the right of taking patents was extended, the remedy against the dreaded danger was made more ample, but at the same time the jurisdiction over such cases of disputes as might arise was transferred from the judicial tribunals to the administrative tribunals, evidently for the purpose of avoiding an overstrict application of the provision made against the possible evil of a patent being taken for the sole purpose of depriving Canada from the use of a useful invention. The twenty-eighth section is also intended as a sort of protective policy in favor of Canadian labor. The legislature has, certainly not without intention, provided for a kind of paternal tribunal, formed by the Commissioner of Patents, the natural protector of patentees, which intention can be no other than that every case should be adjudicated upon in a liberal manner. The duty of this tribunal is therefore, on one hand, after having satisfied itself of the facts, to apply the remedy if the mischiefs provided against by the statute have been really committed in intent or effect, and, on the other hand, to guard against the cruel injustice of inflicting such a punishment as the total destruction of an acquired and vested right when no real damage was either intended or done. The common principle of justice which says that when there is no injury inflicted no damages are to be granted, and that when no offense has been committed no penalty is to be imposed, must govern this matter as well as the principle that no offender should be sheltered from the punishment for offense or injury perpetrated by him.

In order to arrive at a correct interpretation of the words "construction or manufacture of the invention," it is necessary to well understand and carefully consider the nature of the obligation thereby imposed. As to patents, it applies to every patent granted; as to subjects, it applies to every conceivable object which may be invented or improved; as to persons who have the right to exact it, it applies to all inhabitants of the Canadian confederacy; as to extent of territory, it applies to the whole dominion from ocean to ocean and to every province and locality therein; as to time, it applies to thirteen out of fifteen years of the longest patent and to three out of five years of the shortest. This simple enunciation of the nature of things to which the law refers is sufficient to demonstrate that the law-makers could not have had in contemplation to force, on penalty of forfeiture, the patentee to actually fabricate his invention with his own capital, within specific establishments, with his own tools, and to keep stock for every moment of the existence of his privilege; and where? All over the Dominion, and whether he has purchasers or not. The patent might be for a process, for an object to be used in conjunction with something else, or for an improvement on another patent still in existence; it might be for a railway bridge, switch, or spike; it might be for a mailbag; and in all these cases it does lie within the power of others than the patentee to say whether the invention shall or shall not be used at a given time or at any time. Therefore, the real meaning of the law is that the patentee must be ready either to furnish the article himself, or to license the right of using on reasonable terms to any person desiring to use it. But, again, that desire on the part of such a person is not intended by the law to mean a mere operation or mo-

tion of the mind or of the tongue, but, in effect, a *bona fide* serious and substantial proposal—the offer of a fair bargain, accompanied with payment. As long as the patentee has been in a position to hear and acquiesce to such demand, and has not refused such a fair bargain proposed to him, he has not forfeited his rights.

If it were necessary to furnish a collateral proof of this intention of the legislature, within the law itself, of requiring on the part of the customers an actual substantial demand or request, accompanied with a settlement of royalty, it would be found in section 21,* in which an exception to that obligation of demanding is made in favor of the government, which is, by way of derogation to the general rule, allowed to make use of all inventions without going to the patentee, even during the two years' delay, free of any blame for infringement, by resorting to a special and an exceptional mode of settling upon the price to be paid to the patentee. The same rules of interpretation apply to the provision of the act as regards importation. The law says that the patent shall be void if, after twelve months of its being granted, "the patentee or his assignee or assignees, for the whole or a part, imports or causes to be imported into Canada the invention."

The evil aimed at by the legislature in ordering the penalty of forfeiture is the importation of patented inventions being made to the detriment of their being manufactured in Canada. If that was done even by other persons than the patentee or his assignees, but with his consent, that would call for the application of the remedy, although the mere wording of the law might be pleaded as exonerating the patentee from the responsibility of having actually imported or caused to be imported. On the other hand, the actual importation of a few machines as models, or for the purpose of bringing the usefulness of the invention before the eyes of the Canadian public, and thereby hastening the working of the patent in Canada, could not be reasonably taken as being the commission of the evil of injuring the manufacturing interests of the country. It may be, on the contrary, in some given cases, the best and promptest way of benefitting Canada with a new and yet unappreciated invention, and the importation of few models, then, would be fostering the object of the law, which is that Canadian industry and Canadian labor should, in the shortest possible time, be made to profit by new inventions. The words "carry on in Canada the construction or manufacture," with their context, cannot, therefore, mean anything else than that any citizen of the Dominion, whether residing in Prince Edward Island, in British Columbia, in Ontario, Quebec, or elsewhere on federal soil, has a right to exact from the patentee a license of using the invention patented, or obtain the article patented for its use at the expiration of the two years' delay, on condition of applying to the owner for it, and on payment of a fair royalty. The words "imports or causes to be imported into Canada" cannot mean anything else than injury to home labor, which injury, if actually done by or with the connivance of the patentee, most decidedly entail forfeiture of his patent.

It has been argued, in view of meeting the above-mentioned interpretation of the words "construction or manufacture," that the statute has foreseen the difficulties of special cases and has provided for them by sub-section 2 of section 28, in giving to the commissioner the power to extend indefinitely the delay in such cases—as, for instance, would be illustrated by a patent granted for a graving-dock.

The purport and effect of sub-section 2 is totally different from and even at variance with the meaning given to it in this argument. A delay does not at all remedy the condition of impossibility in which a patentee is to establish at any time manufactories accessible to a population scattered over a territory which extends from ocean to ocean, with an area amounting to millions of miles. It does not do away with the impossibility at any time of keeping articles in stock without purchasers, &c. But this is not all. Sub-section 2, construed as is proposed by the said argument, would lead to a positive defeat of the intention of the legislature, which clearly is that the patentee must supply Canadian citizens with the invention, when requested to do so by any one, on payment of a reasonable price or royalty. The effect of the delay of two years and the effect of any further extension thereof means that during that time the patentee is permitted to withdraw entirely (the government excepted) the use of his invention from the Canadian public—that he can refuse the use of it to all and everyone under any and every circumstance. It follows that the granting of a long delay would amount to depriving during such time Canadian industry of the use of such invention, which could not be imported, and which the inventor would not be bound to furnish on any condition. As it is logically necessary to carry the argument to the extent that there are many cases in which the difficulty being of all times, the delay, of necessity, should be carried to the whole duration of the patent, it amounts to saying that the Commissioner of Patents is empowered to grant, and, in fact, forced to grant, that Canada should remain for a long period of time, or the whole period of the duration of patents, *quoad* the utility of certain inventions, in a state of industrial inferiority as compared with all other countries. Another proof of the total error of the argument is that the whole of the twenty-eighth section applies to "every patent granted," precluding in the very terms of the law the idea that it intended to deal with cases; nay, expressly enacting that the same provisions are to apply equally to all patents, as a matter of course, in the legitimate sense which is naturally and equitably suggested by the nature of things in matters of inventions and patents of inventions.

The views taken here on the question at issue are fully sustained by the construction and interpretation put on similar or identical legal enactments in other countries. The jurisprudence established and the doctrine laid down by jurists and patent experts in countries where the patent laws contain the same dispositions as ours about manufacturing and importing appear, from extensive reading on the subject, unanimous. It will be sufficient to enter into a short exploration of this ground to prove the assertion of such common consent of nations in the matter.

In England the patent laws do not contain the same prescription as our statute presents, and no specific provision is made to secure to the public the use of the invention or to home labor the benefit of its working; but

*SECTION 21. The government of Canada may always use any patented invention, paying to the patentee such sum as the commissioner may report to be a reasonable compensation for the use thereof.—The patent act of 1872.

there exists in the present letters patent issued in England a proviso which shows by analogy what doctrine prevails on the general question of the obligations of the patentee when he is bound to furnish his invention under pain of forfeiture. Among the circumstances that cause English letters patent to "cease, determine, and become void" is the following: If he (the patentee)—

Shall not supply or cause to be supplied for our service all such articles of the said invention as he shall be required to supply by the officers or commissioners administering the department of our service for the use of which the same shall be required, in such manner, at such times, and at and upon such reasonable prices and terms as shall be settled for that purpose by the said officers, &c.

This shows that it is not supposed that the legitimate obligation of the patentee toward the customer is to keep open shops, to keep stock, but to supply the invention only when requested to do so by a formal demand accompanied with a settlement of the royalty. Similarly to the laws of England, the present patent laws of the United States do not contain the condition of lapsing for reason of non-manufacturing or of importing. The absence of such dispositions from the patent acts of those two prominent manufacturing countries is, it must be conceded, antagonistic to the idea of Draconian interpretation of the said conditions where they do exist. The obligation of manufacturing in the United States did exist for a certain time. It was introduced by a short act in 1832. This act was repealed by the patent act of 1836, but a provision of the kind was maintained in the last-mentioned statute. By the fifteenth section the defendant, in an action of damages, was permitted to plead the general issue. At the end of the enumeration of defects we read—

* * * Or that the patentee, if an alien at the time the patent was granted, has failed and neglected for the space of eighteen months from the date of the patent, to put and continue on sale to the public, on reasonable terms, the invention or discovery for which the patent issued in either of which cases judgment shall be rendered for the defendant, with costs.

The provisions of this clause were invoked in one case of an assigned alien's rights (*Tatham* v. *Lowber**) Messrs. Justices Nelson and Betts, State of New York, decided—

That even if the plaintiffs took their right with the condition attached to alien patentees, yet they had satisfied the statute; that they need not prove that they hawked the patented improvement to obtain a market for it, or that they endeavored to sell it to any person, but that it rested upon those who sought to defeat the patent to prove that the plaintiffs neglected or refused to sell the patented invention for reasonable prices when application was made to them to purchase.

The French legislation, as does the legislation of most countries, contains conditions similar to those of the twenty-eighth section of our "patent act of 1872."

The doctrine and jurisprudence adopted on the subject is amply summed up in the quotations of two eminent writers on patents and patent laws, which will follow, after citing the text of the law. The French law reads thus, Article 32:

Shall be deprived of all his rights. * * * 2. The patentee who shall not have worked his invention in France within a delay of two years from the date of the signature, or who shall suspend his operations for two consecutive years, unless he show cause for such inactivity. 3. The patentee who will have introduced in France articles manufactured in foreign countries similar to those guaranteed by his patent.

It must be remarked that the last proviso at the end of paragraph 2 of the French law is similar in effect to the means adopted by our statute for making the non-manufacturing a condition of nullity, to take effect only when rendered applicable by an administrative decision. The nullity enacted by the French law can be pleaded in courts. The nullity enacted by our act is conditional upon the decision of the Minister of Agriculture, who alone is to say whether the condition is to be enforced or not.

Renouard, after quoting Arago's speech in the Chambre des Deputés (1844) against the stringency of the then proposed legislation, goes on to explain how it is to be understood:

The tribunals will appreciate [he says] according to circumstances whether it has been worked or not, whether or not the working has been interrupted, if the reasons of not working are sufficiently justified.[1]

This was said by a magistrate of the highest order, and a specialist, in anticipation of the judicial decisions which afterward confirmed his views of the matter. Many years after, Bédarride, reviewing the jurisprudence established on the subject, recapitulates it, and exposes the doctrine in the following sentences:

The spirit of the law is therefore indubitable. It intends to punish only voluntary, premeditated, and calculated inactivity.[1]

It is to be remarked that Bédarride is not a loose, but rather a strict, interpreter of laws. He holds that the laws of France do not admit of pretorian interpretation, and are not to be mitigated by the courts, no matter how severe and hard they may be. Bédarride again says:

The voidance of paragraph 2 of Article 32 touches only voluntary inactivity. The law wishes to punish for inaction the only one who has willingly remained idle. It would have been really too unjust to extend the penalty to the one who has abstained on account of circumstances independent of his will.[2]

As regards the importation, Bédarride says:

The prohibition having for its unique object the protection of national labor, it would have been unreasonable to extend it to cases in which such protection could not be injured.[1] The judicial authority, exclusively inspired by this spirit, refused to apply the penalty of forfeiture when the importation, although non-authorized, was not in its nature susceptible of damaging national labor.[2] It is proper to decide to-day as it was decided by the courts of Douai and Paris in 1846 and in 1855. Should not be considered as violation of the prohibition of the law the importation of a few specimens of the articles or the importation of machines, having no other object in view than to find either associates or licensees for the invention.[2]

It would only be a matter of time and labor to extract similar authorities and decisions from the records of other countries where the laws are either identical or similar to our statute in this respect. All this shows, to borrow the very words of Renouard, "how the practice of nations solves by common sense and experience the questions raised by necessity."

The question of doctrine having been thus established, it remains to examine the facts of the case to confront them with the meaning of the statute. The evidence adduced is ample to give any one a clear and unmistakable knowledge of the state of affairs.

As to manufacturing, it is proved that none of the respondent's inventions were put up in Canada within the time prescribed; but no proof is given that he has refused to furnish them to any one at any time. On the contrary, it is shown in the clearest manner that he has not been requested by any one to be supplied with them during the time of inactivity.

As to importation, it is proved that the machines imported at Thorold by Messrs. Howland & Spink, more than twelve months after the date of the patent are of Smith's invention, No. 2,257; that Smith was neither the consignor nor the consignee, nor the owner thereof; that he did not actually import them, but that he consented to the importation, which action amounts to

*Blatchford, C. C., Vol. II, pages 49 to 51.

*Renouard. Traité des Brevets d'Invention, Paris, 1844, page 243.
[1] Bédarride. Commentaires des lois sur les Brevets d'Invention, Marques de Fabrique et de Commerce, &c., Paris, 1869, Vol. I, page 448.

[1] [2] Bédarride. Vol. I, pages 455, 457, 463.

causing them to be imported. It is clear that Smith's consent in this instance was not intended to defy the law; that it did not cause any appreciable injury to Canadian industry, but had for its object to bring the merits of his patents and process before the Canadian public, with the honest intention of manufacturing in Canada, as his efforts to introduce his process in Lawson's mill proves.

The disputant, aiming at the process of milling patented under No. 2,409, has tried to connect Patent No. 2,257 with Patent No. 2,409, as being necessarily dependent on each other in the way of cause and effect, or rather object and means, but has failed in that, and by his evidence has in fact proved the contrary of his proposition in establishing that Smith's process does not require any special plant or machinery, but can be added to any mill by ordinary tools and workmanship and with ordinary materials, which is besides made plain by a careful study of the patents.

The disputant has also tried to prove unwillingness on the part of the patentee to furnish the Canadian market at the same time that an active demand is alleged to have existed in Ontario for several years for such processes of milling as Smith's, an assertion which is poorly sustained by Barter's third declaration and his own trade-circular, (hereinbefore analyzed,) and by the fact that one of the witnesses who makes this assertion (Mr. Lawson) had no middlings-purifiers of the sort in his own mill at Thorold in May, 1876, when he refused the offer made by Smith to himself (Lawson) to have one put up for him, he having objected to the ordinary price charged for royalty.

The disputant insisted on the point that the three petitions of the respondent (documents 4, 5, and 6, hereinbefore analyzed) are a virtual admission of his having failed to comply with the exigencies of the statute. It would be hardly fair to take even an unconditional admission of the sort, made under the circumstances and in error, as carrying with it the necessary destruction of the patent. The petitions referred to are not, however, an admission of that kind. The patentee, after a statement of facts, says he "submits that his acts, as aforesaid, are a sufficient compliance with the terms of the said twenty-eighth section of the patent act of 1872." * * * He has been unable, "for reasons aforesaid, to comply literally with the terms of the said section," and he concludes by asking for a "declaration that the said patent has not become forfeited," and also for "an extension of time to commence the manufacture."

It is clear that the patentee was conscious of having complied with the spirit of the law, but was apprehensive of the interpretation given to the words on account of threats. He asked for an extension of delay a long time after the expiration of the statutory delay, which extension can, of course, be granted by the Commissioner only as a continuation (without interruption) of the respite, of which it is the mere prolongation. When the statutory delay has expired, a patent then is either voided or in operation, according to the spirit of the law, and no other proceeding on the point in question can intervene unless a dispute is raised.

These few remarks seem sufficient to show the real meaning of this incident, and to prove that the fact of the patentee having presented the said petitions and the terms of these petitions cannot in the least affect his position.

The counsel of the disputant has argued in favor of the conclusions of his dispute from an official answer given to a letter written to the Patent Office at his (the counsel's) advice *pendente lite*. As this is a matter of constant occurrence, and as it gives the occasion of showing how different is necessarily an answer to a question put in the abstract from the decision of a case presented with all its bearings and particulars, it is of importance for the Patent Office and for the public to dispose of the argument.

The letter written contained the following question:

Is it considered as "construction" sufficient to hold the patent if an article composed of various parts is imported in parts and put together and constructed in a Canadian manufactory?

The letter in answer was as follows:

You ask if the manufacturing clause of the patent act would be complied with by importing the whole of the parts of a machinery to be only put together in Canada. Evidently this would not be in compliance with the requirements of the law.

To such an interrogation no other than an answer based on the supposition of a breach of the law could be safely given; but if, departing from the abstraction of the above-given question, the investigation were made as regards a certain patent under specific circumstances, the conclusion might be widely different from the general answer. In fact, it is not difficult to imagine a case in which the importation of all and every one of the component parts of an invention, to be simply put together in Canada, would not be an importation in the meaning of section 28 of the patent act, but, on the contrary, would be the only means of obeying the statute as to manufacturing, and therefore, to all intents and purposes, in full compliance with the spirit of the law and the nature of the contract. Such would be, for example, the case of a patent granted for a composition of matter all the ingredients of which would be products not to be found in the country—a compound of exotic gums and extracts, for instance, or a medicine composed of portions of tropical plants. This is sufficient to illustrate the difference of cases, every one of which must stand on its own merits, viewed in the light of the facts confronted with the spirit of the law. The conclusion is, that the respondent having refused no one the use of his inventions, and that the importation assented to by him to be made, being inconsiderable, having inflicted no injury on Canadian manufactures, and having been so countenanced, not in defiance of the law, but evidently as a means to create a demand for the said inventions, which the patentee intended to manufacture and did, in fact, offer to manufacture in Canada, he has not forfeited his patents.

Therefore, George Thomas Smith's Patents No. 2,257, for a "flour-dressing machine," No. 2,258, for a "flour-dressing machine," and No. 2,409, for a "process of milling," have not become null and void under the provisions of section 28 of the patent act of 1872.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Issue of January 15, 1884.

DESIGNS.

14,545.—SALT AND PEPPER BOX.—*Charles Casper*, Meriden, Conn. Application filed October 23, 1883. Term of patent 3½ years.

14,546.—GATE.—*John McLean*, Brooklyn, N. Y. Application filed November 20, 1883. Term of patent 7 years.

14,547.—CARPET.—*Julius S. Meyer*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed July 28, 1883. Term of patent 3½ years.

14,548.—GIRL'S COSTUME.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed November 19, 1883. Term of patent 3½ years.

14,549.—CHARM.—*Charles S. Pine*, Providence, R. I. Application filed June 29, 1883. Term of patent 3½ years.

14,550.—CENTER-PIECE.—*Vincenzo Dini*, Brooklyn, N. Y. Application filed August 7, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,851.—WHOLE WINTER-WHEAT.—*David Brainard*, New York, N. Y. Application filed November 28, 1883.
"The word 'GRAINLET.'"

10,852.—WHISKY OR BEVERAGES COMPOUNDED OF WHISKY.—*Cook & Bernheimer*, New York, N. Y. Application filed December 4, 1883.
"The word 'LION.'"

10,853.—WHISKY OR BEVERAGES COMPOUNDED OF WHISKY.—*Cook & Bernheimer*, New York, N. Y. Application filed December 4, 1883.
"The word 'GOLD.'"

10,854.—ARTICLES USUALLY SOLD UNDER THE GENERAL NAME OF JEWELRY.—*T. B. Hagstoz & Co.*, Philadelphia, Pa. Application filed December 18, 1883.
"The representation of a diamond emitting a blaze of light in an upward slanting direction, and of a crescent set with brilliants from which rays proceed."

10,855.—PERIODICAL PUBLICATIONS.—*Henry C. Meyer*, New York, N. Y. Application filed December 12, 1883.
"The words 'SANITARY ENGINEER,' the peculiar style of type or letter in which the same are displayed, representing joints of water, gas, or steam pipe, the contrast of said letters with the background, the recumbent figure of a female, and scrolls."

10,856.—BURNING-FLUID.—*Johnston S. Parkison*, Ossian, Ind. Application filed December 21, 1883.
"The cut, figure, or representation of a German student-lamp."

10,857.—OYSTERS PUT UP IN CANS OR OTHER PACKAGES.—*Platt & Co.*, Baltimore, Md. Application filed December 14, 1883.
"The word 'UNION.'"

LABELS.

3,830.—Title: "HAILE'S ELIXIR MANDRAKE AND BUCHU AND M B." *Haile & Mower*, Atlanta, Ga. Application filed December 24, 1883.

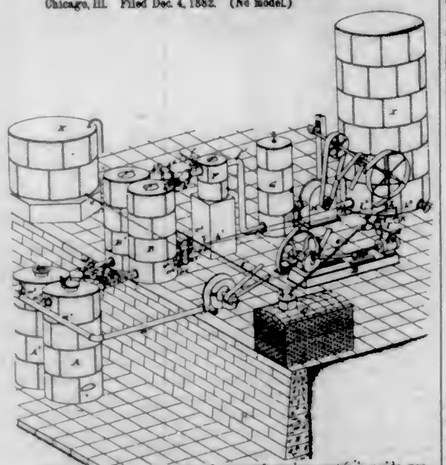
3,831.—Title: "BELFAST LAWNS."—*John A. Lawrence*, Islip, and *William E. Thorn*, Cohoes, N. Y., executors of *William T. Garner*, deceased. Application filed December 21, 1883.

3,832.—Title: "STAR" (FOR PLUG TOBACCO.)—*Liggett & Myers Tobacco Company*, St. Louis, Mo. Application filed December 22, 1883.

3,833.—Title: "SENTINEL" (FOR CIGARS.)—*H. Westcott Son & Co.*, Binghamton, N. Y. Application filed December 22, 1883.

3,834.—Title: "OUR BOB" (FOR CIGARS.)—*H. Westcott Son & Co.*, Binghamton, N. Y. Application filed December 22, 1883.

3,835.—Title: "THE WINNER." (FOR CIGARS.)—*Sackett, Wilhelms & Betzig*, New York, N. Y. Application filed December 24, 1883.



3,836.—Title: "STEWART'S GIPSY PILE OINTMENT."—*Fred W. Stewart*, Oswego, N. Y. Application filed December 24, 1883.

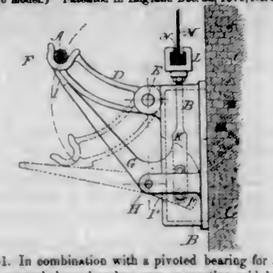
3,837.—Title: "THE JACKSON VENTILATING GRATE."—*Edwin A. Jackson* and *William M. Jackson*, New York, N. Y. Application filed December 21, 1883.

PATENTS

GRANTED JAN. 15, 1884.

291,860. APPARATUS FOR THE MANUFACTURE AND DELIVERY OF HEATING AND ILLUMINATING GAS. WILLIAM H. ADAMS, Chicago, Ill. Filed Dec. 4, 1882. (No model.)

Claim.—1. In an apparatus for manufacturing carbonic-oxide gas, with or without the addition of steam and hydrocarbon, and consisting of a system of air-tight continuously-communicating chambers and pipes extending from the air-forcing apparatus to and through the producers, and thence to the service-mains, the combination of the producers, the pipe for supplying a controllable quantity of air under pressure to the producers, the fan or air-pump for forcing the air-supply through said pipe to the producers, the pipe or pipes for delivering away the produced gas, the regulator operated automatically by the variable pressure of the produced gas, substantially as described, and operating mechanism connecting the air pump and regulator, whereby the quantity and pressure of the air forced to the producers is automatically regulated and controlled by the varying fluid-pressure of the produced gas, as herein set forth.

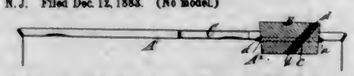


2. In an apparatus for manufacturing carbonic-oxide gas, with or without the addition of steam and hydrocarbon, and consisting of a system of air-tight continuously-communicating chambers and pipes including the producers and the pipe or pipes for delivering away the produced gas, the combination of the producers, the air-duct through which air is admitted to the producers for the manufacture of gas, and the regulator operated automatically by the variable pressure of the produced gas and connecting mechanism, whereby the admission of air into the producers is regulated and controlled automatically by the fluid-pressure of the produced gas, as herein set forth.

3. In an apparatus for manufacturing carbonic-oxide gas and enriching it by steam and hydrocarbon, and consisting of a system of air-tight continuously-communicating chambers and pipes including the producers, the gasogenes, and the gas-delivery pipes, the combination of the producers, the gasogenes, the air-duct for admitting air to the producers, the ducts for admitting steam and hydrocarbon to the gasogenes, and the regulator, substantially as described, and connecting mechanism, as described, whereby the variable pressure of the produced gas automatically regulates and controls the admission of air to the producers and the admission of steam and hydrocarbon to the gasogenes, as herein set forth.

4. In an apparatus for the manufacture of gas, the combination of a regulator actuated by the varying fluid-pressure within the system, the exhauster, the valves controlling the admission of steam and hydrocarbons to the gasogenes, and the fan creating the blast of air to the producers, all connected by suitable mechanism, whereby the production of the gas is automatically regulated and controlled by said fluid-pressure, substantially as described.

5. In an apparatus for the manufacture of gas, the combination of an exhauster, a pressure-box, a regulator automatically controlling the production of the gas, and a regulator controlling the delivery of the gas into the mains, substantially as described.

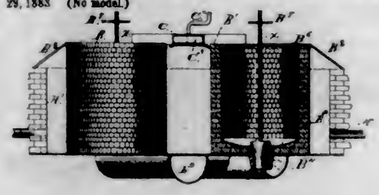


291,861. SHAFT-BEARING FOR TRAVELING CRANES. CHAS. JAMES APPLEBY, Southwark, County of Surrey, England. Filed Oct. 22, 1883. (No model.) Patented in England Dec. 22, 1879, No. 5,226.

Claim.—1. In combination with a pivoted bearing for a rotary or other shaft, a counterbalanced rocker-arm supporting said bearing, and a rod or bar connected to said rocker-arm for actuating the same, substantially as and for the purposes set forth.

2. The combination of a pivoted bearing for a rotary or other shaft, a rocker-arm supporting said bearing, a rod or bar connected to said rocker-arm, and a moving or traveling cam operating said rod, whereby said bearing is automatically depressed and elevated, substantially as and for the purposes set forth.

291,862. CAN FOR KEROSENE, &c. PAUL BABCOCK, Jr., Montclair, N. J. Filed Dec. 12, 1883. (No model.)

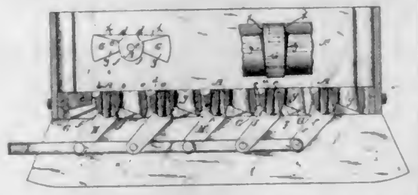


Claim.—1. A tin can having in its top a filling hole or opening, the edge of which is re-enforced by a wire, over which the metal is turned outward and closed, substantially as and for the purpose described.

2. The combination, with a can having a filling-hole in its top, of a wood bung fitting said filling-hole, and having the hole *c* extending through it and filled with a plastic substance, *d*, and a pouring-spout adapted to be inserted into the said hole *c*, and to force the plastic substance *d* therefrom, substantially as and for the purpose described.

3. The combination, with the bung B, formed with the hole *c*, and a plastic filling, *d*, for said hole, of the pouring-spout C, adapted to be inserted in said hole *c*, and to force the plastic filling therefrom, substantially as described.

291,863. FILTER. WILLIAM BALL, Lynchburg, Ohio. Filed Sept. 29, 1883. (No model.)



Claim.—1. The combination, with the reservoir, of a filtering receiving-tank arranged therein, and having its upper end projected above the high-water mark, the said tank being constructed with porous walls and adapted to receive the supply of inflowing water in its upper end, substantially as described, and for the purposes specified.

2. The combination, with the reservoir and the filtering receiving-tanks arranged therein, of the feed-pipe having branches leading into said tanks, and provided with a valve at the juncture of said branches, whereby the inflowing water may be directed into one or both of the tanks, substantially as set forth.

3. In a reservoir, the combination of the filtering receiving tank or chamber, having porous sides and imporous base, and having a tapered discharge-opening formed through its said base, the cross-bar having threaded opening arranged above the discharge-opening, and the tapered plug turning in said discharge-opening and having its stem threaded, as described, and provided with a suitable lever or handle, substantially as set forth.

291,864. GRATE. LEMUEL BANNISTER, Philadelphia, Pa. Filed Sept. 8, 1883. (Model.)

Claim.—1. A grate-bar constructed, as described, with a flat top, and the upper part of its sides concave.

2. A grate-bar constructed, as described, with a flat top, vertical perforations therein, and the upper parts of its sides concave.

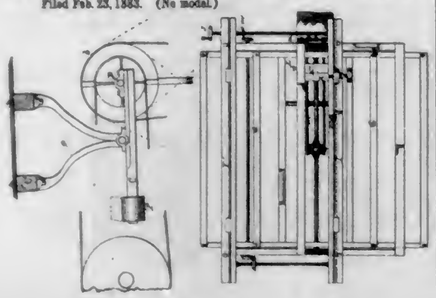
3. A grate-bar constructed, as described, with a flat top, longitudinal grooves and vertical perforations therein, and the upper parts of its sides concave.

4. A grate-bar constructed, as described, with a flat top, the upper parts of its sides concave, and downwardly-tapering convex lower sides.

5. A grate-bar constructed, as described, with a flat top, laterally-projecting lugs or teeth, the upper parts of its sides concave between the teeth, and downwardly-tapering convex lower sides.

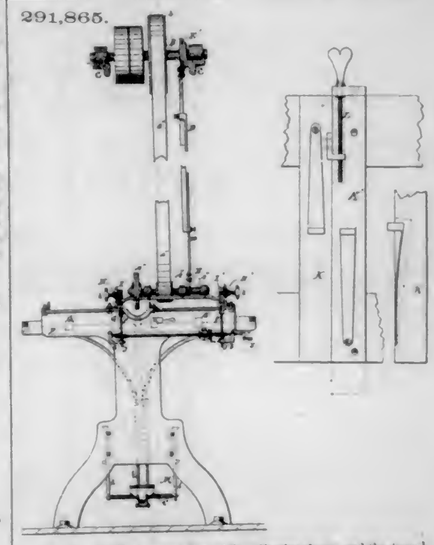
6. A grate-bar constructed, as described, with a flat top, vertical perforations, laterally-projecting lugs or teeth, the upper parts of its sides concave between the teeth, and downwardly-tapering convex lower sides.

7. A grate-bar constructed, as described, with a flat top, vertical perforations, laterally-projecting vertically-perforated lugs or teeth, the upper parts of its sides concave between the teeth, and downwardly-tapering convex lower sides, and a rounded bottom.



8. The combination, substantially as herein set forth, of a series of grate-bars constructed, as described, with flat tops, vertical perforations, laterally-projecting interlapping lugs or teeth, the upper parts of its sides concave between the teeth, and downwardly-tapering lower sides.

9. The combination, substantially as set forth, of the bar and the laterally-projecting teeth formed with a double bevel on each side.



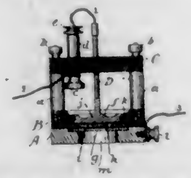
10. The combination, substantially as set forth, of the bar and the laterally-projecting teeth formed on each side with a bevel, *y*, and a concave bevel, *z*.

11. The combination of the bar formed with the upper parts of its sides concave, and the laterally-projecting teeth formed with concave bevels *z*, substantially as and for the purpose specified.

291,865. DADOING-MACHINE. JAMES K. BENWAY, Albany, N. Y. Filed Feb. 23, 1883. (No model.)

291,865.

Claim.—1. The combination of the adjusting-frame and the traveling frame having means of adjustment, as described, the said traveling frame being provided with a central shaft, connected by means of a driving-belt and adjustable rod or rods to a tilting frame having a shaft and balancing-weight, the whole adapted to operate substantially as set forth.



2. In a dadoing or other molding machine, the combination, with a weighted driving-pulley, of a laterally-traveling frame carrying the cutter-head and adapted to be guided in its path by suitable tongues engaging in horizontal grooves in a frame having means for vertical adjustment, substantially as described, and for the purposes set forth.

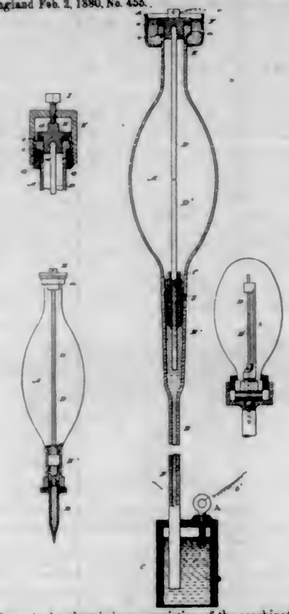
3. In a dadoing or other molding machine, the combination, with a traveling frame carrying the cutter-head, of a vertically-moving work-table operated by a foot-lever having pivotal bearings in the stationary frame and a set-screw for regulating its movement, as set forth.

4. In combination with the dadoing-machine, the spacing, detaining, and duplicating mechanism, consisting of stops arranged as described, one of said stops being provided with an adjusting-screw, as and for the purposes set forth.

5. In combination with a dadoing or other molding machine, the cutter-head consisting of removable blades having detachable chisel-edges and cutting-teeth and suitably-interposed washers, as described.

291,866. TELEPHONE-TRANSMITTER. EMILE BERLINER, Boston, Mass. Filed Oct. 5, 1883. (No model.)

Claim.—1. In a telephone-transmitter, a variable resistance, consisting of a mechanical mixture of small conducting particles—such as lamp-black or granulated coke—with water or other liquid of low conductivity.



2. The combination, in a telephone-transmitter, of a vibrating diaphragm, a weight, and a non-conducting ring, the whole constituting a chamber of which the diaphragm forms one side, the weight the other, and the inner surfaces of the ring the walls thereof, with a variable resistance placed in the chamber thus formed, and consisting of a damp conducting mass produced by mixing granulated carbon particles with water or some other semi-conducting liquid.

3. The combination, in a transmitting telephone, of the containing-cavity, the moist carbon mass formed by adding a partially-conducting liquid to granulated carbon, the conducting-weight peripherally grooved, and the soft and flexible packing for the said groove, all substantially as hereinbefore described.

4. In a telephone-transmitter, the combination of a sliding weight

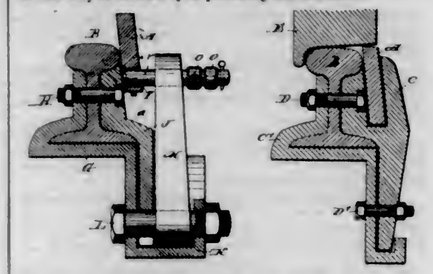
adapted to be acted upon by sound-waves, and a packing of felt or similar soft material around said weight.

291,867. ELECTRIC LAMP. THOMAS H. BLAMIRE, Huddersfield, County of York, England. Filed Sept. 12, 1882. (No model.) Patented in England Feb. 2, 1880, No. 455.

Claim.—1. An electric lamp consisting of the combination of a glass globe containing mercury and formed with an aperture or neck, a metallic stopper closing said neck hermetically, the luminous carbon or carbons or equivalent electric lighting elements in said globe, an electrical connection between one terminal of said carbons and said metallic stopper, and electrical connection between the other terminal of said carbons and said mercury, substantially as set forth.

2. An electric lamp consisting of the combination of a glass globe formed with an aperture or neck, a metallic stopper closing said neck hermetically, a carbon or equivalent electric lighting element fixed to said stopper, a column or body of mercury in said globe, and electrical connection between the other carbon and said mercury, substantially as set forth.

3. An electric lamp consisting of the combination of a glass globe, a tube extending downward from the bottom thereof, a carbon or equivalent electric lighting element fixed in place in said globe, a body of mercury in said tube, and the other carbon floating in said mercury, and thereby pressed buoyantly against the fixed carbon, substantially as set forth.



4. In an electric lamp, the combination of a glass globe, A, formed with a neck having a shoulder, *c*, a metallic stopper, E, and its packing, *s*, a divided sleeve, G, screw-threaded on its exterior, a ring or cap screwing onto said sleeve and thereby holding its halves together, and a screw-coupling, substantially as shown, whereby the stopper is pressed to its seat by drawing against said sleeve.

5. An electric lamp consisting of a glass globe, a long tube or stem extending downwardly from the lower end thereof, the carbon or carbons or other electric lighting elements in said globe, a column of mercury in said tube, and a tight mercury-cup inclosing the lower end of said tube, substantially as set forth, whereby the variations in atmospheric pressure are prevented from affecting the height of the column of mercury.

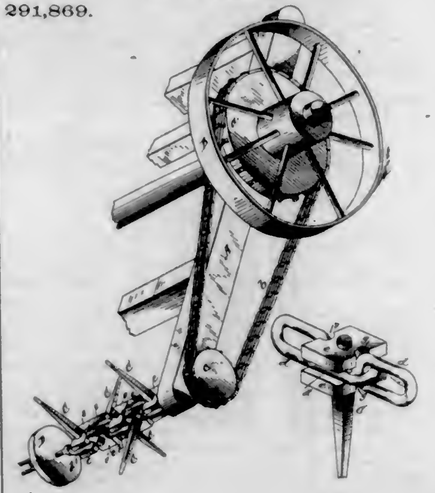
6. In an electric lamp, the combination of a glass globe having a neck, a stopper closing said neck hermetically, and a vessel or receptacle surrounding the neck and containing a liquid whereby the stopper-joint is immersed, substantially as set forth.

291,868. DETECTING-BAR FOR RAILWAY-SWITCHES. JAMES A. BONNELL, New York, N. Y., assignor to the National Interlocking Switch and Signal Company, same place. Filed Feb. 9, 1883. (No model.)

Brief.—A bar held to the side of a rail in the path of the wheel and supported at an inclination to the vertical plane of the rail in inclined recesses in blocks bolted to the rail and chair, as described, the bar being provided with a series of longitudinal slots, each slot being adapted to receive a pintle carried by the free end of a swinging arm arranged as described, the pintles being connected by a rod extending to an operating-lever, whereby the bar is adapted to be raised and lowered by a movement of said connecting-rod longitudinally, and the presence of a train on the rails may be detected by its preventing such movement.

Claim.—1. The combination, with a railroad-rail, of a detecting-bar held to the side of the same at an inclination to the vertical plane of the rail, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with a railroad-rail, of blocks held to the rail, which blocks are each provided in its top with a groove parallel with the rail, and a detecting-bar held in the grooves of said blocks, substantially as described, and for the purpose set forth.



3. The combination, with a railroad-rail, of a bar held to the side of the rail, swinging arms pivoted to chairs held to the rail, pintles passing through the free ends of the said arms and through slots in the bar, and of rods for swinging the arms, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with a railroad-rail, of the bar A, provided with longitudinal slots F, the swinging arms M, pivoted to chairs held to the rails, the pintles N, passing through the arms M and through the slots F in the bar A, and the connecting-rods O, substantially as herein shown and described, and for the purpose set forth.

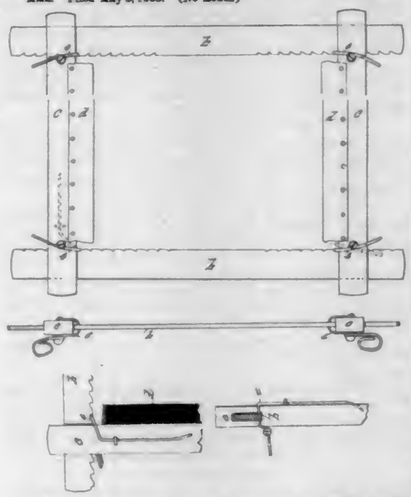
5. The combination, with a railroad-rail, B, of a bar, A, provided with slots F, of the slotted blocks C, the chairs G, provided with pockets K, having beveled inner sides, the arms M, pivoted in the said pockets, and the pintles N, passing through arms M and through the slots in the bar A, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with a railroad-rail, B, of a bar, A, provided with slots F, of the recessed blocks C, the blocks J, the chairs G, the arms M, pivoted in the chairs G, the pintles N, passing through the arms M and through the slots F in the bar A, and of the rods O, substantially as herein shown and described, and for the purpose set forth.

291,869.

291,869. HARROW. EDWARD E. BOSTWICK, Union City, Mich. Filed Oct. 25, 1883. (No model.)

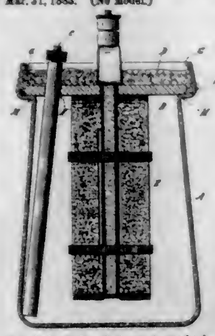
Claim.—1. A flexible shaft for harrows, consisting of a series of links connected together and having harrow-teeth attached, in combination with means for imparting to said shaft a rotary motion, substantially as and for the purpose set forth.



2. A revolving flexible shaft consisting of a series of links connected together, and provided with blocks, nuts, or other like devices, and harrow-teeth detachably connected thereto, substantially as and for the purpose specified.

3. A revolving flexible shaft for harrows, consisting of a series of links connected together, and held between suitable clamping-blocks, to which the harrow-teeth are secured, substantially as and for the purpose set forth.

4. The combination, with a flexible harrow-shaft composed of a series of links connected together, of notched and grooved clamping-blocks provided with means for attaching thereto the harrow-teeth, substantially as and for the purpose specified.



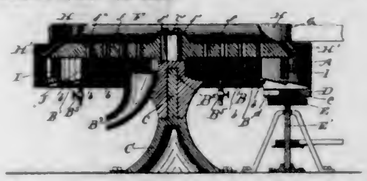
5. A revolving flexible shaft for harrows, consisting of suitable clamping-blocks, to which the harrow-teeth are connected, a series of links, and a series of gage-wheels arranged between the links at intervals along the shaft, substantially as and for the purpose set forth.

291,870. EMBROIDERY-FRAME. GILBERT A. BLACKETT, Springfield, Mass. Filed May 3, 1883. (No model.)

Claim.—In an embroidery-frame, the combination, with the bars *b b*, provided with ratchet-teeth, of the bars *c c*, mortised to receive the ends of the bars *b*, and the springs *a*, pivoted on bars *c c*, and adapted to engage with said ratchet-teeth, substantially as set forth.

291,871. GALVANIC BATTERY. HORATIO J. BREWER, New York, N. Y. Filed Mar. 31, 1883. (No model.)

Claim.—1. A cell for galvanic batteries, which consists of a vessel decreasing in size from the bottom upward, and then increasing in size, forming a lip for the cover to rest on, and then again decreasing in size, thereby enabling the cover to be locked in position by a seal, substantially as described.



2. The battery-cell A, decreasing in size from the bottom upward, and provided with the shoulder M, and with cup-shaped recess F for holding a paraffine seal, in combination with said paraffine seal and with a cover locked in such recess thereby, substantially as described.

3. A galvanic cell consisting of the cup A, provided with shoulder M, cover B, in which the elements E C of the battery are suspended, and the paraffine seal D, surrounding said elements and sealing them in position, substantially as described.

4. The combination of the cell A, cover B, provided with perforation N, cut at an angle to the axis of the cell, and zinc C, held away from the electro-negative element by reason of said hole or perforation, thereby preventing accidental contact between the zinc and the carbon by reason of the proximity of the free end of the zinc to the carbon, substantially as described.

5. A cell for galvanic batteries, which consists of a vessel provided at its upper extremity with a shoulder formed of the material of the cell, and projecting inward to support the battery-cover and to permit the same to be sealed by a paraffine or equivalent seal set above the cover, substantially as described.

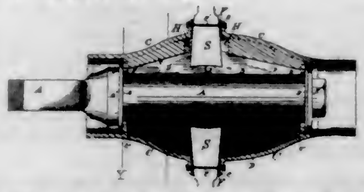
291,872. ORE-SEPARATOR. FRANCIS R. BROWN, Boulder, Colo. Filed Oct. 19, 1883. (No model.)

Claim.—1. A separator-pan provided with a convex bottom constructed in successive inclines, and having a central discharge-opening substantially as set forth.

2. A separator-pan provided with a convex bottom constructed in successive inclines, each incline being provided with one or more pockets adapted to arrest the heavier particles of ore as they are moved circularly or spirally over said bottom, substantially as set forth.

3. In combination with a separator-pan, a rotating diaphragm which has a coiled or spiral flange attached to its under side, and operating as set forth.

4. In combination with a separator-pan, a rotating diaphragm which has a coiled or spiral flange attached to its under side, the coils of said flange being of increasing height or width from the center outward, as set forth.



5. In combination with a separator-pan, a rotating diaphragm which has a coiled or spiral flange attached to its under side, and devices for adjusting the coils of said flange toward or from each other, substantially as set forth.

6. In combination with a separator-pan, a rotating diaphragm which is provided with devices whereby it may be secured in a concentric position with respect to said pan, or adjusted to different degrees of eccentricity, substantially as set forth.

7. In combination with a separator-pan and an axial stud or post, a diaphragm arranged to rotate, and having its hub or center slotted, so that it may be arranged concentrically or eccentrically with respect to said pan, and bolts for securing the same.

8. In combination with a pan for separating ores, a sliding block moving in guides attached to said pan, and certain devices whereby said block is operated to cause oscillation, substantially as set forth.

291,878. VEHICLE-WHEEL HUB. JAMES T. BROWN, Indianapolis, Ind. Filed Sept. 22, 1883. (No model.)

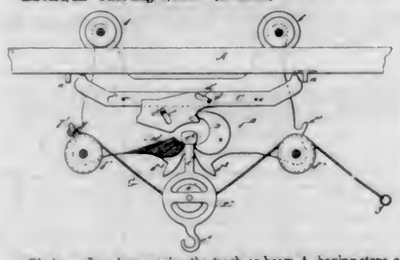
Claim.—1. A vehicle-wheel hub provided with internal longitudinal ribs, in combination with an elastic filler, substantially as and for the purposes specified.

2. The combination of a vehicle-wheel hub provided with internal

longitudinal ribs and an elastic filler, a portion of which lies between said ribs and a portion extends beneath the bottom of the spokes, and a journal-box, substantially as and for the purposes specified.

3. The combination of the shells C, provided with the ribs *c*, stopping a distance short of the spokes, and the elastic filler D and elastic layers or disk H, substantially as and for the purposes specified.

4. The combination of the shells C, provided with the ribs *c*, stopping a distance short of the spokes, and the elastic filler D, the layers H being integral with the elastic filler D, substantially as and for the purposes specified.

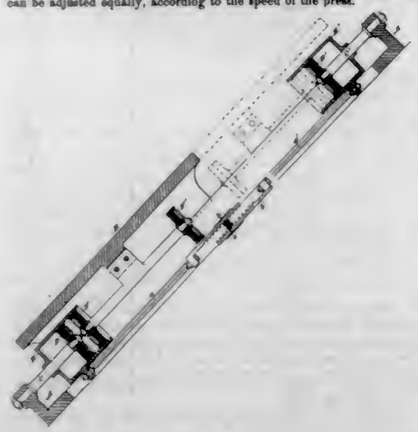


5. The combination of the shells C, provided with the ribs *c*, disks F, lying between the spokes and flange *s* of the shells, and elastic filler D and elastic layers or disk H, substantially as and for the purposes specified.

6. A vehicle-wheel hub consisting of an external shell provided with partitions or lugs fitting in notches in the flanges of the journal-box, and having the intermediate space filled with an elastic material, substantially as and for the purposes specified.

7. The combination of the shells C C, provided with partitions *c* and lugs *d'*, journal-box B, having notches *b'* in flange *b*, the fillers D, and washers *a*, substantially as and for the purposes specified.

8. A hub consisting of the shells C, having an elastic filling, and provided with flanges *s*, in combination with the spokes S and elastic washers F, placed between said flanges and spokes, substantially as and for the purposes specified.



291,874. HAY-CARRIER. ABNER J. BURRAMS and HENRY D. PAGE, Harvard, Ill. Filed Aug. 6, 1883. (No model.)

Claim.—In a hay-carrier, the track or beam A, having stops *a a* upon opposite sides, in combination with the frame B, formed with the lips B' and hooks *b'*, the hooked and weighted lever C, lever C', connected thereto, dog D, guide-pulleys *b²*, fork-pulley E, and the rope G, having a ring, *g*, at each end, all constructed and arranged to operate substantially as and for the purpose set forth.

291,875. AIR CUSHION FOR THE RECIPROCATING BEDS OF PRINTING-PRESSES. ANDREW CAMPBELL, Brooklyn, assignor to John and Edmund McLoughlin, New York, N. Y. Filed June 19, 1883. (No model.)

Brief.—The two opposite air-bells are connected together, so that they can be made to approach or recede from each other simultaneously while the bed is running. By this means the depth of the air cushions can be adjusted equally, according to the speed of the press.

Claim.—1. As a means for checking the momentum of the reciprocating bed of a printing-press, the combination, with said bed and pistons borne thereby, of air-bells arranged at opposite ends of the machine, mounted upon the fixed frame thereof and adjustable axially toward and from each other, and mechanism, substantially as set forth, connected with said air-bells for moving them simultaneously toward or from each other.

2. As a means for checking the momentum of the reciprocating bed of a printing-press, the combination, with said bed and pistons borne thereby, of axially-movable air-bells arranged at opposite ends of the machine, where they will be entered by said pistons at the extreme stroke of the bed, and mechanism, substantially as set forth, connected with said bells, the operation of which causes the bells to move toward or from each other simultaneously and to the same extent, and which is capable of operation while the press is running, as described.

3. As a means for checking the momentum of the bed of a printing-press, the combination, with the bed, of a piston borne thereby, a fixed piston, and a movable bell adapted to be shifted in the direction of its axis over said fixed piston, all arranged to operate substantially as set forth.

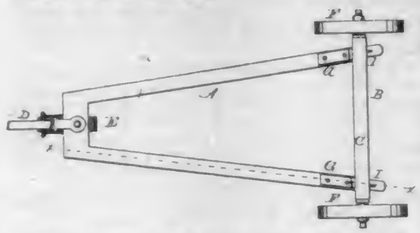
4. The combination, with the reciprocating bed, the pistons F F' borne thereby, the pistons D D', fixedly mounted on the frame, and the movable bells E E', of the means, substantially as described, for shifting said bells simultaneously and equally, as set forth.

5. The combination, with the reciprocating bed and the pistons borne thereby, of the fixed pistons, the movable bells, the rods *a a'*, the racks *b b'*, and the pinion *c*, all arranged substantially as set forth.

291,876. DRILLING-MACHINE. ROBERT K. CARPENTER, Medford, Mass. Filed Aug. 6, 1883. (No model.)

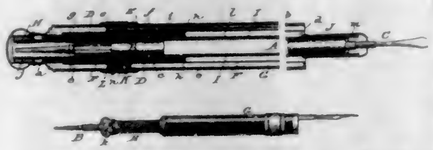
Claim.—1. In a drilling-machine substantially such as described, the shaft C, consisting of the tubes H J, screw *p*, and flexible shafts K L, in combination with means for connecting said shaft with a driving-shaft, and with the mandrel of a drill or other tool, substantially as set forth.

2. In a drilling-machine substantially such as described, the coupling N, provided with the flaring socket *n* and set-screws *r*, in combination with the flexible shaft K, and means for connecting said flexible shaft with the tool-carrying mandrel *a*, substantially as specified.



3. The improved drilling-machine herein described, the same consisting of the shaft K, provided with the coupling-thimble N, having the screws *r* and flaring socket *n*, the pipes J H, provided with the screw *p*, the shaft L, provided with the thimble M, having the screw *b* and recess *h*, the shaft *f*, provided with the gear *x*, spline *i*, and groove *z*, the sleeve E, having an interior groove to receive the spline *i*, and provided with the screw *g* and lever G, the mandrel *a*, provided with the gear *v*, drill *d*, and a feed-screw, *j*, the shaft B, and frame A, all constructed, combined, and arranged to operate substantially as set forth.

291,877. GLOVE-FASTENING. JOSIAH B. CRANE, Newton, MASS. Filed Apr. 16, 1883. (No model.)



Claim.—The herein-described glove-fastening composed of the ball *a*, and neck *b*, to support it, and the loop *c*, adapted to be sprung over the ball to fasten the glove, the said loop at its free end being turned up or provided with a knob, substantially as shown.

291,878. HARVESTER-TRUCK. HENRY CLAYTON, Dayton, Ohio. Filed Nov. 12, 1883. (No model.)

Claim.—In a three-wheeled harvester-truck, the straps G G' of the side rails, and pin I for attachment to the axle B, substantially as set forth.

291,879. COMBINED PEN-HOLDER, PENCIL, AND TOOTH-PICK. RICHARD M. COLLARD, New York, N. Y., assignor to Le Roy W. Fairchild, same place. Filed Sept. 25, 1883. (No model.)

Claim.—1. In combination with a shell or case, a pencil-point provided with a magic movement and adapted to be projected from one end of the shell or case, a tooth-pick point furnished with a simple screw movement and adapted to be projected from the opposite end, and a pen-slide encircling the screw movement and adapted to be protruded from the same end of the case as the tooth-pick.

2. In a combined pencil and tooth-pick, the combination of a central guide-tube, slotted longitudinally, a pencil-point, and a tooth-pick arranged to slide within and guided by said tube, and means, substantially such as shown and described, for independently moving said points within the tube and causing them to project therefrom.

3. In combination, slotted tube A, pencil-point B, and spirally-slotted tubes D E, adapted and arranged to move said point, as explained, tooth-pick slide C, and spirally-slotted tube I, adapted and arranged to move said point, substantially as set forth.

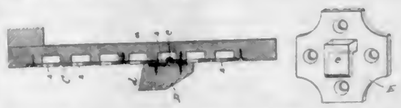
4. In a combined pen-holder, pencil, and tooth-pick, the combination of an outer shell or case, a pen-slide adapted to be protruded from one end of the case, and a central tube carrying at opposite ends, respectively a pencil-point and tooth-pick, said tube being arranged, substantially as shown and described, to move longitudinally, and to have its tooth-pick end drawn within the case when the pencil-point is projected, for the purpose explained.

5. The herein-described implement, consisting of shell G, having inner tube, F, slotted central guide-tube, A, pencil-point B, and its operating-spirals D E, sheath H, and head K, tooth-pick C, and its operating-spiral I, and the pen-slide K L, all combined and arranged substantially as shown and described.

6. In combination with tube F, central guide-tube, A, provided with pencil-point B, and tooth-pick C, spirally-slotted tubes D E, for operating the pencil-point, and spirally-slotted tube I, provided with tip J, by which to rotate tube I, and serving also to support said tube and the central guide-tube laterally.

291,880. ICE-CREEPER. HERBERT COTTRELL, Newark, N. J. Filed Oct. 18, 1883. (No model.)

Claim.—1. The combination, with a base-plate adapted to be permanently secured to the front of a boot or shoe heel, and constructed with dovetailed slideways, of heads or stocks dovetailed to fit said slideways,



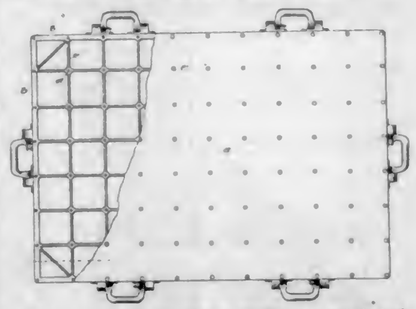
a rod or spindle supported by said heads or stocks and serving to tighten them in said slideways, and an ice dog or calk upon said rod or spindle, substantially as and for the purpose described.

2. The combination of the base-plate B, constructed with slideways *c*, and adapted to be permanently secured to the front of a heel, the heads or stocks E E', fitted to the slideways *c*, the rod or spindle C, screw-threaded and provided with the nut *e*, the dog or calk D, adapted to lock into the head or stock E', and the spring *f*, all substantially as described.

3. The combination, in an ice-creeper, of a spindle on which is fitted a reversible dog, two heads for supporting the said spindle, locking devices on one of said heads and upon the said dog for locking the said dog in either its operative or reversed position, a spring on said spindle for forcing the dog into engagement with the locking devices on the head, and a nut and screw-thread on said spindle for varying the tension of said spring independently of the spindle-head, substantially as herein described.

4. The combination of the base-plate B with slideways *c*, the heads or stocks E E', the rod or spindle C, serving to tighten said heads or stocks and supported by them, the dog or calk D, locking into the head or stock E', the nut *i*, screwed on said rod or spindle inside the head or stock E, and the spring *f*, arranged between the dog or calk and said nut *i*, all substantially as described.

291,881. WORK-BENCH. MILLARD CREIGHTON, Marblehead, MASS. Filed Nov. 23, 1883. (No model.)

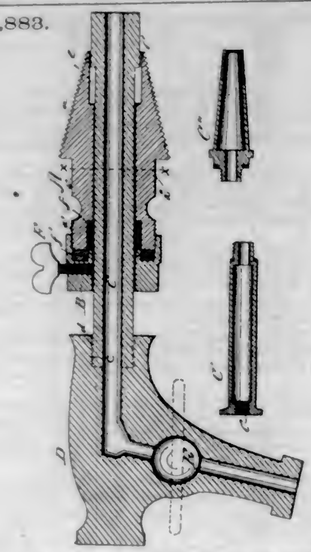


Claim.—1. The improved bench attachment, consisting of two plates, C, provided with a number of perforations, 2, and of two locking-plates, E, having rigidly-attached hooks *e*, to enter the perforations of the said plates C, the locking-plates being adapted to be attached to the rear side of the strip D and support the same at the side of the bench to which the plates C are attached, substantially as and for the purpose set forth.

2. The bench A, having the perforated plates C, said bench being recessed or cut away at the rear sides of the said plates, the board-supporter or strip D, having locking-plates E *e*, to engage with the perforated or recessed plates C, and suitable means for preventing endwise movement of the board to be operated upon, in combination, substantially as described.

3. The bench A, having the perforated plates C, said bench being recessed or cut away at or near the perforations 2 of the plates, and the supporter or strip D, having the locking-plates E, and having its top or upper surface, *d*, beveled, substantially as and for the purposes set forth.

291,882. TABLE FOR LEATHER-SCOURING MACHINES. THOS. L. DARDENT, Boston, MASS. Filed May 12, 1883. (No model.)

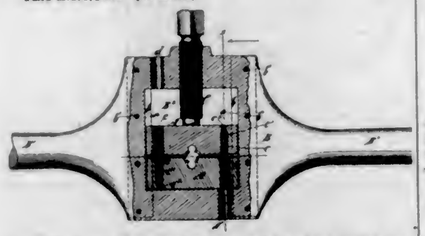


Claim.—As an improved article of manufacture, a table for leather-scouring machines, composed of two metal plates and intermediate strengthening frame-work connected with the said plates to support them at various points between their surfaces, substantially as described.

291,883. FAUCET. JOSEPH H. DORGAN, Plattsburg, N. Y. Filed Feb. 7, 1883. (No model.)

Claim.—1. In a faucet, the combination, with the tube C, of the

291,883.



sliding conical plug A and the collar B, provided with the set-screw F, substantially as and for the purposes set forth.

2. The head D, in combination with the tube C, sliding conical plug A, and collar B, substantially as and for the purposes set forth.

3. In a faucet, the tube C, adapted to be screwed into the head D, and formed with the offset *c'*, and the sliding conical plug A, formed with the chamber *e*, and having the packing *f*, in combination with the sliding collar B, having the set-screw F and packing *f'*, and adapted to be screwed upon the outer end of the conical plug A, substantially as shown and described.

4. The combination, with the tube C, sliding conical plug A, collar B, and main head D, of the extension-tube C', substantially as and for the purposes set forth.

291,884. DIE AND DIE-STOCK. GEAR ELTERICH, New York, N. Y. Filed Mar. 2, 1883. (No model.)

Claim.—1. A screw-threading die, consisting of two sections provided with guide-pins and with holes or recesses for receiving said pins and holding the sections in proper relation to each other, each pin being secured in one section and adapted to slide freely into a hole in the other section, and thereby affording provision for the ready separation of the sections when desired, substantially as described.

2. A screw-threading die, consisting of two sections provided with guide-pins and with holes for receiving said pins, serving both to hold the sections in proper relation to each other, and also as stops to limit the closing movement of said sections, each pin being secured in one section and adapted to slide freely into a hole in the other section, and thereby affording provision for the ready separation of the sections when desired, substantially as herein described.

3. A screw-threading die, consisting of sections provided with guide pins and holes, each pin consisting of a screw screwed into one section and having beyond its thread a smooth portion adapted to slide freely into a guide-hole in the other section, said guide-pins serving both to hold the sections in proper relation to each other and to form stops for adjustably limiting the movement of said sections toward each other, substantially as described.

4. The combination of the die-sections A A, provided with screw-threaded guide-pins c, each having a smooth portion beyond the thread, and with holes or recesses *c'*, in which said smooth portions are free to slide, and the stock B, provided with holes *d* opposite the said guide-pins and through which a screw-driver may be inserted to turn said pins without removing the die from the stock, substantially as described.

291,885. MECHANICAL MOVEMENT. HENRY ERRIC, Philadelphia, PA. Filed Dec. 11, 1882. (No model.)

Claim.—1. In a mechanical movement, the combination of a load-wheel rotated by an internal gear, which is actuated by two eccentrics.

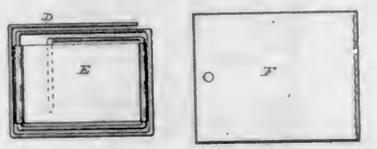
2. The arm B, connecting from one eccentric to the pinion-wheel P.

3. The eccentric or crank, in combination with an arm connecting with pinion P.

4. The pulley or gear G', used to drive the eccentric E' and driven by the wheel W.

5. The wheel W, when used to drive two eccentrics for controlling the motion of pinion P.

6. The combination of wheel L, pinion P, arm B, eccentrics E and E', gear G and G', together with wheel W, all substantially as set forth.



291,886. PEN AND PENCIL CASE. LE ROY W. FAIRCHILD, New York, N. Y. Filed Sept. 4, 1883. (No model.)

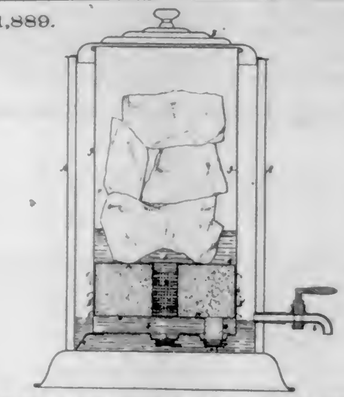
Claim.—1. The combined pen and pencil case consisting of an outer tube or shell, A, a pencil-tube, I, secured at one end to the shell A and extending centrally through the same, and the reversible pen-holder D, open at both ends, all substantially as shown and described.

2. In combination with the shell or tube A, having the pencil-tube I, arranged to project centrally at one end, the reversible open-ended pen-holder D, arranged substantially as shown and described, whereby the end of tube I shall close the opening in the end of the pen-holder when the pen is inserted within the shell, as set forth.

291,887. HARNESS-PAD. WILLIAM H. FELKER, Dayton, Ohio. Filed Aug. 27, 1883. (No model.)

Claim.—In a detachable pad for harness-saddles, the wire spring D, of the form of a parallelogram, with a thin metallic plate, E, attached to the top end sections, the same inclosed in a leathern sack, F, with perforations, as described, which is covered by a cloth attached to the leathern body H, substantially as set forth.

291,888. BED-BOTTOM. EDWIN SCOTT FIELD, Springfield, MASS. Filed Sept. 18, 1882. (No model.)

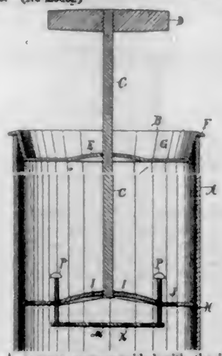


Claim.—In combination, the side rails, *a*, the end rails, *b*, the flexible metallic strips *c*, having the broadened and re-enforced ends, and the spiral springs *d*, the strips connected at each end to the end rails of the frame by two or more spiral springs, all substantially as described.

291,889. FILTER FOR WATER-COOLERS. ALLEN FISKE, Boston, MASS. Filed Apr. 3, 1883. (No model.)

Claim.—1. The filter B, constructed substantially as described—viz., with its filtering-chamber foraminous in its periphery, and provided with a foraminous tube extending down through it, and opening at its

291,889.



lower end into a sediment-chamber and at its upper end into a chamber for the reception of ice and water, such filtering-chamber and ice-and-water chamber being within or surrounded by a tank, A, provided with a cock, *b*, as set forth.

2. The combination of the tank *g*, provided at its bottom with the educt *l*, with the filtering-chamber arranged in such tank and opening through the sides thereof, and having a filling-induct, *o*, opening through the bottom of the tank, as set forth, and also with the foraminous tube *h*, extending through such chamber from top to bottom thereof, and opening at top and bottom into the tank, all being substantially as set forth.

3. The combination of the tank A, provided with the discharge-cock *b*, with the water-and-ice-receiving chamber *r*, sediment-chamber *k*, and the filtering-chamber and its tube, foraminous in their peripheries, as described, all being arranged substantially as set forth, and the said sediment and filtering chamber being provided with the ducts *o* and *l*, as explained.

291,890. EGG-BEATER. WILLIAM G. FLANDERS, Troy, N. Y. Filed June 13, 1883. (No model.)

Claim.—1. A concave cover provided with the inwardly-inclined surface G, stamped from a single piece of sheet metal, and provided with a central stem-opening, in combination with a stem and plunger and inclosing-case, substantially as described, and for the purposes set forth.

2. In an egg-beater, a perforated plunger having a central opening, in combination with a suitably-coanected valve or disk, to close said opening when the plunger moves in one direction and open it again when it moves in the opposite direction, substantially as described, and for the purposes set forth.

3. In an egg-beater, the combination, with a stem and plunger having a suitable inclosing-case, of a perforated disk attached to said plunger by suitable sliding supports, substantially as described, and for the purposes set forth.

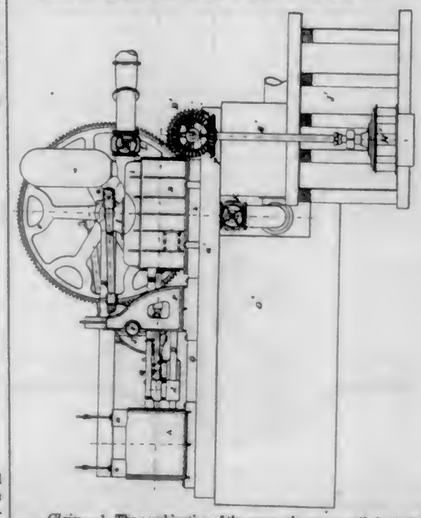
4. The combination of stem C, perforated plunger H, perforated disk K, pins P, and case A, substantially as described, and for the purposes set forth.

291,891. METALLIC PATCH FOR BULLETS. GEORGE VINCENT FOSBERY and HENRY PIEPER, Liege, Belgium. Filed May 31, 1883. (No model.)

291,891.

Claim.—1. A metallic envelope for projectiles of rifled small-arms, the sides of which envelope are formed by sections with their upper edges inclined outward, for the purpose of detaching the envelope from the projectile when the latter leaves the muzzle of the rifle, substantially as described.

2. A metallic envelope for projectiles of rifled small-arms, open at the front end, and provided with circumferential ridges or teeth of sufficient diameter to project into the grooves of the rifle while the projectile passes through the bore, substantially as and for the purposes described.



3. A metallic envelope for projectiles of rifled small-arms, open at the front end, and provided with circumferential ridges or teeth the interstices between which are filled with lubricant, and which are made of sufficient diameter to project into the grooves of the rifle, substantially as and for the purposes described.

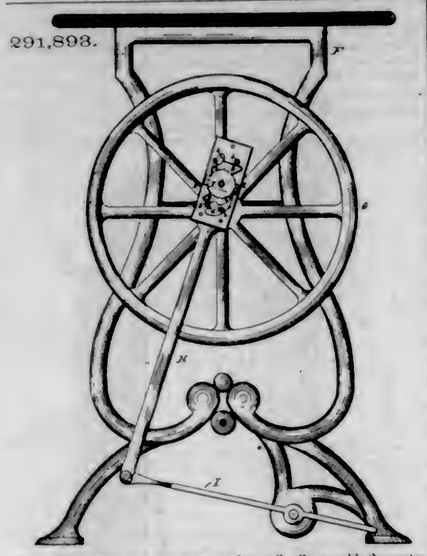
4. A metallic envelope for projectiles of rifled small-arms, open at the front end, and having the front edge turned outward, while the bottom of the envelope is dished, substantially as and for the purposes described.

5. A metallic envelope for projectiles of rifled small-arms, open at the front end, the front edge being turned outward, while the bottom is dished, and the sides are provided with circumferential ridges or teeth of sufficient diameter to project into the grooves of the rifle, substantially as and for the purposes described.

6. A metallic envelope for projectiles of rifled small-arms, open at the front end, and provided near its open end with projecting circumferential ridges or teeth and near its base with indentations, substantially as and for the purposes described.

291,892. STEAM AND HYDRAULIC PUMPING-ENGINE. HARVEY F. GASKILL, Lockport, N. Y. Filed Dec. 26, 1882. (No model.)

Claim.—1. The combination of the pump, the steam-cylinder in line with the pump, the water-motor, the crank-shaft having a bearing on the pump, the gear and fly wheel on the crank-shaft, and the beam, substantially as described.



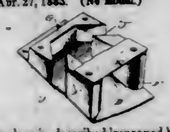
2. The combination of the pump, the steam-cylinder in line with the pump, the crank-shaft having a bearing on the pump, the fly-wheel on the crank-shaft, and the beam connected to the pump and piston-rods and the crank-shaft, substantially as described.

3. The combination of the steam-motor, the water-motor, the pump, the crank-shaft having a bearing on the pump, the gear and fly wheel on the shaft, the beam, the pinion, and the pinion-shaft having a bearing on the backward extension of the frame.

291,893. MECHANICAL MOVEMENT. EMANUEL M. GEORGE, Three Rivers, Mich. Filed Oct. 1, 1883. (No model.)

Claim.—1. The combination, with a crank or its equivalent and its operating device, of mechanism, substantially as described, connected to

291,893.



and carried by the operating means and traveling in an orbit the center of which is the center of the crank's motion, and constructed to overcome the dead-center of said crank, as set forth.

2. In a device for the purposes described, and in combination with the case A and crank-pin B, moving in a circular orbit, the slide C and springs D, constructed to hold the slide centrally, the parts being arranged and operating substantially as and for the purposes set forth.

3. In a device for the purposes described, and in combination with the case A, crank-pin B, slide C, and springs D, the ratchet E, pins *b b'*, and pawls *c d*, the parts being constructed, arranged, and operating substantially as and for the purposes set forth.

291,894. JET WATER-WHEEL. ALDREW JACKSON GOULD, Quincy, Cal. Filed Apr. 27, 1883. (No model.)

Claim.—The herein-described improved bucket for jet water-wheels, comprising the bottom D, the top plate, E, a straight back wall, G, against which the force or impact of the water comes through the opening or mouth at the front of the bucket, and the perpendicular side walls, F F, having openings J J extending through said side walls, so that a sharp angle is formed by the straight back wall, G, and the rear wall of the openings J, the direction of said openings J J being straight and toward the mouth end of the bucket and terminating some distance in the rear of the mouth, whereby the water, as it exhausts from the openings J J, will be against the wheel the entire length of openings J J, and the exhaust will be completed at the side of the bucket in rear of the mouth, substantially as set forth.

291,895. CASH AND PARCEL CARRIER. CHARLES GRANT, Jr., and DAVID LAWRENCE, Boston, Mass., assignors to said Grant. Filed Dec. 3, 1883. (No model.)

Claim.—1. As a means of alternately inclining tracks of the class described, a pair of pivoted levers or segments, B, in combination with a means of vibrating them and a means of holding them when adjusted, substantially as set forth.

2. The pivoted devices B, the wire track, or track supported by wire, &c., extending between the lower ends of said devices, a wire or similar connection, *c*, extending between their upper ends, a means of vibrating the devices B, and a means of retaining them when adjusted, combined to operate as and for the purpose described.

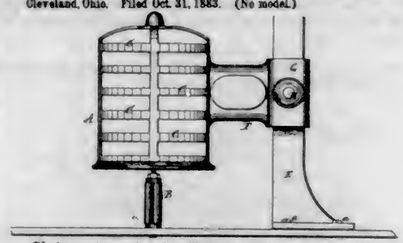
3. The track H, composed of two strips, *l m*, bent and united together, in combination with a wire tube or cord extending longitudinally from end to end of the same, as specified.

4. A pair of spiral springs, G, for arresting the downward motion of the carrier D in either direction, and a pair of inclined stops, *g g*, in combination with a weighted or spring-actuated hooked lever, I, adapted to retain and release the carrier, as set forth.

5. The carrier D, with its springs G, rod E, guides *k*, slot *h*, plate *i*, and inclined stops *g*, in combination with a track having a hooked lever, I, pivoted thereto, a spring, *q*, under the outer end of said lever, and a stop, *r*, under the end of the track, and a stop, *s*, located on the post A, for tripping the lever and releasing the carrier, all arranged to operate as described.

6. In combination with the carrier D and a track for it to travel thereon, the cash and parcel receptacle P, having at its bottom a pair of tubular rollers, R, each provided at its extremities with elastic frictional disks S, a helical spring, *u*, inclosed within each roller, and the operating cords or bands *e*, as and for the purpose set forth.

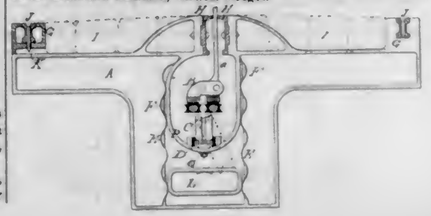
7. A track, H, supported by a wire, cord, or tube, *p*, extending from end to end thereof, in combination with a wire or other connection, *c*, above the same, and one or more vertical wires, M, extending down from the wire *c* to the track H, as set forth.



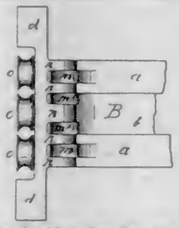
8. The levers or segments B, in combination with the sliding rods T, to the inner ends of which they are pivoted, substantially as set forth.

291,896. TRACE-FASTENER. NICHOLAS MARTIN HANSENSTAD, St. Paul, Minn. Filed May 7, 1883. (No model.)

Claim.—In combination with a whiffletree, a loop, B, adapted to swing laterally upon said whiffletree, a snap, D, having oppositely-pointing and backwardly-bent hooked forward ends, *d' d²*, and a trace, C, substantially as and for the purpose set forth.



291,897. SAFETY-GUARD FOR MOLDING-MACHINES. GEORGE H. HANSCOM, Brooklyn Village, and HENRY P. BROOKS and HERBERT E. BROOKS, Cleveland, Ohio. Filed Oct. 31, 1883. (No model.)



Claim.—A guard and guide for vertical cutters of molding and other machines, formed of a hollow cylinder having horizontal openings for the passage of chips, the upper end with braces and the lower end open, in combination with a rectangular standard and the adjustable arm and set-screw, substantially as and for the purpose described.

291,898. CABLE-RAILWAY PROPULSION. WILLIAM WALLACE HANSCOM, San Francisco, Cal. Filed Sept. 19, 1883. (No model.) Patented in England Aug. 16, 1882, No. 3,927, and Nov. 29, 1882, No. 5,590.

Brief.—Between the transverse frames the tube or tunnel is formed by sheet-metal plates, the ends of which are secured by lugs upon the frames. The bottom of the cable-opening in the frames is curved and perforated for the angular adjustment of the cable-pulley frames. The grip opens at the bottom, to receive and discharge the cable, one jaw being movable and having lugs which are pivoted upon a fixed shank, and a lug secured to a movable slide. A two-part rail is held in chairs on the transverse frames by vertical wedges.

291,898.

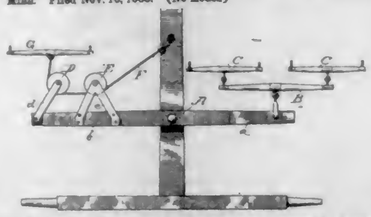
Claim.—1. The frame A, with the lugs F, opening L, and the extensions, with the chairs G and rails J J and wedges K K, in combination with the grip B, carrying-sheave C, and frame D, substantially as described, and for the purpose set forth.

2. In a cable-railway, the frame A, having the opening L and the curved surface P, with bolt-holes in the flanges, and adapted for receiving the end of an angularly-adjustable frame, D, containing a carrier-sheave, C, substantially as and for the purpose set forth.

3. The frame A, having the opening L and the curved surface P with bolt-holes in the flanges adapted to receive the end of an adjustable frame, in combination with the angularly-adjustable frame D, bolt Q, and carrier-sheave C, for the purpose of inclining the carrier-sheave where the road is curved, substantially as shown and described.

4. The frame A, carrying the adjustable sheave C, in combination with the grip B, substantially as and for the purpose specified.

5. The grip B, with its rollers O O O, jaws *d d*, and lugs *n n n n*, having a bottom opening of the jaws, substantially as described.

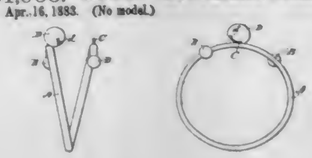


6. In a cable-railway having an underground slotted tube, the grip B, having its opening for the reception and discharge of the rope at the bottom, and having its jaws operated by a vertically-moving slide, *e*, through the slot of the tube, in combination with one or more adjustable inclined sheaves, C, and one or more traveling endless ropes, substantially as described and set forth.

7. The grip B, in combination with the angular adjustable sheave C and frame D, substantially as described, and for the purpose set forth.

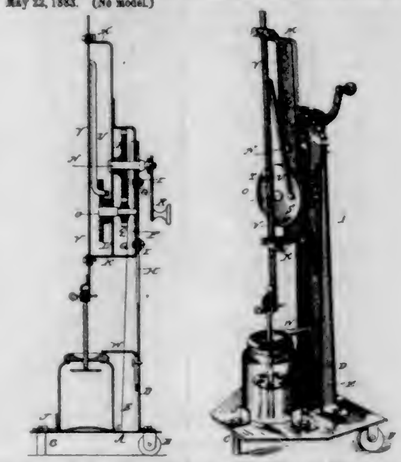
8. The frame A, having the lugs F F, in combination with the corrugated-iron plates E E, substantially as described.

9. The construction and arrangement of the rails J J, in combination with the chairs G G and wedges K K, substantially as and for the purpose set forth.



291,899. DRAFT-EQUALIZER. GEORGE W. HARRINGTON, Plainview, Minn. Filed Nov. 10, 1883. (No model.)

Claim.—1. The means for equalizing at one arm, *b*, double the amount of draft applied to the arm *a* of triple-tree A, consisting of the pulley D, oscillatingly connected to the extremity of said arm *b*, a pulley, E, connected to the same between the end and fulcrum, and a draft rope or chain, F, secured at one end to the pole of the vehicle or machine and passing thence around said pulley, substantially as set forth.



2. In a draft-equalizer for three horses, the pulleys D and E, fixed to the longer arm of the triple-tree, said pulley D being oscillatingly connected thereto, and a draft rope or chain, F, fastened at one end to the tongue of the vehicle or machine, and after passing around said pulleys, as shown, having attached to its other end a single-tree, G, in combination with the double-tree B, connected to the shorter arm of said triple-tree, substantially as and for the purpose set forth.

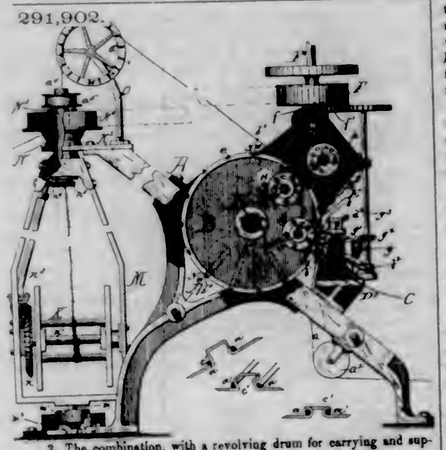
291,900. BRACELET. JOHN C. HARRINGTON, Providence, R. I. Filed Apr. 16, 1883. (No model.)

Claim.—The combination of the stationary hollow ornament having a rounded under surface provided with a slot, substantially as described, and attached to one of the lapped arms of a spirally-wound wire bracelet, with the catch-stud attached to the opposite lapped arm of the bracelet, the catch-stud being adapted to pass under the elevated front end of the slot and to the rear lower end of the same under the inwardly-resilient action of the arms of the bracelet, substantially as described.

291,901. CHURN. ROBERT T. HENDERSON, Shawneetown, Mo. Filed May 22, 1883. (No model.)

Claim.—1. The combination of the base having the flanged vertically-slotted upright, the vertically-adjustable frame having forwardly-projecting brackets, a vertically-sliding rod mounted in the said brackets, a shaft mounted transversely in the vertically-adjustable frame, extending through the slot in the upright, and having at its front end a wheel or disk, a pitman connecting the latter with the vertically-sliding rod, and mechanism for operating the said shaft, substantially as set forth.

2. The combination of the base mounted upon rollers or casters, and having horizontally-adjustable clamps, the flanged vertically-slotted upright, the vertically-adjustable frame carrying the operating mechanism, constructed substantially as described, and a clamp vertically adjustable upon the front side of the upright, to hold the churn from vertical displacement, substantially as set forth.



291,902. BARB-FENCE MACHINE. CHRISTIAN C. HILL, Chicago, Ill. Filed June 18, 1883. (No model.)

Brief.—The main wires pass partially around a large continuously-rotating drum, on the periphery of which are mounted blocks, each provided with a projection and a transverse groove. The barb-wire passes into these grooves under the main wires. Then the severed barb is carried by these grooves under two cheek-pieces, which hold the barb, near its ends, in the grooves, while under the cheek-pieces a tool, mounted on a revolving wheel passing through a slot in the drum, forces the middle of the barb up between the main wires, the barb assuming the shape shown in Fig. 9. By a further rotation of the drum and tool-wheel, the tool is partially withdrawn from the staple, and the middle of the staple is brought into contact with a stationary tool, which bends it into the shape shown in Fig. 10. By the further rotation of the drum and tool-wheel, the tool is entirely withdrawn from the bent barb, and the barb is carried out from the cheek-pieces to between two bending-rollers which force the two main wires toward each other, causing the barb to assume the shape shown in Fig. 11. The drum continuing to rotate, the main wires and barb are brought between two pressing-tools, which force the parts of the barb firmly against the main wires, which are then led to a twisting and spooling device, whereby they are twisted and spooled.

Claim.—1. The combination, with mechanism for feeding the fence-wires continuously, of mechanism for feeding the barb-wire continuously, a continuously-revolving drum or wheel provided with a series of slots through its rim, mechanism for severing the barb-wire, and rotary devices, operating through slots in the drum, for applying and forming the barb journaled on the frame of the machine and projecting inside of the revolving drum, and conjointly operating stationary barb-forming devices secured to the frame outside of said drum, substantially as specified.

2. The combination, with a continuously-revolving drum provided with slots through its rim, of barb-forming tools or devices located inside said drum, and barb-forming devices located outside said drum, substantially as specified.

291,902.

3. The combination, with a revolving drum for carrying and supporting the fence-wires, provided with grooves or devices for carrying and supporting the barbs while they are being applied, and with slots or openings through which the barb may be operated upon by tools inside or outside of the drum, and barb forming and applying tools located inside and outside of said drum, substantially as specified.

4. The combination, with the revolving drum provided with slots or openings through its rim, of a series of knives fixed in its periphery, an opposing-knife mounted on the frame of the machine, concave flanges or cheeks secured to the frame of the machine, revolving tools journaled on the frame of the machine and projecting inside said drum to force the middle portion of the barb between said cheeks, a tool projecting from between said cheeks to again bend the barb, a pair of rolls set tangentially to said drum to force the fence-wires together and further form the barb, opposing revolving tools journaled on the frame of the machine inside and outside said drum to press the bent or loop portion of the barb flat upon the wires, and a device for twisting the fence-wires together, to fix the same securely in the opposite notches or shoulders formed by the loop and the ends of the barb, substantially as specified.

5. The combination, with mechanism for continuously feeding the fence-wires and barb-wire, of mechanism for severing the barb-wire, and a revolving wheel or drum provided with devices for carrying the barbs along with the fence-wires while the barbs are being formed and applied, and barb-applying devices mounted on the frame of the machine, adapted to operate upon the barb as the revolving drum brings the barb in contact therewith, substantially as specified.

6. The combination of a revolving drum or wheel carrying the fence-wire and the severed barbs, and of devices mounted on the frame of the machine for applying the barbs to the fence-wire as the drum revolves, substantially as specified.

7. The combination of a revolving drum or wheel carrying the fence-wires and barbs, of a stationary knife and a series of knives fixed in said drum or wheel for cutting off the barbs from the barb-wire as the drum or wheel revolves, and of devices mounted on the frame of the machine for applying the barbs to the fence-wire as the drum or wheel revolves, substantially as specified.

8. The combination, with a slotted wheel rotating continuously in the direction of the feed of the fence-wires and carrying said wires continuously forward, of a series of knives secured at the rim of said wheel, and an opposing-knife on the frame of the machine for cutting off the barb-wire, and a revolving tool journaled on the frame of the machine and projecting into said wheel, and opposing-cheeks fixed to the frame of the machine outside said wheel, said revolving tool operating on the barb through openings in the rim of said wheel, substantially as specified.

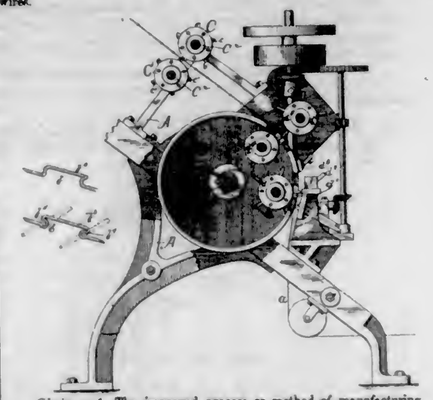
9. The combination, with a wheel having a slotted rim rotating continuously in the direction of the feed of the fence-wires and carrying said wires, of devices for forming or applying the barb to the fence-wires located inside and outside of said rim and conjointly operating upon the barbs through the slots or openings in said rim, substantially as specified.

10. The combination, with a wheel having openings in its rim and carrying the fence-wires, of a pair of revolving barb forming or applying tools journaled on the frame of the machine, one inside and one outside the peripheral line of said rim, substantially as specified.

11. The combination of a slotted wheel or drum for carrying the fence-wires, and provided with transverse grooves or devices on its periphery for carrying the barbs along with the fence-wires, opposing-knives mounted in the revolving wheel, and the stationary frame for cutting off the barbs, revolving tools or devices journaled on the frame of the machine and projecting inside said rim, and stationary devices outside said rim for bending and forming the barbs, tangential rollers or devices for crowding the fence-wires together and further forming the barbs, and revolving tools journaled inside and outside said rim to further form and secure the barbs, and mechanism for continuously driving said revolving wheel and revolving tools, substantially as specified.

12. The combination, with the revolving wheel or drum carrying the fence wires and barbs, of devices for crowding the fence-wires together on the periphery of the rim as the wheel or drum revolves, and thus applying or partly applying the barbs to the fence-wires, substantially as specified.

13. The combination, with a wheel or drum carrying the fence-wire thereon continuously forward, continuously-revolving knives, and an opposing-knife for severing the barb in equal barb-lengths as said barb-wire is fed continuously thereto, and barb applying and forming devices consisting of continuously-revolving and stationary parts, so that all the moving parts of the machine may have a simple continuous rotary motion and be adapted to run at high speed, substantially as specified.

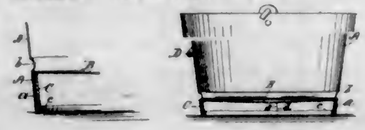


14. The combination, with a slotted wheel or drum having transverse grooves across said slots, and provided with a series of knives fixed in its rim, of a stationary knife for cutting off the barbs, concave cheeks or guards for forcing or guiding the barbs into said transverse grooves, and barb forming and applying mechanism located part inside and part outside said drum and conjointly operating to bend and form the barb, substantially as specified.

15. The combination of the revolving wheel carrying the fence-wires on its periphery, of grooved rollers journaled on the frame of the machine tangentially to said wheel for forcing the fence-wires together, and projecting guides to support the barbs and to regulate the action of said rollers in forming the barb, substantially as specified.

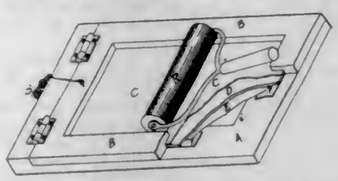
16. In a barb-fence machine, the continuous revolving wheel for carrying the fence-wires and barbs while the barbs are being applied, in combination with mechanism for forming and applying the barbs mounted on the frame of the machine, substantially as specified.

291,903. MANUFACTURING BARBED FENCE-WIRE. CHRISTIAN C. HILL, Chicago, Ill. Filed June 18, 1883. (No model.)



Brief.—The barbs are applied to the wires by the machine here shown, which forms the subject-matter of an application of even date herewith, or by any other machine capable of applying a barb to two separated wires, and then the barb is severed diagonally between the wires.

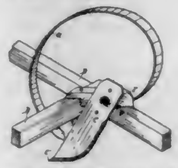
Claim.—1. The improved process or method of manufacturing barbed fence-wire, consisting in first securing a barb-piece of suitable length to form two barbs to each of two fence-wires, and then severing the barb-piece diagonally at its middle between the two fence-wires, thus barbing both wires, substantially as specified.



2. The combination, with mechanism for securing a barb-piece to each of two fence-wires, of mechanism for severing the barb-piece diagonally near its middle between the fence-wires, substantially as specified.

291,904. GALVANIZED OR METAL-COATED BUCKET. JAS. HILL, Providence, R. I. Filed Nov. 30, 1883. (No model.)

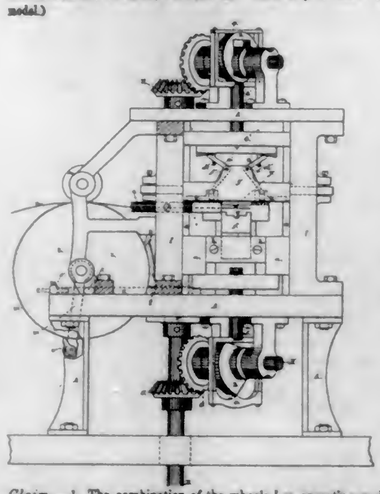
Claim.—In a galvanized or metal-coated bucket, the combination of the body A, provided with the inwardly-turned bead *b*, the bottom plate, B, provided with the rim *a*, and the strengthening-ring C, secured to the bucket by means of the inwardly-turned edge *c*, substantially as described.



291,905. PRESS FOR STENCIL-PRINTING. JOHN C. HILL, Fayetteville, N. Y. Filed Sept. 21, 1882. (No model.)

Claim.—1. The impervious or enameled cloth C C, in combination with the press-frame B B, provided with link and staple, the base A, having spring S, inked felt D, stencil E, frame F F, pad *d'*, and the roller R, to render cleanly the multiplication of copies from stencil, as shown, and for the purposes specified.

2. The combination of the press-frame B B, base A, pad *d'*, frame F F, stencil E, inked felt D, enameled cloth C C, and roller R, to multiply copies from stencil, as shown, and for the purposes specified.



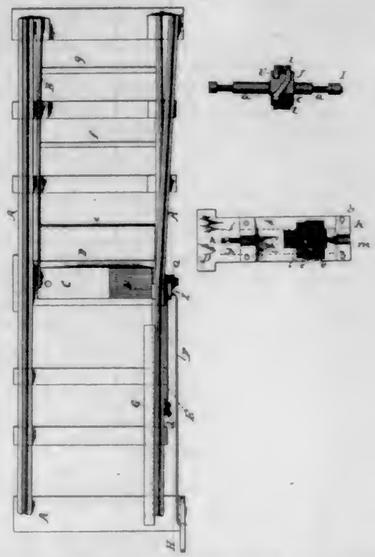
291,906. RUDDER FOR HARROWS. WARREN W. HILL, Texas, Mich. Filed Aug. 23, 1883. (No model.)

Claim.—1. The combination, with the harrow-frame, of the rudders in the angles of said frame, and the single securing-bolt, whereby the rudders cant back to a proper angle, and are held in said angle by the harrow-beams, substantially as set forth.

2. The combination, with the harrow-frame, of the rudder-holders in the angles of the beams, the adjustable rudders, and pivotal bolts, substantially as described.

291,907. MACHINE FOR MAKING BUTTONS. FREDERICK J. RILEY and AUGUSTINE S. FERNALD, Portland, Me. Filed May 7, 1883. (No model.)

Claim.—1. The combination of the wheels *l m*, operating as described, the projections *s' s''*, arm *t*, pawl *u*, conductor *o*, plate *f*, and bar *y*, operating as herein set forth, to bend the wire in the manner described.



2. The combination of the shaft B, eccentric *a'*, frame *p'*, arm *q'*, screw *r'*, crank *s*, slide *k*, and bar *y*, as herein set forth.

3. In combination with the carriage *a*, the horizontally-moving slides *i'' i'*, bell-crank levers *e' e'*, carriage *c'*, eccentric *z*, frame *a'*, and the arm or rod *b'*, as set forth.

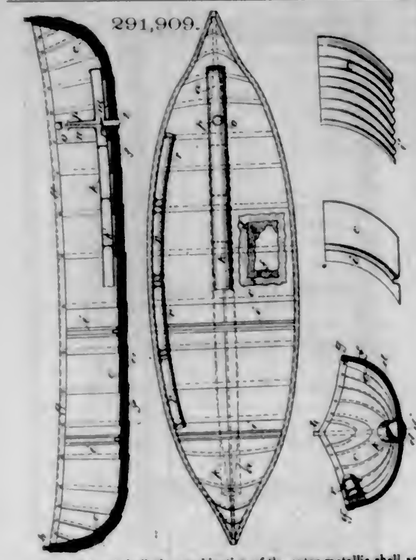
4. The plate *f*, provided with upwardly-projecting ears for bending the wire near its ends, and having also a groove at the middle of the surface between said ears, which groove co-operates with a correspondingly-shaped bar to form the eye.

291,908. RAILROAD-SWITCH. ROBERT H. ISBELL, New York, N. Y. Filed Feb. 14, 1883. (No model.)

Brief.—A rock-shaft to be operated by the switch-lever is arranged in bearings in blocks depending from a plate supporting and connecting the switch-rails, and is provided with a cam-rib, as shown, adapted to engage with projections upon the under side of the plate, whereby the plate and attached switch-rails are shifted as the shaft is oscillated, and are locked against lateral movement at the end of either oscillation. When a train is passing, shifting of the switch is prevented by means of a horizontal bar arranged beside one of the rails, mounted on pivoted parallel arms, so as to rise and fall, adapted to be depressed by the flanges of the wheels of the train, and connected with the switch-shifting rock-shaft by means of a connecting-rod and cranks.

Claim.—1. The combination, in a switch, of the movable switch-rails and the plate C, provided with projections *i' i''*, with the rocking cam-rib *l*, having a return end, *l'*, adapted to hold a projection on said plate between the rib *l* and its return end *l'*, substantially as described.

2. The combination, in a switch, of the rails B B, plate D, connected with the fixed rails, and carrying the bearing-block *k*, the plate C, connected with the movable rails, the shaft *a*, carrying a cam working in a groove formed in said plate C, and means for rocking said shaft and cam, substantially as described.



3. The combination, with the shaft *a*, and means, substantially as described, for moving the switch-rails, of the plate G, supported on the links *p p*, the arm *o*, connected to said plate, the rock-shaft *n*, link E, and arm I, attached to the shaft *a*, as and for the purposes set forth.

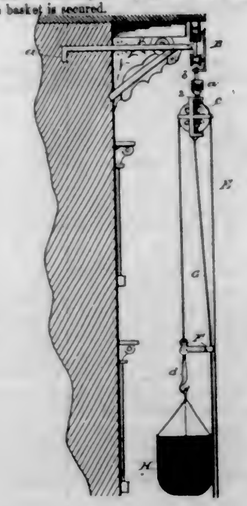
291,909. BOAT. NATHAN C. JESSUP, Southampton, N. Y. Filed Feb. 9, 1883. (No model.)

Claim.—1. A boat having its hull constructed with an inner and an outer shell of sheet metal and an intermediate shell of non-metallic fibrous and swellable material, the said metallic sheets being made with water-tight joints closely embracing the intermediate shell and extending over the same up to the gunwale, and secured together at numerous points, substantially as herein shown and described.

2. A boat having its hull constructed with an inner and an outer shell of sheet metal and an intermediate shell of paper, said shells closely overlying each other, and secured together at numerous points, substantially as set forth.

291,909.

3. In a boat's hull, the combination of the outer metallic shell and an intermediate shell of paper with an inverted-U-shaped gunwale-strip, *g*, of sheet metal, secured to and covering the edges of the metallic shells, substantially as and for the purposes set forth.

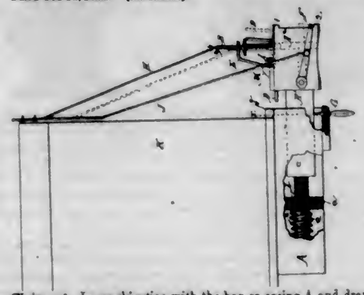


4. In a boat substantially as described, and in combination with the central ballast-tube, *k*, having perforated partitions *k'*, the well or tube *p*, and the spring-valve *m*, the cap *o*, fitting the said well as a plug, and the chain *n*, securing the caps and valve together, as and for the purposes set forth.

5. In combination with a boat's hull, the inner ribs, *i*, formed of sheet metal, with a flanged U-section, and secured in inverted position on the inside of the hull, substantially as herein shown and described.

6. The combination, in a boat with a weighted keel, of air chambers or floats *r r*, affixed on but one side of the interior of the boat, at or near the gunwale, substantially as and for the purpose set forth.

291,910. FIRE-ESCAPE. JOHN A. JOHNSON, Chicago, Ill. Filed Jan. 27, 1883. (No model.)

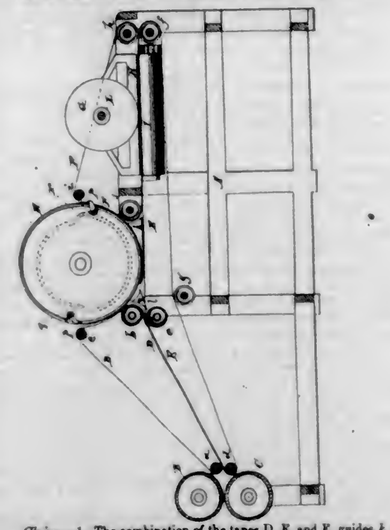


Brief.—Connected to one end of the hoist-rope, which runs over a pulley suspended from the traveling hanger, is a projecting arm, through an eye in the end of which a guide-rope passes, and to which a hook for connecting the basket is secured.

Claim.—1. In a fire-escape, the combination of a horizontal arm having an eye at one end acting as a guide for a rope passing vertically through said eye, a supporting hook or arm hinged to and dependent from the opposite end of said horizontal arm, a hoisting-rope connected with said horizontal arm above and in a line with the supporting-hook, and a basket or cage supported from said hook, substantially as set forth and described.

2. In combination with the bracket, rail, and traversing hanger of a fire-escape, a guide-rope passing through a guide-ring and secured to the base of a pulley-frame, a pulley connected by a chain to the base of the hanger, a hoisting-rope supporting a basket by means of a horizontal arm with guide-ring in end, and a supporting-hook hinged to said arm, substantially as set forth and described.

291,911. CAR-COUPLING. WILLIAM H. JONES, Martinsburg, Iowa. Filed Oct. 12, 1882. (No model.)



Claim.—1. In combination with the box or casing A and draw-bar A', arranged in said box so as to admit of vertical movement, the cam-lever G, pivotally secured in the end of said box, substantially as and for the purpose set forth.

2. In combination with the draw-bar A', having the draw-head A^2, formed with upper and lower transverse ribs, 1 2, the stirrup F, pivotally secured to the draw-head, and suitable lifting means, substantially as described.

3. In combination with the box A, draw-bar, and head, and coupling-pin having a suitable guiding-brace and lifting means, the sliding coupling-pin support D, having spring I, and so arranged and secured to the upper face of the draw-head that its engagement with and release-ment from the pin-head shall be effected substantially as described.

291,912. DELIVERY APPARATUS FOR PRINTING-MACHINES. CONRAD KAHLER, Chicago, Ill. Filed Nov. 6, 1882. (No model.)

Claim.—1. The combination of the tapes D, E, and F, guides *k*, the switch *l*, arranged to alternately deflect the sheets to the grippers and under the cylinder, and the gripper-cylinder M, mounted between the tapes

D and F, and provided with one or more sets of grippers, *p*, adapted to grip and release the alternate sheets fed to the machine, substantially as described.

2. The combination of the tapes D E, adapted to deliver the sheets to the cylinder, the switch *l*, arranged to alternately deflect the sheets to the grippers and under the cylinder, the cylinder M, mounted between the tapes D and F, and provided with grippers *p*, actuated by the cam-disk N, guides *k*, tapes F, and folding mechanism I, all constructed and operating substantially as described.

291,913. NUT-LOCK. SAMUEL P. KIMBALL, Woodstock, Ohio. Filed Dec. 7, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described washer-plate, formed with an eye to receive the bolt, and having locking-points cut within the plate and at the sides of a square or angular space thus formed around said eye, substantially as set forth.

2. As an improved article of manufacture, the herein-described washer-plate, having locking-points cut at the sides of a square or angular space, and having auxiliary locking-points cut within this angular space, substantially as set forth.

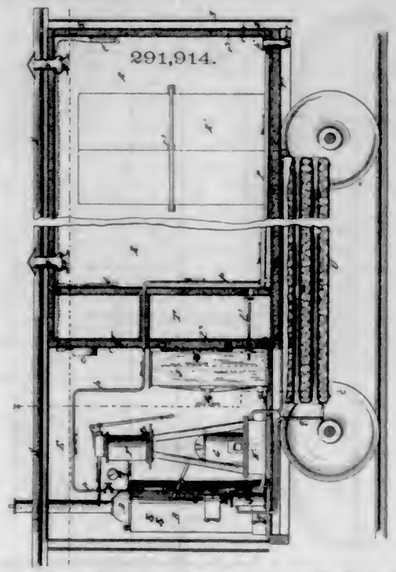
3. As an improved article of manufacture, the herein-described washer-plate, formed with an eye to receive the bolt, having locking-points cut within the plate and at the sides of a square or angular space thus formed around said eye, and having auxiliary locking-points cut within this angular space, substantially as set forth.

4. As an improved article of manufacture, the herein-described washer-plate, having locking-points cut at the sides of a square or angular space and bent up forwardly and from the face of the plate, and having auxiliary locking-points cut within this angular space and bent up rearwardly and from the face of the plate, substantially as set forth.

5. As an improved article of manufacture, the herein-described washer-plate, having an eye for the bolt, points cut within the plate and at the sides of a square or angular space thus formed around the eye and bent forwardly from the face of the plate, and auxiliary >-shaped points cut through the plate within this angular space, and on diametrically-opposite sides of the eye, and bent rearwardly from the face of the plate, substantially as set forth.

6. The combination of the bolt, the contact-surface E, the washer-plate arranged on the bolt and having points *c'* cut at the sides of a square or angular portion extending around the bolt, said points being bent forwardly from the plate, and also having auxiliary >-shaped points *c²* cut within the angular space and entering the surface E, and the nut inclosed by points *c'*, and covering the angular space and auxiliary points, substantially as set forth.

291,914. METHOD OF AND APPARATUS FOR PRESERVING AND TRANSPORTING FOOD. SAMUEL HENRY LINN, New York, N. Y. Filed Sept. 13, 1883. (No model.)



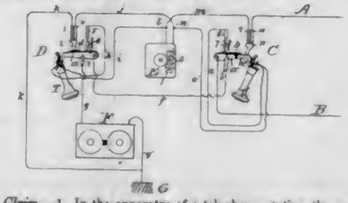
Claim.—1. In the art of preserving articles of food during transportation, the improvement consisting in cooling the air to be supplied to the provision-chamber by a circulation of water or similar liquid from a tank or reservoir on the outside of the vehicle, having walls which permit a portion of said liquid to percolate through, so as to be evaporated by the current of air to which the said reservoir is exposed when the vehicle is in motion, substantially as and for the purpose described.

2. The combination of the air-cooling chamber, the air expansion and compression cylinders, their pistons and means for operating the same, the coil of pipe in said chamber, connected at both ends with a tank or reservoir containing a cooling-liquid, and mechanism for maintaining a constant circulation of said liquid from said reservoir through said coil, substantially as described.

3. The combination, in a refrigerator-car, of the air-cooling chamber, the air expansion and compression mechanism, the coil of pipe in said chamber, the reservoir for the cooling-liquid, supported on the outside of said car, and means for maintaining a circulation of the cooling-liquid from said reservoir through said coil, substantially as described.

4. In a refrigerator-car, the combination of the air-chamber, the air compression and expansion cylinders, their pistons, the coil of pipe in said chamber, communicating with a reservoir containing a cooled liquid, the pump, and connections for operating said pump and said pistons from the car-axle, substantially as described.

5. In a vehicle for transporting perishable articles of food, the tank for the cooling-liquid, supported outside the car, and having air-tubes extending through it in the direction of motion of said vehicle, substantially as described.



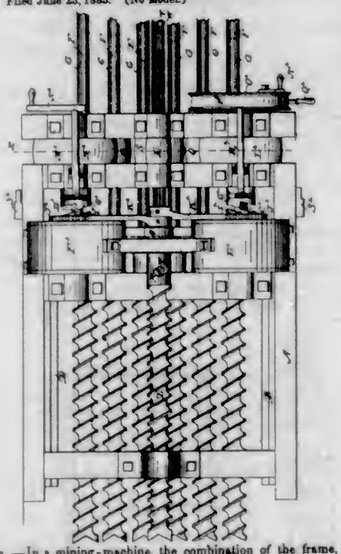
6. In a refrigerator-car or other vehicle, the tank for the cooling-liquid, supported outside the vehicle, and having its walls formed wholly or in part of porous earthenware, substantially as described.

7. In a refrigerator-car or other vehicle, the tank for the cooling-liquid, supported outside the car or vehicle, and air-flues of porous material extending through it in the direction of motion of said vehicle, substantially as described.

8. The combination, with the air-cooling chamber of a refrigerator-car, of the tank or reservoir containing cooling-liquid, supported outside the car, and provided with longitudinal air-tubes of porous earthenware or similar material, a coil of pipe in said chamber, connected with said tank or reservoir, and a pump for maintaining a circulation of the liquid in said coil, substantially as described.

9. In a refrigerator car or chamber, the following devices in combination: a condenser or cooling-chamber, a coil or system of pipes therein, a reservoir or tank connected with said pipes and having air-tubes of porous material, air compressing and expanding cylinders communicating by valves with said condenser or cooling-chamber, pistons working in said cylinders, means for operating the same, and a pipe leading from said condenser to the provision-chamber through vessels containing moisture-absorbing, purifying, and preservative substances, substantially as described.

291,915. TELEPHONE CIRCUIT AND APPARATUS. THOMAS D. LOCKWOOD, Malden, Mass. Filed Apr. 26, 1883. (No model.)



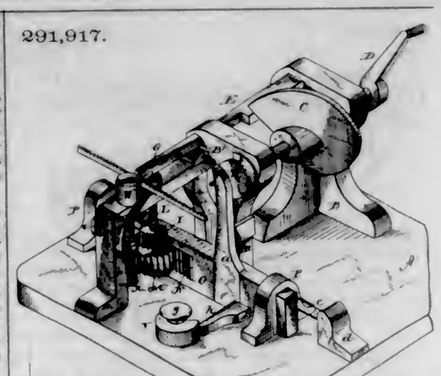
Claim.—1. In the apparatus of a telephone-station, the combination, with the direct circuit, having a normal earth-terminal and a receiving-telephone for use therein, of a normally-open return-wire and an automatic switch supporting a second receiving-telephone, for transferring said direct-circuit line from its normal earth-terminal to the normally-open return-wire, substantially as described.

2. The combination, substantially as hereinbefore described, of a direct circuit, a normal ground-terminal including a signal-bell, a normally-open telephone ground-terminal, a normally-open return-circuit, and two automatic switches, each constituting the support of a receiving-telephone, one of the said switches being interposed between the main line of the direct circuit and the second switch, and adapted to disconnect

the said direct circuit from the said second switch, and to connect it with the return-wire, including in the new circuit one of the receiving-telephones, and the other switch being interposed between the first switch and the normal ground-terminal, and adapted to transfer the direct circuit from the normal ground-terminal to the normally-open ground-terminal, including in the circuit thus formed the other receiving-telephone, whereby the removal of one of the telephones from its support includes the said telephone in an earth-circuit extending to the distant station, and the removal of the other telephones cuts off the earth-terminal and completes a metallic loop to the distant station, and includes the removed telephone in the said loop, for the purposes specified.

3. The combination, in a telephone system, of a direct line-wire, a normal earth-terminal therefor, including a signal-bell, a normally-open telephone earth-terminal, a normally-open return-wire, a transmitting-telephone, two receiving-telephones, and two automatic switches placed in the normal circuit of the said direct line-wire, each constituting a support for one of the said telephones when not in use, one of the said switches being adapted upon the removal of its telephone to transfer the direct circuit from the bell branch to the normally-open earth-terminal, and to include in the said circuit the transmitter and the removed receiving-telephone, and the other being adapted upon the removal of its telephone to transfer the said direct circuit from its normal earth-terminal to th normally-open return-wire, and include its own telephone and the transmitter in the loop-circuit thus formed, whereby the removal of one of the telephones connects the same in an earth-circuit with the distant station, and the removal of the other telephone connects the same in metallic circuit with the distant station, the transmitter being common to both, substantially as described.

291,916. COAL-MINING MACHINE. JOHN LUCAS, Hawk's Nest, W. Va. Filed June 23, 1883. (No model.)



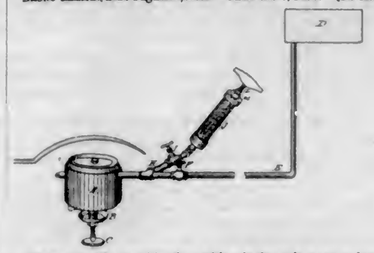
Claim.—In a mining-machine, the combination of the frame, a longitudinally-movable carriage, a feed-screw attached to the said carriage, a revolving nut mounted upon the said feed-screw, drills or augers journaled in the said carriage, and having rearwardly-extending longitudinally-grooved shanks, revolving bushings feathered upon said shanks, and mechanism for operating the said bushings and the feed-nut, substantially as set forth.

291,917. SAW-SETTING MACHINE. HERMANN MARSTALL, Evansville, Ind. Filed July 16, 1883. (Model.)

Claim.—1. A machine for setting band-saws, consisting of a suitable base having secured thereto standards B, a cam-wheel, C, having its shaft journaled in said standards and operated by a crank, D, a punch, E, actuated by the cam-wheel, friction-rollers G H, and pivoted lever T, to propel and support the saw, a cam, V, for regulating the feed of said saw, and suitable mechanism for operating the friction-rollers at each revolution of the cam-wheel, all combined substantially as described, and for the purpose set forth.

2. The combination of the gear-wheels I, arranged upon parallel vertical shafts K L, to mesh with one another, and a ratchet-wheel, M, upon the shaft L, with a rack-plate, N, pivotally secured in a sliding bar,

291,917.



O, having an upwardly-extending arm, *a*, the eccentric R, secured to the end of the main shaft, and provided with a cam, *b*, and suitable spring mechanism for operating said rack-plate, substantially as and for the purpose specified.

3. The punch E, adapted to slide in slots in the standards B, and actuated by the cam-wheel C, in combination with the spring F and the friction-rollers G H, substantially as and for the purpose described.

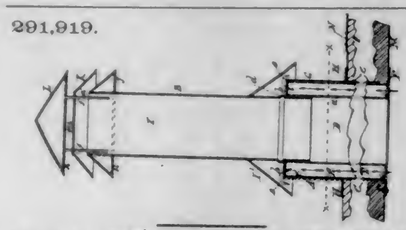
4. The friction-rollers G H, arranged upon the upper ends of parallel vertical shafts K L, the roller H, beveled upon its upper portion to form an anvil, in combination with the punch E, cam-wheel C, gear-wheels I, and means, substantially as described, for operating said gear-wheels, as and for the purpose set forth.

5. The sliding bar O, adapted to work in guides P upon the base A, and provided with an arm, *a*, in combination with the rack-plate N, pivoted therein, the spring S, and the mechanism, substantially as described, for operating said rack-plate, as and for the purpose specified.

291,918. ATTACHMENT TO HYDROCARBON-VAPOR BURNERS. BRUNO MARTIN, East Saginaw, Mich. Filed Oct. 1, 1883. (No model.)

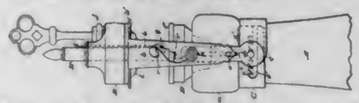
Claim.—1. The combination, with a hydrocarbon-vapor burner, of an exhausting device adapted to extinguish the flame of said burner by withdrawing from it any unconsumed vapor within it, substantially as described.

2. The combination, with a hydrocarbon-vapor burner, of a pump adapted to extinguish the flame of said burner by withdrawing from it any unconsumed vapor within it, and to return said unconsumed vapor to said burner when desired, substantially as specified.



3. The combination, with a hydrocarbon-vapor burner and its feed-pipe, of the exhaust-cylinder J, provided with a piston constructed to withdraw the unconsumed vapor from the burner, substantially as and for the purposes set forth.

4. The combination, with a hydrocarbon-vapor burner and its feed-pipe, of the branch H, valves F I, and cylinder J, provided with a piston and rod, constructed to withdraw the unconsumed vapor from the burner, substantially as and for the purposes described.



291,919. COMBINED VENTILATOR AND CHIMNEY. WILLIAM F. MATTHEWS, Dallas, Tex. Filed June 25, 1883. (No model.)

Claim.—A combined ventilator and chimney, consisting of section A, composed of a central flue surrounded by an annular air-chamber, in the top and bottom of which are openings, flange F, and case G, provided with a water-shed or apron, in combination with section B, consisting of a flue or chimney, I, having its lower end inserted in the flue of the ventilator and extending therefrom above the roof, and covered with a cap or caps, and its juncture with the ventilator protected by a downward-projecting hood, I', substantially as described, and for the purpose specified.

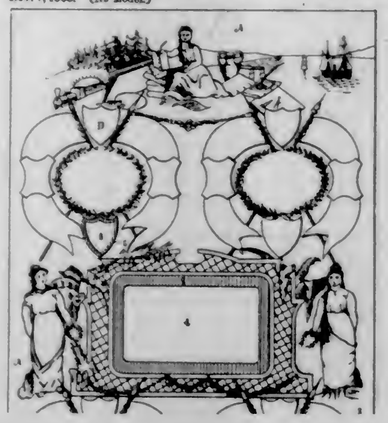
291,919.

291,920. STOPPER-LOCK FOR BOTTLES. JAMES D. MATTESON, New York, N. Y. Filed June 13, 1883. (No model.)

Claim.—1. A stopper-lock for bottles, &c., comprising a collar to clasp the neck of the bottle and take under the fillet thereon, a lock-case connected with said collar, a stopper provided with a stem arranged to play through the lock case, and means, substantially as described, located in the lock-case, for locking the said stem fast in the case, substantially as set forth.

2. A stopper-lock for bottles, &c., comprising a lock-case capable of being secured to the bottle, a stopper for closing the bottle, a stem secured to said stopper and arranged to play through the said lock-case, and means located in the lock-case for locking the stem in the said case when the stopper is seated, substantially as set forth.

3. A stopper-lock comprising a lock-case, substantially as shown and described, means, substantially as shown and described, for securing said case to the bottle or other receptacle, a stopper provided with a stem arranged to play through the lock-case, and means located in said case, substantially as described and shown, for locking the said stem fast in the case, substantially as set forth.



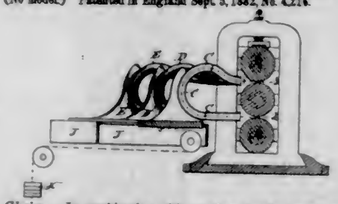
4. The combination, to form a stopper-lock, of a lock-case, B, provided with a screw, F, adapted to be rotated by a key, a collar to embrace the neck of the bottle or other receptacle, branches to connect the collar and the lock-case, and a stopper, D, provided with a stem, E, having teeth *i*, to engage the screw F, substantially as set forth.

5. The combination, with the lock-case and its screw F and branches *b*, of the adjustable collar C, constructed substantially as shown and described, and the stopper and its stem, all constructed and arranged to operate substantially as set forth.

6. The collar C of a stopper-lock, comprising a thin metal band with a slot, *e*, at its middle, and a slot, *e'*, with lateral recesses *e²*, in combination with the branches *b b*, provided with pins or rivets *d* and *d'*, substantially as set forth.

7. The means for lengthening the branches *b*, which comprise the lower portion of *b*, provided with a slot, *n*, and rivet *p*, and the upper portion of *b*, provided with a slot, *q q*, with recessed bearings *r* and a rivet, *o*, substantially as set forth.

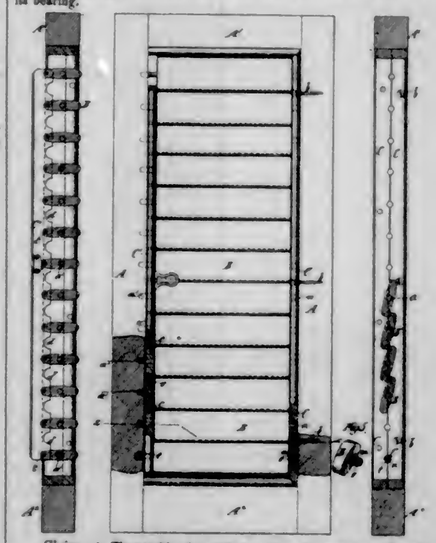
291,921. FRAME FOR DIPLOMAS AND CREDIT-CARDS. ALEXANDER W. MCARTHUR, Arroyo Grande, Cal. Filed Mar. 6, 1883. Renewed Nov. 7, 1883. (No model.)



Claim.—In a frame or mount, a sheet of paper or other suitable material, having perforations, and a second sheet adhering to the back of the first, said second sheet having perforations smaller than the first, so that a portion or rim of said second sheet shows through the larger perforations, in combination with a slip of paper or other suitable material of the size and shape of the larger perforation and adhering to the exposed rim of the second sheet, and a second slip of paper the size and shape of the smaller perforation and adhering to the back of the larger slip, substantially as and for the purpose herein described.

291,922. PROCESS OF PREPARING MEDICATED COURT-PLASTER. CHAS. L. MOREY, Combe, N. Y. Filed June 26, 1883. (Specimens.)

Claim.—The method of preparing court-plaster, which consists in removing from old gold-beaters' skins by rubbing all particles of gold adhering thereto, then beating the skins between paper, then subjecting the skins to pressure between sheets of paper moistened with a medicinal preparation to coat the skins upon both sides, then drying, and finally flattening the same by pressure, as set forth.

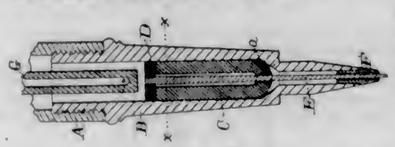


291,923. APPARATUS FOR ROLLING WIRE RODS. WILLIAM MORRIS, Oakengates, County of Salop, England. Filed July 17, 1883. (No model.) Patented in England Sept. 5, 1882, No. 4,216.

Claim.—In combination with a series of rolls, a series of guide-tubes, a series of movable carriages on which said tubes are mounted, and a series of weights, cords, and pulleys which operate to automatically restore the respective carriages and tubes to their respective positions in proximity to the rolls, substantially as set forth.

291,924. BLIND. GEORGE WM. MORSTATT, New York, N. Y. Filed Dec. 12, 1882. (No model.)

Brief.—The bead-pieces on the inner sides of the stiles are formed in two sections, one bead-piece being detachable. Bearings for the tenons at one end of the slats are formed in the meeting edges of the bead-sections. One section of the other bead-piece is fixed to the stile, while the other section is movable and receives auxiliary pivots of the slats. One of the tenons is provided with a split collar between the tenon and its bearing.

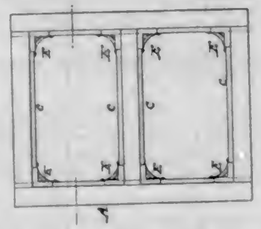


Claim.—1. The combination, with the blind-stiles and slats, of bead-pieces on the inner sides of the stiles, and each composed of two sections, the two sections of one bead-piece having bearings for the tenons at one end of the slats formed in their meeting or abutting edges, substantially as and for the purpose herein described.

2. The combination, with the stiles A and slats B, provided with main pivots or tenons *a a'* and auxiliary pivots *c*, of the bead-piece C C, detachably secured to the inner side of one stile, and the bead-piece C C' on the inner side of the other stile, the portion C thereof being secured to the stile and the portion C' receiving the auxiliary pivots *c*, substantially as and for the purpose herein described.

3. The combination, with a blind-slat tenon and its bearing, of a collar fitting between said tenon and bearing, and split axially or lengthwise of the tenon, substantially as and for the purpose herein described.

291,925. STYLOGRAPHIC FOUNTAIN-PEN. EDWIN W. MORTON, White Plains, N. Y. Filed Jan. 22, 1883. (No model.)



Claim.—1. In a fountain-pen using ink, the combination of a needle carrying an armature with a permanent magnet, substantially as shown and described, and for the purpose set forth.

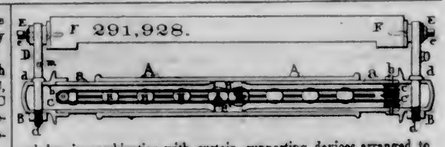
2. In a fountain-pen, the combination, with the ink-reservoir A, of point-section B, magnet C, needle E, having armature D, and air-tube G, arranged to act as a stop for the armature, substantially as specified.

291,926. WINDOW-SCREEN. WILLIAM H. MUNN, Milwaukee, Wis. Filed Oct. 22, 1883. (No model.)

Brief.—A window-screen having its side and cross pieces tongued and its corners united by a tongued-and-grooved joint, and secured by a flanged metallic bracket-piece.

Claim.—A window or door screen frame having its side and end rails provided on their inner sides with a tongue, and its corners united with a tongue-and-groove joint, in combination with a metallic bracket or corner-piece provided with flanges, arranged substantially as shown and described.

291,927. POST-BASE. JOHN NEWTON, Clifford, Ind. Filed May 17, 1883. (No model.)

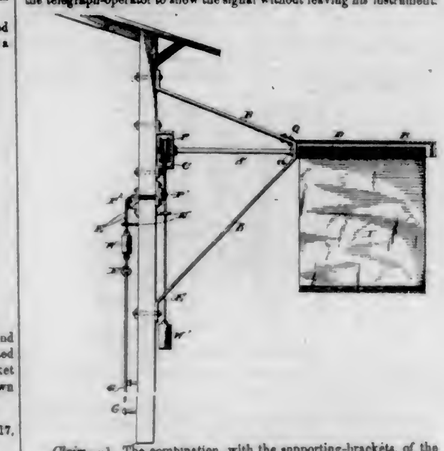


Claim.—1. In a post-base, a central plate provided with a top plate having an opening immediately over said central plate, in combination with a post provided with a cross-slot in its under side, substantially as described, and for the purpose set forth.

2. In a base for posts, a central plate provided with two lateral tapering wings formed integral therewith, said wings projecting in opposite directions at right angles from said central plate, and a top plate provided with a central opening and an upwardly-projecting collar, in combination with a post having a cross-slot in the lower end thereof, whereby said post may be seated in the opening astride the upper end of the central plate, as specified.

291,928. CURTAIN-FIXTURE. LOUIS PAGE and LOUIS WEBER, Brooklyn, N. Y. Filed Feb. 1, 1883. (No model.)

Claim.—1. A curtain-bar formed of two or more sections telescoping into or sliding upon each other, so as to admit a change of length of



such bar, in combination with curtain-supporting devices arranged to travel along or within such extension-bar endwise of the bar in the act of withdrawing or replacing curtains suspended therefrom, substantially as set forth.

2. A curtain-bar formed of two or more sections telescoping into or sliding upon each other, in combination with curtain-supporting devices arranged to travel endwise along such bar, such curtain-supporting devices being operated through cords, substantially as set forth.

3. The combination, with a curtain and its supporting-bar, of curtain-grasping clamps formed of two jaws hinged together and closing automatically at their lower edges through the action of a spring tending to separate their upper ends, substantially as set forth.

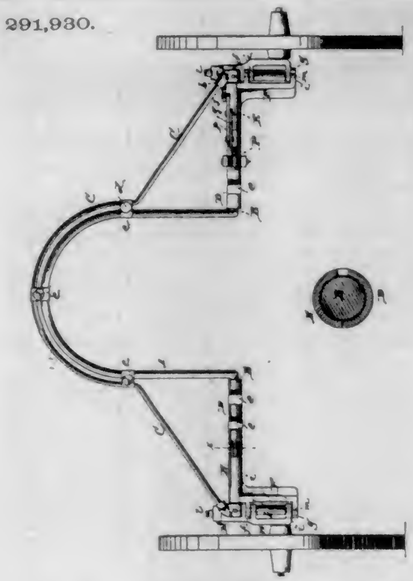
291,929. RAILROAD-SIGNAL. JAMES R. PARK, La Vergne, Tenn. Filed July 6, 1883. (No model.)

Brief.—A horizontal shaft has its bearings in brackets or braces fixed to the outside of the operator's house, the shaft carrying beyond the brackets a roller carrying a weighted signal-flag shielded by a roof supported by one of the brackets. Upon the shaft between the other bracket and the building, or upon the shaft extended within the building, is a pulley provided with a cord and heavy weight, to keep the flag wound upon the roller, and also a flag-unwinding cord leading, either directly or over pulleys and through an aperture in the wall, to the operator's table, and having a light tightening-weight and rings adapted to holding pins in the wall, the whole being arranged for the purpose of enabling the telegraph-operator to show the signal without leaving his instrument.

Claim.—1. The combination, with the supporting-brackets, of the shaft extending outside of said brackets, said extension provided with a drum or roller to which is secured a flag, and a shield located over the drum and secured at one end to the brackets, substantially as set forth.

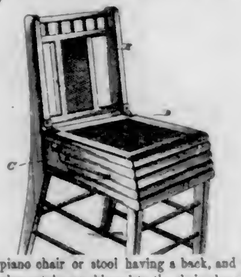
2. The combination, with the shaft, supporting-brackets, the drum, and flag, of the pulleys, cords, and weights, substantially as set forth.

3. The combination, with the shaft, drum, and flag, of the braces and bracket and cords for winding and unwinding the flag, substantially as set forth.



291,930. CULTIVATOR. WILLIAM H. PARLIN, Canton, Ill. Filed Sept. 7, 1883. (No model.)

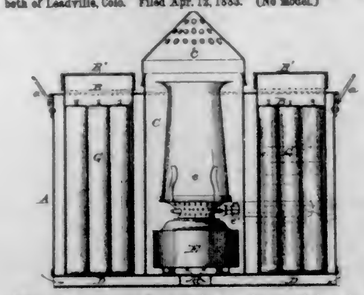
Claim.—1. In a cultivator, two sleeves, D E, upon the axle, one carrying a plow-beam, the other connected with a draft-bar and combined with each other, substantially as described, whereby either sleeve can have a limited rotary movement without affecting the other, for the purpose of providing for regulating the running depth of the shovels, and at the same time leaving the plow-beam free to be raised at its rear end without affecting the draft.



2. The irons *a*, provided with sockets *b*, in combination with the main arch A and secondary arch and brace-rod C, substantially as and for the purpose specified.

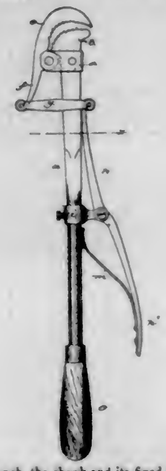
3. In a cultivator, a drag-bar, M, in combination with the plate K, provided with the projections and stops *r r'*, the plate L, and a plow-beam, substantially as and for the purpose specified.

291,930.



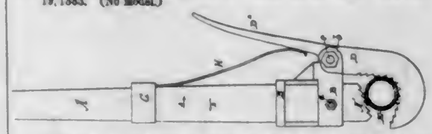
291,931. PIANO-STOOL. MAX PEITH, AURORA, N. Y. Filed Oct. 13, 1883. (No model.)

Claim.—1. A piano chair or stool having a back, and provided with one or more supplemental seats hinged to the chair above the seat proper, substantially as set forth.



2. The combination, with a chair, of stepped blocks secured thereto, and supplemental seats hinged to the said blocks, one above the other, substantially as and for the purpose set forth.

291,932. POWDER-WARMING APPARATUS. SAMUEL POOLE, Denver, assignor of three-fourths to Barzillai S. Morgan and Thomas H. Baker, both of Leadville, Colo. Filed Apr. 12, 1883. (No model.)



Claim.—An apparatus for warming powder, consisting of an air-tight case, A, having separate compartments or chambers B, opening at the top of said air-tight case, and provided with removable covers, and a central chamber, C, provided with a lamp, E, for heating the chambers of the said air-tight case, the said chambers B being insulated from said heating-chamber C by an air-space, substantially as described.

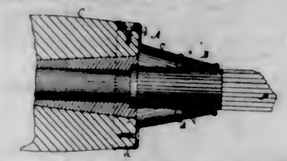
291,933. WRENCH. DANIEL R. PORTER, Randolph, Mass. Filed June 25, 1883. (No model.)

Claim.—In a wrench, the shank and its fixed jaw *b*, having a convex face, combined with the movable jaw, pivoted on a strap connected with the shank and in the described relation to the fixed jaw, and provided with an extension, *f*, and the jaw-operating lever, pivoted with relation to the shank and connected by the link with the extension of the pivoted jaw, to operate substantially as described.

291,934. WRENCH. DANIEL R. PORTER, Revere, Mass. Filed Nov. 19, 1883. (No model.)

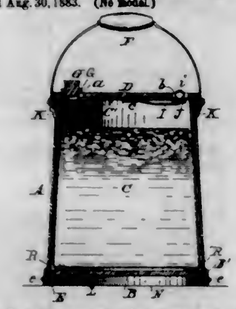
Claim.—As an improved article of manufacture, the herein-described pipe-wrench, composed of the shank A, inclined at one end and toothed to form a fixed jaw, A', the attached metal strap or block B, the movable concaved toothed jaw D, provided with the hand-piece D^2, and mounted upon the fulcrum-pin *c*, supported by an ear of the strap B, beyond the edge of the shank A, and the spring H, connected with or supported by the shank A, the spring acting against the hand-piece, substantially as shown and described.

291,935. BUTTON-FASTENER. GEORGE W. PRENTICE, Providence, R. I. Filed Nov. 22, 1883. (No model.)



Claim.—1. A metallic button-fastener, composed of a table and three or more prongs projecting in substantially the same direction from one side or edge of the table, bent at right angles thereto, and adapted to receive the shank-eye of a button on one of said prongs, and to enter or be forced into the fabric or article to which the fastener is to be secured in line with one another, for the purpose set forth.

2. An improved metallic button-fastener, composed of a table and three integral substantially-parallel prongs, with intervening spaces, the said prongs projecting from only one side or edge of the table and bent at right angles thereto, and the heel of the middle or button-carrying prong disposed in a different plane to that of the heels of the outer prongs, all of the said prongs being adapted to enter or be forced into a fabric or article of apparel in one and the same plane, substantially as and for the purpose set forth.

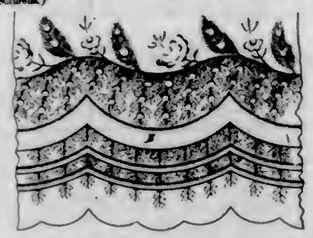


3. The one-piece metallic button-fastener, consisting of the table *a* and the parallel prongs *b* b' b^2, projecting from only the lower edge, *c*, of the said table, with the heel of the middle or button-carrying prong, b^2, above or out of line with the heels of the prongs *b* b', the said prongs *b* b' b^2 being bent in a given plane at right angles to the table *a*, all as shown and described, and for the purpose set forth.

291,936. SAND-BAND FOR VEHICLE-WHEELS. REUBEN RAPHAEL, Wadsworth, Nev. Filed Apr. 19, 1883. (No model.)

Claim.—As a new article of manufacture, a sand-guard consisting of two sections, A and B, said section A having the band *a*, adapted to fit the outside of the hub, the flange *b*, and tapering portion *c*, terminating in an opening provided with a screw-thread, and the tapering section B, screw-threaded at its larger end to fit the screw-thread of section A, all constructed and arranged substantially as and for the purpose specified.

291,937. JACKETED SHIPPING-CAN. GEORGE J. RECORD, Concord, Ohio. Filed Aug. 30, 1883. (No model.)



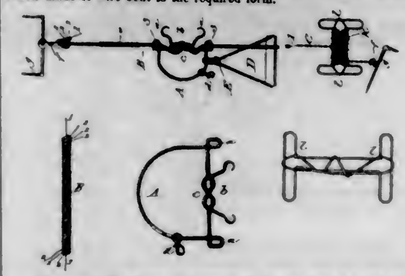
Claim.—1. In a shipping-can, a jacket provided with an opening, *a*, in combination with a can having a nozzle, G, and with ring R, whereby a space is formed between the bottoms of the can and jacket, and an annular space formed between the outer sides of the can and the inner sides of the casing, substantially as described, and for the purposes set forth.

2. The combination, with the can C, of the vent H, consisting of an L-shaped spring-bar, I, secured to the head of said can at *c*, said bar I being provided with a valve-disk, J, adapted to close against the inner side of said head and terminating in an eye, *i*, substantially in the manner as and for the object stated.

291,938. COATING FOR WIRE PREPARATORY TO DRAWING. WILLIAM F REED, Worcester, Mass. Filed June 1, 1883. (No specimens.)

Claim.—A bath or coating for wire preparatory to drawing, composed of glucose in combination with a fine body substance—as lime—in solution with water, substantially as hereinbefore set forth.

291,939. SHELF OIL-CLOTH. EDWARD R. RIESENFELD, New York, N. Y., assignor to Charles H. Wight, same place. Filed Oct. 2, 1882. (Specimens.)

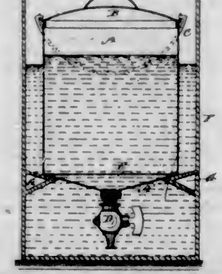


Claim.—1. As a new article of manufacture, the shelf-covering described, consisting of a strip of enameled or water-proof cloth or other fabric, having a plain portion to cover the top of the shelf, and a printed decorative border on one side to overhang the edge of the shelf, as specified.

2. A shelf-cover consisting of a strip of enameled or water-proof fabric, having the border or margin designed to overhang the edge of the shelf ornamented by a complete and independent decorative pattern or design, as specified.

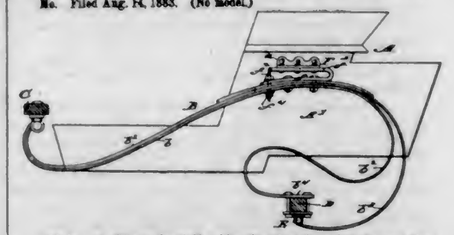
291,940. FIRE-ESCAPE AND SELF-PRESERVER. JAMES B. ROBERTSON, Kingston, N. Y. Filed Sept. 19, 1883. (No model.)

Brief.—A twisted wire friction device through which the rope is rove, said rope being formed of a core and worming of wire. The reel is also made of wire bent to the required form.



Claim.—1. The frame or descender A, having loops *a a*, and twists or knots *c*, cleat *b*, and hook *d* attached.

2. The wire-reel *l*, Fig. 3.



3. The combination, in a fire-escape and self-preserver, of the wire core 1, wire worming 2 2 2, and the Manila rope B with the iron frame or descender A and braided rope-sling D, braided lashing, and wire loops E, all substantially as set forth.

291,941. COFFEE AND TEA POT. FRANK ROCKBROOK, Elmira, N. Y. Filed Apr. 13, 1883. (No model.)

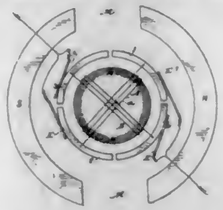
Claim.—The combination, with the vessel F, having projections G or a ring on its inner surface, of the vessel A, provided on its bottom with a faucet or cock, D, and with a strainer, E, above the bottom, substantially as herein shown and described, and for the purpose set forth.

291,942. TWO-WHEELED VEHICLE. FRED. SCHELP, Jr., Ballwin, Mo. Filed Aug. 14, 1883. (No model.)

Claim.—1. The spring *b* b^2, said spring, from its point of connection at its forward end with the vehicle, extending backward and upward to above the vehicle-axle, thence curving downward and backward, and terminating at the rear axle and under the seat in the S form, substantially as described.

2. The combination of the part *b* b^2 and the part b' b^2, the cross-bar C, the vehicle-body A', and the axle D, the part b^2 being bent in S form, and secured to the upper side of said axle, and the part b^2 bent and secured under it, all in the manner and substantially as described.

3. The combination of the body A', the spring B, the cross-bar C, and the axle D, said spring being made in two parts, which are separated between the forward end of the spring and the point where it is connected with the vehicle-body, and also separated into two parts in the rear of the point of connection with the vehicle-body, the part b^2 of the spring terminating in the S form shown, and the part b^3 of the spring being connected with the axle, substantially as shown.



4. The combination of the body A', the spring B, and the coupling F, whereby the vehicle-body can be adjusted at any desired inclination, substantially as described.

291,943. COMBINED HEEL-PLATE AND COUNTER-SUPPORT. HENRY SCHNARR, Nora Springs, Iowa. Filed June 5, 1883. (No model.)

Claim.—The herein-described improved combined adjustable heel-plate and counter-stiffener, the same consisting of a heel-plate composed of a pair of plates or leaves connected by a narrow stem having an upwardly-projecting vertically-slotted shank, in combination with a counter-stiffener consisting of a plate having a semicircular slot, and provided with a downwardly-projecting flanged stem vertically adjustable upon the shank of the heel-plate, substantially as and for the purpose set forth.

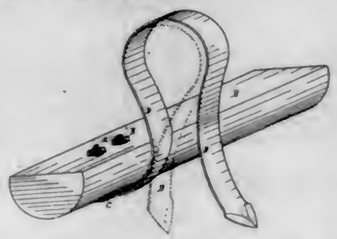
291,944. DYNAMO-ELECTRIC MACHINE. DANIEL A. SCHUYLER and ADDISON G. WATERHOUSE, New York, N. Y., assignors to the Schuyler Electric Light Company, same place. Filed Apr. 5, 1883. (No model.)

Claim.—1. The combination, in a dynamo-electric machine, of two curved field-of-force pole-pieces, a cylindrical armature arranged to rotate on its longitudinal axis between said pole-pieces, and two armature-coils wound upon the exterior of the armature at right angles to one another and connected at their middle portions, the two ends of one coil being connected to two diametrically-opposite segments of a commutator, while the two ends of the other coils are connected to two other diametrically-opposite segments.

2. The combination, in a dynamo-electric machine, of a cylindrical armature or carrier arranged to rotate between two curved field-of-force poles, two independent sets of coils wound longitudinally upon the exterior thereof, each set consisting of two coils wound at right angles to one another and connected at their middle portions, while the two ends of each coil are connected to diametrically-opposite segments of a commutator, and connections from the commutator of one set to the commutator of another, whereby the currents generated in the one set may be combined with the currents generated in the other, substantially as and for the purpose described.

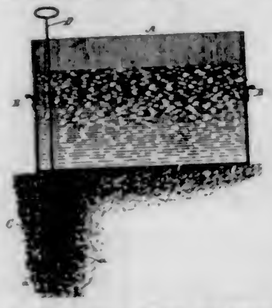
3. The combination, in a dynamo-electric machine, of a cylindrical armature or carrier rotating on its longitudinal axis between two curved field-of-force poles, two sets of armature-coils wound longitudinally upon the exterior of said cylinder, each set consisting of two coils wound at right angles to one another and connected at their middle portion, two commutator-cylinders, each having four segments, to which the four ends of the two coils in one set are connected, and a connection from the positive brush of one commutator to the negative brush of the other, so that the current from one set may be combined for tension with the current of the other.

4. The herein-described improvement in winding the cylindrical armature-coil, consisting in winding from the center of the coil alternately with the two free ends, so as to bring the two halves in alternate layers.



291,945. NUT-LOCK. HENRY SCHWARZWALDER, New York, N. Y. Filed Dec. 7, 1883. (Model.)

Claim.—1. The nut B, frame, yoke, or cap C, and the pin D, connected directly to each other, as specified, in combination with the slotted bolt A, substantially as herein shown and described.



2. The nut B, frame, yoke, or cap C, and conical pin D, all rigidly united together, in combination with the slotted bolt A, substantially as herein shown and described.

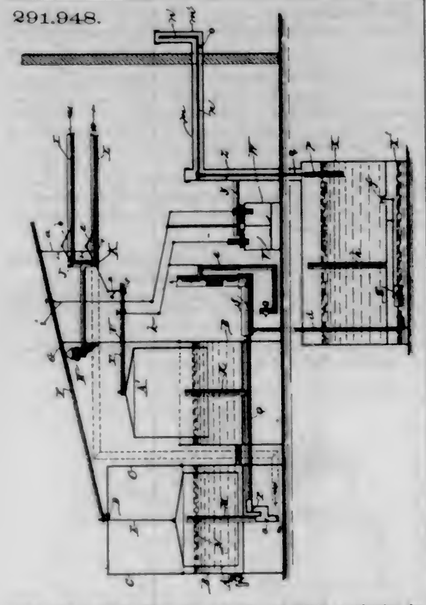
291,946. SPRING-TOOTH. ABRAHAM SHELLMAN, Charleston, Mich. Filed Oct. 19, 1883. (No model.)

Claim.—A spring harrow-tooth consisting of a bell-bow located between the tooth-beams, provided with two downwardly-extending ends on a like but oppositely-turned curve, one of said ends forming the working and the other the secured portion, substantially as set forth.

291,947. IRRIGATING APPARATUS. CHARLES MOSA SKILLEN, Pasadena, Cal. Filed Aug. 29, 1883. (No model.)

Claim.—1. The reservoir A, provided with suitable means for handling the same, and provided at some point in its base with a downwardly-projecting rigid tube or nozzle, C, adapted to be inserted into the earth, perforated, as described, to permit the egress of fluid, substantially as and for the purpose set forth.

2. The nozzle C, perforated laterally, as described, and provided at its lowest extremity with a vertical orifice, in combination with the rod or bar D, whereby the earth may be opened in advance of the tube or nozzle, substantially as hereinbefore set forth.



3. The combination and arrangement of the reservoir A, nozzle C, and rod D, substantially as and for the purpose set forth.

291,948. GAS-GENERATOR. DEXTER M. SMALL, Providence, R. I. Filed Mar. 19, 1883. (No model.)

Claim.—1. The combination, in a device for generating or enriching combustible gas from or with liquid hydrocarbon, of the following elements: a tank or reservoir for the liquid, a vaporizing-chamber, a device for supplying at a uniform pressure the air or the gas to be enriched, a device for automatically compressing air within the reservoir for the purpose set forth, a device for rendering uniform the power required to raise the liquid therefrom, a magnetic device for indicating the amount of liquid therein, and a crooked or angular-jointed pipe, as represented, for filling it, with a device therein for indicating at the orifice thereof when the reservoir is sufficiently full.

2. The combination, with a device for generating or enriching combustible gas from or with liquid hydrocarbon, of an underground reservoir for holding a supply thereof, having a compartment with a device for maintaining therein a uniform level of the liquid, there being a communicating air pipe or passage between the two compartments, and an outlet-pipe connecting the lower one with the vaporizing-chamber, together with a pipe for filling the reservoir, and suitable mechanism for automatically raising the liquid as required for consumption.

291,948.

3. The air-cylinders A A', tanks B B', pipes M, Q, and R, and valves O and P, all combined, arranged, and operating substantially as described, together with a suitable motive power, a vaporizing-chamber, and means for supplying oil thereto.

4. The combination, with a device for generating or enriching combustible gas from or with liquid hydrocarbon, of a tank for holding a supply thereof, having a compartment with a device for maintaining therein a uniform level of liquid, there being a communicating air pipe or passage between the two compartments, and an outlet-pipe connecting the lower one with the vaporizing-chamber, together with suitable mechanism for automatically raising the liquid as required for consumption.

5. The combination, with a hydrocarbon tank or reservoir, of a device for automatically introducing air therein, to expel the liquid therefrom and convey it, as required, to a vaporizing-chamber or point of consumption.

6. Pipe Z, having a branch, *m m'*, with a device therein, connected with, so as to be operated by, the liquid in the tank X, for the purpose set forth.

7. The combination, with a hydrocarbon tank or reservoir, of a magnet connected with, so as to be actuated by, the liquid therein, for the purpose set forth.

8. The combination, in a device for generating or enriching combustible gas from or with liquid hydrocarbon, of two cylinders, A A', each operating to maintain a uniform pressure within the vaporizing-chamber, of the air or gas to be enriched, and each, independently of the other, actuating a device for conveying the hydrocarbon to a vaporizing-chamber as required, together with a suitable motive power.

291,949. CHILD'S CARRIAGE. HORACE SPOONER, New York, N. Y. Filed Oct. 3, 1883. (No model.)

Claim.—1. In a child's carriage, a flexible hammock or body, front and rear wheels supporting posts, and a horizontally-hinged reach, these parts being combined and arranged substantially as shown and described.

2. A rectangular flexible hammock or body, in combination with rear wheels supporting posts, front wheels supporting posts, a hinged reach, and braces extending from the hinge to the posts, substantially as shown and described.

3. The combination of the flexible hammock A, provided with the loops or rings *a*, the posts E F, the wheels B C, the handle D, the reach J J, hinge L, and fastening device L^2, substantially as shown and described.

4. In a foldable carriage, wheels supporting posts, a jointed reach pivoted to the posts, and braces pivotally connected at their inner ends to each other, and at their outer ends to tie-rods between the posts, substantially as specified.

291,949.

5. In a foldable carriage, a jointed reach pivotally secured to posts and extended beyond their pivots, in combination with stops secured to the posts, substantially as specified.

6. In a foldable carriage, a shade-rod clamp mounted upon a block or frame adapted to swing away from the body, substantially as and for the purpose set forth.

7. In a foldable carriage, a flexible body, in combination with a jointed reach and an intermediate pivotally-connected upwardly-folding jointed bracing device, substantially as specified.

8. In a foldable carriage, the combination of a jointed reach formed of two U-shaped sections pivotally connected with front and rear posts, the former provided with inwardly-extending journals, and the latter with outwardly-extending journals, whereby, when folded, the wheels may be placed in substantially a straight line.

9. The combination of the flexible body A, the posts E F, the jointed reach J, pivotally secured to the posts, a fastening device, as L^2, and means for separating the posts, substantially as shown and described.

10. The combination of the flexible body A, the jointed reach J, and the jointed brace M, and posts E and F, substantially as shown and described.

11. The combination of the body A, posts E F, pivotally-connected jointed reach J, pivotally-connected jointed brace M, strap *d*, and handles D, substantially as shown and described.

12. The combination, with the post E, journal G G', reach J, stop K, and bolts *g g'*, substantially as shown and described.

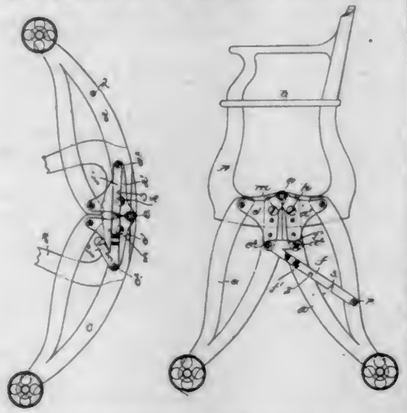
13. The combination of the post F, the journal G G', reach J, bolts *g g'*, binding-piece G^2, and handle D, substantially as shown and described.

14. The combination of the shade-clamp I', the block or frame H', the block H, and the fastening device A A', substantially as shown and described.

15. The combination of the posts F, the tie-rods *s*, braces *e'*, blocks H H', fastening devices A A', and shade-rod clamp I', substantially as shown and described.

291,950. VETERINARY MEDICINE-SPOON. JACQUES R. STEFFENHEIMER and THEODORE LEIB, Rochester, N. Y. Filed Nov. 6, 1883. (No model.)

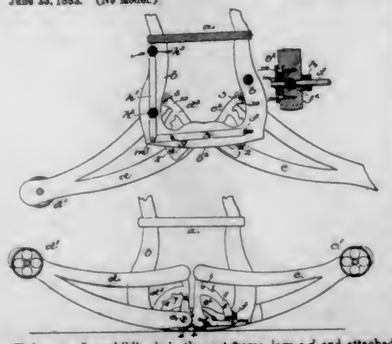
Claim.—1. The combination, with the bowl A, having a continuous straight upper margin or edge, and provided with the handle B on same plane therewith, of the cover C, arranged to slide along the upper sides of the bowl and the handle near the bowl, and adapted to close the bowl by direct sliding contact between its lower surface and the margin of the



bowl, the sliding rod D, attached to the cover and parallel with the handle, and a suitable guide or guides arranged to cause the cover and the rod to slide in the proper path, substantially as and for the purposes set forth.

2. The combination, with the bowl A, having a continuous straight upper margin or edge and provided with the handle B on same plane therewith, of the cover C, arranged to slide along the upper sides of the bowl and handle, sliding rod D, attached to the cover and parallel with the handle, and means for forcing the cover against the margin of the bowl when closed, substantially as described.

3. The combination, with the bowl A, provided with beveled lug *f*, of the handle B, sliding cover C, having guides *h h'*, substantially as described.



4. The combination, with the bowl A, having a continuous straight upper margin or edge and provided with the handle B on the same plane therewith, having a longitudinal groove adapted to receive the sliding rod D, of the sliding cover C, having rod D attached thereto and parallel to the handle, and a suitable guide or guides to insure the motion of the cover in the proper path, substantially as described.

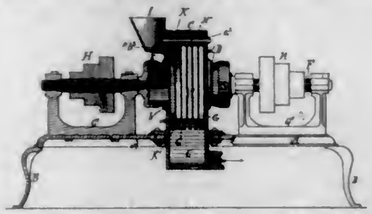
291,951. CONVERTIBLE NURSERY-CHAIR. ASHER B. STEVENS, Stapleton, N. Y., assignor to Thompson, Parley & Waite, Baldwinsville, Mass. Filed June 23, 1882. (No model.)

Claim.—The combination, substantially as shown and described, of the seat-frame, the leg *c*, pivoted by a movable bolt, *m*, in a slot, *n*, in said frame, the leg *d*, having a pivot, *h*, fixed in said frame, the leg-hinging plates c' d', jointed at *e*, and the two-armed locking-lever *f*, fulcrumed at c^2 to the movably-pivoted leg, and notched to engage pins d^2 and *p* on leg *d*, as and for the purpose set forth.

291,952. CONVERTIBLE CHAIR. ASHER B. STEVENS, Stapleton, N. Y., assignor to Thompson, Parley & Waite, Baldwinsville, Mass. Filed June 23, 1882. (No model.)

Claim.—1. In a child's chair, the seat-frame, legs *c d*, and attached metal plates c^2 d^2, geared together and provided with the notched members, as shown, combined with a locking device to engage the notches 6 6 7 7 8 8 in said members to hold the legs in position, substantially as described.

2. The seat-frame, pivoted legs, and connected metal plates, provided with gear-teeth and holding-notches, combined with the rods *f* and bar *m*, and lever and handle to move bar *m* in one direction and a spring to move the said bar in the opposite direction.



3. The quadrantal metal plates c^2 d^2, provided with gear-teeth 4 and notches 6 7 8, combined with the legs *c d*, to which said plates are secured, and the seat-frame, to which the legs are pivoted through said plates, and means to engage the notches to hold said legs as they are adjusted upon their pivots, substantially as shown and described.

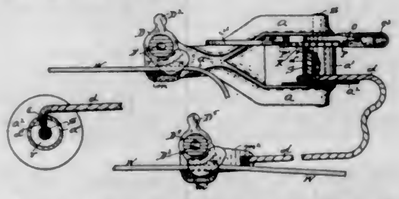
4. The combination, in a child's chair, of the seat-frame, legs pivoted thereto, notched quadrantal plates geared together to connect the legs to each other, and brace each individual leg, and rods or pins to enter the notches of said plates to hold the legs in position, substantially as shown and described.

291,953. DEPILATING HIDES AND SKINS. ALBERT H. STOWE, New York, N. Y. Filed Nov. 2, 1883. (No specimens.)

Claim.—The improved depilatory, consisting of sulphide of sodium in combination with pure sulphur and carbon, substantially as described.

291,954. ATTRITION-MILL. THOS. LEGGETT STURTEVANT, Framingham, Mass. Filed May 12, 1883. (No model.)

Claim.—1. A case and a series of rings contained therein, which act as a screen, in combination with a rotary hollow head adapted to communicate with said case within the space inclosed by the screen, and means for supplying said case and head with grain or other material within the space or chamber inclosed by said rings, in order that the material may grind itself, substantially as set forth.

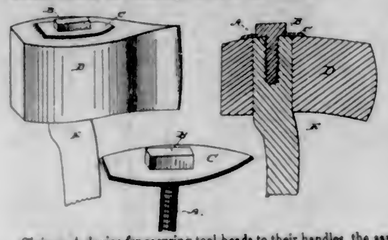


2. The rings G, in combination with head or heads D, case C, and suitable means for supporting said rings independently of each other, substantially as described.

3. In an attrition-mill, the rings G, constituting a screen therefor, each ring being provided with a recess, J, under its point of suspension, substantially as set forth.

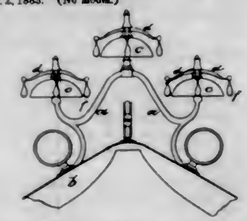
4. The rotary grate L, in combination with the rings G and case C, substantially as explained.

5. In attrition-mills, a grate composed of a series of rings, in combination with a vertical shaft, on which said grate is mounted, and means for rotating said shaft and grate, substantially as set forth.



291,955. WIRE-STRETCHER. LELIX E. SUNDERLAND, Joliet, Ill. Filed May 21, 1883. (No model.)

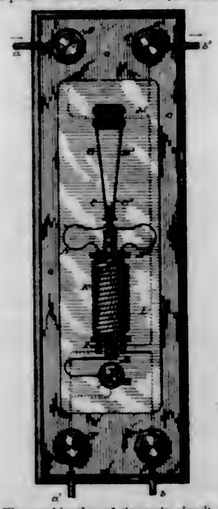
Claim.—1. In the wire-stretcher described, the combination of the body or frame *a*, provided with a suitable clutch at one end to grasp and hold the wire W, slotted lever C, having the pawl P, and journaled by its slot on the shaft S, drum-ratchet R, drum *a'*, having an annular inner chamber between its ends surrounding the removable shaft S, for the reception of the end of the rope *d* through a hole in the side of said drum, removable shaft S, adapted to be withdrawn and driven through said drum *a'*, to retain the end of said rope within said drum between its inner walls and said shaft S, detent-pawl P', having the extended handle C', and rope *d*, provided with a suitable clutch or hook, *q*, at its outer end, all arranged to operate as and for the purpose set forth.



2. In a wire-stretcher, the removable shaft S, in combination with the drum *a'*, having an inner chamber larger than said shaft and surrounding said shaft, for the reception of the rope *d* between said shaft and the inner walls of said drum, as and for the purpose set forth.

291,956. FASTENING FOR TOOL-HANDLES. THOMAS ALBERT SWIFT, Cambria, Cal. Filed Apr. 11, 1883. (No model.)

Claim.—A device for securing tool-heads to their handles, the same consisting in the combination, with a handle having a screw-threaded socket at its outer end, of the screw-threaded shank A, having an integral, flat, annularly-extending top plate, C, from the outer face of which extends a rectangular projection, B, substantially as and for the purpose set forth.



291,957. SLEIGH-BELL. CHARLES M. THEBERATH, Newark, N. J. Filed Nov. 2, 1883. (No model.)

Claim.—1. In sleigh-chimes for harness, &c., the combination, with the bell, of the arms *d*, arranged thereover, and having slots *e* therein, and the hammers *f*, working in said slots, all substantially as and for the purposes set forth and shown.

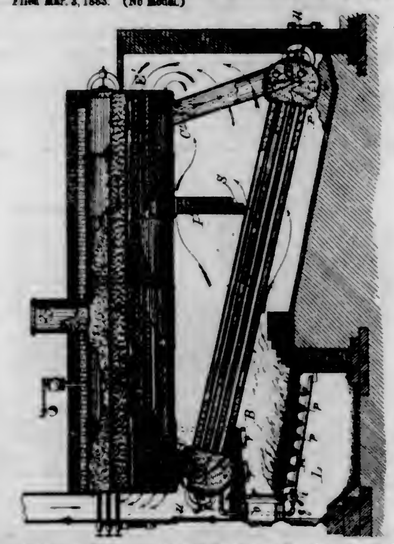
2. In combination, a bell, *c*, arms *d*, arranged thereover, having capped and slotted extremities, and the hammer having the enlarged extremity *g*, resting above the slot, all substantially as set forth.

291,958. ELECTRIC CUT-OUT. WILLIAM M. THOMAS, Grand Rapids, Mich., assignor of one-half to the Grand Rapids Electric Light and Power Company, same place. Filed Oct. 12, 1883. (No model.)

Claim.—1. The combination of the main circuit, the loop-circuit, and means brought into operation by the diversion of the current from the loop to automatically cut out the loop-circuit, substantially as set forth.

2. The combination of the main circuit, the loop-circuit, and means brought into operation by the diversion of the circuit from the loop to automatically short-circuit the loop-circuit, substantially as set forth.

3. The combination of the main circuit, the loop-circuit, and means brought into operation by the diversion of the current from the loop to automatically both short-circuit and cut out the loop-circuit, substantially as set forth.



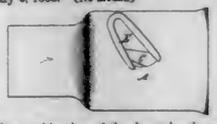
4. The combination of the main circuit, the loop-circuit, the terminals of the two circuits, which are normally electrically connected, and means, substantially such as described, brought into operation by the diversion of the current from the loop, for automatically breaking the connection between the two circuits whenever the current is grounded or otherwise diverted in the loop, thereby cutting out the loop, and at the same time permitting the terminals of the main line to come together, so as to continue the main circuit, substantially as set forth.

5. The combination of the main circuit, the loop-circuit, the terminals of the two circuits, which are normally electrically connected, the electro-magnet, the coils of which are included in the loop-circuit, and which are so disposed that the current which passes through the coils does not normally energize the magnet, but which does energize the magnet whenever the current in the loop is grounded or otherwise diverted, and the armature of the magnet to which the terminals of the loop-circuit are attached, so that when the magnet is energized by reason of a short circuit or ground-connection in the loop it will attract its armature, thereby breaking the connection between the terminals of the two circuits and cutting out the loop, substantially as set forth.

6. The herein-described electrical cut-out apparatus, consisting of the combination of the bed-plate, the terminal springs, the terminal plates normally clamped between the terminal springs, the electro-magnet, the coils of which are wound as described, the armature, the flexible conductors which connect the coils of the electro-magnet with the terminal plates, the binding-posts, and the conductors which lead from one set of binding-posts to the terminal springs and from another set of binding-posts to the coils of the electro-magnet, substantially as set forth.

7. The herein-described electrical cut-out and short-circuiting apparatus, consisting of the combination of the bed-plate, the terminal springs, the terminal plates normally clamped between the terminal springs, the electro-magnet, the cores of which are wound as described, the armature, the flexible conductors that connect the coils of the electro-magnet with the terminal plates, the fixed core of the magnet, its armature, the binding-posts, and the conductors for electrically connecting the terminal springs with one set of binding-posts and the coils of the electro-magnet with another set of binding-posts, the conductor for connecting one of the binding-posts with the fixed core of the magnet, and the conductor for connecting the armature of the fixed core to another of the binding-posts, substantially as set forth.

291,959. STEAM-GENERATOR. THOMAS E. THOMPSON, Chicago, Ill. Filed Mar. 2, 1883. (No model.)

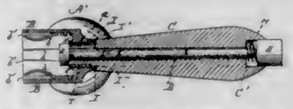


Claim.—1. In combination with the furnace B and tubular boiler A, the stand-pipes C and C', mud-drums D and D', water-tubes E, feed-

water pipes R *f f*, and partitions P P', the whole being constructed and arranged to operate substantially as described.

2. In combination with the tubular boiler A and furnace B, provided with the bridge-walls I and I' and doors *a a'*, the stand-pipes C and C', mud-drums D and D', having man-holes *t t'*, and tubes E, the whole being constructed and arranged to operate substantially as described.

3. The combination of the tubular boiler A, furnace B, stand-pipes C and C', mud-drums D and D', tubes E, pipes *r*, O, and M, three-way cock *i*, and perforated branch pipes *p*, the whole being constructed and arranged to operate substantially as described.

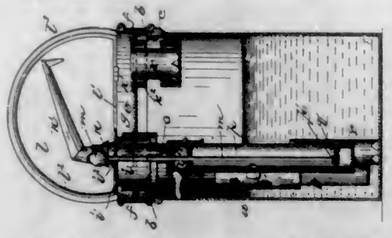


291,960. CAR-COUPLING. MILTON R. THURBER, Scranton, Pa., assignor of two-thirds to Alfred Harvey and Horatio Patrick, both of same place. Filed July 6, 1883. (No model.)

Claim.—1. The combination of the draw-head provided with the incline, the wedge-shaped block sliding on said incline and having the notch in its forward end, with the aperture in the side of the head for the insertion and withdrawal of the sliding block, substantially as described.

2. The combination of the draw-head, entirely inclosing the operating parts of the coupling, the inclines, the wedge-shaped block, having the notch in its forward edge, and the aperture in the side of the draw-head corresponding to the shape of the sliding block and placed at an angle to the plane of the incline, substantially as described.

291,961. CARRIAGE-WRENCH. DAVID TEUE, Salisbury, Mass. Filed July 13, 1883. (No model.)



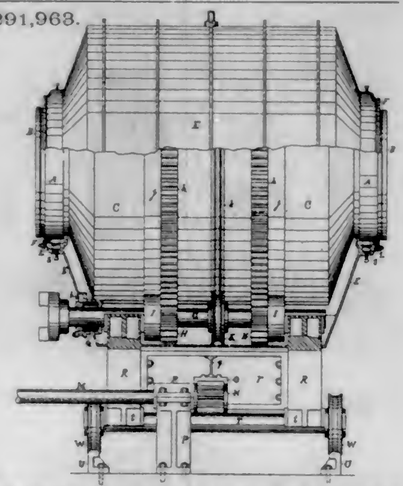
Claim.—1. In a carriage-wrench, the combination, with the bars A and socket B, of the handle C, provided with the ferrule I, substantially as and for the purpose set forth.

2. In a carriage-wrench, the combination, with the socket for grasping the nut, said socket being provided with suitable means for rotating it, of the handle C, provided with the ferrule I, said ferrule constituting a bearing for said socket or bar, substantially as and for the purpose described.

3. In a carriage-wrench, the combination, with the socket B and handle C, of the ferrule I, provided with the annular flange I', substantially as and for the purpose set forth.

4. In a carriage-wrench, the combination of the socket B, bars A, handle C, provided with the ferrule I and ring K, plunger F, and spring H, all substantially as and for the purpose specified.

291,962. OIL-CAN. EDWARD MCG. TURNER, Knoxville, Tenn. Filed Sept. 17, 1883. (Model.)



Claim.—In an oil-can, the combination, with the can-body having internal spring-fastenings projecting above its mouth, and the slotted removable tray having a collar provided with a spring, a trap-cap, and the rim-belt, of a removable pump connected to the spring-collar in the tray and provided with a filling-spout, substantially as specified.

291,963. PUDDLING-MACHINE. HENRY R. VAN BENTHUYSEN, Phœnixville, Pa. Filed Aug. 23, 1883. (No model.)

Claim.—1. A revolving puddling-chamber having annular collared necks around the openings, the collars forming wearing-surfaces for the annular packing that is contained in the recessed ends of the stationary casing, said collars terminating within the space inclosed between the chamber and casing, thereby securing an unobstructed circulation of water against the external surface of the puddling-chamber, substantially as shown and described.

291,963.

2. A stationary casing or water-jacket surrounding and inclosing the body of a revolving puddling-chamber, substantially as shown and described.

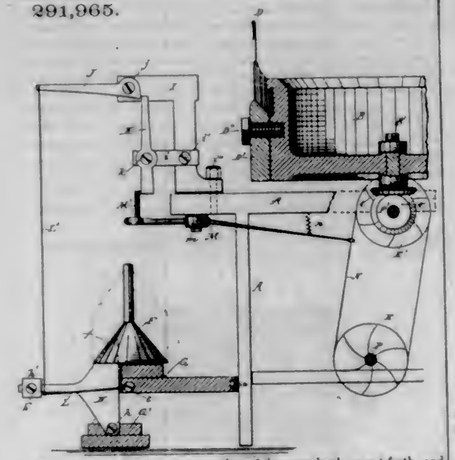
3. A stationary casing or water-jacket having annular packing-spaces and packing appliances at the ends adapted to the expansion and contraction of a revolving puddling-chamber, and in combination therewith, substantially as shown and described.

4. The water-jacket E, with the shafts G *g*, rollers I I, pinions H H, and bearings *x x* placed therein, and the stuffing-box Q and gland *f*, in combination with a revolving puddling-chamber, substantially as shown and described.

5. The circular flanged ring or gland F, segments L L, springs S S, sectional rings D D, and packing *d*, in combination with a stationary casing and revolving puddling-chamber, substantially as shown and described.

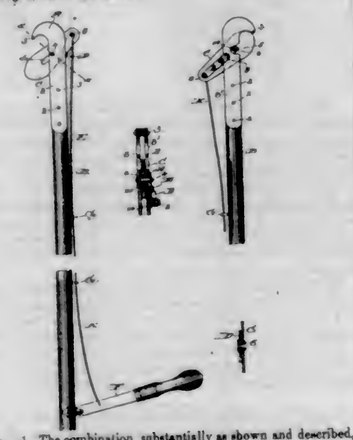
291,964. FOUNTAIN-PEN. WALTER H. WALES, Providence, R. I. Filed Aug. 2, 1883. (No model.)

Claim.—1. The combination of the barrel A, air-tube B, ink-delivering tube C, provided with an aperture, *c*, pen-holding tube F, provided with the tongue *f*, pen E, provided with the perforation *e*, soft-rubber pad *g*, and the lip G, all constructed and arranged substantially as described.



2. In a fountain-pen, the combination of the ink-delivering tube C, provided with the apertare *c*, writing-pen E, provided with the perforation *e*, tube F, provided with the flexible tongue *f*, and the soft-rubber pad *g*, whereby the ink is kept moist and guided freely to the point of the pen at the upper side of the same, substantially as described.

291,965. STOP-MOTION FOR KNITTING-MACHINES. MICHAEL J. WALSH, Amsterdam, N. Y., assignor of one-half to Francis Morris, same place. Filed May 14, 1883. (No model.)



Claim.—1. The combination of the frame A, projecting standard I, carrying bracket *i*, lever K, loosely pivoted to said bracket, lever J, connecting-rod L', and bail L, with the bracket G, slotted bobbin F, the yarn-hook H, provided with an adjustable weight, *h'*, the belt-shipper M, having stamp M', and the coiled spring N, substantially as shown and described.

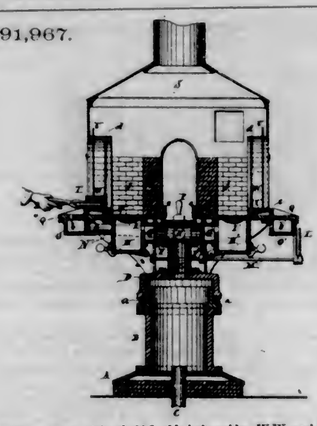
2. In combination with the cylinder provided with barbed needles, the standard I, having attached thereto the bracket *i*, and levers J and K, of the belt-shipper M, provided with the stamp M', of the yarn-hook H, having an adjustable weight attached thereto, of a movable bail, L, and connection L', and of a bobbin, F, provided with a slot, *f*, constructed to receive the upper portion of the yarn-hook, as set forth, and operating as described.

291,965.

291,966. PRUNING IMPLEMENT. GEO. F. WATERS, Boston, Mass. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, of the hook-plates *b b'*, riveted together with an intervening space, the cutting-blade C, having the longitudinal slot 5 and arranged in said space, the screw 4 and its roller *a*, forming an anti-friction fulcrum for said blade, the recesses 10 in the plates to receive the roller, the link D, connecting said blade and one of the plates, the anti-friction device 6, and the operating-rod E and handle F, all constructed and arranged to operate as set forth.

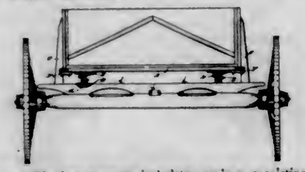
2. The pruning-instrument, the two plates *b b'*, shaped as described and recessed at their inner sides, as at 10, and the fulcrum-screw 4, combined with an anti-friction roller thereon, having its ends located in the recesses 10 of the said side plates, and with the slotted blade mounted to turn thereon, as shown and described.



291,967. FURNACE FOR HEATING BLANKS. GEORGE H. WEBB, Pawtucket, R. I. Filed Apr. 21, 1883. (No model.)

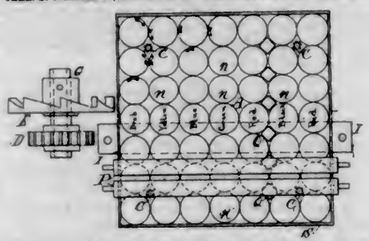
Claim.—1. In a piling-furnace, the combination of a fire-box, J, shelf Q, and the side bolt-guides, W, having inclined edges, substantially as described.

2. In a piling-furnace, the bolt-guides W, having vertical grooves *d d*, in combination with the feeder U and shelf Q, substantially as described.



3. In a piling-furnace, the combination, with the air-chamber B, pipes E F F', fire-boxes J J', having grates I I', the ash-boxes H H', wind-boxes G G' and O O', and connecting-pipes N N', having means for

291,967.



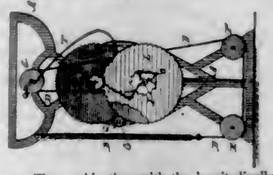
controlling a blast, of the shelf Q, side bolt-guides, W W, and fenders U U, substantially as described.

291,968. VEHICLE-SPRING. JEROME W. WETMORE, Erie, Pa. Filed Apr. 19, 1883. (No model.)

Claim.—The improvement in bolster-springs, consisting of a combination of the cross piece or plate A, the guide-slots C', the supporting-cleats F, and the inverted steel spiral springs B, the apices of the latter resting on the upper face of the bolster or bolster-plates, the whole detachable and readily removable, substantially as described.

291,969. INKING ATTACHMENT FOR PRINTING-PRESSES. BENJAMIN S. WHITEHEAD, Newark, N. J. Filed June 30, 1883. (No model.)

Claim.—1. An inking attachment for a printing-press, consisting, substantially, of a collection of revolving inking-disks arranged in parallel rows above the frame-work in or on which they revolve, the peripheries of the disks of adjacent rows engaging with one another, all substantially as and for the purposes herein set forth and shown.



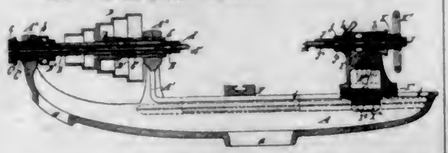
2. The disks N, having the shoulders N', the shanks M, and feathers O, in combination with cogs D and a frame-work, substantially as and for the purpose set forth and shown.

3. The inking attachment consisting of a collection of disks arranged in parallel rows to form the entire table-surface, each disk having a shoulder resting on its driving-cog, in combination with said cogs, adapted, substantially as described, to be intermittingly operated.

4. In combination with the frame-work A B of an inking attachment for a printing-press, the collection of inking-disks arranged in parallel rows, the line of contact of the peripheries thereof being straight lines, said disks being arranged and adapted to be withdrawn individually without disturbing the adjacent mechanism, substantially as herein set forth.

5. The collection of disks arranged in parallel rows, and removably mounted on rotating cogs, in combination with the stationary disks removably fixed between the rotating disks, as and for the purpose specified.

291,970. SPRING-MOTOR. JAMES A. WRIGHT, Rockingham, N. C. Filed June 16, 1883. (No model.)



Claim.—1. The combination, with the longitudinally-extensible spring B and the cord D, attached to it, equal in length to the spring extended, of the loosely-mounted pulleys E F G, serving as receptacles for said cord, the winding-pulley H, and means for winding the same, and means for communicating rotary motion therefrom, substantially as described.

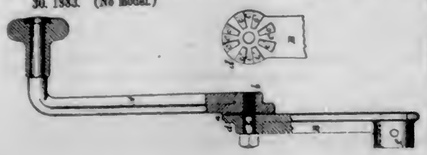
2. The combination, with the longitudinally-extensible spring B, the cord D, attached to it, the cord receiving and transmitting pulleys E F G, the cord-winding pulley H, secured to shaft I, and having ratchet-teeth J, the spur-wheel L, having a pawl, K, to engage ratchet-teeth J, the pinion M, and spur N, of spur-wheel P, the pinion O, and shaft C, for communicating the motion received by wheel L from the springto other machinery, as described.

3. The combination, with the shaft I, carrying the winding-wheel H, of the ratchet-wheel R, secured on said shaft, the crooked hand-lever T, and pawl S on said lever, adapted to engage wheel R, and to disengage therefrom by its own weight in different positions of the lever, as shown and described.

291,971. METAL-TURNING LATHE. JOHN E. ATWOOD, Stonington, Conn. Filed June 9, 1882. (No model.)

Claim.—1. A lathe-bed of dish shape, closed at the bottom throughout the greater portion of its length, but having an opening toward which all parts of the interior have a downward inclination for the delivery of oil, dirt, and chips, substantially as described.

2. A lathe-bed of dish shape, closed at the bottom throughout the greater portion of its length, but provided at its lowest part with an opening for the delivery of oil, dirt, and chips, and having bearings or posts for the head-spindle projecting separately therefrom and made integral therewith, substantially as described.

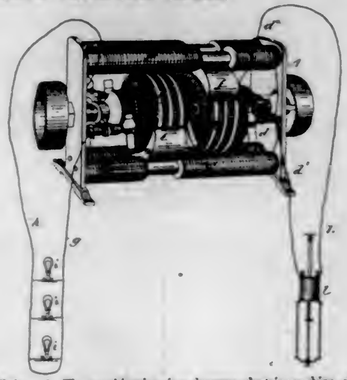


3. The combination, with a head-spindle and its bearings, of a bushing for the front bearing, a bushing for the back bearing provided with a shoulder abutting against said bearing, a cone on the spindle abutting against the end of the front bushing, and a nut screwed upon the outer end of the back bushing, and against which the end of said spindle bears, substantially as and for the purpose described.

4. The combination of the hollow or tubular spindle B, the bearings A' A^2, the bushings C C', the latter provided with the shoulder *b*, the cap-nut C^2, having a bole through it, the cone D, the feed-cone D^2, and the bushing *d* and center *d'*, substantially as described.

5. The combination, with a slide-rest and a tool-post rest provided with nuts of opposite pitch, of a hand-screw provided with right and left hand threads engaging with said nuts, substantially as described.

6. The combination of a tail-spindle having a screw-thread, a tail-stock with which the said spindle engages by a spline and groove, and which is internally screw-threaded, and a sleeve having external and internal threads of opposite pitch, the former thread engaging with the thread in said stock, and the latter thread engaging with said screw-threaded spindle, substantially as and for the purpose described.



291,972. CRANK. JOHN E. ATWOOD, Stonington, Conn. Filed June 30, 1883. (No model.)

Claim.—1. A crank composed of two members or arms, A B, having heads *b d*, which are secured in face-to-face contact and held one on the other by a bolt passing through them, whereby provision is afforded, by slackening the bolt and turning the arm or member A on said bolt, for adjusting it into different positions relatively to the arm or member B, substantially as herein described.

2. A crank composed of two members or arms, A B, having heads *b d*, which are secured in face-to-face contact and held one on the other by a bolt passing through them, and which are provided with projections and notches on their contact-faces, so as to interlock with each other, whereby provision is afforded, by slackening the bolt and turning the arm or member A thereon, for securing said arm or member in different positions relatively to the arm or member B, substantially as described.

291,973. DYNAMO-ELECTRIC MACHINE. CHARLES E. BALL, Philadelphia, Pa. Filed Oct. 9, 1883. (No model.)

Claim.—1. The combination, in a dynamo-electric machine, of two armatures, one of which is wound for quantity and the other for intensity, the quantity-armature being in circuit with the field, the intensity-armature not being in circuit with such field, though designed and adapted to be energized inductively thereby, substantially as set forth.

2. The combination, with a dynamo-electric machine having two armatures, one of which is wound for quantity and the other for intensity, the former being in circuit with the field and the latter not in such circuit, of two external circuits, which include, respectively, incandescent lamps and arc-lights, the former embracing the quantity-armature and the latter the intensity-armature, substantially as set forth.

3. A dynamo-electric machine having two field-poles and two armatures, each of which is located and adapted to be rotated in the field of force of only one of said poles, one of said armatures being wound for quantity and the other for intensity, the quantity-armature being in circuit with the field and having connections for an external incandescent circuit, and the intensity-armature not being in circuit with the field, but having connections for an external arc-circuit, substantially as set forth.

291,974. PRIMER. THOMAS G. BENNETT, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Aug. 13, 1883. (No model.)

Claim.—1. The herein-described primer, consisting in the combination of the principal cup A, the auxiliary cup C, of less diameter than the principal cup and containing the fulminate, with the anvil B, of inverted conical shape, the said auxiliary cup arranged in the principal cup, with its open mouth toward the anvil, and in a concentric position between the anvil and the bottom of the principal cup, and whereby the fulminate is concentrated about the center of the anvil, substantially as described.

2. The herein-described primer, consisting in the combination of the principal cup A, the auxiliary cup C, and the fulminate in the said auxiliary cup, with the anvil B, of inverted conical shape, with a flange around its edge, said auxiliary cup arranged with its open mouth toward the anvil, the said anvil serving to hold said auxiliary cup C in its proper relation to the principal cup, and said auxiliary cup serving to concentrate the fulminate at the center, substantially as described.

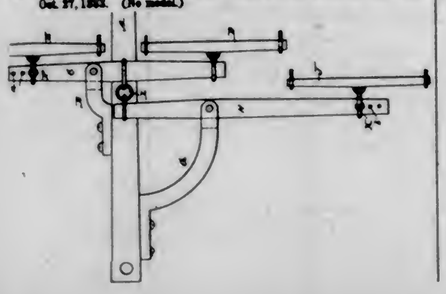
291,975. SULKY-PLOW. BENJAMIN S. BENSON, Baltimore, Md. Filed May 8, 1883. (No model.)

Brief.—A colter attached to a wheel by brackets and arranged to

cut the next furrow. Plow-frame raised by crank-screws. A lever with a wheel is journaled on the land end of the axle. It also has a push-bar, which, by a pawl, may be thrust downward, bringing a brake upon the wheel and the push-bar in contact with the ground. The draft elevates the colter and plow out of the ground. The horizontal wheel is lifted or held down by the lever engaging the foot-board.

Claim.—1. The plow-beam having its front end bent first up and then down, in combination with the vertical shaft C, arranged in bearings on the beam, and having a horizontal draft-arm, C', and an arm, C^3, at right angles to both the shaft C and its draft-arm, and provided with the wheel D, as and for the purpose described.

2. The combination of the plow-beam, the offsetting brackets E E, the vertical tubes F G, cross-bar H, the screw-threaded wheel-standards F' and G', the adjusting screw-rods F^4 G^4, the said standards and screw-rods being contained in the tubes F and G, as and for the purpose described.



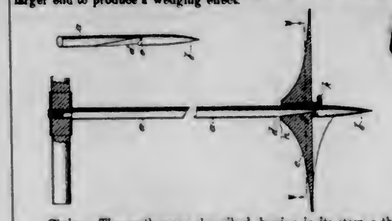
3. The combination, with the adjusting-rod G^4 and of the crank G^3, pivoted detent *b*, locking-projection *b'*, the hand-hold b^2, and spring b^3, as and for the purpose described.

4. The combination, with the rear crank-axles and the plow-beam, of the drag-bars L L, having a downwardly-projecting arm, M, bearing a horizontal rotating wheel adapted to bear against the wall of the preceding furrow, and made vertically adjustable, substantially as shown and described.

5. The combination of the platform, the adjusting-bar O, the lever N, the drag-bars L L, and the arm and wheel M M', substantially as shown and described.

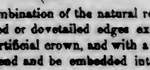
6. The combination, with the colter-wheel axle, of the lever Q, bearing-wheel R, and the push-bar S, adapted to be projected into the earth, to cause the draft of the team to throw the plow and colter out of the ground, substantially as described.

291,976. DRAFT-EQUALIZER. JOHN BOWMAN, Brookville, Ill. Filed Oct. 27, 1883. (No model.)



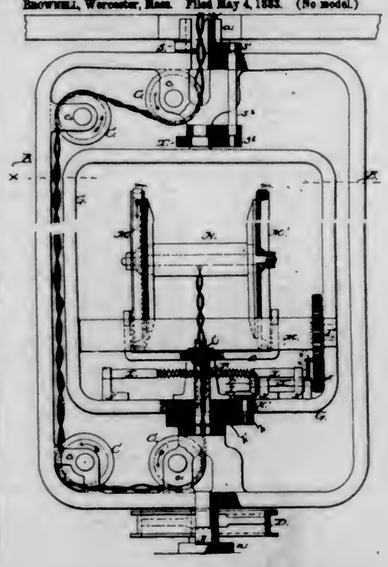
Claim.—1. In a three-horse equalizer, the combination, with the tongue A, of the double-tree C H, fulcrumed at opposite sides of the tongue, and connected in line therewith, as shown and described.

2. The combination, with the tongue A and the arms B and G, of the double-trees C and H, pivoted to the arms B and G, respectively, the single-tree D, held on the inner end of the double-tree C, the single-tree E, held adjustably on the outer end of the double-tree C, the single-tree J, held adjustably on the outer end of the double-tree H, and the links or loops L, connecting the inner end of the double-tree H with the middle of the double-tree C, substantially as herein shown and described.



291,977. EARTH-AUGER. FRANK BROWN, Chagrin Falls, Ohio. Filed July 29, 1882. (No model.)

Brief.—A bevel-recess in the auger-shaft is held in contact with an inward projection in the eye of the cutting-disk to secure such shaft to the disk by a semi-cylindrical key tapering from a lip or flange at its larger end to produce a wedging effect.

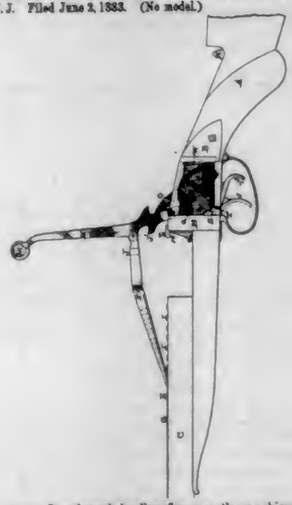


Claim.—The earth-auger described, having in its stem *a* the elongated bevel-wall recess *d*, to receive the hub of the blade *c*, and in the eye A of the blade the inwardly-projecting inclined bearing, having its greatest projection at the lower end of the said eye, and designed to be wedged against the bevel-wall recess of the stem by means of the semi-cylindrical key *k*, which tapers at a wedging angle from the lip *l*, all constructed and adapted to operate substantially as specified.

291,978. ARTIFICIAL TOOTH. E. PARMLY BROWN, Flushing, N. Y. Filed Feb. 16, 1883. (No model.)

Claim.—The combination of the natural root, with the metal band and shell with serrated or dovetailed edges extending into or baked in the porcelain of the artificial crown, and with a central opening and depending edges to extend and be embedded into the amalgam to be inserted and placed around a central pin, all as and for the purposes set forth.

291,979. MACHINE FOR MAKING WIRE CORDAGE. GEORGE L. BROWNELL, Worcester, Mass. Filed May 4, 1883. (No model.)



Claim.—1. The combination, with the flier B and frame G, of the return-screw I, cradle O, provided with the reversible dog P, rollers M, the spool N, having disks M', with bands *m*, and means for operating said flier and frame, and from the said flier the screw I and rollers M, as shown and described.

2. The combination, with the flier B and frame G, of the cradle O, provided with the reversible dog P, screw I, the rollers M, spool N, having friction-disks M', the shaft K', having friction-rollers *k* and the gear-wheel L, shaft J', provided with gear-wheels L' and J, and means for operating said rollers M and screw I from said gear J, as shown and described.

3. The combination, with the flier B and frame G, with the connections between said flier and frame, of the rollers M, screw I, and means for operating said rollers and screw from the flier, cradle O, provided with dog P, the spool M, having disks M', with friction-bands *m*, as shown and described.

291,980. BREECH-LOADING FIRE-ARM. William E. Budd, Chatham, N. J. Filed June 2, 1883. (No model.)

Claim.—1. In a breech-loading fire-arm, the combination of the operating-lever, which is pivoted in the top of the main frame and extends backward over the grip of the stock, the endwise-moving barrels, and the connecting rod or arm which connects the lever and the barrels together, and which rod or arm is placed above the rear end of the barrels, substantially as shown.

2. In a breech-loading fire-arm, the combination of the operating-lever, which is pivoted in the top of the main frame, and which extends back over the grip of the stock, the endwise-moving barrels, the connecting rod or arm, which is placed above the rear end of the barrels, and which serves to connect the operating-lever and barrels together, the pivoted fastening device, and a means for fastening the device to the barrels, substantially as described.

3. In a breech-loading fire-arm, the combination of the operating-lever pivoted upon the top of the main frame and extending back over the grip of the stock, the endwise-moving barrels, the connecting rod or arm which connects the lever and barrels together, and which is placed above the rear end of the barrels, a means of connection for the connecting-rod with the barrels, and a guide or way placed upon the forearm for the barrels to slide upon, substantially as set forth.

4. In a breech-loading fire-arm, the combination of the operating-lever, pivoted in the main frame and extending back over the grip of the stock, the spring-snap N, for locking the lever down in place, the endwise-moving barrels, the connecting-rod placed above the rear end of the barrels and connecting the barrels together, a means of connection between the rod and the barrels, and a guide or way placed upon the forearm for the barrels to slide upon, substantially as specified.

5. In a breech-loading fire-arm, the combination of the operating-lever, the endwise-moving barrels, and the rib F, which is loosely connected to both the lever and barrels, the rib being grooved upon its top, so as to aid in directing the aim, substantially as shown.

6. In a breech-loading fire-arm, the combination of the endwise-moving barrels provided with the projections I, with the perforated connecting rod or arm placed above the rear end of the barrels, and adapted to close down upon them, and the operating-lever H, substantially as described.

7. In a breech-loading fire-arm, the combination of the lever H, pivoted upon the top of the main frame, the rod O, provided with the projections for engaging with the cocking-plates, and pivoted to the lower edge of the lever H, the slotted main frame, the cocking-plates, and the hammers, substantially as set forth.

8. In a breech-loading fire-arm, the combination of the main frame, having a recess formed in its side or sides to receive the hammer and spring, with a mainspring, which is formed from a single piece of metal, which is bent double and then bent at right angles, the side of the recess against which the bent portion of the spring rests being inclined forward, so as to hold the spring in place, substantially as specified.

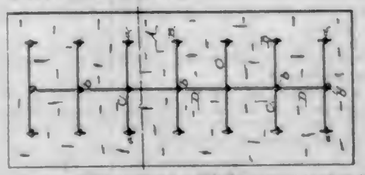
9. In a fire-arm, the combination of a hammer, the plate S, to which the hammer is pivoted, the main frame provided with slots through which the plates are passed, set-screws for holding the plates in place, and a spring, which has one end to catch against the plate and the other against the hammer, substantially as specified.

10. In a fire-arm, the combination of the operating-lever H, connecting rod or arm F, and the vertically-moving spring-actuated cartridge-extractors, which are depressed upon the cartridge by the rod or arm when the gun is closed, substantially as shown.

11. In a fire-arm, the combination of a hammer, a connecting-rod attached thereto, a sliding block attached to the front end of the connecting-rod and provided with a safety-notch, and notches in which the sear catches, and the vertically-moving spring-actuated cartridge-extractor, which engages with the safety-notch to prevent premature explosions, substantially as shown.

12. In a fire-arm, the combination of the trigger provided with a projection on its front end, the sear having an extension on its rear end, the spring 6, which engages with both the sear and trigger, and the notched sliding block, which is moved by the hammer, and with which the sear engages, substantially as described.

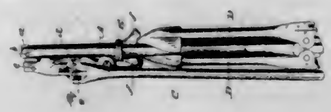
13. In a fire-arm, a vertically-moving cartridge-extractor, in combination with the spring 9, which presses the extractor upward when the extractor is left free to move, the sliding block, and trigger, whereby the extractor serves as an indicator to show whether the barrel has been fired, substantially as set forth.



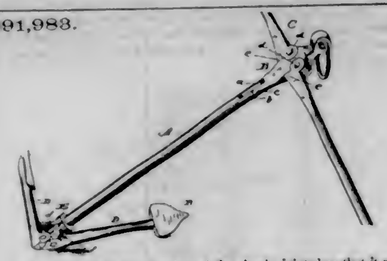
291,981. PRIMER. Henry S. Burns, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Nov. 3, 1883. (No model.)

Claim.—1. The combination of the principal cup A, the internal cup, B, of less diameter than the internal diameter of the principal cup, and constructed with an outwardly-projecting flange around its open end, said cup having the fulminate within it and arranged within the principal cup, opening outward, substantially as described.

2. The combination of the principal cup A, the internal cup, B, having an outwardly-projecting annular flange around its edge, by which flange the internal cup is secured, said cup having a central recess to receive the fulminate, and an anvil within said principal cup, substantially as described.



291,982. BUTTON-CARD. Henry A. Buttner, San Quentin, Cal. Filed Nov. 1, 1883. (No model.)

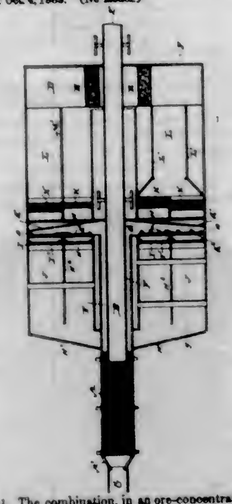


Claim.—1. The combination, with the cross-wires adapted to be looped in the eyes of buttons in opposite rows, of the central wire having loop-connection with the said cross-wires, substantially as described.

2. The combination, with the series of cross-wires adapted for loop-connection to button-eyes, of the central wire passing through loops of said cross-wires, and looped in the loops of the end cross-wires of the series, substantially as described.

291,983. ANCHOR. Hubbard C. Chester, Noank, Conn. Filed Dec. 3, 1883. (No model.)

291,983.



Claim.—1. The combination of the shank, jointed so that it may fold upon itself, with an upwardly-folding stock jointed to the upper section of the shank, substantially as hereinbefore set forth.

2. The combination of the shank, jointed so that it may fold upon itself, with an upwardly-folding stock jointed to the upper shank-section, and folding arms hinged to the lower shank-section, substantially as hereinbefore set forth.

3 The combination, substantially as hereinbefore set forth, of the two-part folding shank, the upwardly-folding stock, jointed to the upper shank-section, the folding arms hinged to the lower shank-section, and the slide.

291,984. ORE-CONCENTRATOR. Alexander D. Clarke, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, in an ore-concentrator, of an inclined chute for conducting the water containing the sand, ore, &c., the screen for receiving the same, an additional chute inclined downward in the inverse or opposite direction of the first-mentioned chute, and settling tanks or boxes, substantially as herein shown and described, and for the purpose set forth.

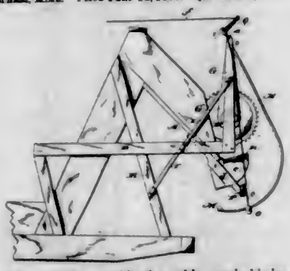
2. In an ore-concentrator, the combination, with an inclined chute, of a screen arranged at the lower end of the same, a chute inclined from the bottom of the screen in the inverse or opposite direction of the chute through which the water is conducted upon the screen, a transverse gutter arranged at the lower end of the latter chute, and a settling-tank into which the water is conducted that flows from the gutter, substantially as herein shown and described, and for the purpose set forth.

3. In an ore-concentrator, the combination, with an inclined chute, B, of a screen, A, upon which the water, stones, and sand are conducted by the said chute B, a chute, F, inclined from the screen A in the inverse or opposite direction of the chute B, and a transverse gutter, G, at the lower end of the chute F, the chute C, inclined about in the same direction as the said chute B, into which chute C the water is conducted which has passed into the transverse gutter G, substantially as herein shown and described, and for the purpose set forth.

4. In an ore-concentrator, the combination, with the inclined chute B, of the screen A at the lower end of the same, the chute F, inclined from the screen in the inverse direction of the chute B, a transverse gutter, G, at the base of the chute F, a settling-tank below the chute F, inclined platforms at the front and rear of the said settling tank or pocket, and a chute, C, inclined in the same direction as the chute B, into which chute C water from the settling tank or pocket is conducted, substantially as herein shown and described, and for the purpose set forth.

5. In an ore-concentrator, the combination, with a chute, B, of a screen, A, arranged at the lower end of the same, a chute, F, inclined from the screen in the inverse direction of the chute B, a transverse gutter, G, at the lower end of the chute F, a settling tank or pocket, H, a tank, D, and the chute C, substantially as herein shown and described, and for the purpose set forth.

6. In an ore-concentrator, the combination, with the chute F, of the transverse gutter G, into which water is conducted, the gates G^2, for closing the apertures *b* in the front of the gutter, and the inclined riffles *a* on the floor of the gutter, substantially as herein shown and described, and for the purpose set forth.



7. In an ore-concentrator, the combination, with the chute F, of the transverse gutter G, provided with apertures *b*, gates G^2, the pocket or settling-tank H, the partition I, and the gates I', substantially as herein shown and described, and for the purpose set forth.

8. In an ore-concentrator, the combination, with the chute F, of the transverse gutter G, the settling tank or pocket H, into which the water flows from the gutter G, and a filter arranged in the settling tank or pocket H in front of or behind the gutter G, substantially as herein shown and described, and for the purpose set forth.

9. In an ore-concentrator, the combination, with an inclined chute, B, of a screen, A, at the lower end of the same, a chute, F, inclined from the screen A in the inverse direction of the chute B, a transverse gutter, G, at the base of the chute F, tanks or pockets H, the chute C, inclined about in the same direction as the chute B, and means for connecting the water that flows from the gutter G into settling tanks or pockets and into the chute C, substantially as herein shown and described, and for the purpose set forth.

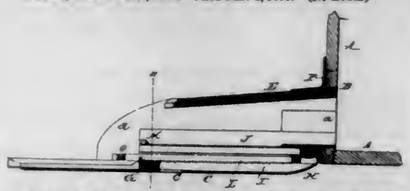
10. The combination, with an inclined chute, B, of the screen A, the chute F, the transverse gutter G, the settling tank or pocket H, the partitions I, having gates I', the inclined platform J in front of the settling tank or pocket H, and one or more partitions, H^2, extending longitudinally over the said inclined platform, substantially as herein shown and described, and for the purpose set forth.

291,985. BUNDLE-CARRIER FOR GRAIN-BINDERS. Wm. Collins, Perham, Minn. Filed June 12, 1883. (No model.)

Claim.—1. The combination, with a grain-binder, of a rock-shaft, curved depending fingers secured to said shaft, and an abutment situated below the table and above the points of the fingers, and adapted to limit the inward swing of the carrier and hold the grain on said carrier, substantially as set forth.

2. The combination, with a grain-binder, of a rock-shaft, curved fingers secured to the rock-shaft and adapted to receive the bundles of grain, a strengthening-brace secured to the curved fingers, rods connecting said brace to the rock-shaft, and an abutment against which the grain rests.

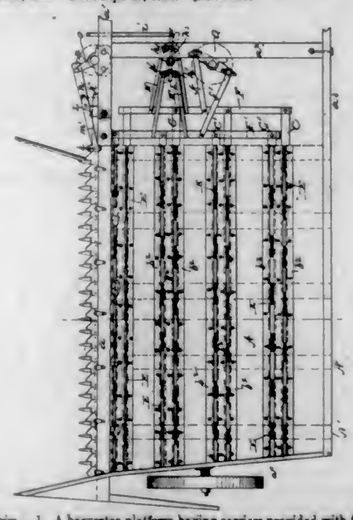
3. The combination, with a grain-binder the grain-table of which is provided with a gate, and guards secured to the lower face of said gate, of a rock-shaft, curved fingers secured to the rock-shaft, and an abutment secured to the binder-table below the gate, substantially as set forth.



4. The combination, with a grain-binder, of a rock-shaft, an arm secured thereto, a suitable rope or equivalent secured to the arm, curved fingers depending from the rock-shaft, a strengthening-brace connecting the fingers, rods connecting the strengthening-brace and rock-shaft, and an abutment against which the grain rests.

5. The combination, with a grain-binder provided with a gate, and guards secured to the gate, of the rock-shaft, curved fingers, brace, rods connecting the brace and rock-shaft, and an abutment, all of the above parts combined, constructed, and adapted to operate as described.

6. The combination, with the binder-table, gate, and sleeve surrounding the binder-shaft, of a standard secured to the frame of the machine, a standard secured to the sleeve, and a bundle-carrier the rock-shaft of which is provided with suitable bearings, substantially as set forth.



7. The combination, with a binder-table and upright standards, of the rock-shaft having the curved fingers secured thereto, and the depending bearings, one of which is elongated, substantially as set forth.

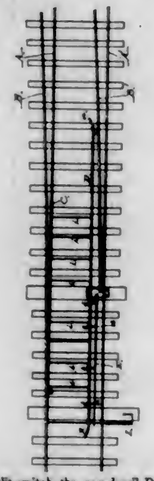
291,986. GRAIN-SPOUT FOR THRASHING-MACHINES. LESLEY H. CONKLIN, Willow Creek, Minn. Filed June 2, 1883. (No model.)

Claim.—The herein-described spout attachment for thrashing-machines, composed of the casing C D E, having aperture c, bracket P, fixed screen J, parallel ways K K, located in chamber I, between the fixed screen J and bottom C, removable screen L, having cross-bar O at its front end, pin or bolt M, inserted through the apertures *l* and N, to hold the removable screen in its fixed position, the whole constructed to adapt it to be attached removably to the spout-opening B of a thrashing-machine, substantially as and for the purpose shown and specified.

291,987. HARVESTING-MACHINE. WALTER ELPHALET CRANE, Wasoca, Minn. Filed Sept. 27, 1882. (No model.)

Claim.—1. A harvester-platform having carriers provided with fingers E, pivoted in castings D, and operating as described, combined with the bars F F', and pitmen connecting with a double crank on a vertical shaft, whereby alternately-reciprocating motion can be imparted to said carriers, substantially as set forth.

2. In a harvester-platform having sets of fingers alternately reciprocated and jointed to the bars F F', the braces H H', having rollers A A', in connection with a movable controlling-guide, I, substantially as and for the purposes set forth.



3. In a harvester-platform having sets of fingers alternately reciprocated, as described, and provided with braces H H', having rollers A A', a pivoted swinging steadying-guide, I, on which the braces H H', having rollers A A', move, substantially as set forth.

4. In a harvester-platform having carriers C C', provided with castings D, the fingers E, increasing in length according to their position, those at the outer end of the platform being shorter and those near the binder or elevator being longer than those in the middle portions, as and for the purpose set forth.

5. In a harvester, reciprocating or longitudinally-moving carriers connected to cross-bars F F', combined with a swinging guide, whereby said bars may be caused to change their relative length of stroke at front and rear ends, substantially as described.

291,988. RAILROAD-SWITCH. JOHN H. CROWLEY and BERNARD M. TEMPLE, Galveston, Tex. Filed July 13, 1883. (No model.)

Brief.—One of the points consists of a short switch-rail bolted to a spring guard-rail to move therewith, and held at a fixed distance therefrom by interposed blocks. A hand-lever is employed for setting the points for the siding.

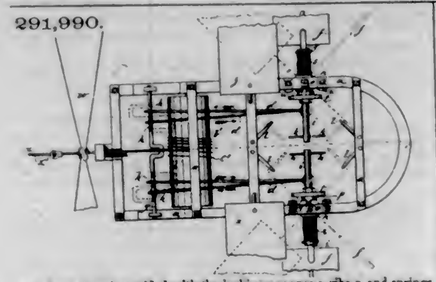
Claim.—In a split switch, the guard-rail D, secured to the track at one end, c, and carrying on its loose end the short split rail E, rigidly secured thereto with intervening bolsters, *d d*, in combination with the long pivoted switch-rail C and lever L, all constructed, arranged, and operated substantially as set forth.

291,989. CLOCK-DIAL. HENRY J. DAVIES, Brooklyn, assignor to the Ansonia Rubber Company, New York, N. Y. Filed Feb. 6, 1883. (Model.)

Claim.—As a new article of manufacture, a hard-rubber clock-dial having smooth and glossy face, letters flush with the surface, depressions surrounding the letters to present them in relief, and minute depressions, as set forth.

291,990. BALLOON-PROPELLER. KANSAS D. DAVIS, Cole City, Ga. Filed Jan. 5, 1883. (No model.)

Claim.—1. In a balloon-propeller, the combination, with the frame, posts *b*, and wings *f*, of the arms *i*, extending through the posts, and provided with supporting-sleeves *j*, projecting outwardly from the posts, as shown and described.



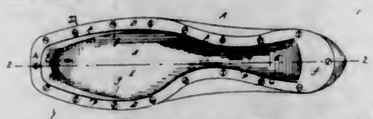
2. In a balloon-propeller, the reversing-wings *f* and sailing-wings *e*, combined with means for operating them, for the purpose specified.

3. The combination of the driving-shaft *g*, having the reverse-cranks A and connecting-rods *d*, with the two wings *f* and wing-posts *b*, located on the respective sides of the machine, as described.

4. The wings *f*, arranged to turn in the wing-posts, by which they are vibrated, and having a turning-finger, *k*, in combination with the reversing-studs *l*, substantially as described.

5. The wings *f*, arranged to turn in the wing-posts, by which they

291,990.



are vibrated, and provided with the locking-grooves *o*, ribs *q*, and springs *s*, substantially as described.

6. The combination of the unlocking-arms *t* and studs *u* with the wings *f*, arranged to turn in the posts by which they are vibrated, and having the locking-grooves *o*, ribs *q*, and springs *s*, substantially as described.

7. The combination, in a balloon-motor, of the vibrating wings *f*, posts *b*, turning-fingers *k*, reversing-studs *l*, locking-ribs *q*, and grooves *o*, and the unlocking-arms *t*, and studs *u*, substantially as described.

291,991. LAST. GEORGE W. DAY, Haverhill, Mass. Filed Aug. 6, 1883. (No model.)

Claim.—1. A boot or shoe last having the center portion of the bottom surface recessed or depressed, as shown, and the outer edge provided with a metallic rib, D, all substantially as and for the purpose set forth.

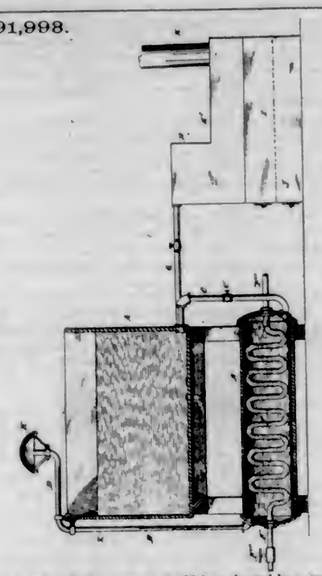
2. A boot or shoe last having the center portion of the bottom surface recessed or depressed, as shown, and the outer edge provided with a metallic rib, D, having the shallow groove *p*, all substantially as and for the purpose set forth.

3. A boot or shoe last having a rib, D, surrounding its recessed bottom surface, and having its toe portion widened and inwardly beveled thereat, substantially as and for the purpose specified.

291,992. MANUFACTURE OF BOOTS OR SHOES. GEORGE W. DAY, Haverhill, Mass. Filed Aug. 6, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 266,018, dated October 17, 1882.

Claim.—1. That improvement in the manufacture of boots and shoes which consists in first channeling the inner sole to form a flap or lip around its edges, then turning in the sides and folding back the toe portion of said flap or lip, and then securing said toe portion to the sole by cement or its equivalent, then securing the inner sole to the upper and outer sole by stitches, &c., and then turning back said flap and securing it to the channeled portion of the inner sole, substantially as and for the purpose specified.

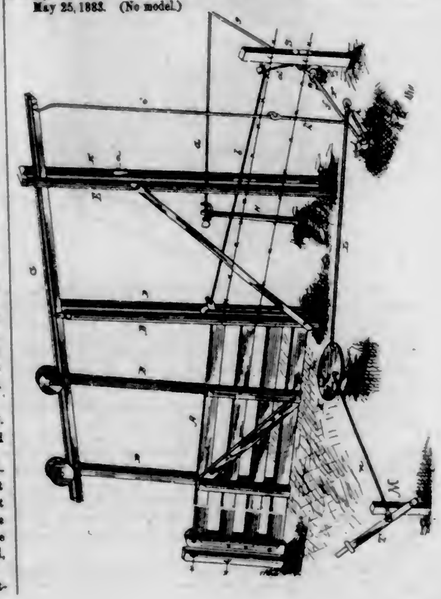


2. That improvement in the manufacture of boots and shoes which consists in channeling the inner sole to form a flap or lip around its edge, which shall be of increased width at its toe portion, then turning back such flap at the toe and folding it upon itself, and then securing it to the bottom of the sole by cement or its equivalent, for the purpose specified.

291,993. APPARATUS FOR RECOVERING SODA USED IN MANUFACTURE OF PAPER-PULP. JOHN W. DIXON, Philadelphia, Pa. Filed Nov. 30, 1883. (No model.)

Claim.—1. In combination with a concentrating-tank, A, an additional heating-chamber, B, the contents of which are heated by contact with the walls of a steam or hot-water chamber, F, tube C, to conduct the contents of tank A to chamber B, and exit-pipe D, to return the heated contents of chamber B to the concentrating-tank A, whereby the liquor is heated and an automatic circulation of the same is sustained, substantially as described.

2. In combination with a concentrating-tank, A, an additional heat-

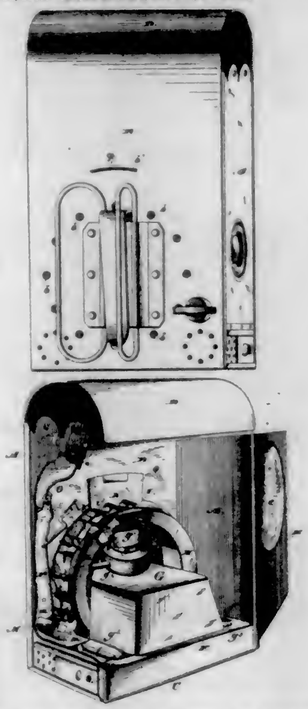


291,998.

ing-chamber, B, the contents of which are heated by a steam-heated surface, tube C, to conduct the contents of tank A to chamber B, and exit-pipe D, to return the heated contents of chamber B to the concentrating-tank A, whereby the liquor is heated and an automatic circulation of the same is sustained, substantially as described.

3. In combination with a concentrating-tank, A, an additional heating-chamber, B, the contents of which are separated by a shell from a steam or hot-water chamber, whereby said contents are heated, tube C, to conduct the contents of tank A to chamber B, and exit-pipe D, to return the heated contents of chamber B to the concentrating-tank A, whereby the liquor is heated and an automatic circulation of the same is sustained, substantially as described.

291,994. FARM-GATE. CHARLES J. DOANE, Old Gilroy, Cal. Filed May 25, 1883. (No model.)



Claim.—1. The gate A, provided with the vertical beams B B, carrying rollers at their upper ends, in combination with the vertical post D, the track-beams C, the spring *a'*, secured to the rear adjacent post of the fence, and the rope or chain *b*, for preventing jar or injury to the gate and frame in its closing movement, all constructed and adapted to operate substantially as specified.

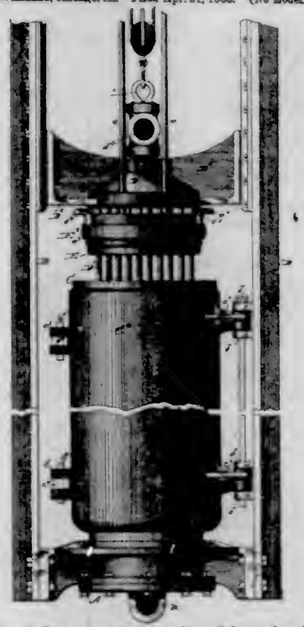
2. In a rolling-gate substantially as described, the compound lever F, journaled in short vertical posts at the rear of the gate, in combination with the rod *i*, pivoted vibrating track-beams, connecting-rods L and N, the eccentrically-pivoted disk K, posts M and H, and the operating-levers G and T, all constructed and adapted to operate substantially as and for the purposes specified.

3. The disk K, eccentrically-pivoted upon the post M, and provided with a plurality of perforations, in combination with the gate A, posts B, carrying rollers, as shown, the lateral posts D and E, track C, compound lever F, and operating rods and levers, substantially as specified.

291,995. APPARATUS FOR LIGHTING AND EXTINGUISHING LAMPS. WILLARD D. DORRIUS, Washington, D. C., assignor, by direct and mesne assignments, to himself, and Theodore F. Swayze, same place, and Samuel R. Stratton and John T. Stratton, both of Strattonville, Pa. Filed Apr. 11, 1883. Renewed Dec. 4, 1883. (No model.)

Claim.—1. A lantern in which are combined the following elements, to wit: a lamp provided with a wick or other flame-producing equivalent, a carrier adapted to receive and contain friction-matches, means whereby said carrier may be moved to bring each match successively into contact with or position near to said wick, means whereby each match is ignited as it moves to position near said wick, and means whereby each burned match is automatically expelled from said carrier as the succeeding match is ignited and moved into position for lighting said wick, substantially as and for the purpose specified.

2. A lantern in which are combined with the lamp means whereby the burner-wick may be automatically ignited and extinguished by one rotation of the operating-shaft, substantially as and for the purpose shown.



3. In combination with the wick *g'*, the carrier or holder I, contained within the housing H, and provided with the grooves *i*, teeth *i'*, and concavities *i²*, the spring L, having the serrated end *l*, and the cam M, provided with the spur *m'*, substantially as and for the purpose set forth.

4. The combination of the housing H, provided with the opening *h'*, the carrier I, having the transverse grooves *i* and peripheral intersecting groove *i²*, and the spring N, with mechanism, substantially as described, whereby said carrier may be rotated, substantially as and for the purpose described.

5. In combination with a lantern, a match holder or carrier adapted to be filled through the back of the casing of said lantern without opening the same, substantially as and for the purpose specified.

6. The hereinbefore-described lantern, in which are combined with the casing and lamp the annular rotating match-holder, the friction-spring, the expelling-spring, the carrier-housing, the extinguisher, and means whereby said match holder and extinguisher may be operated, said parts being constructed to operate substantially as and for the purpose shown.

291,996. APPARATUS FOR MOLDING THE SECTIONS OF ELECTRICAL CONDUITS. DANIEL H. DORSETT, JOSEPH E. MORRIS, and BENNETTE WILLIAMS, Chicago, Ill. Filed Apr. 21, 1883. (No model.)

Claim.—1. In an apparatus for casting cellular sections for underground electrical conduits, a vertically-sliding hollow or chambered head having an opening for the admission of steam or water, and provided with hollow cell-cores depending from its lower side, in combination with a perforated base-plate through which the cores are passed, substantially as shown and described.

2. In an apparatus for casting sections for underground electrical conduits, a base-plate upon which the section is cast, formed or provided with projections around its periphery, adapted to form longitudinal depressions in the end of the casting, substantially as and for the purpose set forth.

3. In an apparatus for casting cellular sections for underground electrical conduits, a hollow or chambered base having an escape-opening for water or steam, and a series of openings provided with stuffing-boxes, in combination with a series of hollow core-tubes adapted to pass through the stuffing-boxes and open into the hollow base, substantially as shown and described.

4. In an apparatus for casting sections for underground electrical conduits, the hollow base A, having its upper side chambered out, and provided with holes *a²*, having nipples A' in them, and provided with an outlet, *a*, for steam and water, in combination with the base-plate A³, recessed within the base, but projecting somewhat above it, and having openings corresponding to the nipples in the base and projections *a²* around its periphery, substantially as and for the purpose set forth.

5. In an apparatus for casting sections for underground electrical conduits, an outer mold formed in two parts, hinged to the main frame, and each part provided with a jacket or casing having inlet and outlet passages for steam or water, substantially as described and shown.

6. In an apparatus for casting sections for underground electrical conduits, an outer mold provided with a jacket or casing having inlet and outlet passages for steam or water, and a series of diversions between the mold and its jacket, having openings in alternate ends, whereby the steam or water is caused to circulate around the mold in its passage, substantially as shown and described.

7. In an apparatus for casting cellular sections for underground electrical conduits, the combination, with a mold and its base, and a series of cell-cores, of a bell-former through which the said cores are passed, and adapted to be dropped to the bottom of the mold when desired to clean or center the cores, substantially as described and shown.

8. In an apparatus for casting cellular sections for electrical conduits, a bell-former constructed in two independent parts, one within the other, the outer of which is adapted to form two annular shoulders upon the inner side of the cast section, substantially as shown and described.

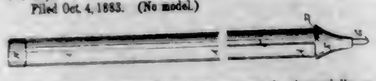
9. In an apparatus for forming cellular sections for underground electrical conduits, the bell-former E, having holes or tubes E', adapted to slide upon the cell-cores, and supported by the rods *e e*, in combination with the shouldered ring E², having the arms *e'* and shoulders *e³*, and the handle or bar E³, substantially as and for the purpose set forth.

10. In an apparatus for casting cellular sections for underground electrical conduits, the combination, with a base having uprights upon each side, and a two-part mold hinged thereto, of a head adapted to slide vertically in said uprights, and having cell-cores depending therefrom, and provided with means for raising and lowering it, substantially as shown and described.

11. In an apparatus for forming cellular sections for underground electrical conduits, a casing for the cell-cores, formed of sheet metal, and adapted to fit closely around said cores when they are in the mold, but capable of being sprung together for removal, substantially as described and shown.

12. In an apparatus for forming cellular sections for underground electrical conduits, the combination of a series of open sheet-metal casings adapted to fit around the cell-cores, with a base-plate formed with a series of socketed or shouldered openings, and a centering device composed of two racks or frames adapted to hold the casings in position while the cores are being lowered, substantially as described and shown.

13. An apparatus for casting cellular sections for underground electrical conduits, consisting, essentially, of the hollow base A, having the nipples A', packing-boxes *a²*, and exhaust-opening *a*, and provided with the perforated base-plate A³, having projections *a³*, and the uprights B, in combination with the hollow head D, adapted to slide vertically in the uprights, and provided with the inlet *d²* and cell cores or tubes D', and the two-part bell-former E E², having tubes E', and jacketed two-part mold C, hinged to the uprights and having locking devices, all constructed and arranged to operate substantially as and for the purpose set forth.

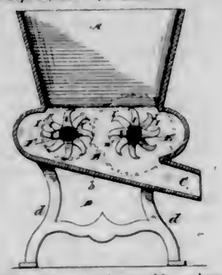


291,997. CONCENTRATOR AND AMALGAMATOR. GEO. R. EVANS, San Francisco, Cal., assignor to John P. Couch and William T. Oneale, both of same place. Filed Sept. 7, 1883. (No model.)

Claim.—1. A riffle or sluice having the sides A and the amalgamated metallic bottom or floor, consisting of the alternate plane, concave, and convex surfaces *a b c*, succeeding each other, substantially as herein described.

2. In a sluice, the sides A and the bottom B, having an amalgamated metallic floor or surface, consisting of the alternate plane, concave, and convex surfaces *a b c*, succeeding each other, the edges of which project, so as to enter grooves in the sides and form a tight joint, substantially as herein described.

291,998. PENCIL-HOLDER. BERNHARD EYBEL, New York, N. Y. Filed Oct. 4, 1883. (No model.)



Claim.—1. A pencil-holder constructed substantially as herein shown and described, and consisting of the case A, having its lower end slitted and its end edge bent inward, the die E, having exterior groove, D, and interior screw-thread, F, and the pencil-tube H, having angular interior, as set forth.

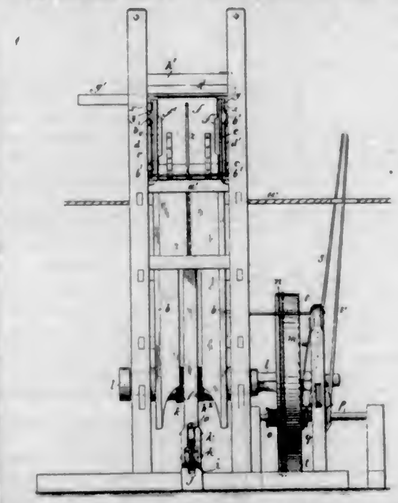
2. In a pencil-holder, the case A, made substantially as herein shown and described, with its lower end slitted, and the slitted ends turned inward, to adapt it to receive a die and hold it by friction, as set forth.

3. In a pencil-holder, the die E, made substantially as herein shown and described, with exterior groove, D, and interior screw-thread, F, to adapt it to be held in place by friction and to cut a screw-thread upon an angular lead, in combination with a suitable case or holder, as set forth.

4. In a pencil-holder, the combination, with the die E, having interior screw-thread, of the pencil-tube H, having angular interior, substantially as herein shown and described, and a case or holder, whereby the lead will be held from turning while being moved in and out by the said die, as set forth.

291,999. ICE-CRUSHING MACHINE. J. YALE FAIRMAN, Middletown, Conn. Filed Sept. 22, 1883. (No model.)

Claim.—1. In an ice-crushing machine, a hopper, ice-chamber, and chute, all cast in a single piece, part of the end walls of the ice-chamber being formed integral therewith, and having half-bearings for the shafts of the crushing mechanism, substantially as described.

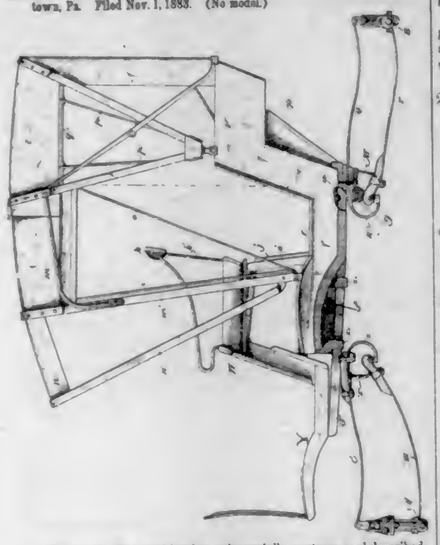


2. In an ice-crushing machine, the combination, with the hopper, the ice-chamber, and chute, cast in a single piece, and having part of the end walls of the ice-chamber formed therewith, of a supporting-frame having a plate which closes the end of said chamber, half-bearings being formed in the upper and lower portions to receive the journals of the crushing mechanism, substantially as described.

3. In an ice-crushing machine, the combination, with the rectangular arbors, of cutting-teeth arranged thereon in the manner described, said teeth being formed in pairs projecting in opposite directions, with a central disk having a rectangular opening to receive the arbor, said openings being arranged in adjacent pairs to give alternate arrangement of the teeth, substantially as described.

4. The combination, with the hopper A and ice-chamber B, of the arbors E and F, having cutters I, arranged thereon as described, and the chute C, opening in front of the machine, substantially as described.

5. The combination, with the hopper A, ice-chamber B, and chute C, cast in a single piece, with a portion of the end walls, *a'*, formed therewith, and having half-bearings *a a* and lugs *b'*, of the supporting-frame D, having plate *d'*, with half-bearings *d²* and lugs *d³*, registering with the like parts upon the upper portion of the structure, substantially as described.



292,000. COTTON-PRESS. F. LEONIDAS FAISON and GEORGE M. NEWELL, Wake Forest College, N. C. Filed Nov. 2, 1883. (No model.)

Claim.—1. The combination of grooved rail *i*, flanged and grooved rollers *h*, endless rope *k*, thrust-bars *f²*, follower *a*, and the drum *m* and axle *l*, substantially as described.

2. The combination of lever *z*, rock-shaft *a'*, elbow-levers *b'*, slide-bolts *c'*, and connecting-rods *d'*, with the side doors, *e*, substantially as described.

292,001. CONVERTIBLE CARRIAGE. ANTHONY K. FELTON, Stoystown, Pa. Filed Nov. 1, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, of the front springs connected more or less immediately with the front axle, longitudinally-movable timbers connected to a fixed carriage-body and carrying the said springs, fixed rear springs, and means to lock the parts in position, as and for the purpose set forth.

2. The springs C C, clipped more or less directly over the front axle, and the springs E E, attached beneath the fifth-wheel, the transverse braces F G, connecting springs C C, the braces H K, connecting springs E E, the irons I, connecting springs C C and E E, and the movable timbers J J, to which said irons are attached, combined with fixed rear springs, and a convertible or extension body, substantially as described.

3. The combination, with longitudinally-moving timbers borne by and supporting a fixed extensible body, of the fixed rear springs, the independent front springs connected and moving with the timbers and front axle, and locking-rods to engage and hold the springs and body in proper relative position, substantially as shown and described.

4. The combination, with an extension-body and longitudinally-moving timbers borne by and supporting such body, the fixed rear springs, the independent front springs connected and moving with the timbers and front axle, a cross-bar connecting the rear ends of the timbers, and resting upon the lowermost of the rear springs when the carriage is extended, and means, substantially as described, to lock the springs and body in proper relative position, as and for the purpose set forth.

5. The combination, with an extension-body, fixed rear springs, movable front springs, and a longitudinally-moving coupling member, to which the front springs are attached, of pulleys bearing upon the upper and lower faces of such coupling member, and eccentric or cranked rods for holding the body and coupling member in proper relative position to each other and to the springs, substantially as described.

6. The combination, with an extension running-gear, of an extension-body composed of a fixed body and seat, and a movable body and seat hinged within the fixed body, and movable bodily into and from the fixed body, substantially as described, and for the purpose specified.

7. The combination, with the fixed body, of the angle-irons *i j*, hinged to the said body and to a seat and body, made movable thereby in said body to cover or uncover the body and seat of said fixed body, to convert the carriage into a single or double seat vehicle, substantially as described.

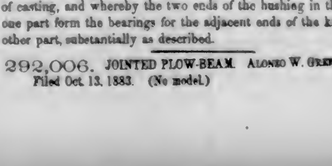
8. The upholstered rear seat provided with depressions in its back to receive the irons of the front seat, substantially as described.

9. The combination, with the fixed seat and body, of a seat and body in one, hinged to and movable within the fixed seat and body, to make of the carriage a single-seat vehicle, and movable forwardly from the same to bring the seat and body into the horizontal planes of the fixed seat and body, respectively, to make a two-seat vehicle, substantially as described.

10. The combination, with an extension running-gear and extension-body, of a falling top composed of telescoping sections, substantially as shown and described.

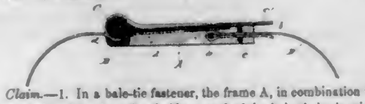
11. The combination, with the top sections, of the movable curtain-guards *o p q*, substantially as shown and described.

12. The combination, with the top sections, of the movable curtain-guards *o p q* and weather-curtains arranged inside the carriage-top, and arranged to pass down the guards to cover the sides of the carriage, substantially as described.



292,002. POCKET-KNIFE. JAMES D. FRARY, Bridgeport, Conn. Filed Nov. 26, 1883. (No model.)

Claim.—The herein-described improvement in pocket-cutlery, consisting of the composition covers A, having a plate, *a*, applied upon the outer surface of the cover at the bolster end and independent of the lining, substantially as described.

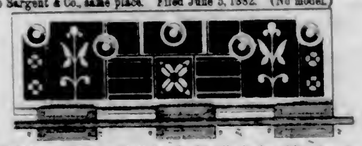


292,003. CORNER-BRACE. WILLIAM CULLEN GARRETSON, Oskaloosa, Iowa. Filed June 2, 1883. (No model.)

Brief.—A metallic corner-brace with a brace connecting the wings, bent or doubled upon itself on the inner side, forming a re-enforcing rib.

Claim.—The metallic corner-brace herein shown and described, composed of a sheet-metal plate cut into the shape shown, having lips H H and G G, set up at right angles to the plate, and the brace I, connecting the wings E E, between their respective lips H and G, and bent or doubled upon itself on the inner side to form a re-enforcing rib or web, I', substantially as and for the purpose shown and set forth.

292,004. BALE-TIE FASTENER. CULBERSON S. GARRISON, Tiffin, Ohio, assignor of one-half to J. H. Pittenger, same place. Filed July 3, 1883. (No model.)

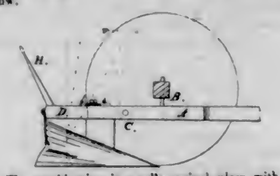


Claim.—1. In a bale-tie fastener, the frame A, in combination with the rods *a*, *b*, and *c*, adapted to hold one end of the bale-tie by looping it around and passing it between the rods, substantially as shown and described.

2. In a bale-tie fastener, the frame A, provided with the concave corrugated cross-bar B, in combination with the corrugated cam-lever C, substantially as described, and for the purpose specified.

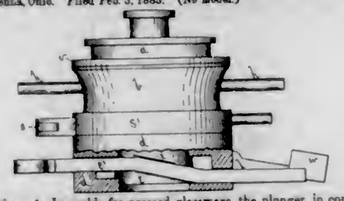
3. In a bale-tie fastener, the frame A, provided with the cross-rods *a*, *b*, and *c*, and the concave and corrugated cross-bar B, in combination with the corrugated cam-lever C, substantially as shown and described.

292,005. HINGE. WILLIAM GILFILLAN, New Haven, Conn., assignor to Sargent & Co., same place. Filed June 5, 1882. (No model.)



Claim.—1. The method herein described of making bronze and similar metal hinges, consisting in the arrangement of hard-metal bushings upon a spindle in a position relative to each other corresponding to the knuckles on the hinge to be cast, said spindle and bushings placed in the mold preparatory to casting, and so that metal poured into the mold will flow around said bushings in the formation of the knuckles, substantially as described.

2. A bronze-metal hinge constructed with a hard-metal bushing extending through the knuckle and inclosed in the knuckle in the process of casting, and whereby the two ends of the bushing in the knuckles of one part form the bearings for the adjacent ends of the knuckles of the other part, substantially as described.



292,006. JOINTED PLOW-BEAM. ALONZO W. GREEN, Spencer, Mass. Filed Oct. 13, 1883. (No model.)

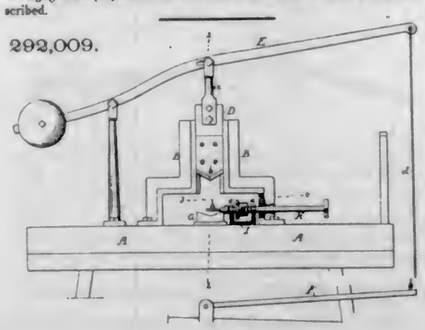
Brief.—The plow-beam is jointed, the front end being fixed to the axle or frame. It is designed to be lifted when it is desired to reverse the swivel-plow.

Claim.—The combination, in a sulky swivel-plow, with the frame and axle, of the vertically-jointed plow-beam consisting of the fixed forward part, A, the hinged rear part, D, carrying the reversible plow, and a locking device for holding down or releasing the plow, substantially as shown and described.

292,007. MOLD FOR PRESSED GLASSWARE. WILLIAM HALEY, Ravenna, Ohio. Filed Feb. 3, 1883. (No model.)

Claim.—1. In molds for pressed glassware, the plunger, in combination with a sliding plug to form an opening through the glass, having its upper end above the molten glass to be pressed and closely fitting the plunger while the latter is forcing down the plug and molding the glass, substantially as described.

2. In molds for pressing glassware, the plunger *a* and sliding plug *c*, having their ends closely fitted to each other, and a sliding sleeve, *e*, surrounding and closely fitting the plug, and each having vertical movement independent of the other, in combination with bottom plate, *d*, connected with and supporting both the plug and sleeve, substantially as described.

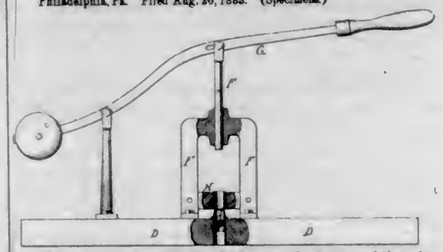


3. In molds for pressing glassware, the plug *c* and its sleeve *e*, each having vertical movement independent of the other, in combination with the weighted lever *l*, sliding bar *e'*, bottom plate, *d*, hinged half-rings *s s'*, and plunger *a*, the sliding plug *c* extending above the molten glass to be pressed, and its upper end closely fitting the bottom of plunger *a*, substantially as described.

292,008. HAME-FASTENER. CHARLES N. HART, Pittsford, Vt., assignor of one-half to Charles S. Smith, same place. Filed Nov. 27, 1883. (No model.)

Claim.—In a hame-fastener, the fastener A, consisting of the portion *a*, having the hook end a^2, the link a^3, interposed, and hinged at its ends to the parts *a' a*, the portion *a'* having the hooked end a^4, provided with the spring-pin *c*, and pivoted bail, with its thumb-piece adapted to engage the projection *b* on the end of the link, as shown and described.

292,009.



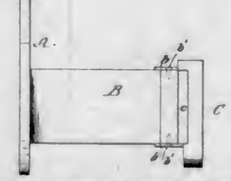
292,009. MACHINE FOR MAKING TASSEL-BLANKS, &c. DAVID HEER, Philadelphia, Pa. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination, in a tassel-blank cutter, of the guided slide D, its blade or blades, and mechanism for operating the said slide, with the bed G and a rotating spindle, H, carrying the blank, and having its axis at right angles, or thereabout, to the plane of movement of the slide D, as set forth.

2. The combination, in a tassel-blank cutter, of the slide and its blade or blades, with a bed, G, and with a spindle, H, and with bearings constructed to permit both the turning and tilting of the said spindle.

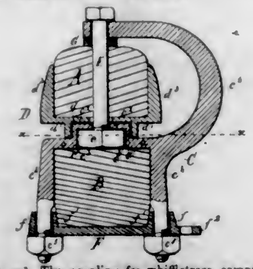
3. The combination, in a tassel-blank cutter, of the slide and its blade or blades, and the bed G, with the spindle H, its notched collar, and spring-retainer.

292,010. MACHINE FOR MAKING TASSEL-BLANKS. DAVID HEER, Philadelphia, Pa. Filed Aug. 20, 1883. (Specimens.)



Claim.—1. The within-described cutter, the same consisting of a tube having internal spiral grooves, and terminating at one end in a cutting-edge coinciding with the bore of the tube, substantially as set forth.

2. The combination of the internally and spirally grooved cutter, with the guide H, the guided plunger E, and mechanism for operating the said plunger, substantially as specified.



3. As a new article of manufacture, the within-described block or strip, having throughout a uniform polygonal cross-section, and having flat sides with a longitudinal twist, as set forth.

292,011. BRACKET. JONAS HERRMANN, Columbus, Ohio. Filed July 26, 1883. (Model.)

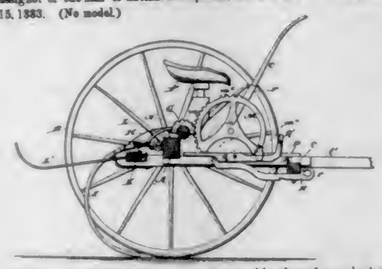
Claim.—The combination of the board A, the bracket-arm B, secured at right angles thereto, the hinged plates *b b* at the outer end of said arm, the screws *b' b'*, the leaf C, recessed at *c*, and the cross-bar D, all arranged substantially as shown and described.

292,012. WHIFFLETREE-COUPLING. WILLIS T. HINE, West Meredith, N. Y. Filed Oct. 2, 1883. (No model.)

Claim.—1. The coupling for whiffletrees, comprising the perforated plate D, having horizontal portion c^2, stay and binding projections d^3, arms d^2, and an annular rim, *d'*, the perforated clip-plate C, having horizontal portion *c*, cylindrical socketed bearing $c' c^2$, screw-threaded clip-extensions c^4, with nuts c^5, extension or guard c^6, yoke F, and bolt E, with nut *e*, substantially as and for the purpose described.

2. A whiffletree coupling-plate, D, having the front and rear staying and binding projections, d^3, arms d^3, and an annular socket-rim, d', in combination with a whiffletree, A, having a passage through it, through which the coupling-bolt E can be passed, substantially as and for the purpose described.

3. The clip coupling-plate C, formed with front and rear clip-extensions, c^2, socketed bearing c' c^3, horizontal portion c, extension bolt staying strap or guard c^4, evener or cross-bar B, and yoke F, in combination with whiffletree A and the center bolt, E, with nut s on its end, said bolt being passed through the whiffletree and fastened by the single nut s in the socket of plate C above the cross-bar B, substantially as and for the purpose described.

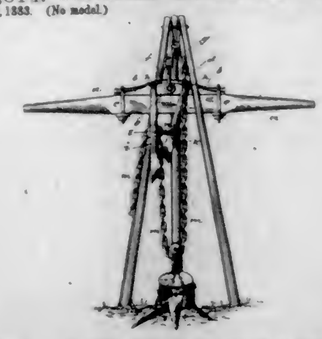


4. The combination of a center bolt, E, having a single fastening-nut, s, on its end above the evener or cross-bar B, and the bearing c' d' of the clip coupling-plate C, and the clip whiffletree coupling-plate D, having nut-socket c^3, substantially as and for the purpose described.

5. The clip coupling-plate C of the evener or cross-bar, having horizontal portion c, screw-threaded front and rear binding-extensions, c^2, nut-socket c^3, and a perforated extension or guard, c^4, substantially as and for the purpose described.

6. In a whiffletree-coupling, the combination of the center bolt, E, above the evener or cross-bar, the clip coupling-plate C, having a bearing, c, and nut-socket c^3, and the coupling-plate D, having the bearing portions d d', substantially as and for the purpose described.

7. The clip coupling-plate C, having a socket, c^3, provided with a nut s, and extension or guard c^4, in combination with the coupling-plate D and the bolt E, passed through the extension or guard c^4, and entered into the nut s above the evener or cross-bar, substantially as and for the purpose described.



292,013. HORSE HAY-RAKE. CHARLES T. HOLMAN, Lincoville, Pa., assignor of one-half to Alexis C. Carpenter, Rochester, N. Y. Filed June 15, 1883. (No model.)

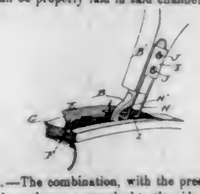
Claim.—1. In a horse hay-rake, the combination of a rock-shaft having spring-presses and rigid arms, the teeth supporting and elevating bar having clearer-fingers, and pivoted to said rigid arms with the wheeled frame or axle, and the curved rake-teeth pivoted thereto, substantially as described.

2. In a horse hay-rake, the combination of a sliding draft-bar, a centrally-pivoted lever having a treadle at its front end, and connected with the draft-bar, the oscillating disk engaging with said lever, and the hand-lever applied to the oscillating disk, with the wheeled axle, the pivoted rake-teeth, and suitable devices for raising the rake-teeth connected with or actuated by the aforesaid devices, substantially as described.

292,014. STUMP-MACHINE. ASA A. HOWE, Ulysses, Pa. Filed Aug. 14, 1883. (No model.)

Claim.—1. In a stump-puller, the hook i, having the pulley l in its loop and the depressions s and u near its point, for the reception of the adjacent links of the chain, substantially as specified.

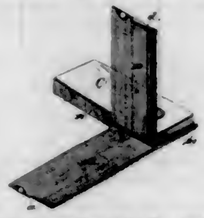
2. In a stump-puller, the combination, with the long hook i, having pulley l and link depressions s u, of the short link k, having link depressions s u, and supported upon the same lever as the hook i, and working above, substantially as specified.



3. In a stump-puller, the combination, with the wooden lever a, having the cap-plate b, secured thereto by the clips c c, and provided with the journals d d, bail f, notches h h, and ring g, of the long grappling-hook i, having pulley l, the short grappling-hook k, the springs n n, connecting said hook, and the chain m, substantially as specified.

292,015. INSECTICIDE MIXTURE. JOHN M. JAQUES, Sr., Thorntown, Ind. Filed Sept. 4, 1883. (No specimens.)

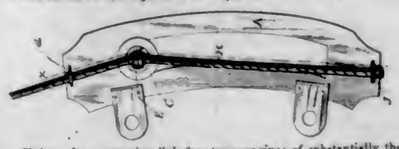
Claim.—A seed-protecting compound consisting of coal-oil, turpentine, tobacco, and indigo, in the proportions substantially as set forth.



292,016. CHANNEL-OPENER FOR SOLE-SEWING MACHINES. EDEN OTIS JAQUITH, Weymouth, Mass. Filed Feb. 1, 1883. (No model.)

Brief.—This device is designed for attachment to a McKay or other boot and shoe sole sewing machine, to serve in raising the flap that covers the channel and holding it away from the needle-point, so that the stitches can be properly laid in said channel.

Claim.—The combination, with the presser-foot of a sewing-machine, of a channel-opener attached to the side of said presser by means substantially as described, said channel-opener consisting of a spring-wire having an offset at 2, and extending backward from a point a little distance from the offset, substantially as shown.

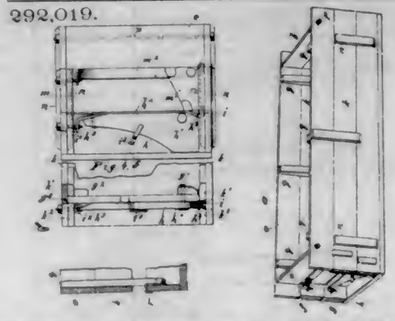


292,017. CARPENTER'S SQUARE. WILLIAM R. JONES and SAMUEL E. JONES, Toccoa, Ga. Filed Apr. 14, 1883. Renewed Dec. 5, 1883. (No model.)

Claim.—1. A square provided with a supplemental blade hinged to the long blade or arm, so as to be capable of being turned down against it or outward to stand at a right angle to said arm and in a plane with the inner edge of the short arm, substantially as and for the purpose set forth.

2. In combination with the blade A of the square, the supplemental blade D, hinged thereto and formed with a lip on its end to engage the end of blade A and lock the two together to form one arm or blade, substantially as shown and described.

292,018. REVERSING-LINK FOR ENGINES. WILLIAM ELLIOTT KARNS, Parker's Landing, Pa. Filed Sept. 28, 1883. (No model.)



Claim.—In a reversing-link for steam-engines of substantially the described construction, the combination of the link A, having the countersunk recess F, and eyebolts G J, link-pin B, having apertare I and collar B', adapted to fit within the countersunk recess F, and provided with the sliding sleeve C, having flange C', spiral spring D, and washer E, with the operating-cord H, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

292,019. WAGON-BOX. FRED LANE MORTON, Wis. Filed Nov. 10, 1883. (No model.)

Claim.—1. In a wagon-box, a tail-gate consisting of a tail-board

292,019.

shorter than the inside width of the wagon-box, provided with a pivoted lever having one end of the same or nearly the same width as the tail-board, and projecting beyond one end of the tail-board when the lever and tail-board are in place, said lever having engaging-hooks at its ends upon its upper edge, in combination with the side-boards and cleats, and engaging-eyes for holding the tail-gate in place in the ways, and permitting its ready removal therefrom, substantially as specified.

2. In a wagon-box, a reversible removable head-gate provided with a hinged foot-rest, having bracing hook-arms with eyes and tightening-nuts, in combination with the side-boards and cleats forming the ways, whereby the head-gate may be used to form a foot-rest, and also to close the head of the box when an extension is placed thereon, substantially as specified.

3. In a wagon-box, the top box having inside stakes provided with hooks for forming an open or stock box, in combination with the main box and the intermediate box-section, substantially as specified.

4. In a wagon-box, an intermediate section having a tail-gate provided with a pivoted lever extending at one end beyond the board to which it is pivoted, and provided with engaging-hooks, in combination with the side-boards and cleats of said intermediate section, substantially as specified.

292,020. MODE OF UTILIZING DISCARDED RUBBER BELTING. FRANK A. MAGOWAN, Trenton, N. J. Filed Nov. 22, 1883. (No model.)

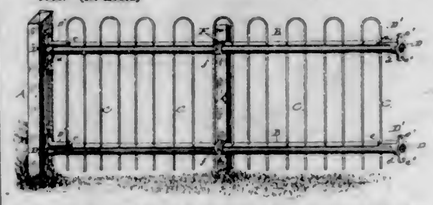
Claim.—1. The mode herein described of utilizing worn rubber belting, the said mode consisting in first ripping strips of the belting; second, folding out the ripped strips; and, third, subjecting the same to pressure and to the process of vulcanizing, all substantially as set forth.

2. The mode herein described of first ripping strips of rubber belting; second, folding out the strips; third, applying to the same a layer or layers of rubber; and, fourth, subjecting the whole to pressure and to the process of vulcanizing, substantially as specified.

292,021. MODE OF UTILIZING DISCARDED RUBBER HOSE. FRANK A. MAGOWAN, Trenton, N. J. Filed Nov. 22, 1883. (No model.)

Claim.—The mode herein described of utilizing discarded rubber hose, the said mode consisting in first folding out severed sections of the hose, and then subjecting the sections to pressure and the process of vulcanizing, substantially as set forth.

292,022. SOUND-MUFFLER FOR TELEPHONES. HIRAM MAINE, Chicago, Ill. Filed May 31, 1882. (No model.)

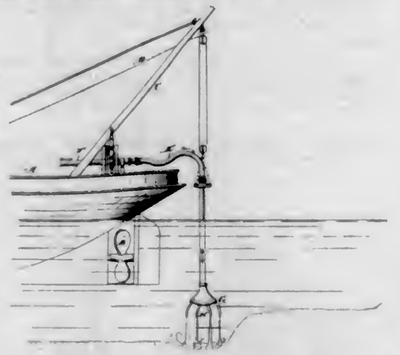


Claim.—1. A transmitting and receiving telephone, combined with the elastic muffling-cap D, permanently mounted in position to cover one ear of the operator while standing in proper speaking position before said transmitter, for the purpose set forth.

292,022.

2. The elastic extension C, provided with internal movable muffling-diaphragms, which may be adjusted to muffle the sounds more or less, as set forth.

292,023. FENCE. JOSEPH L. MAMLOVE, Milton, Ind. Filed July 27, 1883. (No model.)



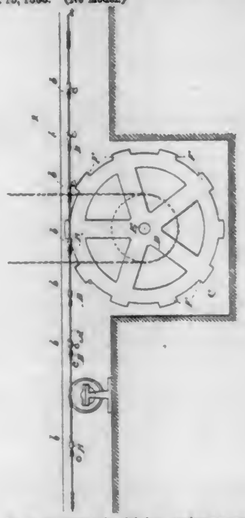
Claim.—1. As a means for attaching rails to corner-posts, the casting D, having an interior configuration corresponding to the exterior configuration of the rail, outwardly-projecting side flanges, d, perforated horizontally-extending flange D', and vertically-extending flanges d' d^2, with perforations and attaching means, substantially as shown, and for the purpose set forth.

2. The casting E, with grooved exterior surface and perforation f, and an interior configuration conforming to the shape of the rail B, in combination with the post A', horizontal rail B, and attaching-bolts, substantially as shown, and for the purpose set forth.

292,024. HYDRAULIC EXCAVATING-MACHINE. SAML. M. MANSFIELD, Galveston, Tex. Filed July 9, 1883. (No model.)

Brief.—An eroding jet-tube has a flexible connection permitting lateral and longitudinal adjustment with relation to the vessel, its position relative to the screw-propeller of which is such that the agitation produced by the propeller supplements that of the jet.

Claim.—1. The combination, with a propeller-wheel, of a water-jet tube and a flexible coupling for connecting said tube with a support and permitting its longitudinal and lateral adjustment, substantially as described.

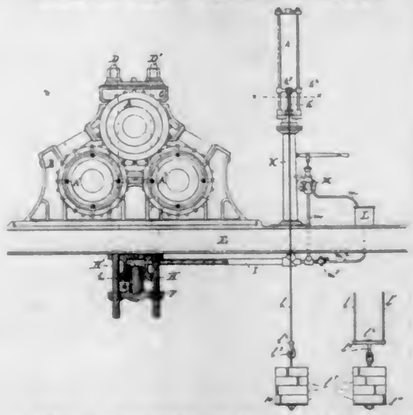


2. The combination, with the submerged propeller-wheel, of a water-jet tube having a flexible connection with a support permitting its longitudinal adjustment, and suspended vertically in such proximity to the propeller-wheel that the current induced by the said propeller will hold in suspension till carried off by the natural current the material disengaged by the jet, substantially as described.

3. The combination of a submerged propeller-wheel, a water-jet tube adjustable longitudinally and laterally, and located in such proximity to said propeller that the currents induced by the propeller will hold in suspension till carried off by the natural currents the material disengaged by the jet, and means for elevating and lowering said tubes, substantially as described.

4. The combination of a submerged propeller-wheel, a water-jet tube connected with a support by a flexible coupling, permitting its longitudinal and lateral adjustment, and suspended in such proximity to the propeller-wheel that the currents induced by the said propeller will hold in

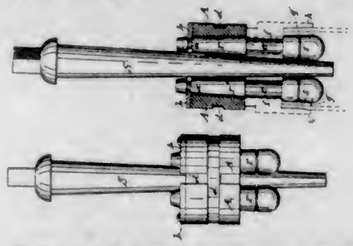
suspension till carried off by the natural current the material disengaged by the jet, and means for elevating and lowering said tube, substantially as described.



292,025. DEVICE FOR TRANSMITTING POWER FROM A CENTRAL STATION. WILLIAM MCCALL and J. VITAL DE VRY, San Francisco, Cal. Filed Oct. 15, 1883. (No model.)

Claim.—1. In an apparatus for driving stationary machinery by means of an endless traveling belt composed of wire ropes or strands, the central plates having side arms through which the ropes are interwoven at regular intervals, in combination with a wheel mounted upon a shaft, and having projections or teeth adapted to engage with the belt, whereby motion is imparted, substantially as set forth, and for the purposes described.

2. An endless traveling belt composed of wire ropes or strands arranged in groups upon each side of a central opening, in combination with central plates having side arms through which the ropes are interwoven at regular intervals, substantially as herein described.



292,026. HYDRAULIC-PRESSURE REGULATOR. JOHN SHEPHERD MCDONALD, New Orleans, La. Filed July 16, 1883. (No model.)

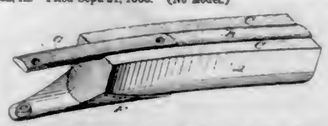
Claim.—1. The accumulator-head provided with the perpendicular guide-rods, the vertically-moving piston, and the cross-head, in combination with the rods *l l* and the removable weights for regulating the pressure of the piston, substantially as described.

2. The hydraulic-pressure regulator herein described, consisting of the liquid-pressure cylinder and accumulator, in combination with a reservoir, L, pump M, and pipes connecting said reservoir with the pressure-cylinder and accumulator, said parts being arranged substantially as described, and for the purpose set forth.

292,027. TUBE-EXPANDER. JOHN H. MCGRAW, Oswego, N. Y. Filed Aug. 4, 1883. (No model.)

Claim.—1. A flue-expander comprising a tapering spindle, conversely tapered rollers, and an expansible collar or body holding the rollers around the spindle, as specified.

2. A flue-expander consisting of a tapering spindle, an expansible body surrounding the spindle, and rollers interposed between said spindle and body and projecting with their ends at the face of the body, substantially as set forth.

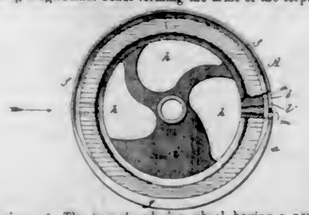


3. A flue-expander consisting of a longitudinally-divided collar or body, rollers partly embedded in the inner surface of the collar-sections and projecting at the end thereof, a yielding clamp applied to the collar, and a tapering spindle passing through the collar between the inclosed rollers, substantially as described and shown.

4. In combination with the tapering spindle, the longitudinally-divided collar provided internally with longitudinal channels, tapering rollers arranged in said channels and projecting at the end of the collar, and provided at one end with a circumferential groove, plates removably secured to the end of the collar-sections and engaging the groove of the rollers, and a yielding clamp applied to the exterior of the collar, all as described and shown.

5. In combination with the tapering spindle and tube-expanding rollers, the roller-carrying body, divided longitudinally, a yielding clamp applied to the exterior of the body, and gibs or compensating-blocks inserted between the body-sections, substantially as and for the purpose specified.

6. In combination with the tapering spindle and expansible body, the interposed rollers projecting at the end of said body, and provided between the same and the tube-rolling portion of the roller with a circumferential rabbet, substantially in the manner described and shown, and for the purpose set forth.

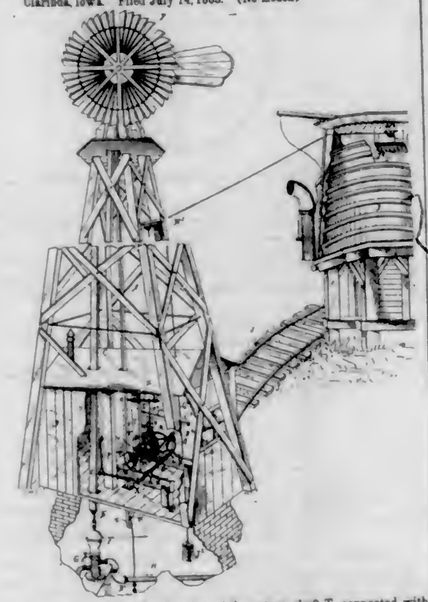


292,028. TIRE AND FELLY FOR WHEELS. PATRICK W. MCGUIRE, Lacon, Ill. Filed Sept. 21, 1883. (No model.)

Claim.—The combination, with the felly A, having the curved rib B, of the countersunken portion G, adapted to form a continuation of the rib, as described, and the tire D, provided with a groove adapted to receive the rib B of the felly.

292,029. RAILWAY TORPEDO-PLACER. GIBSON WARNER METCALFE, Baltimore, Md. Filed Sept. 27, 1883. (No model.)

Brief.—A portion of the tread of the torpedo-placing wheel is wider between the flanges than the normal width of the tread, has radial openings, and is weighted. The torpedo is provided with a metal strip having longitudinal beads forming the arms of the torpedo.



Claim.—1. The torpedo-placing wheel, having a portion of its tread between the flanges made wider than the normal width of the tread, and weighted, to cause said portion to assume the lowest position when the wheel is suspended by an axle, substantially as shown and described.

2. The torpedo-placing wheel, having a tread between two annular flanges and radial openings through the tread, and provided with recesses in the flanges for holding a torpedo in line with each of said openings, substantially as shown and described.

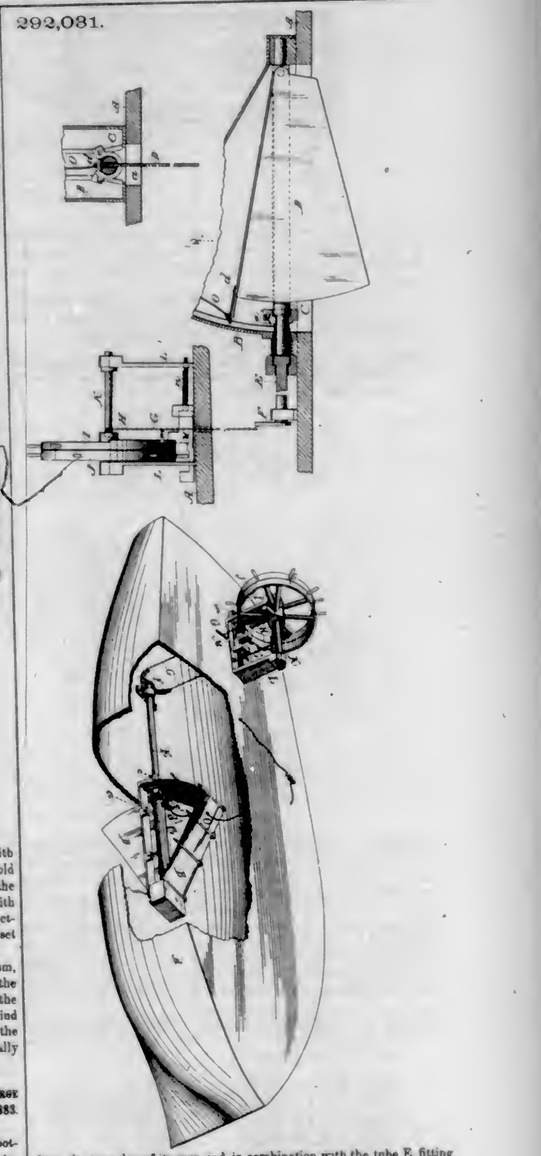
3. As an article of manufacture, the metal strip for securing a torpedo-signal to a rail, having longitudinal beads or folds *n*, substantially as shown and described, whereby the arms formed by the strip may be firmly held by the wheel when the former is made of soft metal, as specified.

292,030. ATTACHMENT TO WINDMILLS. GEORGE W. MILLER, Clarinda, Iowa. Filed July 14, 1883. (No model.)

Claim.—1. The combination of the rotary shaft T, connected with the stop mechanism and carrying the ratchet-wheel, the pawl to hold the latter, the pitman, the rock-shaft having the crank end carrying the pivoted loop that engages the ratchet-wheel, the lever connected with the pawl and loop, the tank, the float in the tank, and the line connecting the float with the said lever, substantially as and for the purpose set forth.

2. The combination of the pitman of the wind-wheel mechanism, the rock-shaft having the crank ends and operated by the pitman, the loop arranged on the end of the rock-shaft, the rotary shaft carrying the ratchet-wheel and drum, the stop-rod having the chain arranged to wind on the drum, the pawl, the lever connected with the pawl and loop, the float, and the line connecting the float with the latter lever, substantially as and for the purpose set forth.

292,031. ADJUSTABLE CENTER-BOARD FOR VESSELS. GEORGE L. MILLS and UPTON M. GORDON, San Rafael, Cal. Filed Nov. 17, 1883. (No model.)



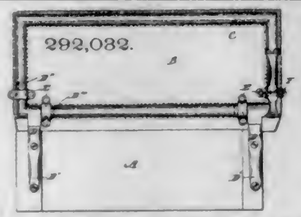
Claim.—1. In a boat, a center-board within the opening in the bottom thereof, and pivoted at one end and hinged longitudinally therein, in combination with means for rocking or inclining said center-board from side to side, substantially as and for the purpose set forth.

2. The slotted shaft C, mounted to oscillate over the opening in the bottom of the boat, and the center-board D, fitted in said shaft and pivoted by one end, in combination with means for rocking or oscillating said shaft to incline the center-board, substantially as herein described.

3. The slotted shaft C, mounted to oscillate over the opening in the bottom of the boat, and the pivoted center-board D, fitted in said slotted shaft, in combination with the rod or tube E, connected with the shaft, and having arms F, the chains G, and the hand-wheel I, to which they are secured, substantially as herein described.

4. The slotted shaft C, mounted to oscillate in a suitable casing over the opening in the bottom of the boat, and the center-board D, pivoted by one end in said slotted shaft, and having a flange or lip, *d*, projecting

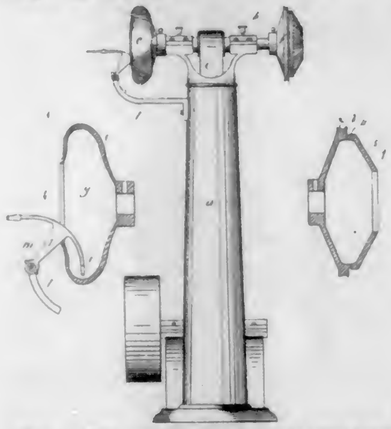
292,031.



from the top edge of its rear end, in combination with the tube E, fitting loosely the rear end of shaft, and having a slot, *e*, and side wings, *e'*, on its end to receive and confine the lip *d* of the center-board, the arms F on said tube, chains G, and hand-wheel I, all arranged and operating substantially as herein described.

5. In a boat, the pivoted and laterally-swinging center-board D, as described, in combination with the rocking tube or rod E, connected with the center-board, the arms F, chains G, and wheel I, and the means for holding said wheel, consisting of the spring pawl-bar M and the teeth *m* on the wheel, substantially as herein described.

292,032. DASH-BOARD. WILLIAM ELLIS MINSHALL, Mineola, Ill. Filed Aug. 25, 1883. (No model.)



Claim.—1. The combination, with an imperforate and footless dasher-frame, of a foot having angular tangs and an angular groove in

their faces, and means, substantially as specified, for clamping said frame to said foot, whereby the vertical and horizontal bars of said dasher-frame may be held at the same time in vertical and horizontal grooves of said clamp.

2. The combination, with a dasher-frame, of a foot adapted to secure one end of the same to a carriage, said foot containing a whip-socket in one and the same piece, as shown and described.

292,033. SOLE AND HEEL BURNISHING MACHINE. ALBION L. F. MITCHELL, Lawrence, and JAMES R. MITCHELL, Danvers, Mass. Filed Aug 21, 1883. (No model.)

Claim.—1. The combination, in an organized burnishing-machine, of the rotating hollow burnisher open at the front, and a swinging gas-burner mounted on a bracket, as described, so as to swing into the open end of the burnisher, substantially as and for the purposes set forth.

2. In an organized burnishing-machine, and in combination with a rotary shaft therein, driven by suitable mechanism, substantially as described, the burnisher described, having plane beveled surface 5, provided with radial ribs or corrugations, and adapted to burnish the tread of the heel, and having the molded surfaces 2 4, adapted to fit the contour and burnish the edge of the sole or heel, substantially as described.

292,034. SECONDARY BATTERY. EUSEBIUS J. MOLERA and JOHN C. CEBRIAN, San Francisco, Cal.; said Molera assignor to said Cebrian. Filed Feb. 23, 1883. (No model.)

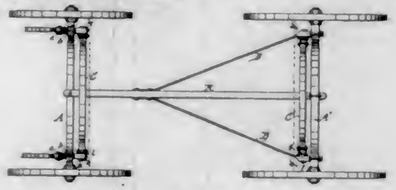
Claim.—The combination, with the electrodes of a secondary battery, each electrode being provided with a copper strip, as described, of a revolving commutator made of non-conducting material, and having metallic pins and strips disposed longitudinally upon its periphery, and respectively arranged to connect part of the electrodes for tension and part for quantity, substantially as set forth.

292,035. TILE, PIPE, AND SEWER PROTECTOR. ROBERT R. MORRISON, Vincennes, Ind. Filed Mar. 19, 1883. (No model.)

Brief.—Consists of a cylinder having a longitudinal slit, and a series of strips fastened by one end to the shell of the cylinder and their other end inclining toward the axis thereof.

Claim.—1. In a sewer, tile, or pipe protector, a cylinder having

292,035.



a longitudinal slit, and means therein for preventing animals from passing through, substantially as described.

2. In a sewer, tile, or pipe protector, a cylinder having a series of stripe fastened by one end to the shell of the cylinder and their other end inclining toward the axis thereof, substantially as described.

3. In a sewer, tile, or pipe protector, a cylinder having a longitudinal slit, and a series of strips fastened by one end to the shell of the cylinder and their other end inclining toward the axis thereof, substantially as described.

292,036. SPRING-VEHICLE. HARVEY A. MOYER, Syracuse, N. Y. Filed Oct. 3, 1883. (No model.)

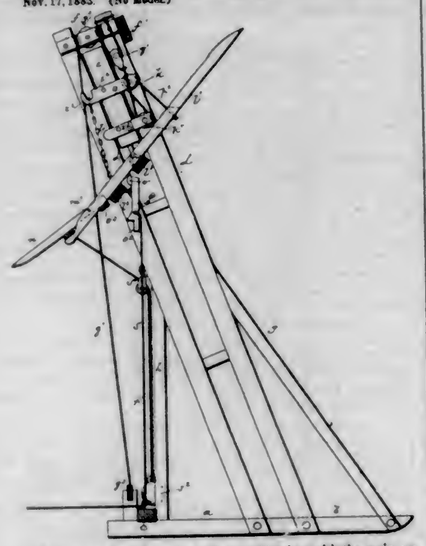
Claim.—1. The combination, with the axle, of a clip-bar attached thereto and formed at one end with a thill-coupling and at the opposite end with a spring-coupling, and a cross-spring hung on the latter.

2. The combination, with the axle, of a clip-bar attached thereto and formed at one end with a thill-coupling and at the opposite end with a sleeve standing with its axes horizontally at right angles to the axle, a link hung in said sleeve, and a cross-spring connected with the link, substantially as described and shown.

3. In combination with the front and rear running-gears, two reach-braces connected to the hind axle and formed at the side of said axle with a sleeve standing with its axes at a right angle to the axle, a link hung in said sleeve, and a cross-spring connected to the link, substantially as described and shown.

4. The combination of two axles formed with a depressed central portion, a reach connected to the center of said axles, reach-braces attached to the hind axle near the wheels thereof, and cross-springs coupled to the side of the axles, substantially as specified and shown.

292,037. FIRE-PROOF SHEET. JUNIUS NAGEL, Vienna, Austria-Hungary. Filed June 16, 1883. (Specimens.)



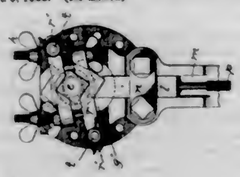
Claim.—1. As an improved article of manufacture, fire-proof plates or sheets made substantially as herein shown and described, and consisting of wire cloth or netting or other fabric on which a mixture of asbestus and oxide of zinc, magnesia, lime, or analogous substances is applied,

which mixture is saturated with a solution of sulphate of alumina or metal chloride, as set forth.

2. The herein-described method of making fire-proof sheets or plates, consisting of applying a mixture of asbestus and oxide of zinc, magnesia, or lime on wire netting or cloth, then pressing the said mixture into the meshes of the netting or fabric, and then saturating the fabric with a solution of sulphate of alumina or a metal-chloride solution, substantially as set forth.

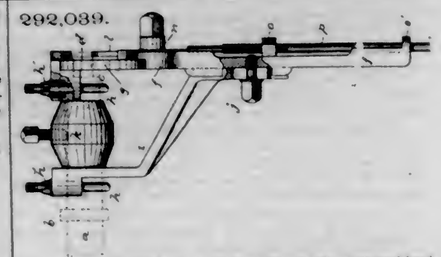
292,038. HAY-RICKER. D. FRANKLIN OLIVER, Huntsville, Mo. Filed Nov. 17, 1883. (No model.)

Claim.—1. In a hay-stacker, the combination, with the main carriage and frame and mechanism for tilting, raising, and lowering it in said frame, of a hinged folding auxiliary carriage connected thereto, and mechanism for holding and tripping it, substantially as specified.



2. In a hay-stacker, the combination, with the frame having rearwardly-inclined parallel uprights secured together in pairs, and having ways or spaces between them, of the carriage-heads, inner and outer guide-plates therefor, upper and lower pulleys mounted upon the inner plates, the stay-chains and tilting-ropes connecting the front and rear of the main carriage to the guide-plates, their pulleys, and the loose pulley-block, the folding carriage, and mechanism for operating them, substantially as specified.

3. In a hay-stacker, the combination, with the main carriage, its heads, operating-pulleys, ropes, and stay-chains, of the folding or auxiliary carriage, the pivoted weighted latch, and ropes for tripping and setting the auxiliary carriage, substantially as specified.

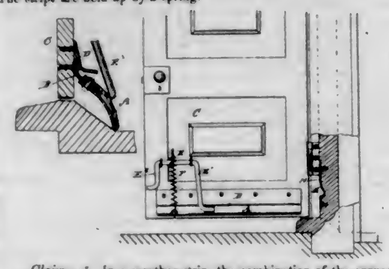


4. In a hay-stacker, the combination, with inclined ways, carriage-heads working therein, and a tilting and folding carriage hinged to the lower ends of the carriage-heads, of mechanism for tilting, elevating, tripping, and lowering the same, substantially as specified.

5. In a hay-stacker, the combination, with the supporting-frame and the tilting and folding carriage, of the carriage-heads connected at their lower ends to said carriage, guide-plates on both sides thereof, upper and lower fixed pulleys, the loose pulley-block, ropes passing from the tilting-bars of the main carriage to the loose pulley-block, the stay-chains connected to the inner upper guide-plates, and to the rear ends of the main carriage, and mechanism for operating them, as set forth.

292,039. AXLE-REPAIRING TOOL. FRANK S. PACKARD, Rockville, Conn. Filed Sept. 3, 1883. (No model.)

292,039.

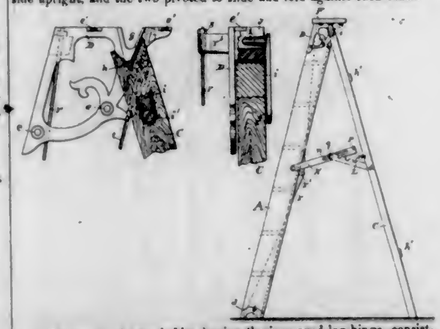


Claim.—1. In combination, the lever *f*, having the perforated head, the auxiliary arm *i*, and the collar bearing the set-screw and adapted to rotate between the lever and arm, all substantially as described.

2. In a tool of the within-described class, in combination, the lever *f*, with the head *g*, provided with a number of bolt-holes, and bearing a cutting-tool, *l*, the nut *e*, the dog *r*, consisting of the arms having slots *r'*, and the bolts *t* and nuts, whereby the dog may be secured to the nut and lever-head, all substantially as described.

292,040. WEATHER-STRIP. IRA PADDOCK, Greeley, Kans. Filed Nov. 25, 1882. (No model.)

Brief.—A curved flexible strip is secured at one edge to a door, and has its other edge clamped within a curved doubled metallic strip. The strips are held up by a spring.

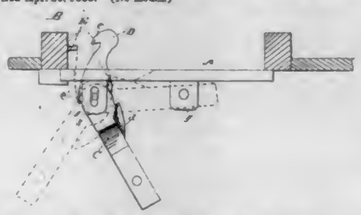


Claim.—1. In a weather-strip, the combination of the curved metallic strip A and curved flexible strip B, the former doubled and the latter clamped within its fold, and secured to the bottom of the door, as shown and described.

2. The combination, with the strips A B, of the spring F, attached to the door and said strip A, and adapted to hold up said strips as the door opens and closes, as described.

292,041. STEP-LADDER. DUDLEY PAGE, Frederick, Md. Filed Oct. 4, 1883. (No model.)

Brief.—The hinge is formed by notching the upper ends of the legs to receive lugs from the top irons, the legs being provided with pins which bear in the recessed portions of said lugs. The side rails are braced or trussed by steel wires, the upper ends of which are secured in the top irons and the lower ends in irons at the bottom of the rails. A brace composed of two arms, one pivoted to the leg and the other to the side upright, and the two pivoted to slide and fold against each other.

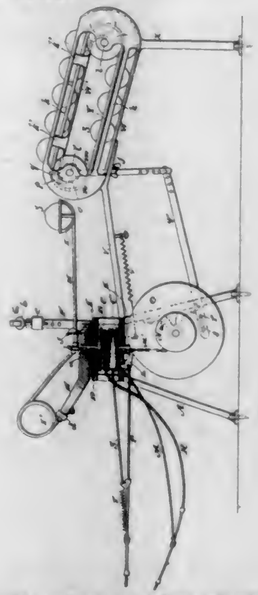


Claim.—1. A step-ladder having the improved leg-hinge, consisting of a lug at the top of the side upright, having a depression on its upper side constituting one part, a notch at the upper end of the leg in

which the lug has bearing, and which constitutes the other part, and means to bind the said two parts together, as set forth.

2. A step-ladder having a brace to limit the spread of the legs from the side uprights, consisting of two arms, one of which is pivoted to the leg and the other to the side upright, and the said arms hinged or jointed together to permit them to fold against each other, and adapted for the hinged ends to slide or extend on each other, as set forth.

3. A step-ladder having attached to the lower end of each side upright a metal shoe provided with a lug having a hole, and at the upper end a top iron provided with a lug having a hole, and a wire truss, one end of which is passed into the hole of the shoe-lug and the other end into the hole of the top iron lug, as set forth.



292,042. DOOR-LATCH. MELVIN HARRY PALMER, St. Louis, Mo. Filed Apr. 26, 1883. (No model.)

Claim.—1. In a locking device for car-doors, the combination of the door and frame with the slotted plate having arranged thereto the lever and latch, as described, said plate being provided with the lugs by which the lever and latch are pivotally held, and corresponding lugs at its opposite end, between which it is turned and secured, by which movement of the lever the latch is made to engage a keeper on the frame, as set forth.

2. In car-door locks, the combination of the slotted plate *a*, provided with lugs *f*, having holes for the passage of a pin, and the slotted lugs *b*, with the forked lever C, having on its inner edge the shoulder *d*, and the latch having projection *d'*, said latch and lever being held between the slotted lugs by a pin, as shown, and the whole adapted substantially for the purpose described.

292,043. BALL-TRAP. JAMES C. PARMERLEE, Sedalia, Mo. Filed July 5, 1883. (No model.)

Claim.—1. The combination, in a ball-trap, of a spring-lever for impelling the ball, a revolving lever-supporting arm, a trigger pivoted to the latter and having a heel-piece, a vertically-movable trigger-tripping device having an arm at its upper end connected with the heel of the trigger to move the latter both into and out of engagement with the ball-impelling lever, said trigger-tripping device revolving with the lever-supporting arm, and means for lifting the trigger-tripping device to swing the trigger on its pivot and release the ball-impelling arm, substantially as described.

2. The combination, in a ball-trap, of a spring-lever for impelling the ball, an arm supporting said lever and provided with a vertical shaft, two pulleys secured to said shaft, two ropes respectively connected with said pulleys for revolving the lever-supporting arm and restoring it to its normal position, a trigger for holding the ball-impelling lever, and means for operating the trigger to release said lever, substantially as described.

3. The combination, in a ball-trap, of a spring-lever for impelling the ball, an arm supporting said lever and provided with a vertical hollow shaft, a trigger secured to the lever-supporting arm, a trigger-tripping tube extending through the hollow shaft and connecting at its upper end with the trigger, means for vertically moving the trigger-tripping tube, a chain extending through the said tube and connected with the ball-impelling lever, and means for drawing the chain downward to engage the ball-impelling lever with the trigger, substantially as described.

4. The combination, in a ball-trap, of a spring-lever for impelling the ball, an arm supporting said lever, and having a vertical hollow shaft, a trigger for holding the ball-impelling lever, a trigger-tripping tube projecting through the hollow shaft and connected at its upper end with the trigger, a pivoted angle-lever, on one end of which the trigger-tripping tube bears, a rope for operating the lever to lift the tube, a chain extending through said tube and connected with the ball-impelling lever, and means for drawing the rope downward to engage the ball-impelling lever with the trigger, substantially as described.

5. The combination of the ball-impelling lever, the lever-holding trigger, the trigger-tripping device, a chain connected with the ball-impelling lever, a pulley with which said chain is connected, a shaft supporting the pulley, an additional pulley on said shaft, and a rope for rotating the latter pulley to draw the impelling-lever downward to engage the trigger, substantially as described.

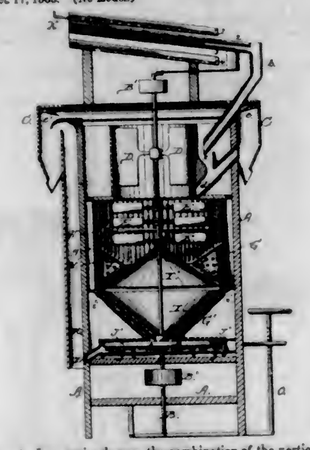
6. The combination, in a ball-trap, of the spring-lever for impelling the ball, the arm supporting the lever, and having a shaft, the two pulleys secured to said shaft, and the positioning and the rotating ropes passing around the pulleys in opposite directions, substantially as described.

7. The combination, in a ball-trap, of the lever for impelling the ball, a chain connected with the lever, a pulley for winding and unwinding the chain, a traveling carrier for carrying the balls and delivering them to the ball-impelling lever, and connecting mechanism between the chain-pulley and the carrier for moving the latter when the ball-impelling lever is set, substantially as described.

8. The combination, in a ball-trap, of the lever for impelling the ball, a chain connected with the lever, a pulley for winding and unwinding the chain, an endless traveling belt for carrying the balls arranged in line with the lever, and connecting mechanism between the belt and the chain-pulley for driving the belt when the lever is set, substantially as described.

9. The combination, in a ball-trap, of the spring-lever for impelling the ball, the arm supporting said lever and carrying a vertical post having a series of perforations, and the cushioned stop-bracket having a pin adapted to enter any one of the perforations to adjust the bracket vertically, substantially as described.

10. The combination, in a ball-trap, of the spring-lever for impelling the ball, the arm supporting said lever and carrying a vertical post, the cushioned bracket adjustably connected with said post, and means for vertically adjusting and holding the bracket on the post, substantially as described.



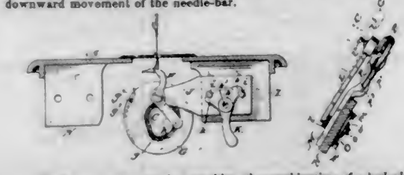
11. The combination, in a ball-trap, of the ball-impelling lever, a chain connecting therewith, and a pulley for actuating the chain to set the lever, the ball-feeding mechanism composed, substantially, of a traveling apron, and pawl and ratchet for moving it forward, and devices connecting the chain-pulley with the pawl and ratchet, substantially as described.

12. The combination, in a ball-trap, of the revolving arm and its hollow shaft, the ball-impelling lever supported thereon, the tripping-tube passed through the hollow shaft, the trigger pivoted to the arm and entering a slot in the extension of the tripping-tube, a lever for operating the tripping-tube, a rod, string, or chain passing through the tube and connecting the impelling-lever and a pulley, the rope connecting with the chain-pulley, the two pulleys on the hollow shaft, the rotating-rope connecting with one of said pulleys, and the positioning-rope connecting with the other, the setting-rope connecting with the positioning-rope and passing around the main operating-pulley, and the trigger-cord connecting with the rotating-rope and tripping-lever, substantially as described.

13. The combination, in a ball-trap, of the revolving arm having the shaft, the pulleys on the shaft, the trigger, the tripping-tube, the lever for operating the tube, the main pulley, the positioning and the rotating ropes connected to the pulleys on the shaft of the arm, the setting-rope connecting the positioning-rope and main pulley, the trigger-rod connecting the tripping-lever and rotating-cord, and the spring for reversing the main pulley, substantially as described.

14. The combination, in a ball-trap, of the revolving arm, the ball-impelling lever thereon, the pulley for revolving the arm, the pulley for operating the chain which draws down the arm, the setting-rope, and the positioning-rope joined to the pulley connected with the arm, and having a spring or elastic connection with the setting-rope, substantially as described.

292,044. GRAIN-CLEANER. ELNATHAN PHELPS, Hartford, Mich. Filed Oct. 17, 1883. (No model.)



Claim.—1. In a grain-cleaner, the combination of the vertical shaft B, suction-fan D, distributing beater-blades E, vertical rods F, inclined shelves H H', and brush-frames J, I, and J' with the spout *b*, chamber C, casing G, and frame A, substantially as described.

2. In a grain-cleaner, the inclined distributing beater-blades E, arranged one above the other, in combination with the vertical rods F, inclined shelves H H', and perforated casing G, as shown and described.

292,045. SEWING-MACHINE. JOHN W. POST, New York, N. Y. Filed Nov. 16, 1883. (No model.)

Brief.—Improvement upon the machine shown in Letters Patent No. 287,576, granted same party October 30, 1883, the object being to render the interchangeable parts for forming different stitches quickly and easily attachable to and detachable from the machine in making the change from one form of stitch to another. A take-up consists of two eyes on the face-plate, serving as guides for the thread, and a projection in the needle-bar to engage the thread between the said eyes on the downward movement of the needle-bar.

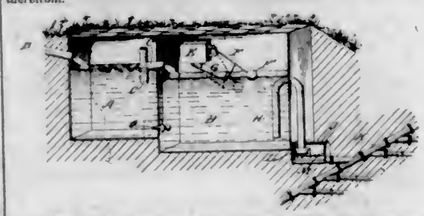
Claim.—1. In a sewing-machine, the combination of a bed-plate, a fixed bracket, a removable bracket, a plurality of recessed pins, and a single pivoted latch adapted to engage said pins, and thereby secure the removable bracket to the fixed bracket, substantially as described.

2. In a sewing-machine, the combination of a bed-plate, a fixed bracket provided with recessed pins, a removable bracket having holes for the passage of said pins, and a single pivoted latch adapted to engage said pins, and thus secure said brackets together, substantially as described.

3. In a sewing-machine, the combination of a bed-plate, a fixed bracket, a removable bracket, a plurality of recessed pins, a single pivoted latch adapted to engage said pins, and a friction device for holding said latch in any position to which it may be adjusted, substantially as set forth.

4. In a sewing-machine, the combination of a bed-plate, a fixed bracket, a removable bracket, a plurality of recessed pins, a single pivoted latch adapted to engage said pins, and a looper carried by said removable bracket, substantially as described.

5. In a sewing-machine, the combination, with a bracket adapted to be removably secured to a bracket on the bed-plate thereof, of a bobbin-supporter and a looper, both carried by the removable bracket, and thus adapted to be simultaneously attached to or removed from the machine, substantially as described.



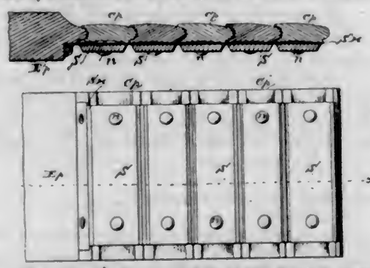
6. The combination, with a looper having a recessed pin fixed thereto, of a crank-disk having a hole in which said pin fits, and a spring-catch for removably securing said pin in said hole, substantially as described.

7. The combination, with a bracket adapted to be removably attached to the bed-plate of a sewing-machine, of a bobbin-supporter consisting of two arms, one of said arms being fixed with relation to said bracket, and the other arm hinged to the fixed arm, substantially as described.

8. The combination of the bed-plate A, fixed bracket N, and removable bracket M, with the bobbin-supporter P, consisting of the fixed arm *p*, hinged arm *p'*, and the spring p^3, for holding said hinged arm in its operative position, substantially as described.

292,046. DISINFECTING-TANK FOR THE DISPOSAL OF SEWAGE. JAMES J. POWERS, Brooklyn, N. Y. Filed Oct. 1, 1883. (No model.)

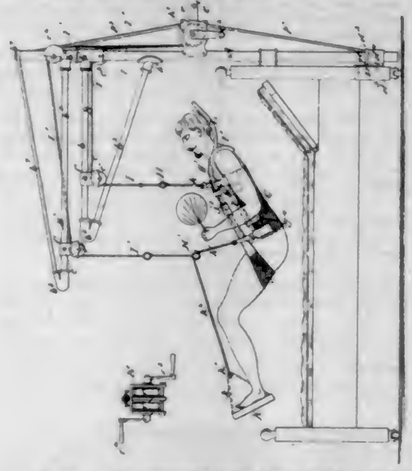
Brief.—Employs a settling-tank connecting with a disinfecting-tank, which connects by a siphon with a tank receiving the end of the siphon, the latter having an automatically-closing valve. The last tank connects with a series of drain-tiles. The disinfecting-tank has within it a tank containing a disinfecting-liquid, which is automatically discharged therefrom.



Claim.—1. The combination, with a settling-tank, of a disinfecting-tank, a tank for containing a disinfecting-liquid, and a series of absorption or drain tiles for carrying off the liquid sewage from the disinfecting-tank, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with a settling-tank and a disinfecting-tank, of a tank for receiving disinfecting-liquid, and provided with means for automatically discharging the disinfecting-liquid, a siphon for conducting the liquids from the disinfecting-tank, a tank into which the free end of the siphon discharges, and tiles connected with the last-mentioned tank, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with a settling-tank and a disinfecting-tank, of a tank containing a disinfecting-liquid, and provided with devices for automatically discharging the disinfecting-liquid, a siphon for conducting the liquid out of the disinfecting-tank, an automatically-closing valve at the lower end of the outer shank of the siphon, and a tank into which the outer end of the siphon projects, substantially as herein shown and described, and for the purpose set forth.



292,047. FLEXIBLE SHUTTER. JOHN P. RECKER, Indianapolis, Ind., assignor to the Indianapolis Cabinet Company of Indiana. Filed July 5, 1883. (No model.)

Brief.—A flexible-jointed shutter having its several slats joined together by a continuous metal tie-strip and individual rear strips.

Claim.—The flexible-jointed shutter herein described, composed of the shutter-slats *Cp*, slats S, and continuous metallic strip *Sm*, all combined substantially as described.

292,048. APPARATUS FOR HOLDING AND MOVING INVALIDS. CHARLES F. REED, Brooklyn, N. Y. Filed Sept. 14, 1883. (No model.)

Claim.—1. The combination of the pivotal upright A, the horizontal arm B, fixed on said upright, and the longer horizontal arm B', revoluble independently on the upright, together with the adjustable runners C, carrying the pulleys c' and c^2 on said arms, respectively, the pulleys c^3 of the fixed arm, the pulley c^4 of movable arm, the cords I and I', and the reels e and e', and means attached to said cords, for holding and sustaining the human body, as described, and for the purpose specified.

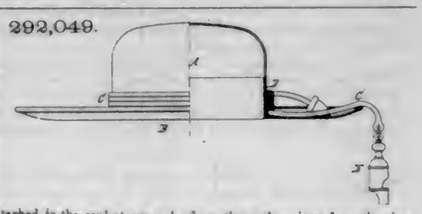
2. The combination of the upright of piping A, the piping b, T b', piping b^2, elbow b^3, union b^4, and the piping b^5, T b^6, rod b^7, elbow b^8, and pin b^9, constituting, respectively, the fixed horizontal arms B and the movable arm B' of the said upright, together with pulleys c', c^3, c^4, and c^5, reels e and e', and cords I and I', and a jacket or straps for holding and sustaining a human body, all constructed and arranged to operate as and for the purpose specified.

3. The combination, with the upright A, having the fixed arm B and movable arm B', and the hoisting-tackle described, together with means for holding and sustaining a human body, as set forth, of the angle-plates D, mounted upon the leg of a bedstead, as specified, and having the face-plate d, recessed at d', and carrying the flanges d^4, together with the sleeves d^4, having shanks d^5, and lock-flanges d^3, all constructed and arranged to operate as and for the purpose set forth.

4. The combination, with the pivotal upright A, having the fixed arm B and movable arm B', and the hoisting-tackle described, of the jacket G, provided with the side-edge corner-loops g g' and g^2 g^3, the cords A and A', the eveners H and H', attached to the tackle-ropes I and I', respectively, and the thigh-strap J, composed of the central supporting part, j, and the fastening-straps j', the latter being secured to the loops g g' of the jacket, as described, and for the purpose specified.

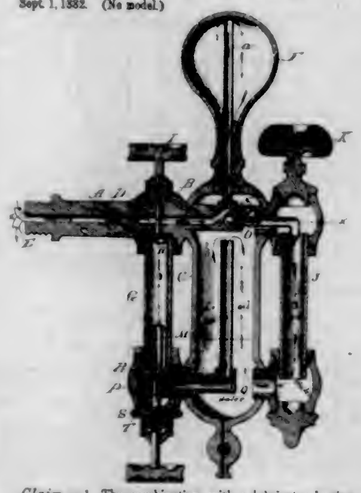
5. The combination, with the supporting-jacket G, which is attached to the lifting-tackle, and devices described, of the head-rest L, carried by rods l, seated in loops g^4, on the edge of the jacket, and the curved shoulder-pieces l', together with the thigh-strap J and its fastenings j', attached to loops g g' of the jacket, all as set forth, and for the purpose specified.

6. The combination, with the supporting-jacket G and the thigh-strap J, as described, attached to the hoisting-tackle set forth, by the eveners, of the foot-rest K, its cords k, evener k', and adjustable cord k^2, extending to the evener H', as and for the purpose specified.



7. The combination, with the supporting-jacket G and thigh-strap J, as described, carried by the lifting-tackle set forth, of the leg-brace composed of the sections M N, hinged at m by set-screw n, the upper ends of sections M being seated in sockets g^2 on the jacket, and said section having cross-piece m^1, and section N, having cross-piece n^1, and the sections being adjustable as to length, all as and for the purpose specified.

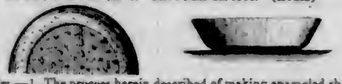
292,049. HAT. WILLIAM RETTENTER, Brooklyn, N. Y. Filed Dec. 22, 1883. (No model.)



Claim.—1. The combination of the clasp, the hat-cord drawn through the clasp in coils, and the whistle attached to the cord at one end, where the cord projects from the clasp, substantially as shown and described, for the purpose set forth.

2. The combination, with a hat, of the clasp, the cord drawn through the clasp in coils to embrace the crown of the hat, and the whistle attached to the cord at one end, where the cord projects from the clasp, substantially as shown and described, for the purpose set forth.

292,049.



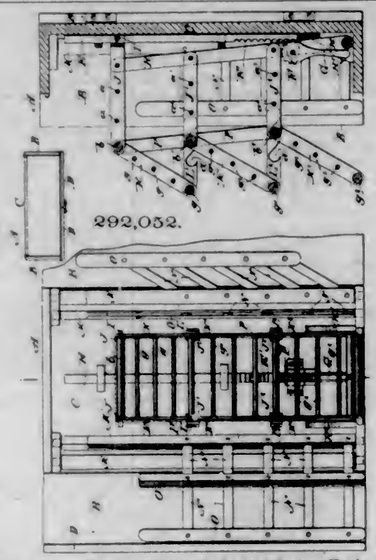
292,050. LUBRICATOR. JOHN J. REINHARD, Detroit, Mich. Filed Sept. 1, 1882. (No model.)

Claim.—1. The combination, with a lubricator having separate steam and oil chambers arranged in a vertical line one above the other, and a supporting-trunk provided with separate steam and oil passages, of two glass sight feed-tubes, through which both the descent of water and ascent of oil may be observed, as set forth.

2. The combination, with a lubricator having separate steam and oil chambers, and a supporting-trunk having separate steam and oil passages, of the two separate water and oil sight feed-tubes, the upper ends of which tubes communicate, respectively, one with the steam-chamber, from which water is received, and the other with the separate oil-passage in said trunk, through which oil is conducted from the oil-chamber to the boiler, as set forth.

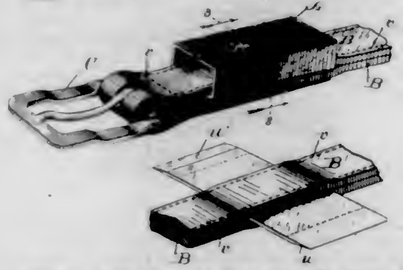
292,051. MANUFACTURE OF ENAMELED SHEET-METAL WARE. CARL REUSCH, New York, N. Y. Filed June 22, 1883. (Model.)

Claim.—1. The process herein described of making enameled sheet-metal ware, which consists, first, in uniting a layer of sheet-iron with a layer of copper or other suitable metal; secondly, stamping or forming said sheets into various hollow forms, with the copper or other metal at the outside; and, lastly, lining the interior surface of said sheet-iron body with a suitable glaze or enamel, substantially as and for the purpose set forth.



2. As a new article of manufacture, an enameled sheet-metal vessel formed of a body of sheet-iron having an exterior covering-layer of copper or other suitable metal united thereto by rolling, and an interior protecting coating of enamel or glaze, substantially as set forth.

292,052. CLOTHES-DRIER. ROBERT RUSSELL RICHARDSON, Laramie City, Wyo. Filed Aug. 9, 1883. (Model.)

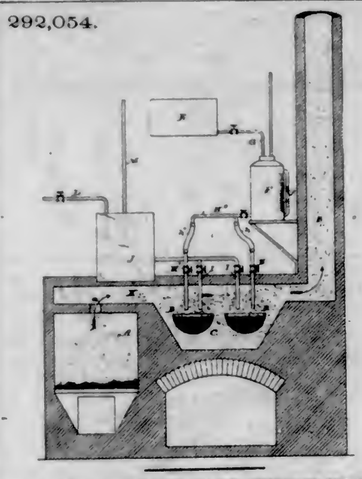


Claim.—1. The combination, with a closet having the back C, a vertical slide-rack on the middle thereof, a supporting-frame, and a pinion-lever, of frames pivoted to the standard and connected with the rack, substantially as shown and described.

2. The combination, with the closet having a vertical slide, E, carrying the cross-rod I on the middle of its back, of the bars H, pivoted at their lower ends to plates H', the connected arms J, pivoted to cross-rod I and bars H, the arms J' J^2, united by rods a' b' a^2 b^2, and pivoted to bars H, the bars K K' K^2, pivoted, respectively, to arms J J' J^2, the notched bars L L' L^2, pivoted to and united with bars K K' K^2 by rods g g' g^2, and the bars P, pivoted to the outer ends of the bars J J' J^2, as and for the purpose specified.

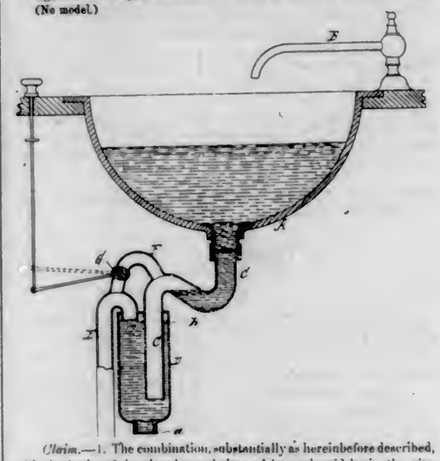
3. The combination, with a closet, of the sliding rack-bar E, the bars H and P, the bars J J' J^2, united by suitable rods, the bars K K' K^2, pivoted to the bars J J' J^2, and united by suitable rods, and the bars L' L^2, pivoted to the bars K K', and provided with notches d, and united by rods, substantially as herein shown and described.

292,053. HARNESS-LOOP. FRANK RICHESON, Chicago, Ill., assignor of one-half to Charles Stafford, same place. Filed Oct. 31, 1883. (No model.)



Claim.—1. A loop for harnesses, straps, and the like, formed of a strip of suitable material secured transversely to the harness or strap, and having its ends brought together away from the strap-bearing and secured one to the other, substantially as described.

2. A loop for harnesses, straps, and the like, formed of a strip of suitable material secured transversely to the harness or strap, and having its ends correspondingly chamfered—the one on the upper the other on the lower surface—and brought together away from the strap-bearing and cemented one to the other, substantially as described.



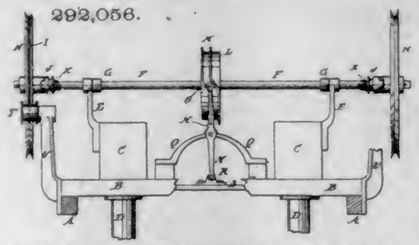
292,054. APPARATUS FOR MAKING SULPHURIC ACID. JOHN SAMUEL RIGBY, Beaufort, assignor of one-half to Fred Brotherhood, Charleston, S. C. Filed Nov. 1, 1883. (No model.)

Claim.—The combination of the kiln or burner, the niter-oven, its pans, the sulphuric-acid-beating cistern, the vessel provided with the indicator and serving to contain nitrate of soda in solution, the pipes provided with stop-cocks for supplying the solution to the pans, and the pipes for supplying the pans with sulphuric acid, substantially as and for the purpose hereinbefore set forth.

292,054.

292,055. COMBINED TRAP AND OVERFLOW FOR WASH-BASINS, WATER-CLOSETS, SINKS, &c. CARROLL L. RIKER, Brooklyn, assignor to Christopher Gullmann, New York, N. Y. Filed July 18, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with the basin, of the closed vessel situated beneath said basin, the pipe bent to form the trap, and extending from the bottom of the basin into and near to the bottom of the closed vessel, the discharge-pipe, extending from the top of the closed vessel and turning downward, the connecting-pipe, which extends from the highest point of the trap into the discharge-pipe, and the stop-cock fitted into the connecting-pipe.



2. The combination, substantially as hereinbefore described, with the basin, of the closed vessel situated beneath said basin, and constructed so as to provide an air cushion in the top thereof, the pipe bent to form the trap, and extending from the bottom of the basin into and near to the bottom of the closed vessel, the discharge-pipe, extending from the top of the closed vessel and turning downward, the air cushion formed in the top of the closed vessel, the connecting-pipe, which extends from the highest point of the trap into the discharge-pipe, and the stop-cock fitted into the connecting-pipe.

3. The combination, substantially as hereinbefore described, with the basin, of the closed vessel situated beneath said basin, the pipe bent to form the trap, and extending from the bottom of the basin into and near to the bottom of the closed vessel, and the discharge-pipe, extending from the top of the closed vessel and turning downward.

292,056. CHECK-ROW ATTACHMENT FOR CORN-PLANTERS. WM. W. ROBINSON, Ida Grove, Iowa. Filed Aug. 14, 1883. (No model.)

Claim.—The combination, with the seed-boxes C and the seed-dropping slide S, of the brackets E, the shaft F, the wheels H, grooved

292,056.

to receive the check-line, the wheel L, having cam-groove M, the lever N, having roller P, and the bracket Q, substantially as herein shown and described, whereby the said seed-dropping slide will be operated by the advance of the machine, as set forth.

292,057. WIND-WHEEL. ROBERT N. ROCKWELL, Peabody, Kans. Filed June 29, 1883. (No model.)

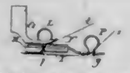
Claim.—1. The combination of the hub having the spiral mortises in its periphery, the longer vanes fitting with their inner ends into the said mortises, the shorter vanes fitting with their inner ends into the spaces between the ends of the longer vanes, and means for holding the said vanes in position, as and for the purpose shown and set forth.

2. The herein-described wind-wheel, consisting of the shaft having the outer square portion and the outer screw-threaded end provided with a fastening-nut, the hub having the spiral mortises in its rim, and having the square central perforation, the longer vanes, the shorter vanes, the inner smooth disk, the outer disk having the annular sharp inwardly-projecting flange upon its inner face, the bolts passing through the edges of the disks and through the vanes, and the outer flat ring or annular rim fastened to the outer ends of the vanes, all constructed and combined as and for the purpose shown and set forth.

292,058. SHIRT-STUD. BERNHARD ROEDE, Jersey City, N. J. Filed June 8, 1883. (No model.)

Claim.—As an improved article of manufacture, a stud or button having its spiral screw-shank gradually diminishing in diameter from its inner to its outer end, substantially as shown and described.

292,059. NEEDLE-CASE. JOSEPH S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed May 31, 1883. (No model.)



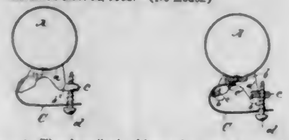
Claim.—1. The combination of the base A, the case B, pivoted thereto, the sliding plate D, within said case, the said plate and base constructed, the one with a transverse slot and the other with a corresponding stud, whereby the turning of the said case upon its pivot imparts to said plate a longitudinal movement, substantially as described.

2. The combination of the base A, constructed with the flange *a* at one end, the case B, pivoted to said plate at its opposite end, the sliding plate D, within said case, the said plate and base constructed, the one with a transverse slot and the other with a corresponding stud, whereby the turning of said case upon its pivot imparts a longitudinal movement to said plate, said flange *a* forming a cap for the open end of the case in its closed position, substantially as described.

3. The combination of the base A, the case B, pivoted thereto, the sliding plate D, within said case, the said plate and base constructed, the one with a transverse slot and the other with a corresponding stud, whereby the turning of the said case upon its pivot imparts to said plate a longitudinal movement, the inner side of said plate D provided with a cushion, E, substantially as and for the purpose described.

292,060. HEMSTITCH ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed Oct. 31, 1883. (No model.)

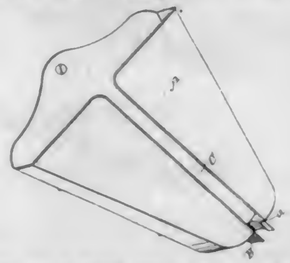
292,060.



Claim.—1. A guide for sewing-machine work, consisting of an arm having a slot in line across the path of the needle, combined with the spring-guide P, of horseshoe shape, the opening in the spring-guide parallel with the slot, the two ends extending through the slot and turned at right angles to the slot, and whereby the elasticity of the horseshoe-shaped guide P holds it in position in said slot, yet admits of its adjustment, substantially as described.

2. The combination of the two connected arms D E, the arm E divided by a slot in line across the path of the needle, the two divisions provided the one with a removable sleeve, H, and the other with a removable sleeve, I, the one I constructed with a needle-hole, *o*, and slot, *r*, leading forward therefrom, substantially as and for the purpose described.

3. The combination of the two connected arms D E, each constructed with a slot diagonal to the path of the needle, the forward part of the arm E provided with a bearing to stand between the presser-foot and work-table, the other part provided with a separator, and so as to leave a slot, *l*, forward of the separator, substantially as described.



292,061. WHIP-SOCKET. ANSON SEARLS, Newark, N. J. Filed Jan. 2, 1883. Renewed Nov. 14, 1883. (No model.)

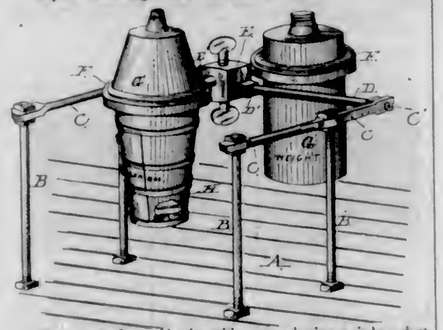
Claim.—1. The described whip-socket fastener, consisting of the described buckle-frame rigidly attached to the socket and composed of the sides *a a'* and the cross-bars *b b'*, and b^2, said bars *b* and *b'*—one or both—being provided with spurs, as specified, and the bar b^2 being provided with the perforated screw-threaded lug *c*, together with the flexible looped perforated metallic strap C, one end of which is inserted between the said sides *a a'* under the said cross-bar *b'* and over upon the cross-bar *b* and in engagement with the spurs on said bars—one or both—the opposite end being secured to the said lug *c* by a screw, *d*, all constructed and arranged to operate as and for the purpose described.

2. The combination, in a whip-socket fastener, of the described buckle-frame, composed of the sides *a a'* and the cross-bars *b b'* b^2, the bars *b* and *b'*—one or both—being provided with spurs, as specified, and the bar b^2 being provided with the perforated screw-threaded lug *c*, and screw *d*, with the flexible looped perforated metallic strap C, having the slotted opening *f*, all as and for the purpose described.

292,062. BROOM-SUPPORT. WILLIAM T. SHAFFER, Evanston, Wyo. Filed June 28, 1883. (No model.)

Claim.—As an improved article of manufacture, the broom-pocket A, made similar in shape to the brush of a broom, and provided with a closed bottom, having a central aperture, *a*, neck B around said aperture, and the slot C, extending from the top down to and through the neck, the said slot being of a uniform width throughout, and of a width greater than the diameter of a broom-handle, as set forth.

292,063. LOCK-NUT. NATHAN E. SHALLER, Pullman, Ill., assignor of two-thirds to Simeon W. Shaller and W. W. Shaller, both of Ivoryton, Conn. Filed Nov. 26, 1883. (No model.)



Claim.—1. The combination of the washer A, constructed with its central bearing surface, *a*, the concentric channel B, spring C in said channel, and ring D in said channel and upon the spring, and having its upper surface radially serrated, with the nut E, having its under face, *i*, constructed to bear upon the surface *a* of the washer, and its surrounding surface serrated corresponding to the serrations in the ring, and so as to work therein, substantially as described.

2. The combination of the washer A, constructed with a bearing-surface, *a*, for the nut, and with a concentric channel, B, the spring C in said channel, and serrated ring D upon said spring, said ring and washer constructed the one with a projection, *d*, and the other with a corresponding notch, *b*, whereby said ring is engaged with said washer, and the nut E, constructed with its bearing-surface *i* corresponding to the surface *a* of the washer, and with a serrated surface surrounding said bearing-surface corresponding to the serrated surface of the ring, substantially as described.

3. The combination of the washer A, constructed with a bearing-surface, *a*, for the nut, and with a concentric channel, B, the spring C in said channel, and serrated ring D upon said spring, the said ring constructed with one or more recesses upon its face, and the washer with corresponding tongues, *f*, substantially as and for the purpose described.

292,064. SELF-ADJUSTING STOVE. WILLIAM G. SHOWERS, Ridgway, Ill. Filed Aug. 9, 1883. (No model.)

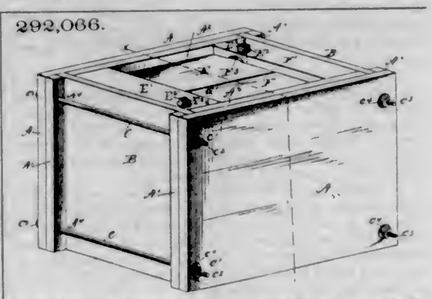
Claim.—1. In combination with a stove having an independent weight-receptacle, H, a counter-weight receptacle, G, the stove and weight being supported within frames F F, and by a block, E, pivoted upon the rod D, the parts being organized substantially as shown, and for the purpose set forth.

2. The improved self-adjusting stove herein described, secured within a frame which supports the counter-weight, said stove and frame being attached to a block having right-angled perforations and set-screw, said block being supported upon a bar provided with offset, as shown, and supporting means, for the purpose set forth.

292,065. CANISTER-SHOT. ALLEN G. SINCLAIR, Brooklyn, N. Y. Filed Dec. 1, 1879.

Claim.—1. A holder for the bullets of canister-shot, consisting of a single wire wound in a spiral, with its coils laid closely together, whereby the small balls are normally confined in place, and are gradually dispersed during the flight of the projectile by the gradual spreading of said spirals.

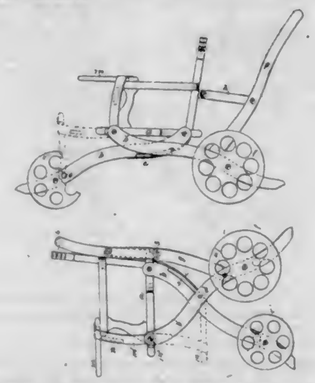
2. The combination of a spirally-wound wire holder, a suitable head and base, and connecting means constituting the envelope for canister-shot, substantially as described.



3. The combination of a spirally-wound wire holder, a sheet-metal case, a metal base, and metal head, all substantially as described.

292,066. SHIPPER'S DRY-GOODS BOX. LEWIS SMITH, Wallace, Ill. Filed Nov. 30, 1883. (Model.)

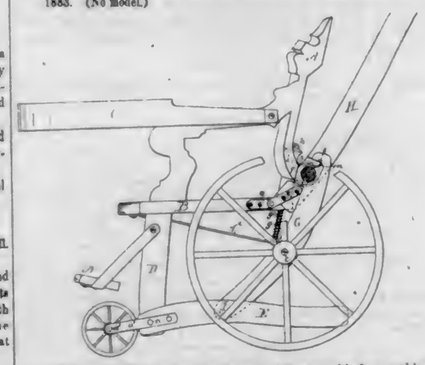
Claim.—1. In a shipper's dry-goods box, the sides, ends, top, and bottom composed of separate removable parts, and provided with cleats to aid in securing the parts in position, the top made in two parts, with right-angled lapping arms, as specified, and cross tie-rods through the sides, whereby the parts are rigidly united, leaving the top removable at pleasure, in the manner specified.



2. In a shipper's dry-goods box, the sides, ends, top, and bottom composed of separate parts, means for removably securing together, and provided with cleats to aid in securing the parts in position, the top made

292,066.

in two parts, with right-angled lapping arms and bolts for securing the two parts rigidly together, substantially as described, and for the purpose set forth.

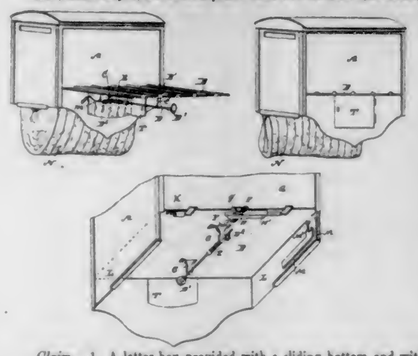


292,067. CHILD'S CHAIR. ASHER B. STEVENS, Stapleton, N. Y., assignor to Thompson, Perley & Waite, Baldwinsville, Mass. Filed Dec. 22, 1882. (No model.)

Claim.—1. The seat combined with the crossed legs *b b'*, their connecting-rod *d*, and guideways *e*, the wheels *e' f* on said legs, and the handle *g*, pivoted to the rear legs and connected with the chair-seat by links *h* and a locking device, substantially as shown and described.

2. The seat and its supporting adjusting-legs and their cross-bar *o*, substantially as set forth, combined with the foot-rest having the arms *m'*, pivoted or hinged to the seat, the board *m*, and leg-rest secured between them, substantially as shown and described.

292,068. CHILD'S CHAIR. ASHER B. STEVENS, Stapleton, N. Y., assignor to Thompson, Perley & Waite, Baldwinsville, Mass. Filed Jan. 15, 1883. (No model.)



Claim.—1. The chair seat or frame and the movable front and back legs, and braces connecting them together by fixed pivots 5 and 6, respectively, combined with the large wheels carried by the braces connect-

ing the said front and back legs, and having a portion of their peripheries always beyond the outer edges of the front legs, as and for the purposes described.

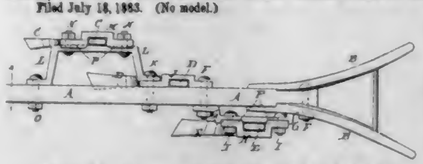
2. The chair seat or frame and the movable front legs provided at their upper ends with the wheels F, and the back legs, and braces connecting them together by fixed pivots 5 and 6, respectively, combined with the large wheels carried by the braces connecting the said back and front legs, the said wheels being located substantially as described, whereby a portion of their peripheries is always beyond the outer edges of the front legs, as and for the purposes described.

3. The combination, substantially as shown and described, of the chair seat or frame, the jointed front legs, the pivoted rear legs, braces fixed to the front and rear legs by fixed pivots 5 and 6, and connecting and moving with the said front and rear legs, the large wheels secured to and moving with the said braces and projecting beyond the front legs at all times, and a locking device for engaging the rear legs to hold the chair in either of its two positions, as set forth.

292,069. COMBINED LETTER-BOX AND MAIL-BAG. CARL FRIEDRICH TELLER, Offenbach-on-the-Main, Germany, assignor to Carl Otto Weber and Theodor Mayrx, both of same place. Filed Nov. 13, 1883. (No model.)

Claim.—1. A letter-box provided with a sliding bottom and with a door, T, in the front and below the sliding bottom, substantially as herein shown and described.

2. A letter-box provided with a sliding bottom, on the under side of which a key-rod is hu'd, substantially as herein shown and described.



3. In a letter-box, the combination, with the sliding bottom B, of the ears or jaws C, on the under side of the same, the rod D, held in the said jaws, the knob D' on the front end of the rod, the key D^2 on its rear end, and of the spring E, for pressing the rod in the direction toward the front, substantially as herein shown and described.

4. In a letter-box, the combination, with the sliding bottom B, of the latch F, the pin J, connected with the same, the loop K, and the casing H', substantially as herein shown and described.

5. A bag having a frame, O, provided with a sliding bolt, R, having upwardly-projecting hooks S, substantially as herein shown and described.

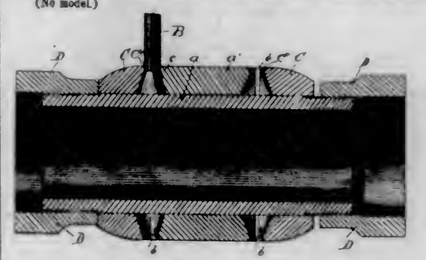
6. The combination, with a letter-box provided with a sliding bottom and grooves M, terminating in pockets M', of a bag provided with a frame, P, with pins Q on its ends, and a frame, O, provided with a sliding bolt, R, having upwardly-projecting hooks S, substantially as shown and described.

292,070. CULTIVATOR. HENRY DENTON TERRELL, Stantsville, Ga. Filed July 18, 1883. (No model.)

Claim.—In a cultivator, the combination, with the bracket G, connected to the beam, of an approximately U-shaped clamp, H, with its arms or wings provided with upper and lower inwardly-projecting flanges, P, and bolts I, substantially as shown and described, and for the purpose set forth.

292,071. SEAT FOR PUBLIC BUILDINGS. GEORGE H. THOMPSON, Plattsmouth, Nebr. Filed Aug. 21, 1882. (Model.)

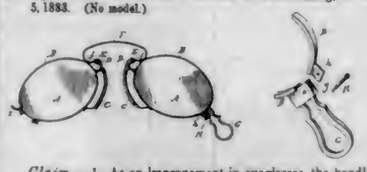
Claim.—1. As a means for providing a level floor with graded seats, a series of chairs having from front to rear regularly-increasing



292,071.

elevations, and platforms pivoted to each rear chair and extending from the same to the one in front at elevations corresponding to the elevation of the chairs, whereby a raised stepped floor is formed, substantially as and for the purpose specified.

2. In combination with two or more series of graded chairs and pivoted platforms, constructed, substantially as described, and grouped in sections, with aisles or passages between the sections, platforms placed in such aisles or passages at heights which correspond to the elevation of the contiguous pivoted platforms, whereby a stepped floor is formed for such aisles, substantially as and for the purpose set forth.



292,072. WHEEL. DAVID TICE, Lockport, N. Y. Filed Oct. 25, 1883. (No model.)

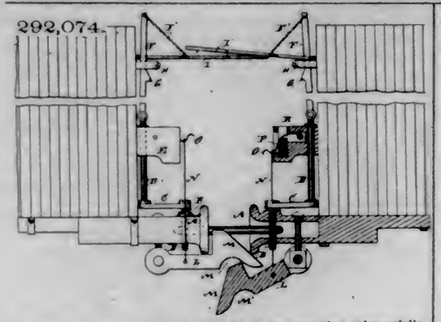
Claim.—1. In a vehicle-wheel, the combination of the sleeve *a*, shoulder *a'*, having sockets *b b*, collars or rings C C, having half-sockets C', capped nuts D, sleeves E, for reception of spokes B, and curved plates *e*, substantially as shown and described.

2. The combination of the cast integral sleeve E and plate *e*, the sleeve being inserted in an orificed plug corresponding to recess F, and spokes B and hub A, substantially as shown, and for the purpose described.

292,073. EYEGLASSES. DUDLEY L. TICE, Reading, Pa. Filed Dec. 5, 1883. (No model.)

Claim.—1. As an improvement in eyeglasses, the handle, slotted or bifurcated at its upper end, in combination with the eyeglass-frames formed with an extension fitting in the slotted end of the handle, and an upwardly-projecting pin or stop connecting the parts, as and for the purpose set forth.

2. In eyeglasses, the combination, with the nose-pieces and eyeglass-frames, of plates secured to the upper ends of the nose-pieces, and the bow pivoted at its ends to the said plates, as set forth.



3. In eyeglasses, the combination, with the nose-pieces and eyeglass-frames, of plates secured to the upper ends of the nose-pieces, a rod extending across and within the plates, and the bow pivoted at its ends to said rod, as and for the purpose set forth.

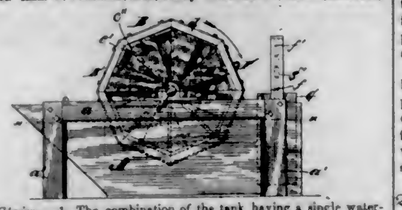
4. As an improvement in eyeglasses, the combination, with the nose-pieces and eyeglass-frames, of plates secured to the upper ends of the nose-pieces and formed with lugs *a*, a rod extending across and connecting the lugs, and the bow pivoted at its ends to said rod, as and for the purpose set forth.

292,074. CAR-COUPLING. CHAS. UHRINGER, St. James, Ind. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head and the inclined apron, with its rear end pivoted to the under side of the draw-head, of the stirrup-frame with its lower ends connected to the apron and its upper end contracted, and the arm O, entering the upper contracted end of the said frame, and acted upwardly upon by the spring

292,074.

P, whereby the aprons are rendered self adjusting or acting, substantially as and for the purpose set forth.



2. In a car-coupling, the combination, with the draw-head having the inclined pivoted apron on its under side, of the coupling-pin, the rod D, the arm C, the rod F, having the tooth G, the jaws H, and the lever I, having the bend I', substantially as and for the purpose set forth.

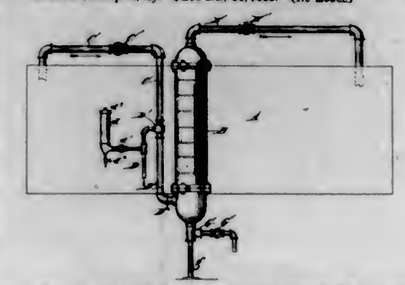
3. In a car-coupling, the combination, with the draw-head having the inclined pivoted apron on its under side, of the coupling-pin, the rod D, the arm C, the rods D F, the latter having a tooth, G, the jaws H, united by a cross-bar, H', the lever I, having a bend, I', and the chain F', connected to the lever I and arm F, substantially as and for the purpose set forth.

4. The combination, with the draw-head A, of the rod D, the arm C, the coupling-pin B, the rod F, having the tooth G, the jaws H on the end of the car, and the lever I, pivoted to the car and provided with the bend F, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the draw-head A, of the rod D, the arm C, the coupling-pin B, the pivoted arm F, provided with a tooth, G, the jaws H, united by a cross-piece, H', the lever I, having a bend, I', and the chain F', secured to the lever I and to the upper end of the pivoted arm F, substantially as herein shown and described, and for the purpose set forth.

292,075. RUMBLE FOR SCOURING CASTINGS, WASHING ORES, &c. EZRA W. VANDUZEN, Newport, Ky. Filed Mar. 17, 1883. (No model.)

Claim.—1. The combination of the tank having a single water-compartment, the shaft journaled on the tank, and the rotating cylinder constructed with an imperforate periphery and contracted open ends, and provided at one end with water-supply buckets for lifting the water from the tank into the cylinder through one end thereof, and discharging such water at the opposite end of the cylinder directly into the tank, substantially as described.



2. In a machine for cleaning and treating castings, ores, and other articles, the combination of a tank, a rotating cylinder journaled above the tank and extending down into the same, and a water-displacer or level-regulator moving in ways within the tank, and means for sustaining the regulator at any desired point, substantially as described.

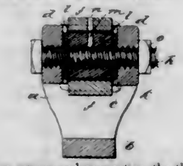
3. In an ore washer or pulverizer, the combination of a water-tank, A, a cylinder, B, mounted above the tank and extending down into the same, and having an imperforate periphery and contracted open ends, the water-supply buckets at one end of the cylinder, and inclined amalgam-plates P beneath the cylinder, and extending beyond the end thereof to gather such particles of metal as may escape in the overflow of water from the end of the cylinder, substantially as described.

4. In an ore washer and pulverizer, the combination of the tank A, the rotating cylinder journaled above the same and extending down into it, the water-supply buckets communicating with the interior of the cylinder through one end, and a feed-spout, E, and apron *e* for feeding the cylinder while in motion, substantially as described.

5. The combination of the tank, the revolving cylinder supported on a shaft above the tank and provided with bucket-supply openings at one end and a discharge-opening at the other end, and a water-displacer or level-regulator within the tank, substantially as described.

292,076. WATER-PURIFIER FOR STEAM-BOILERS. EZRA W VANDUZEN, Newport, Ky. Filed May 31, 1883. (No model.)

Claim.—1. In a boiler feed-water circulator and purifier, the combination of a purifier, a boiler, a pipe connecting the delivery end of the purifier with the boiler, a water-supply pipe connecting with the receiving end of the purifier, a pipe connecting the supply-pipe and boiler, and valves, the several parts being arranged to maintain a circulation of water from the supply-pipe and boiler through the purifier to the boiler, substantially as described.



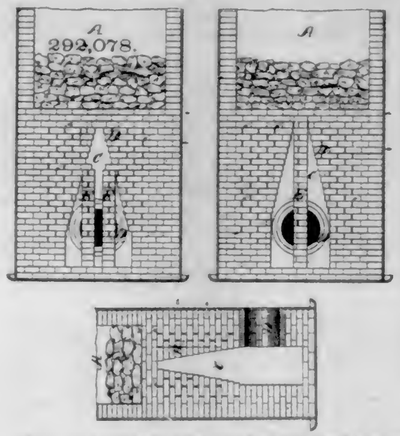
2. In a boiler feed-water circulator and purifier, the combination of a purifier provided with a series of diaphragms having openings at alternate ends, a boiler, a pipe connecting the delivery end of the purifier with the boiler, a water-supply pipe connecting with the receiving end of the purifier, a pipe connecting the supply-pipe and boiler, an ejector connected with the pipe between the boiler and purifier, and valves, the several parts being arranged to maintain a circulation of water from the supply and boiler through the purifier to the boiler, substantially as described.

3. In a boiler circulating and purifying attachment for steam-boilers, the purifier B, having heads B' B^3, and provided with a series of diaphragms, *b*, perforated or partially open at alternate ends, and having dividing-edges *f*, substantially as described.

4. In a boiler feed-water circulator and purifier, the combination of the boiler, a purifier, a pipe connecting the delivery end of the purifier with the boiler, a water-supply pipe connecting with the receiving end of the purifier, a pipe connecting the supply-pipe and boiler, whereby a circulation is maintained from the boiler through the purifier and back to the boiler, and a device for supplying a purifying material to the purifier, whereby the warm water and purifying material will mingle in the purifier, and the resulting sediment deposited in the purifier, substantially as described.

5. In a boiler feed-water circulator and purifier, the combination of boiler A, purifier B, pipe E, connecting the boiler and purifier, supply-pipes D D^4, pipe C, connecting the boiler and pipe D^2, and the vessel *d*, connecting with pipe D, and the valves, whereby water is circulated from the boiler through the purifier and back to the boiler, and a purifying water is drawn from vessel *d*, to mingle with warm water in the purifier, substantially as described.

292,077. PITMAN-ROD CONNECTION. GEORGE E. WAGGONER, New Hampton, Mo. Filed Nov. 15, 1883. (No model.)



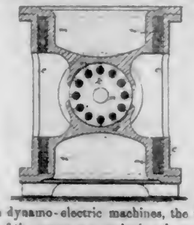
Claim.—1. In a pitman-rod connection, the thimble *i*, for the solid eye *f* of the pitman, secured between the jaws of the head by a screw-bolt, *h*, and having means to prevent it from turning when the bolt is screwed in and out, substantially as described.

2. In a pitman-rod connection, the thimble *i*, for the solid eye *f* of the pitman, secured between the jaws *a* of the head by a screw-bolt, *h*, and jam-nut *o*, said thimble having ribs *k*, and the jaws *a* having grooves *l*, to prevent the thimble from turning when the bolt is screwed in and out, substantially as described.

3. The combination of the presser-bearing *e*, adjusting-screw *e*, and jam-nut *p* with the solid eye *f* of the connecting-rod *g*, and the bolt *h* and thimble *i*, by which said rod is connected to the jaws of the sickle-bar head, substantially as described.

292,078. GLOVER TOWER. MOSES A. WALSH, Camden, N. J. Filed June 12, 1883. (No model.)

292,078.



Claim.—1. A tower formed with an arch the sides of which are corbeled out by overhanging courses of blocks or bricks, having passages between them for the descent of acid and ascent of gases, and having a lateral opening for the admission of such gases, substantially as and for the purpose specified.

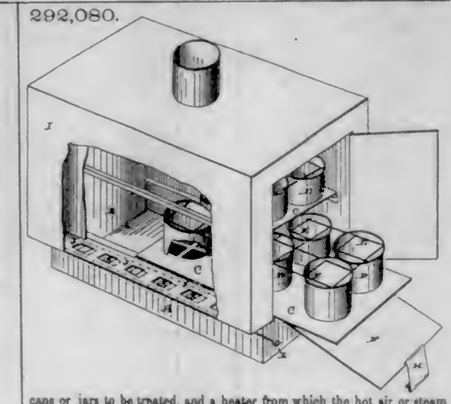
2. A tower the walls and arch of which are composed of blocks of cut or shaped quartz, said tower having an upper chamber for the reception of acid and a lateral opening near its base for the introduction of gases, substantially as and for the purposes set forth.

3. A Glover tower the walls and arch of which are composed of courses of cut quartz, said arch being corbeled out by overhanging arches, and formed with openings for the descent of acid from an upper chamber and the ascent of gases admitted through a lateral opening near the base of the tower, substantially as shown and described.

4. A Glover tower having an arch with supporting column or columns, said arch having its sides corbeled out by overhanging courses, substantially as shown and described.

292,079. DYNAMO-ELECTRIC MACHINE. JONAS WENSTRÖM, Örebro, Sweden. Filed Dec. 7, 1882. (No model.) Patented in England Oct. 10, 1882, No. 4,819; in France Nov. 9, 1882, No. 151,999; in Sweden Nov. 25, 1882, No. 409; in Belgium Nov. 27, 1882, No. 59,676; in Austria-Hungary Mar. 23, 1883, No. 11,903 and No. 21,432, and in Norway May 23, 1883.

Claim.—1. In dynamo-electric machines, the field-magnets arranged on both sides of the armature, enveloping the two energizing-helices *w w* by iron housings, whereby all the excited magnetism may be collected and transmitted, the magnetic field confined within the machine, and a firm connection obtained between the pole-pieces and bearings.



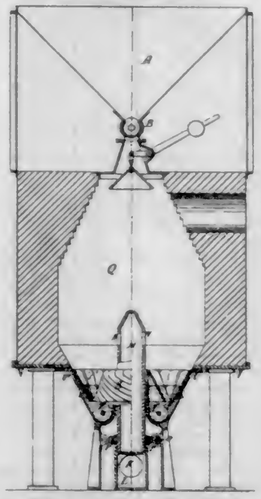
2. The field-magnets of a dynamo-electric machine, composed of one or more annular energizing-helices *w w*, arranged concentrically about shaft *a*, and inclosed in iron shells *m c*, from which project alternate pole-pieces, and which serve at the same time as a riged frame for the machine, as described.

3. In dynamo-electric machines, an armature provided with grooves in the core of the armature, for receiving the electrical conductors, which grooves are arranged in such a manner that narrow slits are formed in the surface of the core, which slits are filled with diamagnetic material, substantially as herein shown and described, and for the purpose set forth.

292,080. CANNING APPARATUS. RICHARD WEEKLER, San Francisco, Cal. Filed June 16, 1883. (No model.)

Claim.—1. In a canning apparatus, a containing-case having perforated floors or trays with independent chambers adapted to contain the

292,080.



cans or jars to be treated, and a heater from which the hot air or steam may be introduced to the chambers, in combination with a secondary sliding door, which may serve also as a bottom, substantially as herein described.

2. In a canning apparatus, a containing-case with perforated floors or trays having independent chambers for the cans or jars to be treated, adapted to receive steam or hot air from a heater below, and a main door, in combination with a secondary sliding door having leaves or flaps hinged to its opposite ends, substantially as herein described.

3. In a canning apparatus, a containing-case with perforated floors or trays having independent chambers for the cans or jars to be treated, and a heater from which hot air or steam may be introduced to the chambers, in combination with wires or elastic guards E, crossing the chambers outside the jars, substantially as herein described.

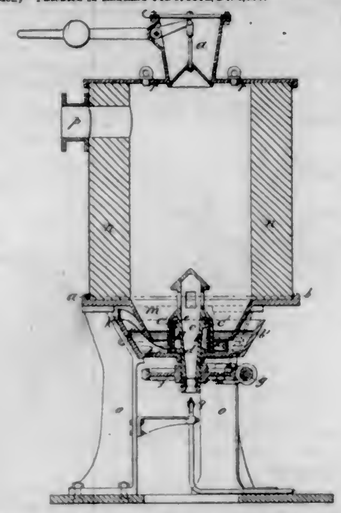
4. In a canning apparatus, a containing-case having perforated floors or trays with chambers adapted to receive the cans or jars to be treated, and a heater from which hot air or steam may be introduced to the chambers, in combination with an exterior case forming a space between itself and the interior one, and a series of openings with dampers, through which hot air from the furnace may be allowed to circulate around the interior case, substantially as herein described.

292,081. APPARATUS FOR MAKING GAS. ALFRED WILSON, Handsworth, County of Stafford, England. Filed May 4, 1883. (No model.) Patented in England Oct. 3, 1882, No. 4,697

Claim.—1. In a gas-producer, the combination, with a solid hearth, of a central tuyere and means for imparting rotary motion to said tuyere, substantially as described.

2. In a gas-producer, a solid hearth with walls, forming a box or

chamber adapted to receive incombustible refuse and to contain liquid, forming a trap or seal that will prevent escape of gas, in combination with rotating screws F F, adapted to automatically remove the refuse which collects in said hearth, substantially as described.



3. In a gas-producer, the combination of a central tuyere, a solid hearth, and means for automatically removing incombustible refuse from the apparatus, substantially as described.

4. In a gas-producer, the combination of a central tuyere, a solid hearth, means for automatically removing incombustible refuse, and means for reducing residue to a suitable condition for removal from the apparatus, substantially as described.

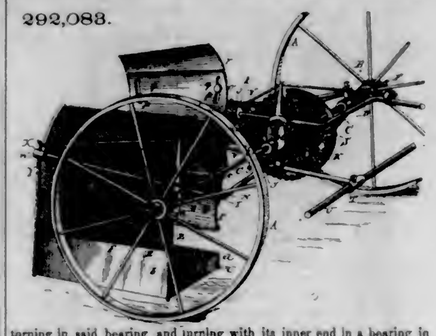
5. A gas-producer comprising a self-acting fuel-feeder, a central tuyere, a solid hearth, and means for automatically removing incombustible refuse from the apparatus, substantially as described.

6. A gas-producer comprising a self-acting fuel-feeder, a central tuyere, a solid hearth, means for automatically removing incombustible refuse, and means for reducing residue to a suitable condition for removal from the apparatus, substantially as described.

292,082. APPARATUS FOR MAKING GAS. ALFRED WILSON, Handsworth, County of Stafford, England. Filed May 4, 1883. (No model.) Patented in England Oct. 3, 1882, No. 4,697.

Claim.—1. In a gas-producer, the combination, with a solid hearth, of a central tuyere, means for imparting rotary motion thereto, and a curved arm or blade for automatically removing incombustible refuse from the apparatus, substantially as described.

2. In a gas-producer, the combination of a solid hearth, with walls forming an annular box or chamber to receive incombustible refuse from the fuel, a central tuyere with curtain or cap overlapping the inner wall of said box or chamber, a curved arm or blade attached to said tuyere, means for imparting rotary movement thereto, and a conical case dipping into said box or chamber, so as, when the latter is charged with liquid, to form a trap or seal for preventing escape of gas, substantially as described.

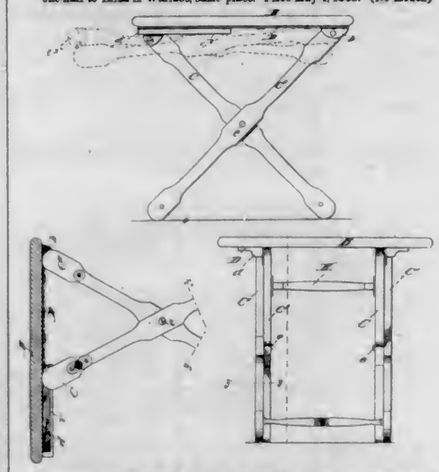


3. The improved gas-producer comprising the hopper *a*, solid hearth *h*, annular box or chamber *b' b²*, tuyere *c*, worm-wheel *f* and worm *g*, shaft *k*, hand-wheel *j'*, curtain or cap *c'*, curved arm *k*, with blade *k' k²*, cone *m*, fire-brick lining *n*, columns *o*, outlet *p*, steam-jet *q*, and holes *r r*, the whole constructed, combined, arranged, and operating substantially as described and illustrated.

292,083. MACHINE FOR GATHERING INSECTS FROM PLANTS. FERDINAND WERLOCH, Prairie du Sac, Wis. Filed Oct. 22, 1883. (No model.)

Claim.—1. The combination of the insect-receiving box having hinge-eyes at the inner edge of its bottom, the inner side of said box having hinge-eyes at its lower edge, and the rod or pintle connecting the hinge-eyes and forming a fender at its forward end, as and for the purpose shown and set forth.

2. The combination of the block H, having a bearing at its upper end, block P, pivoted in said bearing and having a longitudinal perforation, rod S, having perforated block *k*, rod *i*, having bearing *h*, and shaft *g*,



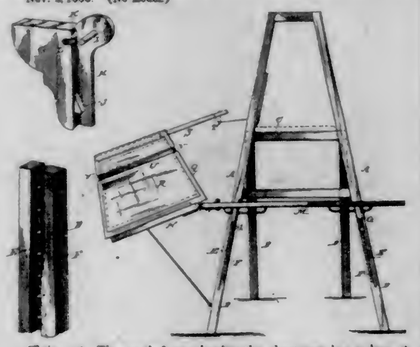
292,083.

turning in said bearing, and turning with its inner end in a bearing in block H, as and for the purpose shown and set forth.

3. The combination of the frame having bearings, the drive-axle turning in said bearings and having drive-wheels and the crown-wheel, the fan-shaft having the pinion meshing with said crown-wheel, and the curved fans provided with the adjustable curved extensions, and the insect-receiving box having a screen at its outer side curving inward at its upper end, a hinged inner side, and a fender, all constructed as and for the purpose shown and set forth.

292,084. TABLE. CHARLES N. WITT, Springfield, Mass., assignor of one-half to Eliza L. Wallace, same place. Filed May 4, 1883. (No model.)

Claim.—The combination, with the top B, having the sockets *d d*, provided with the bearing-edges *v v*, of the legs C C', pivoted at *c*, hinged to the top at *b b*, provided with the pins *f f*, and having the round H to rotate to clamp the ends of legs C against surfaces *v v*, all arranged and operating substantially as shown and described.



292,085. BELLOWS ATTACHMENT FOR INSECT-POWDER, &c. THOMAS WOODASON, Chicago, Ill. Filed June 20, 1883. (No model.)

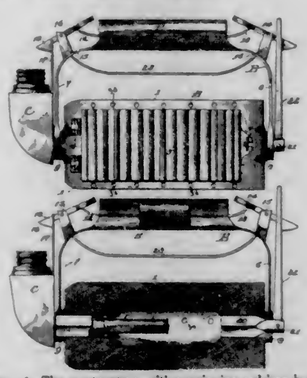
Claim.—1. In a bellows attachment, the combination of the bellows-pipe B, an outlet-pipe, E, the chamber D, having an opening through its top, and which serves to connect the two pipes B E together, and a pipe, G, which is connected to the outlet-pipe E, and which extends upward from the outlet-pipe into the top of the chamber D, substantially as shown.

2. In the combination of a bellows-pipe, B, provided with a series of perforations near its closed end, the powder-receptacle, the outlet-pipe E, which is supported in position by means of the receptacle, and the small pipe connected with the outlet-pipe, substantially as set forth.

292,086. EASEL. DELBERT K. WOODWARD, Lordstown, Ohio. Filed Nov. 2, 1883. (No model.)

Claim.—1. The easel-frame having the short rear leg or legs attached to the cross-bar C near the center of the easel, and the back formed of the canvas or other suitably-covered frame, substantially as shown and described.

2. The canvas-covered frame Q, having the pivoted rod or bar S and notches V, and tape U, substantially as shown and described.



3. The combination of the frame A, the inclined section of shelf N, the canvas frame Q, having bar S, and the hook T, for grasping said bar, substantially as shown and described.

4. The easel-bracket G, having rib or flange H, pin I, lug J, and rounded shoulder K, substantially as shown and described.

5. The combination of bracket G, having rib H, pin I, and lug J, the easel-leg D, having slot E, and the notched surface or rack-bar F, all arranged and adapted to operate substantially as described.

6. The easel-shelf having extension N and hooked extension O, substantially as shown and described.

292,087. REVERSIBLE SAD-IRON. JOHN A. YARGER, New Hampton, Iowa. Filed Nov. 10, 1882. (No model.)

Claim.—1. The combination, with a swinging sad-iron having two oppositely-placed fluting-surfaces and two oppositely-placed polishing-surfaces, of a bail or handle in which such iron is journaled, the square locking-block inserted within corresponding openings in the ends of the iron, and means, substantially as described, for withdrawing such blocks to permit the iron to be rotated.

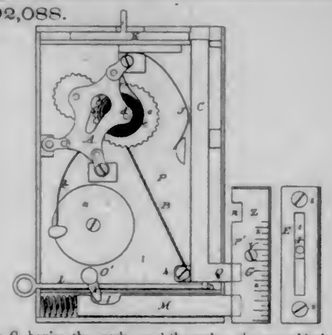
2. The combination, with the handle B and the sad-iron A, journaled therein, and having the square hole at one end, of the removable locking-block 20, the lever 22, the pivoted latch 14, and the spring 13, all substantially as described.

292,088. ALARM-LOCK. ROBERT ZINSMAIER, Galion, Ohio. Filed Feb. 24, 1883. (No model.)

Claim.—1. In a lock, the combination, with a vertically-reciprocating angular locking-bolt, of a key-shaft connected to said bolt and to the spring of an alarm, whereby when the shaft is turned to raise the locking-bolt the alarm is wound up, substantially as specified.

2. The combination, with the slotted base-plate E of the keeper-

292,088.



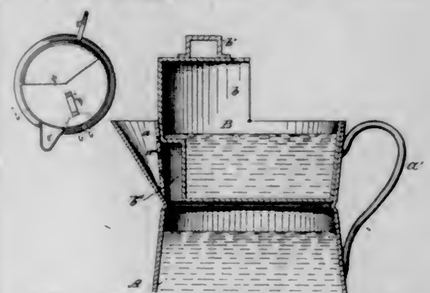


plate G, having the notch *a* and the scale *z*, the screw-block in the slot of the base-plate, the fastening-screw V, the winding-drum on the shaft, and the angular vertically-reciprocating bolt connected by a chain to the said drum, substantially as specified.

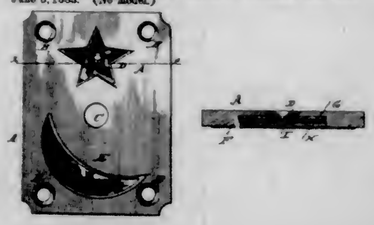
3. The combination, with the vertically-reciprocating angular locking-bolt, of the winding-shaft and alarm, the chain-connection, guide-spring, eight-latch, and notched keeper, substantially as specified.

292,089. COFFEE-POT. JAMES A. ASHLEY, Washington, D. C. Filed July 14, 1883. (No model.)

Claim.—1. The combination, with a coffee-pot, of a condensing-vessel having a channel through which the contents of the coffee-pot may be discharged.

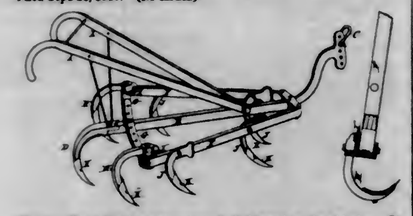
2. The combination, with a coffee-pot, of a condensing-vessel in which the entire upper surface of the contents of the same is directly exposed to the air, and which is provided with a channel or conduit for the passage of the contents of the coffee-pot.



3. The combination, with a coffee-pot, of a condensing-vessel which is provided with a hood of a capacity adapting it to receive one-half or about one-half of the contents of such condensing-vessel when filled, whereby such contents will be retained whether the condensing-vessel be placed in a vertical or in a horizontal position.

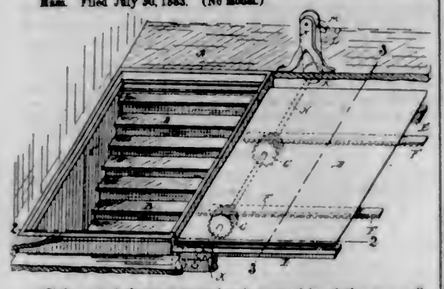
4. In a coffee-pot, a condensing-vessel which has a hood and a pouring-channel.

5. The combination, with a coffee-pot, of a condensing-vessel which, by a slight horizontal movement, is adapted either to permit or to prevent the discharge of the contents of such coffee-pot.



6. The combination of a coffee-pot having a spout or pouring-lip, and a condensing-vessel provided with a conduit for the passage of the contents of the coffee-pot.

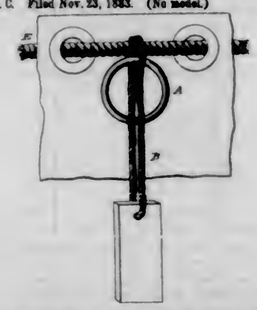
292,090. LUMINOUS GUIDE-PLATE. SAXTON TICE AYRES, Philadelphia, Pa., assignor of one-half to Charles D. Williamson, same place. Filed June 8, 1883. (No model.)



Claim.—The luminous guide-plate herein shown and described, adapted for the purposes specified, consisting of the plate or body A, having screw-holes B, a central aperture, C, and irregular-shaped apertures D and E, located on opposite sides of the central aperture, and rabbeted to form boxes or recesses F, into which are inserted glass disks G, coated on the inside with a luminous paint or composition, and held in place by the cement lining H and fastening-strips I, substantially as and for the purpose shown and set forth

292,091. CULTIVATOR. PERSLEY BERLER, Jefferson County, Ky. Filed Sept. 21, 1883. (No model.)

Claim.—The adjusting cross-bars G G, hinged to the side bars, F, by means of flanges above and below, with the corrugated projection I and tooth-hook H, as above described, in combination with the side bars, F, tooth-hooks J J, and teeth K K, substantially as described, and for the purpose set forth.



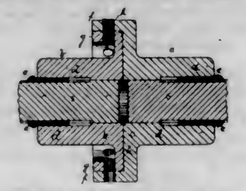
292,092. GUARD TO HATCHWAYS. HENRY J. BLEULER, Boston, Mass. Filed July 30, 1883. (No model.)

Claim.—1. A door constructed and arranged in relation to a well-opening, C, in the floors of a building, to close and open the same, in combination with mechanism connected with said door, and extending through the several floors of the building, to be operated at any one of said floors, and so as to slide said door either to close or open said well-opening, as the case may be, substantially as and for the purpose specified.

2. The combination, with a well-opening in the floor of a building, of a door constructed and arranged to slide across said opening, rack-bars F, a shaft, H, gear-wheels G, pulley-wheels K, and ropes L and pulley M, for operation of said door, substantially as and for the purpose specified.

292,093. TAG-ATTACHING DEVICE. LORENZO DAVIS BOND, Washington, D. C. Filed Nov. 23, 1883. (No model.)

Claim.—An attaching-tag or similar device consisting of a suitable tag proper, a cord, and rigid ring or loop, all connected and adapted for use substantially as shown and described.

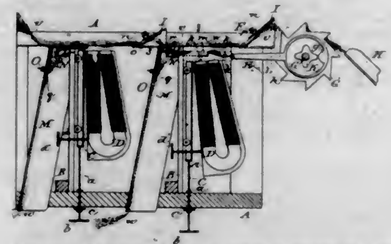


292,094. COCK AND TANK FOR DRAWING FLUIDS OF VARYING TEMPERATURES. JOHN BYRNE, Cleveland, Ohio. Filed Jan. 22, 1883. (No model.)

Claim.—1. The combination, with a faucet-body having one outlet and two inlet passages, and a tubular stop-cock constructed to connect or to stop all of said passages, of a stopper fitted within said stop-cock, said stopper having a reduced body and oppositely-inclined spiral shoulders at the ends of said reduced body, substantially as and for the purpose specified.

2. The combination, with a faucet-body having one outlet and two inlet passages, and a tubular stop-cock constructed to connect or to stop all of said passages, of a stopper fitted into said stop-cock, and constructed to increase the aperture of one inlet and to decrease the aperture of the other inlet by the same act of rotating in one direction within said stop-cock, and a graduated dial and index on said cock and stopper, substantially as and for the purpose specified.

292,095. COUPLING FOR SHAFTS OR ROLLS. CHAS. P. CARLSON, McKeesport, Pa., assignor to himself and the National Tube Works Company, Boston, Mass. Filed May 2, 1883. (No model.)



Claim.—1. A shaft or roll coupling formed of two parts held together against rotary strain by means of one or more wooden pins extending through the parts thereof, substantially as and for the purposes set forth.

2. A shaft or roll coupling formed of a female part, a male part adapted to fit therein, and one or more pins extending radially through said parts to hold them against rotary strain, substantially as and for the purposes set forth.

3. In a shaft or roll coupling, the combination of the part *b*, having the flange *g*, part *c*, having the flange *f*, and series of holes *h*, extending radially through said flanges, and wood pins *k*, fitting within each holes, substantially as and for the purposes set forth.

292,096. MAGNETIC ORE-SEPARATING MACHINE. GEORGE W. L. CARTER, New York, N. Y. Filed Apr. 1, 1882. Renewed Mar. 5, 1883. (No model.)

Claim.—1. The combination, with a magnet or magnets and a hopper arranged to deliver the material in a stream past said magnet or magnets, of a septum or shield separated from the magnet or magnets and arranged between the same and the path of the falling material, and at one side of said path, so that the non-magnetic material will fall clear of the septum or shield, while the magnetic particles, being attracted, will diverge and come against said septum or shield, substantially as described.

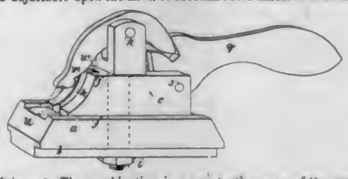
2. The combination, with a magnet or magnets and a hopper ar-

ranged to deliver the material in a stream past said magnet or magnets, of a reciprocating shield or septum arranged between the magnetic poles and the path of said stream, so that the non-magnetic material is carried past the septum or shield, while the magnetic particles are attracted to and collected on it, substantially as described.

3. The combination, with the magnet or magnets, of a reciprocating septum or shield provided with an offset or recess, substantially as described, for collecting and discharging the magnetic particles, as set forth.

4. The combination, with a hopper and a magnet or magnets arranged below and at one side of the hopper-outlet, not directly beneath the same, of means, substantially as described, for adjusting the angle of the magnet or magnets with respect to the stream of material falling from the hopper, as set forth.

5. The combination, with the magnet or magnets of a magnetic separating-machine, and a hopper arranged to deliver the stream of material in front of said magnet or magnets, of means, substantially as described, for adjusting the angle of the magnet or magnets to the falling stream, substantially as described.

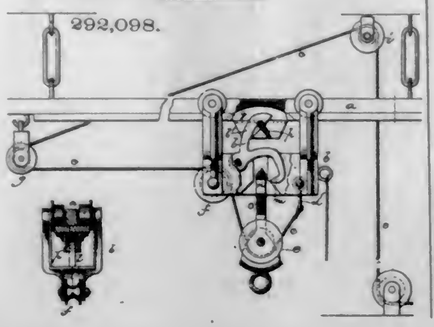


6. A magnetic ore-separator constructed substantially as herein shown and described, containing the following elements: adjustable magnets, adjustable hoppers, and adjustable division or ore-separating plates, said magnets being arranged below and at one side of the hopper-outlets, not directly beneath the same, and the said plates below the magnets between the poles thereof and the direct path of the falling material, as set forth.

7. In a magnetic ore-separator, the combination, with the adjustable magnets D, of the car O and adjusting-screws *a d*, substantially as and for the purpose described.

8. In a magnetic ore-separator, as a means for dividing or separating the falling streams of the magnetic from the non-magnetic ore particles, the combination, with the magnets and their support, of a division-plate, N, constructed, substantially as herein shown and described, of rectangular slotted plate *q*, vertical slotted plate *r*, set-screw *r'*, and hinged plate *s*, arranged and operated as set forth.

292,097. SAW-TOOTH SWAGE. SAMUEL JESSE CHALFANT, Albion, Cal. Filed June 2, 1883. (No model.)

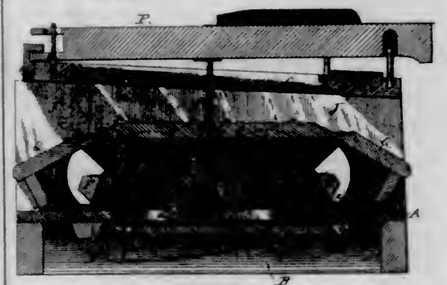


Brief.—A removable saw-tooth is clamped by lever *m* upon die *k*, with its point *o*, which is to be sharpened by being drawn out with a light hammer, resting upon the flat upper surface of anvil *a*. The die-holder is adjustable upon the anvil to accommodate different sized teeth.

Claim.—1. The combination, in a saw-tooth swage, of the anvil *a*, die-block *e*, bed-die *k*, clamping-die *m*, and the cam-lever *q*, substantially as described.

2. The combination, in a saw-tooth swage, of the anvil-block *a*, having rabbet-grooves *b*, grooved upper surface or marginal ribs, *f*, and slotted hole *h*, the die-block *e*, fitting in and adjustable along the groove of the anvil, the clamping-bolt *g*, dies *k m*, and the operating-lever *q*, substantially as described.

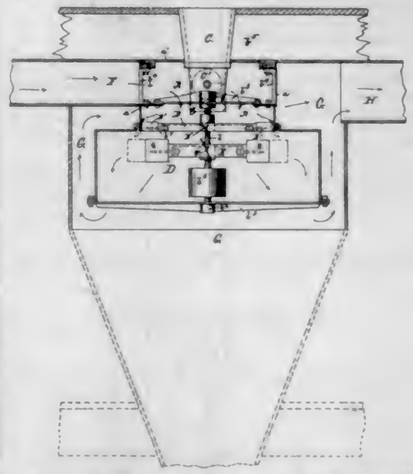
3. The combination of the anvil-block *a*, having beveled end *u* and grooved upper surface, die-block *e*, clamping-bolt *g*, dies *k* and *m*, and the lever *q*, substantially as described.



292,098. HAY-CARRIER. LEWIS C. CRASE, Waupun, Wis. Filed Sept. 22, 1883. (No model.)

Claim.—1. In a hay-carrier, a reversible latch, pivoted in a recess in the track, and adapted to engage or pass the trip-latch in the car when set, substantially as specified.

2. In a hay-carrier, the combination, with a track having a reversible latch pivoted in a recess in its under face, of a car having a trip-catch with a hook for engaging the pulley-frame, substantially as specified.



292,099. REED-ORGAN. MELVILLE CLARK, Chicago, Ill. Filed Feb. 5, 1883. (No model.)

Claim.—1. In a reed-organ, the boards E E', provided with an opening, *g*, for each reed-cell, in combination with mutes G, for closing said openings, and a chamber, K, said chamber having no other inlet or outlet than through said openings *g*, as and for the purpose set forth.

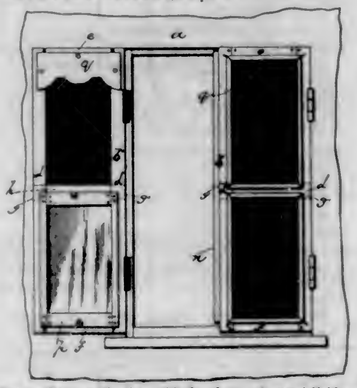
2. In a reed-organ, the boards E E', that form the reed-cells and have openings *g*, one for each reed-cell, communicating with vacuum-chambers K above such reed-cells, and provided with mutes G, the ends of which are passed through openings *m* in end boards, J, and have disks or washers *n*, for closing the ends of such chambers K, all constructed and arranged substantially as and for the purpose set forth.

292,100. PROCESS OF AND APPARATUS FOR MIXING AND COOLING SUGAR. MORTIMER C. COGSWELL, Brooklyn, N. Y. Filed Nov. 14, 1883. (No model.)

Claim.—1. The herein-described process for mixing and cooling sugar, which consists in first feeding the sugar upon a horizontal disk in an inclosing-chamber, and by the rapid revolution of said disk throwing the sugar to the periphery of the disk and against the wall of said chamber, then by means of beaters on the periphery of said disk throwing or whirling the sugar around said chamber and between the extremities of said beaters and the wall of said chamber, then allowing said sugar to fall into a lower and communicating chamber, and by means of revolving blades to finely distribute the sugar in said chamber, either by the air-currents created by said blades or by contact with said blades themselves, and causing a current of cooling-air to pass downward through the chambers and be intimately mingled with the distributed sugar in said lower chamber, all as described.

2. The combination of the chamber A, having the closed circumferential sides *a*, top *a'*, and an open bottom, the feed-hopper C, and the horizontal disk B, carrying the beaters B', all constructed to operate as specified, whereby the sugar is broken and mixed, as set forth.

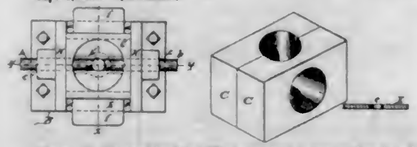
3. The combination of the chamber A, open at its bottom, the feed-hopper C, the horizontal disk B, carrying the beaters B', the chamber D, with its open bottom, and the disk E, carrying the blades *e*, all constructed substantially as described, and for the purpose specified.



4. The combination of the chamber A, having an open bottom, the feed-hopper C, the horizontal disk B, carrying the beaters B', and the air-conduit F, leading into said chamber, together with the communicating chamber D, having an open bottom, and the horizontal disk E therein, carrying the blades *e*, all constructed substantially as described, and for the purpose specified.

5. The combination of the chamber A, having an open bottom, the feed-hopper C, the horizontal disk B, carrying the beaters B', and the air-conduit F, leading into said chamber, together with the chamber D, having an open bottom, and the horizontal disk E therein, carrying the blades *e*, and the outer inclosing-chamber, G, with the air-exhaust H leading therefrom, all constructed as described, and for the purpose specified.

6. The combination of the chamber A, having sides *a* and top *a'* and an open bottom, the feed-hopper C, and the horizontal disk B, carrying the beaters B', together with the air-inlet F, entering said chamber above said disk, all as and for the purpose specified.



292,101. SHUTTER. MELVIN COTTLE, Scipio, Kans. Filed Oct. 16, 1883. (No model.)

Brief.—A combined shutter and window-sash consisting of shutters provided with permanent outside screens, in lieu of the ordinary shutter-slats, and removable inside glass panes.

Claim.—The combination, with the shutter-frames *b b'*, hinged to the window-frame, and provided with the wire screen permanently secured to their outer sides, of the frames *p*, containing the glass removably secured to the inside of the shutters, so as to be covered and protected by the permanent screens when the frames *p* are in place, substantially as specified.

292,102. CORE-BOX. PHILO COWING, Seneca Falls, N. Y., assignor to Cowing & Gleason Manufacturing Company, (Limited,) same place. Filed Sept. 1, 1883. (No model.)

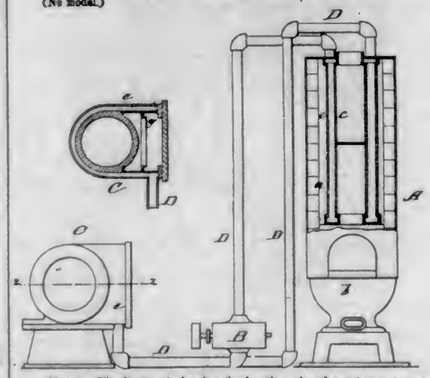
Claim.—1. In combination with a core-box, a case embracing the same, arbors in the cavities of the core-box, and means, substantially as described, for sustaining the arbors, as set forth.

2. In combination with a core-box, a case embracing the same, bolts projecting from the case to the axes of the core-box, and an arbor or arbors sustained in the core-box by the bolts, and removable from the bolts to allow the core-box to be removed from its embracing-case, substantially as and for the purpose set forth.

3. In combination with a core-box, a case embracing the same, and a tubular arbor sustained in the axes of the core-box by bolts sliding through the walls of the case and entering the central cavity of the arbor, substantially as described and shown.

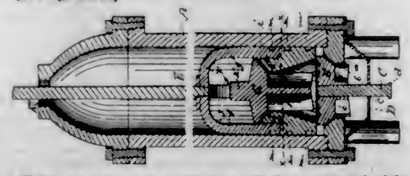
4. In combination with a core-box, a sustaining-case consisting of a bed-plate, and cheek-pieces attached to the bed-plate, adapted to receive between them the core-box, channels through the cheek-pieces in range with the axes of the core-box, bolts sliding in said channels, and an arbor sustained in the core-box by the sliding bolts, substantially as described and shown.

5. In combination with a core-box, a case embracing the sides and bottom of said box, a stud-pin or bolt projecting from the bed of the case into the vertical axes of the core-box, a removable plate extended across the bed of the case, and provided with a passage for the aforesaid bolt, bolts sliding through the sides of the case in range with the horizontal or lateral axes of the core-box, and tubular arbors sustained in the core-box by the bolts entering the same, substantially as specified and shown.



6. In combination with a core-box, the bed B, fixed bolt *b'*, cheeks H, provided with guides *a* and channels *c*, plate E, provided with the eye *e* and with the shoulders *d* and extensions *f*, bolts *b b*, sliding in channels *c c*, and the tubular arbors A, adapted to receive in them the aforesaid bolts, all constructed, combined, and operating substantially in the manner shown and set forth.

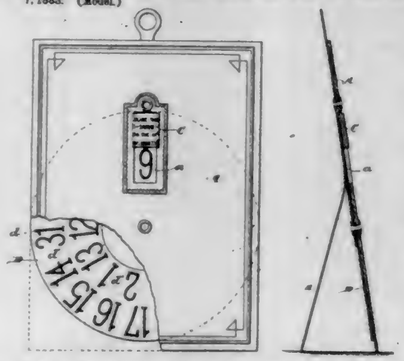
292,103. SNAP-HOOK. ROBERT B. CRAIGHEAD, Milton, Ohio. Filed May 4, 1883. (No model.)



Claim.—The improved snap-hook, consisting of the flat base A, with the upwardly-curved hook D at one extremity thereof, and having studs or rivets on the back, all of said parts being formed integral, and the flat spring B, riveted to the top of said base-plate at the end opposite the hook, and having its free end adjacent to the under portion of the hook, as set forth.

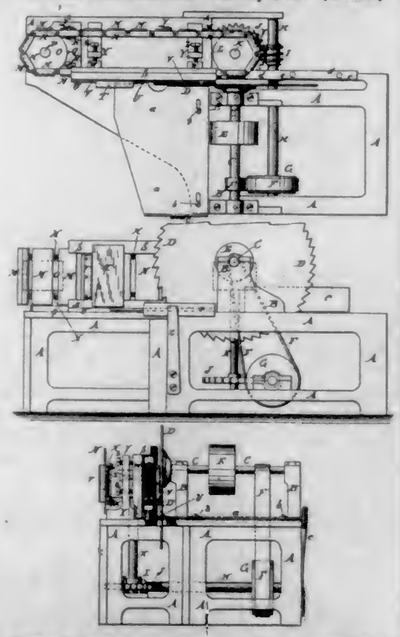
292,104. MEANS FOR PREVENTING CONDENSATION IN STEAM CYLINDERS. CHARLES W. CRAWFORD, Brazil, Ind. Filed Apr. 4, 1883. (No model.)

Claim.—The heater A, having the heating-chamber *a* between concentric cylinders *c c* around a central smoke-flue, in combination with pipes D D, blower B, and cylinder C, having jacket *e*, whereby the air will be drawn from the cylinder, forced through the heater, and back to the cylinder continuously, as and for the purpose specified.



292,105. LIFTING-PUMP. CYRUS JEROME CURTIS and JAMES E. CAINE, Logan City, Utah; said Caine assignor to said Curtis. Filed Mar. 31, 1883. (No model.)

Claim.—In a pump, the combination, with the pump-barrel, of the plunger F, formed in two parts, *f f'*, the upper part, *f*, being formed of a series of arms, *g*, secured to a ring or annulus, *h'*, and the lower part, *f'*, being screw-threaded to receive the ring or annulus, and having an



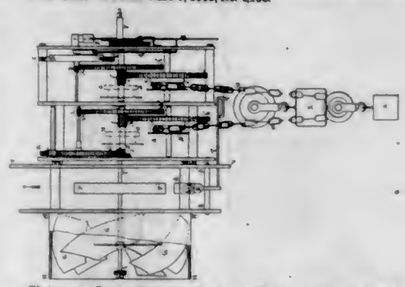
opening, *i*, in which a valve, G, works, said valve being provided with guide plates or rods *j*, which are connected together at their inner ends and project downward through the passage *i*, and an extension, K, of said valve, which serves to limit the upward movements of the valve, substantially as shown and described.

292,106. CALENDAR. JOHN COSSONS, Glen Allan, Va. Filed July 7, 1883. (Model.)

Claim.—In combination with the face-plate A, having aperture *a* and the dial D, having concentric circular rows *d'* of characters *d*, the slide C, moving in guides in the aperture *a*, and adapted to disclose either row of characters at will, substantially as described.

292,107. SHINGLE-SAWING MACHINE. WILLIAM F. DAKE and JAMES H. SEEX, Grand Haven, Mich. Filed July 3, 1883. (No model.)

Claim.—1. In a shingle-sawing machine, the combination, with the saw-mandrel and its saw, of the shaft having a pulley belted to a pulley on the saw-mandrel, said shaft having also a worm, the vertical shaft having the sprocket-wheels carrying the endless belt of bars, one of said shafts also having a toothed wheel, and the said belt of bars being provided with a dog, and the frame having the flanged guard-plate S V, substantially as and for the purpose set forth.

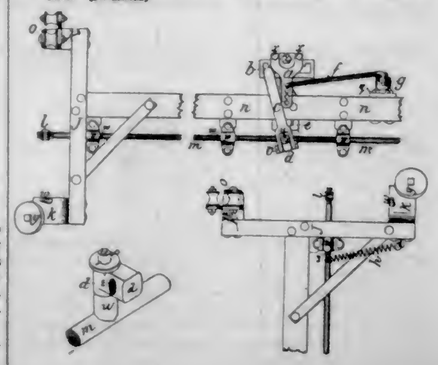


2. In a shingle-machine, the endless belt of upright cross-bars provided with dogs, in combination with the vertical guard-plate S, having a narrow horizontal flange at its front edge, the table *a*, and the spring adapted to hold the table inward toward the saw, substantially as and for the purpose set forth.

3. In a shingle-sawing machine, the endless belt of upright cross-bars provided with dogs, in combination with the vertical plate S, having its upper and lower portions forming guideways or guards for the belt of cross-bars, and its rear side connected to movable uprights W, and the fixed uprights Y, connected to the latter by bolts X, and having the adjusting-screws Z Z, adapted to act upon the guard-plate uprights W, substantially as and for the purpose set forth.

4. In a shingle-sawing machine, the endless belt of bars M, provided with dogs, in combination with the guard-plate S, with its upper and lower ends adapted to receive and permit the passage through them of the endless belt of bars, its lower end also having a narrow horizontal flange, U, at its forward edge, substantially as and for the purpose set forth.

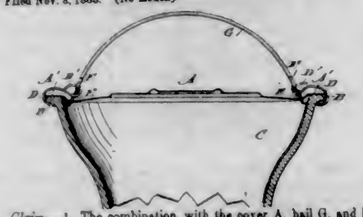
5. In a shingle-sawing machine, the endless belt of bars M, having dogs V, in combination with the guard or guide plate S, having the narrow horizontal flange U and the rear plate, *d*, forming a continuation of flange U, and having a vertical flange, *e*, with the forward end inclined toward and terminating close to the side of the rear part of the saw, substantially as and for the purpose set forth.



292,108. SELF-WINDING CLOCK. AUGUSTE DARDENNE, Marienburg, Belgium. Filed Oct. 19, 1881. (Model.) Patented in Belgium Aug. 3, 1881, No. 55,353, and Aug. 31, 1881, No. 55,616; in France Aug. 5, 1881, No. 144,256; in England Aug. 3, 1881, No. 3,425; in Austria Nov. 23, 1881, No. 323,908; in Canada Nov. 11, 1882, No. 15,310; in Sweden Dec. 23, 1882; in Italy Dec. 31, 1882, No. 265 and No. 14,736; in Norway May 1, 1883, and in Russia June 9, 1883, No. 4,183.

Claim.—1. In combination with a propelling-screw for winding the weight of a clock by the force of an air-current, an automatic click to prevent backward motion of the winding mechanism, and a friction-brake operated by the rise of the weight to prevent overwinding, all substantially as described.

2. The combination, with a friction-wheel, P, fixed on the axle of the driving-screw, of a brake consisting of rod T T', lever R, and shoe Q, the said brake being adapted to act upon the rim of the wheel P when the rod T T' is moved upward by the pulley of the weight X, substantially as described, and for the purpose set forth.

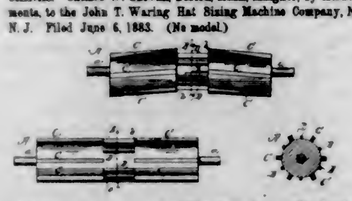


292,109. CHECK-ROWER. WILLIAM EDWINS and JOHN EDWINS, Compromise, assignors to C. B. Smith, Champaign City, Ill. Filed Aug. 28, 1883. (No model.)

Claim.—1. The combination, in a check-rower, of the within-described intermittent mover, having a vertical pivot, *z*, and composed of rigidly-united parts *a b*, constructed, the former with elevating-heels and a rearwardly-projecting transmitting-arm, and said part *b* with a straight or substantially straight slot at right angles to the line of said arm, and having rearward extensions or notches at its respective extremities, and the push-finger *c*, adapted to engage with said part *b* within its respective notches alternately, substantially as herein specified, for the purposes set forth.

2. In the within-described check-rower, the combination of the horizontal rock-shaft *m*, constructed with an upright pivotal lever-arm, *u*, the knuckle *d*, swiveled on said arm, the horizontal cross-pivot *v*, passing through said knuckle, and the loosely swinging and gravitating push-finger *c*, bifurcated and drilled to embrace said knuckle and receive said cross-pivot, with a slotted intermittent mover, *b a*, adapted to be actuated by said push-finger, substantially as shown, for the purposes set forth.

292,110. CROCK-COVER. DANIEL WEBSTER PROCT, Keokuk, Iowa. Filed Nov. 8, 1883. (No model.)



Claim.—1. The combination, with the cover A, bail G, and hooks D, of the staples E, connecting the hooks and cover, as and for the purpose specified.

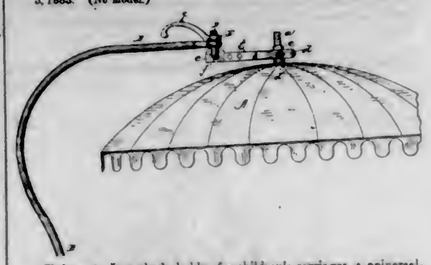
2. The combination, with a cover, A, of the bail G, the loops or staples E in the cover, and of the hooks D, having hook ends D', passed through the loops E and through the loops on the ends of the bail, substantially as herein shown and described.

3. The combination, with a cover, of loops fastened on the same, hooks passed through the loops and through loops on the end of the bail, whereby the cover will be secured to the bail by means of the loops or staples and the hooks, substantially as herein shown and described.

292,111. ROLLER FOR HAT-BODY FELTING AND SIZING MACHINES. CARLOS W. GLOVER, Boston, Mass., assignor, by mesne assignments, to the John T. Waring Hat Sizing Machine Company, Newark, N. J. Filed June 6, 1883. (No model.)

Claim.—1. In a machine for felting hats, &c., a roller having a circumferential cavity of equal depth throughout its length, and at or near the longitudinal central portion of said roller, substantially as and for the purpose specified.

2. In a machine for felting hats, &c., a roller having a circumferential cavity of less depth at its middle portion than at its ends, and at or near the longitudinal central portion of said roller, substantially as for the purpose specified.

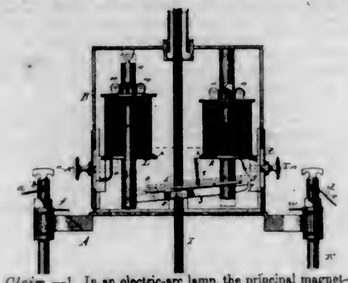


3. In a machine for felting hats, &c., a roller having a circumferential cavity, substantially as described, with shoulders or abutments *b* at its ends, substantially as and for the purpose specified.

4. In a machine for felting hats, &c., a roller having lags or projections on its surface extending from each end near to its central portion, and intermediate lags or projections at said central portion of less height radially than the end lags, for the purpose specified.

5. In a machine for felting hats, &c., a roller having a circumferential cavity, substantially as described, lags or projections extending from each end of said roller to said cavity, and intermediate and independent lags or projections in said cavity of less height radially than the end lags, for the purpose specified.

6. In a machine for felting hats, &c., a roller having a circumferential cavity, substantially as described, lags or projections extending from each end of said roller to said cavity, and intermediate lags or projections in said cavity of less height radially than the end lags, and said end lags being in a line slightly angular circumferentially, substantially as and for the purpose specified.



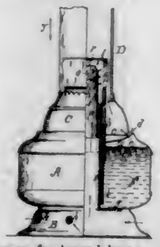
292,112. CARRIAGE-SHADE HOLDER. NICOLA M. GUILLOW, Chicago, Ill., assignor of one-half to Jehiel D. Guillow, Boston, Mass. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a shade-holder for children's carriages, a universal-jointed clasp, consisting of the curvilinear and pivoted plate *c*, in combination with the screw-pin D, arm B, nut E, and clasp C, substantially as and for the purposes specified.

2. In a shade-holder for children's carriages, a universal-jointed clasp, consisting of the curvilinear and pivoted plate *c*, in combination with the screw-pin D, arm B, and nut E, said plate *c* being provided with the bifurcated spring-clasp C, whereby said shade may be detachably suspended therefrom, substantially as and for the purposes specified.

292,113. ELECTRIC-ARC LAMP. CHARLES H. HAYES, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed Nov. 10, 1883. (No model.)

Claim.—1. In an electric-arc lamp, the principal magnet-coil arranged upon a bracket adjustable within the inclosing-case with relation to its core, in connection with the clutch mechanism, said bracket in electric connection with the case, one end of the coil of the magnet in connection with the bracket, the other end in connection with a metallic surface movable with the bracket, but insulated therefrom, said movable metallic surface in connection with a fixed metallic surface insulated from the case, but in connection with the positive wire, substantially as described.



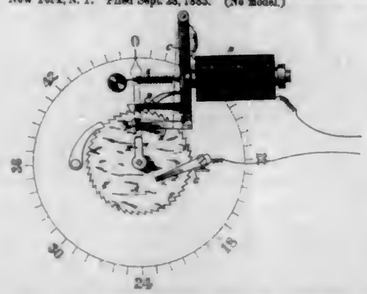
2. In an electric-arc lamp, the principal magnet-coil arranged upon a bracket adjustable within its inclosing-case with relation to its core, in connection with the clutch mechanism, said bracket in electric connection with the case, one end of the coil of the magnet in connection with the bracket, the other end in connection with a metallic surface movable with the bracket, but insulated therefrom, said metallic movable surface in connection with a fixed metallic surface insulated from the case, but in connection with the positive wire, the case constructed with a slot parallel with the axis of the magnet, and a clamping device through said slot and in connection with the bracket, whereby the bracket and the magnet-coil it carries may be adjusted from outside the case, substantially as described.

3. In an electric-arc lamp, the shunt-magnet coil arranged upon a bracket adjustable within its inclosing-case with relation to its core, in connection with the clutch mechanism, said bracket in electrical connection with the case, one end of the coil of the magnet in connection with the bracket, the other end in connection with a metallic surface movable with the bracket, but insulated therefrom, said movable metallic surface in connection with a fixed metallic surface insulated from the case, but in connection with the negative wire, substantially as described.

4. In an electric-arc lamp, the shunt-magnet coil arranged upon a bracket adjustable within its inclosing-case with relation to its core, in connection with the clutch mechanism, said bracket in electric connection with the case, one end of the coil of the magnet in connection with the bracket, the other end in connection with a metallic surface movable with the bracket, but insulated therefrom, said metallic movable surface in connection with a fixed metallic surface insulated from the case, but in

connection with the negative wire, the case constructed with a slot parallel with the axis of the magnet, and a clamping device through said slot and in connection with the bracket, whereby the bracket and the magnet-coil it carries may be adjusted from outside the case, substantially as described.

292,114. LAMP. LEONARD HENKLE, Rochester, N. Y. Filed June 16, 1883. (No model.)

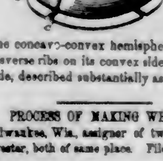


Claim.—1. In a burner for Argand lamps, a wick-tube provided at its upper end with a thimble, forming, with the wick-tube, a passage for the inner upward-moving current of air, said thimble being vertically adjustable in the wick-tube and made conical at its upper end, with perforations through its straight and conical parts, so that some of the jets of air flowing outward through the perforations shall impinge horizontally and others obliquely against the inner surface of the flame, substantially as set forth.

2. In a burner for Argand lamps, the inner wick-tube provided internally at its upper end with a circular part or thimble, forming, with said wick-tube, a passage for the central upward-moving air for the flame, said thimble being reduced in diameter at its upper end, or made conical thereat, and perforated in such a manner that some of the jets of air flowing outward through the perforations move horizontally and others obliquely against the flame, substantially as set forth.

3. In a burner for Argand lamps, a wick-tube provided at its upper end with an internal thimble, forming, with said wick-tube, a passage for the inner upward-moving current of air for the flame, said thimble being perforated to turn the air in jets against the flame and made adjustable within the tube, substantially as described.

292,115. TELEPHONE-EXCHANGE SYSTEM. F. BENEDICT HERRON, New York, N. Y. Filed Sept. 28, 1883. (No model.)

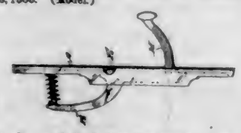


Claim.—1. The combination, in a telephone or telegraph exchange system, with two or more subscribers' circuits connected with the central office thereof, and telephonic or telegraphic apparatus whereby the subscribers may communicate with the central office, of indicators located at or near the offices of one or more subscribers, for indicating specified times of day or other information according to the positions at which they are set, and mechanism whereby the said indicators may be set by the operator from the central office, substantially as described.

2. The combination, in a telephone or telegraph exchange system, with two or more subscribers' circuits connected with the central office thereof, and telephonic or telegraphic apparatus whereby the subscribers may communicate with the central office, of indicators located at or near the offices of one or more subscribers, for indicating specified times of day or other information according to the positions at which they are set, means whereby the said indicators may be set by the subscribers at their offices, and mechanism whereby they may be set by the operator from the central office, substantially as described.

3. The combination, in a telephone or telegraph exchange system, with two or more subscribers' circuits connected with the central office thereof, and telephonic or telegraphic apparatus whereby the subscribers may communicate with the central office, of indicators located at or near the offices of one or more subscribers, for indicating specified times of day or other information according to the positions at which they are set, means whereby the said indicators may be set by the subscribers at their offices, mechanism whereby they may be set by the operator from the central office, and devices to enable the central operator to tell at what positions the said indicators have been respectively set by the subscribers, substantially as described.

4. The combination, with the metal ratchet-disk A, electro-magnet B, and lever C, for actuating the said disk step by step, of the insulating-strip F in the said disk, and the connecting-spring E carried by the lever C and bearing upon the disk A, so constructed that on the back stroke of the lever C, when the said disk is at a particular point of its revolution, the spring E slides over the strip F, first breaking the circuit and then closing it again before the lever reaches its back stop, substantially as described.



292,116. MUCILAGE-BOTTLE AND HOLDER. NATHAN B. HUBBARD, Chicago, Ill., assignor of one-half to John Gray, same place. Filed July 30, 1883. (No model.)

Claim.—1. In combination with a bottle having lateral orifices *a*, a base having arms *b*, provided with projections *b'* at their upper ends, constructed to enter the orifices *a*, for the purpose of pivotally supporting the bottle, substantially as described.

2. In combination with a bottle having lateral orifices *a*, a base-frame constructed of wire bent to form a ring, B', and arms *b*, the latter being bent inwardly at their upper ends to form projections *b'*, constructed to enter the orifices *a*, substantially as described.

292,117. SASH-FASTENER. ROBERT B. HUGUNIN, Hartford, Conn. Filed Oct. 3, 1883. (Model.)

Claim.—1. In a sash-lock, the plate having a longitudinal slot, L, a pivot-bearing at the upper portion of the slot, and a lateral slot, K, connecting with the lower portion thereof, in combination with the bar B, having a pivot or journal at its upper end and an upwardly-extending arm, B''', and at its lower end provided with the extended arm H, having a lateral locking-tongue, G, to enter a notch of the sash, said bar being arranged in the longitudinal slot, and normally held there by the action of a spring, substantially as described.

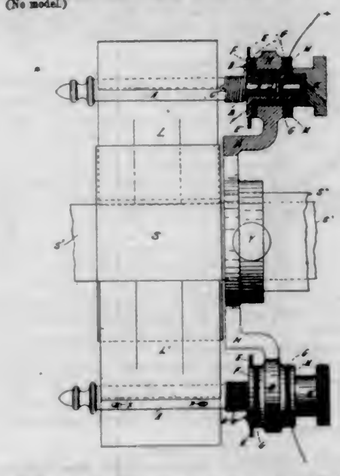
2. The plate provided with a slot for the passage of the locking-lever and bearings for the journals or pivots of the lever, and having flanges on opposite sides of the said slot, in combination with the locking-lever journaled in the bearings in the plate, and having at opposite ends arms extending laterally from the face and back of the plate, and an elastic spring interposed between the arm and back of the plate, substantially as described.

292,118. FLYING TARGET. JAMES JOPLING, Oskaloosa, Iowa. Filed Aug. 16, 1883. (No model.)

Claim.—The concave-convex hemispherical flanged target, having the radially-transverse ribs on its convex side and corresponding grooves in its concave side, described substantially as and for the purpose specified.

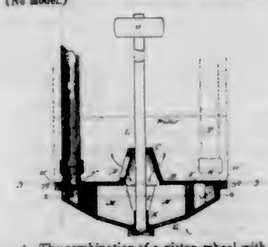
292,119. PROCESS OF MAKING WHITE LEAD. JOHANN KARL KINDLER, Milwaukee, Wis., assignor of two-thirds to Morris Roth and George Sylvester, both of same place. Filed July 16, 1883. (No specimens.)

Claim.—The process of making white lead, which consists in passing an electric current through an electrolyte composed of the acetate of an alkali in solution, using lead for both the anode and cathode, whereby a solution of acetate of the oxide of lead is formed at the positive pole and a caustic solution of the alkali is formed at the negative pole, keeping the products forming at the opposite poles separate from each other, then mixing the said products together, whereby hydrated oxide of lead is precipitated and the original solution of the acetate of an alkali regenerated, and then introducing carbonic-acid gas into the last-named solution, whereby the suspended precipitate is converted into white lead, substantially as described.



292,120. WEATHER-STRIP. WM. R. KIMER, Hammond, Ill. Filed Nov. 8, 1883. (No model.)

Brief.—A weather-strip consisting of two hinged sections and a pivoted adjustable stop or block.

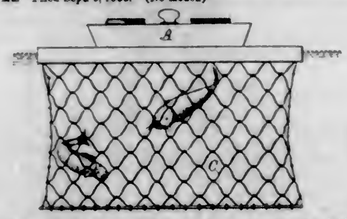


Claim.—The combination, with a weather-strip of the described class, of the pivoted adjustable stop D, whereby the weather-strip can be employed to exclude air, or not, at pleasure, as set forth.

292,121. DYNAMO-ELECTRIC MACHINE. EDWARD R. KNOWLES, Brooklyn, N. Y., and FRANK E. IDELL, Hoboken, N. J., assignors to the Consolidated Electric Light Company, of New York. Filed Sept. 6, 1882. (No model.)

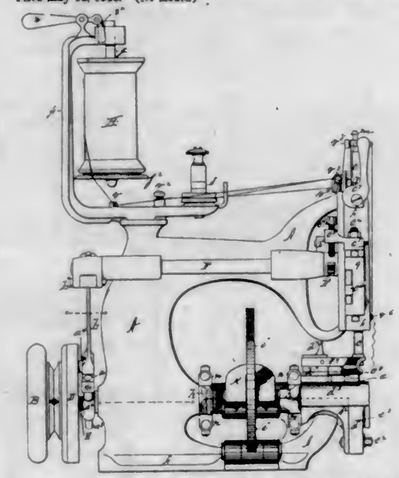
Claim.—In a dynamo-electric machine, the combination, with the brushes and commutator, of an arm, A, a spring, B, an adjusting-sleeve, F, a contact-ring, M, and a tightening-nut, K, the whole being supported upon a yoke, H, substantially as described, for the purpose specified.

292,122. ROTARY PUMP. JOSEPH LEE, Cleveland, Ohio. Filed May 3, 1883. (No model.)



Claim.—1. The combination of a piston-wheel with an inclosing-case, the said case having central inlet-ports and outlet-ports located near its outer edge, substantially as set forth.

2. The combination of the piston-wheel and the casing A, said casing consisting of the sections B G, section B having centrally-located inlet-ports D, and outlet-ports E near its outer edge, section G having central chamber, I, connecting with the inlet-ports, and ways N, connecting said chamber I with the outlet-ports, substantially as shown.



3. The combination of the piston-wheel with the casing A, said casing consisting of the sections B G, section B having cone C, inlet-ports D, outlet-ports E, and ways F, section G having chamber I, groove H, and ways N, registering with ways F, all combined to operate substantially as shown and described.

292,123. LIVE-BOX FOR FISH. RICHARD A. LINDSAY, Baltimore, Md. Filed Sept. 6, 1883. (No model.)

Claim.—In a fisherman's live-box, the combination of a rigid buoyant top having an opening for the introduction of fish and a hinged door to close the said opening, a rigid non-buoyant bottom, and cord-netting sides, substantially as and for the purpose specified.

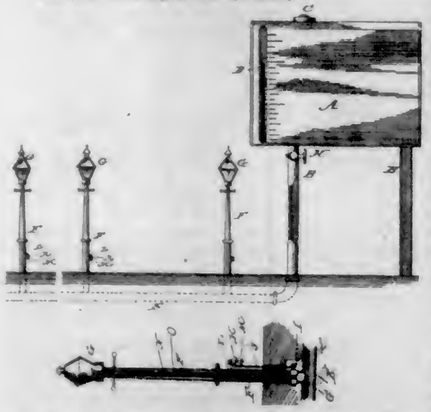
292,124. STRAW-BRAID-SEWING MACHINE. MEHEL MARCH, Amherst, Mass., assignor of one-half to the Hills Company, same place. Filed May 12, 1883. (No model.)

Claim.—1. In combination, the needle-bar *m*, the presser foot-bar *c*, the rock-shaft F, having the pitman-arm b^2 thereon, extending in an opposite direction from the arm thereon, connecting said shaft with the needle-bar, the pitman *b*, provided with the yoke *a*, having arms a^2 thereon, the yoke-box a^3, the ring x^2, having the stud x^3 thereon, the wheel B, having the eccentric plate *x* thereon, and the shaft E, substantially as set forth.

2. The combination, with the driving-shaft of a sewing-machine, of an eccentric fixed on said shaft, of two perforated yoke-boxes fitted on said eccentric, of a feed-frame, substantially as described, having yoke-arms fitting the perforations in said boxes, and a feed-dog arm thereon, substantially as described, and having its outer end supported upon a vibratory lever pivoted to the base of the machine, of means, substantially as described, for giving to said feed-frame reciprocating horizontal movements, substantially as described.

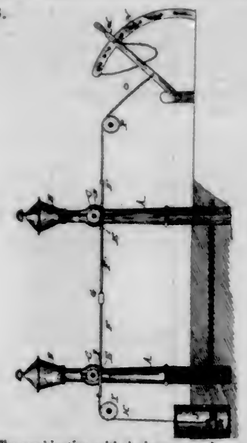
3. The combination, with the driving-shaft of a sewing-machine, of an eccentric fixed on said shaft, of two perforated yoke-boxes fitted on said eccentric, of a feed-frame having yoke-arms fitting the perforations in said boxes, and a feed-dog arm thereon, substantially as described, and having its outer end supported upon a slotted vibratory lever pivoted to the base of the machine, and the eccentric-rod K, connected by one end to said eccentric, and having its opposite end adjustably connected to said slotted vibratory lever, substantially as set forth.

292,125. PROCESS OF MANUFACTURING VINEGAR. VICTOR MEHARLE, Luxemburg, Germany. Filed July 27, 1882. (No model.) Patented in France Sept. 26, 1878, No. 126,556; in Belgium Jan. 23, 1879, No. 47,255; in Germany Feb. 11, 1879, No. 6,620, and Oct. 16, 1879, No. 9,231; in Luxemburg Feb. 15, 1879, No. 2; in Italy June 30, 1879, No. 93; in Spain Aug. 1, 1879, and in England Oct. 6, 1879, No. 4,033.



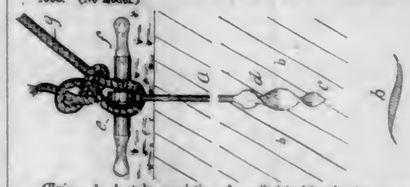
Claim.—The process of manufacturing vinegar, which consists of the following successive steps: First, saturating the acetifying material with a portion of the liquor to be acetified; secondly, removing the saturated acetifying material from the main body of liquor to be acetified; thirdly, permitting the liquor in said saturated acetifying material to be oxidized for a given period, as described; fourthly, passing the acetifying material quickly through the main body of the liquor to be acetified, and periodically repeating the foregoing steps until the whole charge of liquor is acetified, substantially as described.

292,126. CAR-COUPLING. THOMAS JEFFERSON MILLER, North Manchester, Ind., assignor of one-half to Marcus L. Hartar, same place. Filed Nov. 3, 1883. (No model.)



Claim.—In a car-coupling, the combination, with the draw-head having a coupling-bar receptacle, of the clamping-hooks within the draw-head on the transverse rod near the rear end of the receptacle, the coil-spring between their rear ends, and the key having the rectangular enlargement working between the clamping-hooks, substantially as specified.

292,127. APPARATUS FOR LIGHTING STREETS, &c. BARNARD W. MITCHELL, Hubbard, Ohio, assignor of one-third to Adam Holtzbaugh, same place. Filed Aug. 25, 1883. (No model.)



Claim.—The combination of the tubular lamp-posts, the perforated wick-tubes extending from the burner down to the stop-cock, the stop-cock inserted transversely through the tubular post at the lower end of the perforated wick-tube, with its opening registering with said tube, means for opening and closing said stop-cock, and the main feeding the oil to the posts from a common reservoir.

292,128. APPARATUS FOR LIGHTING STREETS. BARNARD W. MITCHELL, Hubbard, Ohio, assignor of one-third to Adam Holtzbaugh, same place. Filed Oct. 16, 1883. (No model.)

Claim.—The combination, with the lamp-posts, lamps, and their regulating mechanism, of the sliding racks E, connecting-rods F, chain H, weight K, or its equivalent, and suitable means or mechanism for actuating the rack-bars and their connecting-rods, substantially as and for the purpose shown and set forth.

292,129. STAKE FOR GUY-ROPES. JONATHAN J. MOORE, Thorntown, Ind., assignor of one-half to James A. Ball, same place. Filed June 29, 1883. (No model.)

Claim.—1. A stake consisting of a cylindrical bar having a screw-blade thereon, with thin edges, and terminating in a tapered point and adapted to enter the earth without raising it, substantially as shown and described, and for the purpose specified.

2. A stake consisting of a cylindrical bar having a screw-blade formed thereon, with thin edges, and terminating in a taper point, and adapted to enter the earth without raising it, an eye formed on said bar, and a handle inserted in said eye, all combined, substantially as and for the purpose specified.

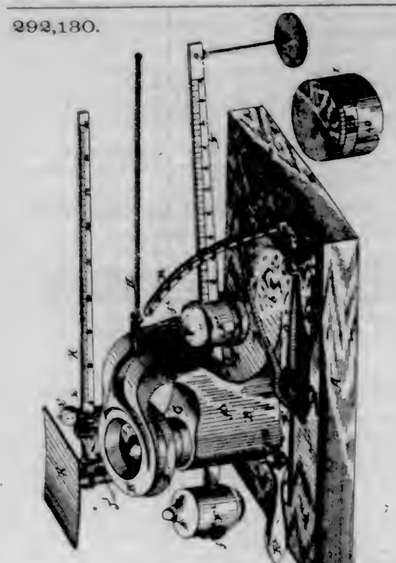
292,130. MACHINE FOR TESTING FABRICS. EBENEZER MORRISON and JAMES P. HERRON, Washington, D. C. Filed Aug. 25, 1883. (No model.)

Claim.—1. In the art of testing fabrics where the force applied is measured, the step herein set forth, which consists in confining an area wholly within the edges of the fabric, substantially as and for the purpose set forth.

2. The method herein set forth of testing fabrics, which consists in confining an area located wholly within the edges of the fabric, and applying pressure within said area, substantially as specified.

3. The method of testing fabrics which consists in confining a circular area of the fabric, applying pressure at the center of said area, breaking or rupturing the fabric, and indicating the amount of pressure, substantially as specified.

4. The method of testing fabrics which consists in rupturing or breaking the same at a confined portion only, and measuring the force employed, substantially as specified.



5. The combination of a rigidly clamping or confining mechanism, a plunger, and means for measuring the force applied to the plunger, substantially as specified, and for the purpose set forth.

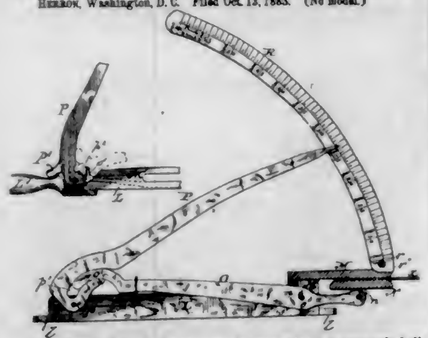
6. In a machine for testing fabrics, an annular clamp, a concentric plunger, and a weighing apparatus connected with the plunger, substantially as and for the purpose set forth.

7. In a machine for testing fabrics, an annular clamp, comprising a head, as B', and a collar, as D, a cylinder, as C, and means for operating the cylinder, substantially as specified.

8. The combination of the annular collar D, having the rib *d*, and the annular head B', having the groove b^3, substantially as specified.

292,130.

9. The combination of the annular head B', the annular collar D, the cylinder C, and the plunger G, arranged concentric with each other, substantially as specified.



10. The combination of the plunger G, cylinder C, collar D, shaft E, cam E', and lever E^2, with the standard B, provided with the annular head B', substantially as shown and described.

11. The combination of the standard B, bored and slotted as described, with the plunger G and scale F F^1 F^2, substantially as shown and described.

12. The standard B, bored and slotted as described, and provided with the pivot-standards J, substantially as shown and described.

13. The testing apparatus herein shown and described, comprising the pressure weighing scale F F^1 F^2, the scale K K', and the thickness-gage L, substantially as shown, and for the purpose specified.

292,131. THICKNESS-GAGE. EBENEZER MORRISON and JAMES P. HERRON, Washington, D. C. Filed Oct. 13, 1883. (No model.)

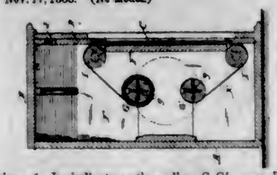
Claim.—1. In a thickness-gage for measuring paper, a scale indicating degrees and sheets to the inch, substantially as specified.

2. In a thickness-gage, a fixed jaw having a degree-scale mounted thereon and a movable jaw mounted upon a lever, the free end of which is curved and directly connected to a pointer between its pivot and the said scale, the whole being constructed and operating substantially as specified.

3. In a thickness-gage, the combination of a lever supporting one of the jaws, and connected with a pointer having a thumb-piece, and a base provided with a handle, substantially as specified.

4. In a thickness-gage, the combination of a base provided with a handle, and a pointer provided with a thumb-piece, substantially as specified.

5. The combination of a base provided with a fixed jaw and with a handle of a lever carrying a movable jaw and provided with a toothed curved free end, with a pointer provided with meshing teeth and a thumb-piece, substantially as specified.



6. In a thickness-gage, the combination of the fixed jaw M, the movable jaw N, and the lever O, pivoted to a step or extension, M', of the fixed jaw, substantially as shown and described.

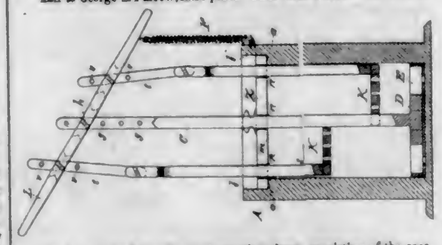
7. The combination of the lever O, having the curved portion *o'*, with the pointer P, having a similarly-curved slot, *p'*, and the base L, having the pivots *o p* and the extensions *l*, substantially as shown and described.

8. In a thickness-gage, the combination of the fixed jaw M, provided with the lug *m*, and the sector scale-beam R, provided with the stop *r'*, substantially as shown and described.

9. The combination of the pivoted scale-beam R, the pivoted and curved slotted pointer P, the curved lever O, the base L, and the jaws M N, substantially as shown and described.

292,132. INDICATOR. CHARLES W. MUSGROVE, Lock Haven, Pa. Filed Nov. 17, 1883. (No model.)

Claim.—1. In indicators, the rollers G G', reversibly mounted in the casing F, to expose both sides of the sheet successively, longitudinally divided both to insert round tubes *g g'* concentrically therewith, and to permit of grasping the cloth so that it will lie true thereon.



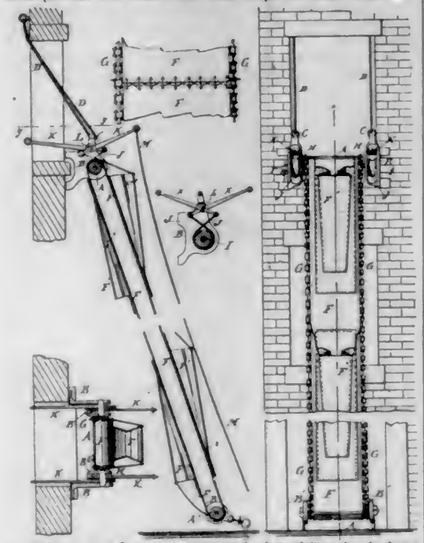
2. In indicators, the combination, with the rollers G G', containing round tubes *g g'*, having square ends, which pass on one side through the casing A of plate M, attached at that side to the casing, and suitably perforated to permit by its rotation access successively to the ends of the tubes *g g'*, a catch whereby such rotation is effected, and operating-crank L.

3. In indicators, the combination, with the receiver and delivery rollers G G', of guide-rollers I I', also mounted in the frame F, serving to change the direction of the cloth K, guide-frame F, located between said guide-rollers, to guide the indicator belt or cloth, being immediately behind it, glass E, mounted in the slide D, which exposes the information, frame F, in which the mechanism is removably mounted, and cloth K, attached to both rollers G G', and bearing the information.

4. In indicators, the rollers G G', longitudinally divisible, containing tubes *g g'*, concentric therewith, plate M, suitably perforated to permit access to the square end of the tube contained in the receiving-roller, catch N, having end *n* and spring *n'*, and crank L, in combination with guide-rollers I I', guide-frame F', glass E, frame F, and cloth K.

5. In indicators, the casing A, having lid B, the removable frame F, the glass E, mounted in slide D in the front of the casing, whereby the glass is removable for cleaning and other purposes, the rollers G G' I I', guide-frame F', plate M, perforated to expose the square end of the tube contained in the receiver and rotary for this purpose, as the same roller is alternately a receiver and deliverer, catch N, having end *n*, attached to spring *n'*, serving normally to hold the plate stationary and permitting rotation of the plate M by pulling the spring from its bed, crank L, cloth K, removable slide J, to permit of reversing the roller, and retaining-hooks H H.

292,133. CHURN. HENRY C. NEER, Brecksuridge, Ill., assignor of one-half to George L. Farrow, same place. Filed June 4, 1883. (No model.)



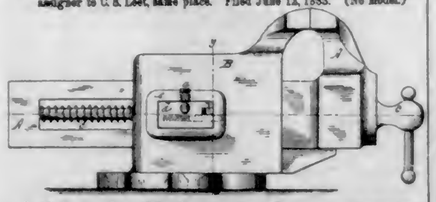
Claim.—A double-acting reciprocating churn, consisting of the case A, having the interior ledges, *a*, the sectional cover Z, the removable central stem, C, secured by its rigid base-piece to the butter-pan E, the adjustable lever L, the dasher-stems *s s*, and their connections *t t*, secured to the lever L, and the perforated dashers K K, one of which is recessed in

its inner edge to receive the stem C, all combined and operating substantially as specified.

292,134. FIRE-ESCAPE. SAMUEL NORRIS, Halifax, Nova Scotia, Canada. Filed Sept. 12, 1883. (No model.)

Brief.—An endless belt having pockets and strengthening-chains, and passing over rollers journaled in suspended bearing-blocks, said rollers provided with brake-levers, brake-straps, and brake-cords.

Claim.—1. A fire-escape constructed substantially as herein shown and described, and consisting of a roller provided with chain-wheels and brake-wheels, an endless belt provided with pockets and strengthening-chains, suspended bearing-blocks to carry the endless-belt roller, and brake-straps, brake-levers, and brake-cords for controlling the escape, as set forth.



2. In a fire-escape, the endless belt F, made substantially as herein shown and described, with pockets F' and strengthening-chains G, as set forth.

3. In a fire-escape, the combination, with the roller A, provided with chain-wheel H and the suspended bearing-blocks B, of the endless belt F, provided with pockets F' and strengthening-chains G, substantially as herein shown and described, whereby people and property can be lowered by their own weight, as set forth.

4. In a fire-escape, the combination, with the roller A, carrying the endless belt F, and the suspended bearing-blocks B, of the brake-wheels I, the crossing brake-straps J, the pairs of crossing brake-levers K, having a common fulcrum and their shorter arms connected to the brake-straps, and the brake-cords M, substantially as herein shown and described, whereby the rapidity of descent can be readily controlled, as set forth.

5. In a fire-escape, the combination, with the suspended bearing-blocks B, the roller A, and the endless belt F, having pockets F', of a second set of bearing-blocks, B', and a second roller, A', substantially as herein shown and described.

292,135. SLIDING-JAW VISE. WM. H. NORTHALL, Bridgeport, Conn., assignor to C. S. Lee, same place. Filed June 13, 1883. (No model.)

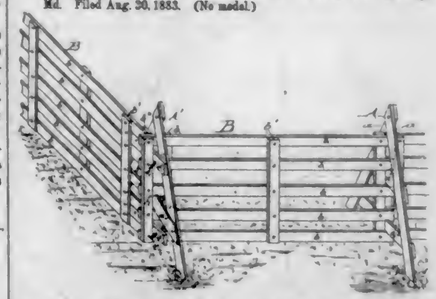
Claim.—1. In a sliding-jaw vise, the combination, with the body, the movable jaw, and the clamping-screw thereof, of one or more sectional nuts, substantially as described, attached to said body, and mechanism, substantially as described, for operating said nut or nuts by and under the control of the said screw, to move them toward and from the latter, substantially as set forth.

2. The combination, with the body and the movable jaw of a sliding-jaw vise, of a longitudinally-grooved clamping-screw, of a cam fitted on said screw and having a splined connection therewith, of one or more sectional nuts attached to said body, each of which is provided with a cam-lever, a wedge, and a locking-bolt, substantially as described, and springs *c* and 3, all as set forth.

3. The combination, with the body B, the sliding jaw A, the screw *a*, and the cam *c*, of the nut *d*, the springs *c* and 3, the lever *z*, the wedge *x*, and the bolt *n*, substantially as set forth

292,136. LEAD AND CRAYON HOLDER. BENJAMIN G. PLATT, Bayonne, N. J. Filed Oct. 4, 1883. (No model.)

Claim.—1. In a lead and crayon holder, the sheath A, the inner surface of which is oval in cross-section, provided on opposite sides, from end to end, with ratchet-teeth a^2, and having between said ratchet-teeth an intermediate smooth surface, *m*, in combination with a propellible traveler, D, provided with a collar, E, having on opposite sides spring-pawls *e*, all arranged as described, whereby said traveler D may be propelled step by step within a suitable case or sheath, substantially as described.

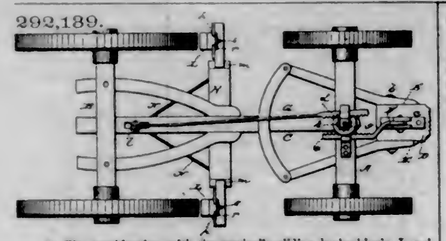


2. In a lead or crayon holder, the combination of the sheath A, provided with nozzle *a*, said sheath provided with a bore, oval in cross-section, and having on opposite sides of said bore ratchet-teeth a^2, and the concentric tube B, having longitudinal slot *b*, with traveler D, having collar E and side spring-pawls *e*, and means, substantially as described, whereby a writing-core can be propelled a predetermined distance longitudinally within and without said sheath A and retracted, substantially as described.

292,137. FOUNTAIN ATTACHMENT FOR PENS. GEO. W. PRICE, Baltimore, Md., assignor to Bernard N. Baker, same place. Filed Nov. 3, 1883. (No model.)

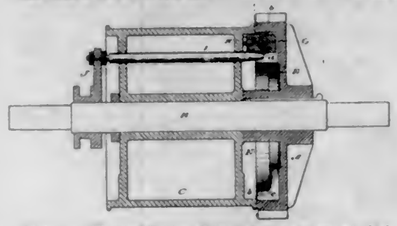
Claim.—A fountain attachment for pens, consisting of a spiral wire and a holder for the same, having a back piece, *c*, to shield the spiral coils, and a stiff piece, *b*, extending through the spiral coils, as shown, and adapted for connection with a pen-holder on top of the pen, as set forth.

292,138. PORTABLE FENCE. FRANCIS C. REDNER, New Midway, Md. Filed Aug. 30, 1883. (No model.)



Claim.—In a portable fence, the combination of the corner-post A', composed of the inclined bars *a a*, connected together at their upper ends, and the connecting cross-bar a^2, with the adjacent panels B B, one of said panels provided with end upright, b^2, and one or more projecting short bars, *d*, and the other panel provided with an end upright, b^2, cut away, as shown, and means for locking the parts together, substantially in the manner as and for the purpose described.

292,139. WAGON-BRAKE. JAMES D. RUSSELL, North Hamden, N. Y. Filed May 26, 1883. (No model.)



Claim.—1. In a wagon-brake, the combination, with a sliding tongue and brake-bar, of the rack-and-pinion connection under the front axle, substantially as specified.

292,139.

2. The combination, with the vertically-sliding brake-blocks L and the parallel moving brake-bar K, of the lever *l*, the rack-connection F and G, and the double pinion *g*, substantially as specified.

292,140. FRICTION-CLUTCH. THEODORE SCHEYTLER, Paterson, N. J., assignor, by direct and mesne assignments, to Otto Fiehr, Newark, N. J., and Francis M. Pierce, Brooklyn, N. Y. Filed Oct. 31, 1883. (No model.)

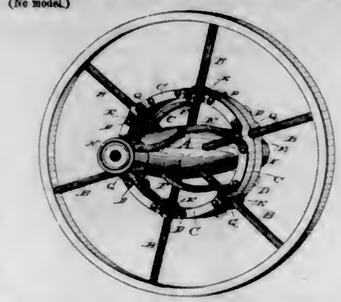
Claim.—1. The combination of two rotary parts, one of which is adapted to drive the other in one direction through the medium of a friction-clutch, with a clutch consisting of an annular flange on one of said parts, a pin on the other, a divided expansive ring within said flange, and an expanding-lever fulcrumed to said ring on one side of a division therein, bearing against the same on the opposite side of said division, and adapted to be actuated to expand the ring by the pressure of said pin, substantially as set forth.

2. In a friction-clutch, the combination of annular flange *b*, expansive divided ring E, lever G, fulcrumed to said ring on one side of a division therein, and bearing against it on the opposite side of said division, and pins F and H, acting against said lever, substantially as set forth.

3. In a friction-clutch, the combination of annular flange *b*, expansive divided ring E, expanding-lever G, fulcrumed to and extending against said ring, clutching-pin F, and releasing-pin I, all arranged and adapted to operate substantially as set forth.

292,141. FENCE-POST. FANNIE S. SMITH, Topeka, Kans., assignor, by direct and mesne assignments, to H. Thomas and W. F. Thomas, same place, and L. C. Laurent, Shawnee County, Kans. Filed July 23, 1883. (No model.)

Claim.—A metallic fence-post consisting of the standard formed by the parts A and A' in one piece, disposed at right angles to each other, and having holes K E I, and notches D, connecting-brace B, and wire ties O G H, all constructed and combined substantially as and for the purpose shown and described.

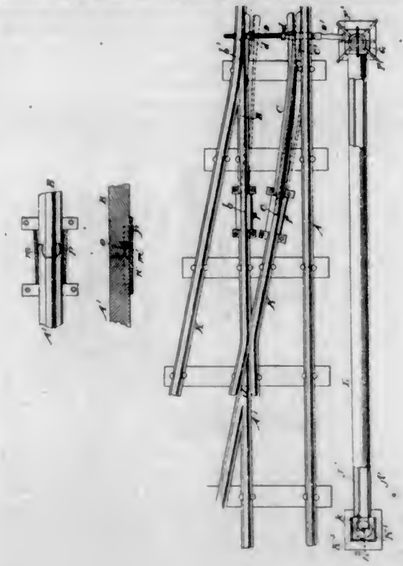


292,142. SECONDARY BATTERY. CHARLES A. SMITH, Hoopeston, Ill., assignor of one-half to Hamer T. Brown, same place. Filed Mar. 7, 1883. (No model.)

Claim.—1. In a secondary or storage battery, the combination of the vessel A, having the corrugated sheet-lead lining *a*, the boxes B, having slits *b'*, and shot D, having perforations *d* previously oxidized in a bath of nitric acid, the whole arranged as and for the purposes set forth.

2. In a secondary or storage battery, the combination of the vessel A, having the corrugated sheet-lead lining *a*, the boxes B, having slits *b'*, and shot D, having perforations *d* previously oxidized in a bath of nitric acid, the balls being filled with white lead mixed with sulphuric acid and water, the whole arranged as and for the purposes set forth.

292,143. VEHICLE-WHEEL. PHILIP HARRIS STERN, Austin, Tex., assignor of one-half to James W. Shepard, same place. Filed Aug. 18, 1883. (No model.)



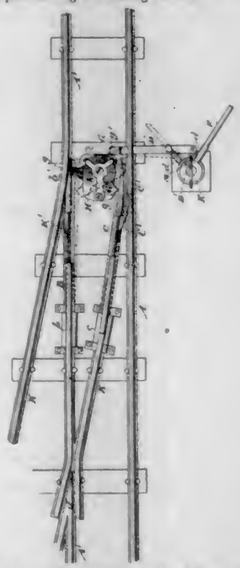
Claim.—1. A device for bracing the spokes of vehicle-wheels, consisting of two recessed spoke-clamping rings having braces extending to fastenings upon the hub, as and for the purpose shown and set forth.

2. The combination of two spoke-clamping disks having recesses in their meeting sides for the reception of the spokes, rings fastened upon the ends of the hub, and brace-rods extending between the spoke-clamping and the hub-clamping rings, as and for the purpose shown and set forth.

3. The combination of a hub of a vehicle-wheel, the spokes, two spoke-clamping rings secured together, and bulged to form recesses for the reception of the spokes, hub-clamping rings fastened around the ends of the hub, and brace-rods extending from the spoke-clamping to the hub-clamping rings, as and for the purpose shown and set forth.

292,144. RAILWAY-SWITCH. EDWARD STONE, Cortland, N. Y., assignor of one-half to John Hodgson, same place. Filed July 18, 1883. (No model.)

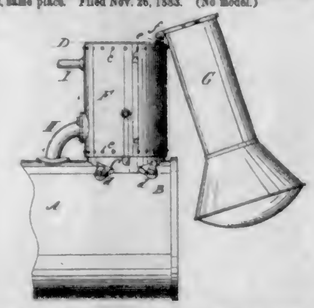
Brief.—The ends of the fixed rails to which the switch-rails are to be pivoted are socketed, in which sockets the cut-away convex bearing portion of the ends of the switch-rails is placed, a sleeve surrounding the joint. A switch-stand constructed with a box containing a spiral spring is connected to the points by hinged bars, one of which is screw-threaded.



Claim.—1. In combination with the rails having projections *m* with sockets *n*, the switch-rails B and C, having cut-away portions and convex bearings *o*, and the chair P, having flaring mouth, as set forth, for the purposes specified.

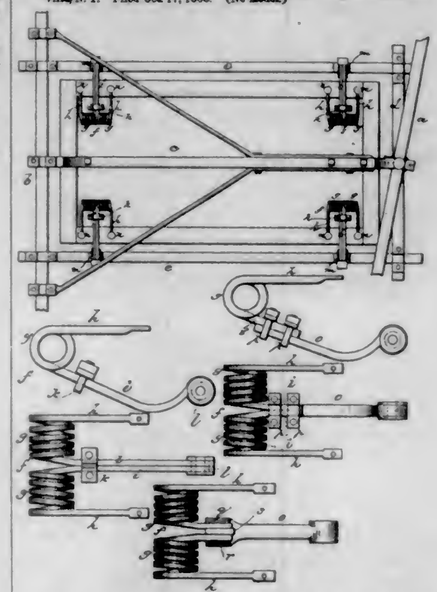
2. In combination with the switch-rails B and C, pivoted, as shown, to the rails A' K, the standard F, box G, spring H, and connections E, D, and D', as set forth.

292,145. RAILROAD-SWITCH. EDWARD STONE, Cortland, N. Y., assignor of one-half to John Hodgson, same place. Filed July 18, 1883. (No model.)



Brief.—The switch-point rails are pushed inwardly by springs and outwardly by a cam-plate having flat bearing-surfaces.

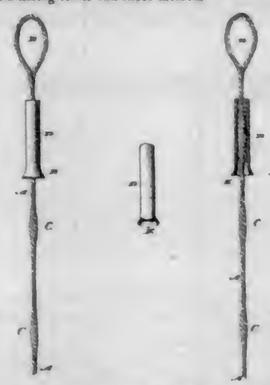
Claim.—1. In combination with the rails B and C and the cam-plate G, whereby they are both forced outwardly, the springs B' and C', adapted to serve substantially as herein specified.



2. In combination with the rails B and C, main rails, and springs B' and C', as shown, the cam-plate G, having arms G', with inclined bearings *g*, the pivot *h*, rod D, standard D', lever F, box E, having slot g^3, and the locking-pins *x*, as and for the purposes set forth.

292,146. SUPERHEATING ATTACHMENT FOR STEAM-BOILERS. JAMES ANDREW STOUT, Belleville, Ill., assignor to the Harrison Machine Works, same place. Filed Nov. 26, 1883. (No model.)

Claim.—The combination, with the boiler over the smoke-box end thereof, of the superheating steam-dome consisting of the lower and upper cast-metal rings, C D, the lower one of which is made to fit the boiler as a saddle, and is provided with the securing lugs or ears *d*, and of inner and outer wrought-metal shells, E F, united with each other and with the rings C D by rivets passing through the shells and rings, and the inlet and outlet pipes, substantially as set forth.



292,147. SPRING FOR VEHICLES. CHARLES L. THOMAS, Hernellsville, N. Y. Filed Oct. 17, 1883. (No model.)

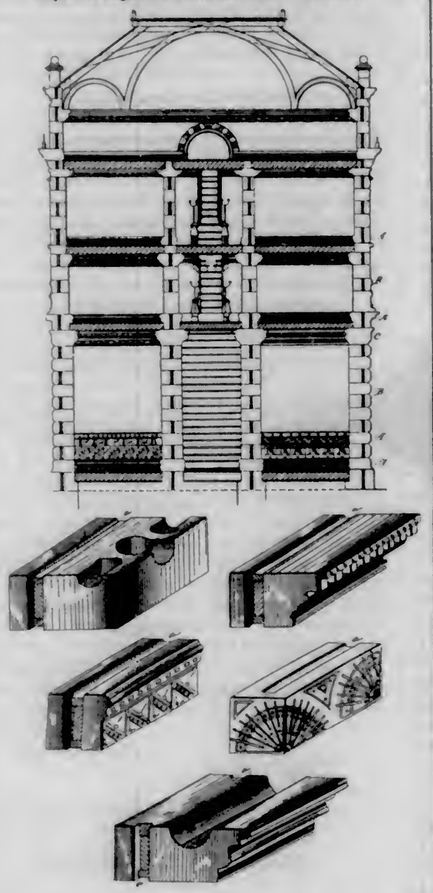
Claim.—A coil-spring for vehicles, formed of two separate pieces of steel, each provided with an upper outer arm extending to and connected with the body of the vehicle, a spiral coil running inwardly from said outer arm and terminating in an inner lower arm extending nearly straight forward from the inner coil, in combination with a rigid fastening device connecting the inner arms in front of their inner coils, and secured to the side bars, substantially as specified.

292,148. FIRE-ESCAPE. CHARLES M. TRAVIS and CASPER H. STIBOLT, Crawfordsville, Ind., assignors of one-third to J. Roach Johnson, same place. Filed Mar. 26, 1883. (No model.)

Brief.—The fibrous and wire rope is provided with enlargements at intervals along its length, and a pliable sleeve having a roughened inner surface and a flaring lower end slides thereon.

Claim.—1. In combination with the rope provided with a series of enlarged portions at intervals of its length, the sleeve formed of pliable material surrounding and adapted to slide upon the rope, substantially as and for the purpose set forth.

2. In combination with the rope provided with a series of enlarged portions or swells, the sleeve adapted to slide upon said rope, and formed of pliable material with a rigid enlarged portion at its lower end, substantially as and for the purpose set forth.

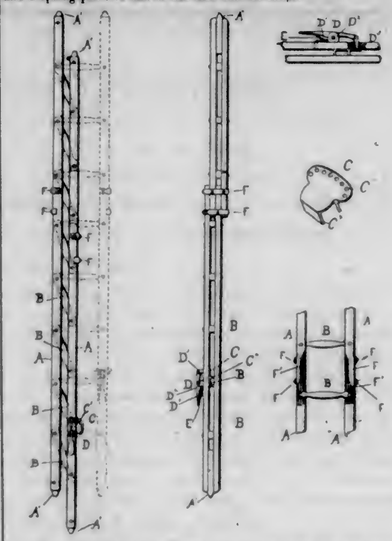


3. In combination with the rope formed of a series of enlarged portions or swells, the pliable sleeve with interior roughened surface, substantially as shown and described.

4. In combination with the rope formed with a series of enlarged portions or swells, the pliable sleeve formed with interior roughened surface, and provided at its lower end with a bard ring flaring outward and downward from the sleeve, substantially as shown and described.

5. The rope formed with a series of enlarged portions or swells, in combination with the soft-rubber sleeve roughened on its interior surface, and provided with a bard flaring lower end, substantially as and for the purpose set forth.

6. The fire-escape rope for use with a frictional sleeve, made of suitable fibers interwoven or twisted with finer metal wires, and formed with a series of enlargements or swellings along its length, substantially as shown and described.

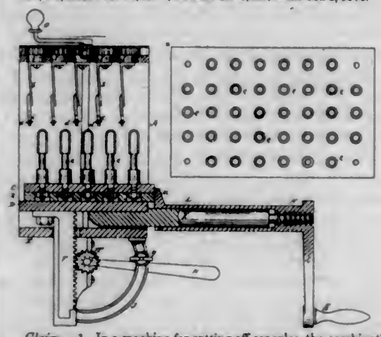


292,149. METHOD OF CONSTRUCTING BUILDINGS OF ARTIFICIAL STONE. THEODORE W. TYRER, Stillwater, Minn., assignor to Sarah P. Tyrer, Los Angeles, Cal. Filed June 14, 1883. (No model.)

Claim.—In a building, the walls consisting of blocks of artificial stone provided with interior and exterior decorations, and being united to each other by horizontal and vertical grooves filled with cement, said stones being ornamented on the interior so as to form base-boards, wainscoting, cornices, and other desired ornamentation, as described, and on the exterior portion to form cornices, brackets, friezes, capitals, and other ornamentation, the parts being arranged and organized substantially as shown, and for the purpose set forth.

292,150. LADDER. CHARLES G. WORK, Lancaster, Ohio. Filed Dec. 6, 1883. (No model.)

Brief.—Where the sections of the folding ladder are united one strip of each section is cut away, to allow of the folding in of the adjacent round, and is secured between the two strips of the other section. The ladder is adjusted through a perforated rack on one of the rounds and a spring-pawl on one of the side bars or strips.



Claim.—1. In a ladder, the combination, with the side bars, and the rounds pivoted thereto, of a rack secured on one of the rounds, and a pawl supported on one of the side bars, and arranged in position to engage the rack, whereby the several parts of the ladder may be locked in any desired position, substantially as set forth.

2. The combination, in a ladder, of the bars composed of two strips and made in sections, one strip of each section having the inner edge of one end cut away or beveled and secured between the two strips of the other section, and the rounds pivoted between the strips of the side bars adjacent the meeting ends of the sections, all arranged and operating substantially as and for the purposes specified.

REISSUES.

10,437. MACHINE FOR CUTTING OFF GELATINE CAPSULES. FREDERICK A. HUBEL, Detroit, Mich. Filed Nov. 16, 1883. Original No. 187,279, dated Feb. 13, 1877; Reissue No. 8,440, dated Oct. 1, 1878.

Claim.—1. In a machine for cutting off capsules, the combination of the series of molds *e*, and the rack, pinion, and lever, F T H, or their equivalents, substantially as and for the purposes described.

2. In a machine for cutting off capsules, the combination of the mold-plate, adapted to and holding a series of molds, and the screw mechanism L K N, substantially as and for the purposes described.

3. In a capsule-cutting machine, a series of knives operated by a crank and pinion acting upon a series of pinions, one of which operates each of said knives, substantially as described.

4. In a capsule-cutting machine, the knives operated by gearing, substantially as described, and supported upon spring-arms, substantially as and for the purposes set forth.

5. In a capsule-cutting machine, the combination with the mold-plates provided with molds, rack, pinion, and lever, F T H, and the screw mechanism L K N, substantially as and for the purposes described.

6. In a capsule-cutting machine, the combination, with the supporting-frame, of a mold-plate bearing a series of capsule-molds substantially such as described, secured thereto at regular intervals, and a series of knives arranged at like regular intervals as said molds, and adapted to cut the capsules formed therein, substantially as described.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISION OF SECRETARY OF THE INTERIOR.

DISCLAIMER UNDER RULE 42—SPECIFIC REFERENCES REQUIRED.

Rule 42 contemplates such specific reference as will clearly identify the particular application referred to, and this would seem to be best accomplished by stating the date of filing and the serial number of the application.

DEPARTMENT OF THE INTERIOR,
Washington, January 4, 1884.

SIR: I have considered the question involved in the appeal from the action of your predecessor in the case of John M. Finch, *ex parte*. It appears that Mr. Finch has filed two applications for patents for improvements in dust-collectors. In one the specific device is shown and described, but not claimed, and in the other the device is shown, described, and claimed. The drawings accompanying the applications are identical.

Rule 42 of the Rules of Practice is as follows:

When an applicant makes two or more applications relating to the same subject-matter of invention, all showing but only one claiming the same thing, those not claiming it must contain disclaimers thereof with references to the application claiming it.

The applicant filed a disclaimer in the words:

I do not in this case claim any invention except those specifically set forth in the claims hereof, preferring to claim any other patentable feature shown or described in another application, which I have filed as a division of this case.

This general reference to another application, &c., was not regarded by your Office as sufficient to meet the requirement of the rule, and the applicant was called upon to specify the particular application by stating the date it was filed and its serial number. From this requirement the appeal is taken.

I concur in the opinion of the Commissioner that the rule contemplates such specific reference as will clearly identify the particular application referred to, and this would seem to be best accomplished by stating the date of filing and the serial number of the application.

The decision of the Commissioner is affirmed. The papers belonging to the files of your Office are herewith returned.

Very respectfully,

H. M. TELLER,
Secretary.

The Commissioner of Patents.

COMMISSIONER'S DECISIONS.

EX PARTE FINCH.

Decided April 6, 1883.

DISCLAIMER UNDER RULE 42—SPECIFIC REFERENCES REQUIRED.

Rule 42 contemplates such specific reference as will clearly identify the particular application referred to, and this should be effected by stating the serial number and date of filing of the application.

13

DUST-COLLECTORS.

INTERLOCUTORY APPEAL.

Application of John M. Finch filed December 11, 1882.

Messrs. Doubleday & Bliss for the applicant.

MARBLE, *Commissioner:*

Applicant has filed two applications for patents for improvements in dust-collectors. The drawings accompanying the applications are identical. In one the specific device is shown and described but not claimed, and in the other the device is shown, described, and claimed. The Examiner requires the applicant, if he desires to take out his patent for the specific device, to make a reference to his application in which the device was shown and described but not claimed, the claim in the latter application being broader than in the former. This requirement was made under Rule 42 of the Rules of Practice, which reads as follows:

When an applicant makes two or more applications relating to the same subject-matter of invention, all showing but only one claiming the same thing, those not claiming it must contain disclaimers thereof, with references to the application claiming it.

Under this rule the applicant claims that it is sufficient for him to refer to another pending application, in which the device is shown but not claimed, without giving the date of its filing or serial number.

It will be observed that the rule above quoted requires that where two or more applications are filed by the same inventor, all showing the same subject-matter of invention, but claiming it in distinct parts, that the applications not claiming a particular part must contain disclaimers thereof, "with reference to *the* application claiming it." There is no way of specifying the particular application in which the invention is claimed except by stating in the other applications filed its date of filing or serial number. If such statement be given, any person interested in any particular patent which may issue, or, in case one application is passed to issue before the others, can ascertain by inquiry where such application is, and what it contains and claims. This, I think, is the object and purpose of the rule. In requiring that such reference should be made in the present case the Examiner did not exceed his duty; on the contrary, he would have been remiss in his duty had he failed to make such requirement. Purchasers of rights under patents granted are entitled to be notified, so far as possible, of any application or patent which subordinates the patent under which they obtain their rights. If an application is pending which, when it ripens into a patent, will subordinate the patent which they desire to purchase, or under which they are operating, they have the right to be notified of such application, in order that they may protect their rights.

The decision is affirmed.

EX PARTES GRUSON AND SCHUMANN.

Decided January 5, 1884.

1. OATH—SECTION 4892 REVISED STATUTES CONSTRUED.

Section 4892 Revised Statutes does not authorize an applicant who is a resident of a foreign country to make oath to his application before any officer other than those designated in said section. They are "any minister, *chargé d'affaires*, consul, or commercial agent holding commission under the Government of the United States, or any notary public of the foreign country in which the applicant may be."

2. SAME—AUTHORITY TO ADMINISTER OATHS DERIVED FROM UNITED STATES STATUTE ALONE.

Such designated officials in administering the oath act by virtue of the authority conferred by the statute of the United States, and not by virtue of any power or authority conferred by the foreign government.

3. SAME—OFFICER NOT AUTHORIZED.

An oath taken before a judge of the royal Prussian court is not sufficient.

APPEAL from Primary Examiner.

ARMOR-PLATED GUN-CARRIAGES.

Application of Hermann Gruson and Max Schumann, filed April 19, 1883.

Messrs. Knight Brothers for the applicants.

BUTTERWORTH, *Commissioner:*

The question raised on this appeal is as to the sufficiency of the oath accompanying the application. Applicants are residents of Germany, and took and subscribed the oath to their application before a judge of the royal Prussian court at Buckau. The Examiner rejected the application as not being in compliance with the requirements of the Revised Statutes, section 4892, which provides that the—

> * * * Oath may be made before any person within the United States authorized by law to administer oaths, or, when the applicant resides in a foreign country, before any minister, *chargé d'affaires*, consul, or commercial agent holding commission under the Government of the United States, or before any notary public of the foreign country in which the applicant may be.

The section just quoted is so clear and distinct that there is no necessity for resorting to rules of construction. That it is perfectly competent for Congress to designate the officers in this country or elsewhere before whom the oath shall be taken cannot be doubted. It has pleased Congress in the present instance to do precisely that thing. If the applicant resides in the United States, the oath may be administered by any officer authorized to administer an oath, the evidence of his authority being attested by the seal of his office, or a certificate from some competent authority declaratory of the fact. The statute does not say that when the applicant is a resident of some other country he may make and subscribe the oath before any officer authorized to administer an oath, but states with particularity before *what* officer the oath shall be taken; and those mentioned are ministers, *chargé d'affaires*, consuls, and commercial agents holding commissions under the Government of the United States, or any notary public of the foreign country in which the applicant may be. It is urged that this is merely directory, and that the oath may be administered by any officer in the foreign country who has authority under the laws of such country to administer oaths. The statute does not admit of any such construction.

It is further urged that "the German government does not permit consuls or other American officers to administer oaths to German subjects." This may be true, but if so, it could not change or modify the construction of a statute of the United States which is clear and explicit in its terms, even though such strict construction might greatly embarrass German subjects in the matter of procuring patents in the United States.

It is urged also that a notary in Germany is not authorized to administer an oath—that he acts merely as a conveyancer. That may be so, but whether it is or not the statute has designated notaries, American consuls, ministers, commercial agents, and *chargé d'affaires* as persons who may administer oaths to applicants for patents in this country. It has mentioned no others, either specifically or by implication. Such designated officials in administering the oath act by virtue of the authority conferred by the statute of the United States, and not by virtue of any power or authority conferred by the foreign government. It might, therefore, well be doubted whether the German government has by law forbidden citizens or residents of that empire from taking the oath required before the officials authorized by the law of the United States to administer the same.

It is also urged that the judge of the royal Prussian court performs, in part at least, many of the functions which appertain to a notary public in the United States. If counsel is correct in this, that fact could not change or modify my ruling in this case. If the German government for any reason declines to permit the officers mentioned in the statute of the United States to administer oaths to applicants who are citizens or residents of Germany, and thereby makes it difficult for them to comply with the requirements of our laws regulating applications for patents, such fact would offer no valid reason for a departure from the plain requirements of an act of Congress prescribing the mode of procedure in the matter of framing applications for patents by citizens or residents of foreign countries.

The provisions of our law are liberal. If, however, hardship results from an observance of them, as is claimed in this case, relief must be sought by a modification of the law, and not by disregarding it. I am of opinion, however, that it is very exceptional for a foreign applicant to hesitate in the matter of taking the required oath before some one of the officials designated. If, as suggested, the government of Germany forbids it, the remedy might very properly be sought in an appeal to that government to modify the law or regulation to the extent of doing away with such prohibition.

The Examiner's action is approved and affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Oregon.

CHAPMAN *v.* FERRY *et al.*

Decided December 3, 1883.

1. PRINTED COPY OF TITLE OF BOOK, &c.

The "printed" copy of the title of a book or other article required by section 4956 of the Revised Statutes to be delivered or mailed to the Librarian of Congress, may be "printed" with a pen as well as type, with or without the aid of tracing-paper.

2. DEPOSIT OF COPIES OF WORK WITH LIBRARIAN.

The copies of a copyright work required by section 4959 of the Revised Statutes to be deposited with the Librarian of Congress within ten days after publication, may be so deposited after the printing of the work and before its formal publication.

3. COPYRIGHT OF MAP—INFRINGEMENT OF.

It is difficult to say in some cases what constitutes an infringement of the copyright of a map; but where the subsequent map appears to have been substantially copied from the prior one, without alteration or revision except in scale and color, there is clearly an infringement, which authorizes a court of equity to enjoin the sale of such infringing map, and to require the publisher to account for the profits arising from the sale thereof.

SUIT in equity for an injunction and an account.

Mr. H. Y. Thompson for the plaintiff.
Mr. Frederick V. Holman for the defendants.

DEADY, *J.:*

This suit is brought against the defendants to obtain an injunction and an account, because of an alleged infringement by them of the plaintiff's copyright of a "Map of the Cities of Portland, East Portland, and the Town of Albina," obtained by him in 1874. The suit was commenced on May 13, 1881. A demurrer to the original bill was sustained, on the ground that the title of the map could not be copyrighted, and because it did not appear that the plaintiff had performed the several acts necessary to obtain a copyright. (*Parkinson v. Laselle*, 3 Sawy. 330.) On March 18, 1882, an amended bill was filed, to which a demurrer was sustained, so far as it prayed for a discovery of the number of copies of the defendants' map that had been disposed of and were still on hand, and for a surrender of the latter and the plates on which they were printed. (8 Sawy., 191; S. C., 12 Fed. Rep., 693.)

It appears from the amended bill that at and before the commencement of this suit the plaintiff was the author and proprietor of a map of the cities and towns aforesaid, entitled as aforesaid, drawn upon a scale of about eight hundred feet to the inch, for which he duly obtained a copyright in the year 1874; that on May 10, 1881, the defendants published five hundred copies of a certain map with the same title as the plaintiff's, and then and thereafter sold three hundred copies of the same at five dollars a copy; and that in the preparation of said map the defendants copied the map of the plaintiff without alteration, except to enlarge the scale to five hundred feet to the inch, and change the colors of the lines of the land-claims upon which these towns are located, and thereby wrongfully appropriated the skill and labor of the plaintiff. On September 15, 1882, the defendants answered so much of the amended bill as was not included in the demurrer thereto, by which they deny any knowledge or information as to the plaintiff's alleged copyright, and admit the publication and sale of a map by them, as stated in the bill, but allege that their map includes many additions, improvements, and changes, not in the plaintiff's, and deny that in the preparation of their map they copied the whole of the plaintiff's map, but admit that they made use of said map for comparison, and, in small part, for compiling their map, and allege that by reason of the imperfections in the same, and the changes and additions to the towns aforesaid since the publication thereof, and prior to the publication of the defendants', the former had "become of little value and unsalable."

It satisfactorily appears that the plaintiff duly complied with the law in obtaining his copyright. The plaintiff testifies that he filed a tracing of the printed title of his map with the Librarian of Congress; but it is contended that this is not a "printed" copy of such title as is required by section 4956 of the Revised Statutes. The "copy" of such title furnished the plaintiff by said librarian in pursuance of section 4957 of the Revised Statutes does not indicate what was the character in this respect of the title deposited with him. It is described in the certificate of the librarian simply as "the title of a map." A tracing is a mechanical copy or fac-simile of an original, produced by following its lines, with a pen or pencil, through a transparent medium, called "tracing-paper." The map, together with the title in Roman letters, was engraved on stone and then printed, and a copy of this printed title thus made was filed with the librarian. This, I think, was a substantial compliance with the statute. A "printed" copy can only be required for convenience of reading as compared with ordinary script or writing. But a copy of the title which has the form and appearance of a printed one, whether made by an impression upon type or with a pen, with or without the aid of tracing-paper, is so far a printed copy. The result and not the means by which the printing is accomplished is the thing to be considered. As legible a copy of the title may be printed or produced with a pen as with type.

The defendants also object that it does not appear from the evidence that the plaintiff deposited two copies of his map in the mail, addressed to the librarian, within ten days *after* its publication, as provided in section 4959 of the Revised Statutes; but, as they contend, it appears such copies were deposited in the mail some time after the map was printed, but *before* it was published or offered for sale. It appears that the copies of the map were deposited in the library of Congress on January 23d—just one month after the copy of the title was. At that time the mail from here to Washington was from twelve to fourteen days in transit, so that it is quite certain that the copies were mailed here near about January 10, 1874. The map was then printed, of course, but how long before is not clear or material. Probably it had not then been formally published or offered for sale to the public. The plaintiff says in his testimony:

> I sent them [the maps] on before I offered any copies for sale.

The objection then comes to this, that it is not sufficient to mail the copies after printing and before formal publication, but that the same must be sent to the librarian after publication. The purpose of the statute is to secure a collection in the library of Congress of all the works copyrighted under the laws of the United States, and so two copies of each are required to be delivered or mailed to the librarian at an early period after publication—not less than ten days. But if the proprietor of the work will take the pains to send the copies on the very day of publication, I see no reason why he may not; and if a day or two, or ten, should intervene between the printing and formal publication of a work, what purpose of the statute is not as well served if the proprietor should be diligent enough to mail or deliver the copies before such publication? None that I can conceive of. The statute must have a reasonable construction in this respect, having in view the purpose for which it was made, and this is, that the copies cannot be delivered or mailed later than ten days after publication, but may be before.

From the evidence it appears that the defendants employed a civil engineer and draftsman to compile or prepare the original of their map, and that in so doing he used the map of the plaintiff and three other

older uncopyrighted maps, one of which was in manuscript, together with the public records and common observation, but no actual surveys. The city of Portland and its suburbs, which are the subject of these maps, having been improved and increased in population during the seven years that elapsed between their publication, that of the defendants contains some matter that is not found on the plaintiff's.

Questions of infringement of copyright are often very difficult to decide. The distinctions between the lawful and unlawful use of a prior publication are sometimes very fine and almost inappreciable. They have been called the "metaphysics of the law." (*Folsom* v. *Marsh*, 2 Story, 105.) A person who bestows his skill and time in the surveys, research, and observation necessary to the making of a correct map of any place or locality does not thereby prevent any other person from using the same means to accomplish the same end. The natural objects, public records, and surveys from which a map is made are open to the examination of any one; but it is clear that no person has a right to sit down and copy the map of another, and thereby defraud the latter of the profit of his labor and skill. (*Gray* v. *Russel*, 1 Story, 18; *Blunt* v. *Patten*, 2 Paine, 397; *Cary* v. *Longman*, 1 East, 358; High, Inj., sec. 647.) At the same time, it is not every use of a prior publication that is considered an unlawful infringement. *Bona fide* quotations from a book do not constitute such an infringement. But as absolute originality is not possible in the case of a map, a person may take material from prior publications, provided he bestows on it such skill and labor, in revision or otherwise, as to produce an original result. But the appropriations must not be denied, and the alterations must not be merely colorable, nor the result a servile imitation of the original. (Cop. Law Copyr., 181, 183; High, Inj., sec. 647.)

It is not very clear from the evidence what use was made of the plaintiff's map in the compilation of the defendants', unless it was substantially copied. It is admitted by the defendants, and their draftsman so testifies, that it was used for comparison and correction. But this may mean more or less. The defendants' map may have been so far compared with and corrected by the plaintiff's as to make the former not only like the latter, but practically a copy of it. So far as the defendants' map was corrected by the plaintiff's it was in effect a copy of it. Save the additions on the defendants' map, indicating the changes and improvements that had taken place since the publication of the plaintiff's map, there is no difference between them, except that the former is on a larger scale than the other, and has some lines printed in colors; and yet it is possible, although they are both so far alike, that one was not copied from the other, but only compiled from the same sources, but the probabilities are otherwise. There is a singular coincidence in the two maps that tends strongly to prove that one was copied from the other. On the plaintiff's map, block 106, in Caruthers' addition to Caruthers' addition, appears with a square piece out of the northwest corner, caused by a re-entering angle. This is the first time that said block appears in that form on any map. The plaintiff testifies that he entered it on his map in that form as the result of a survey made by himself that he has since demonstrated to be incorrect. The defendants must have copied it from the plaintiff's map, and the fact that they copied such a singular error, which appears on no other map, indicates strongly that they copied the plaintiff's map indiscriminately and generally.

Another coincidence is quite as convincing in the same direction. The plaintiff's map shows that South First street, in Caruthers' addition to Caruthers' addition, does not conform in line and width to the same street in Caruthers' addition to Portland, and it is the only one except the defendants' on which the fact appears; while from the testimony of the plaintiff it is shown they do conform on the county records, and that he ascertained the want of conformity from actual survey. Now, as the defendants' map is not made from actual surveys, but from other maps and public records, they must have copied this feature of their work from the plaintiff's; and if the plaintiff was mistaken, either as to the error in the form of block 106 or the conformity of South First street on the county records, the defendants might easily have shown it. But they have not attempted to do so, and the facts thereabout must be taken as stated by the witness. Add to this the admission made in the testimony of the defendants' draftsman to the effect that he got all he could out of the plaintiff's map, and "never thought of its being copyrighted," and the only reasonable inference from the premises is that in the compilation of the defendants' map they substantially copied the plaintiff's, and are therefore so far guilty of an infringement upon his copyright.

The plaintiff is entitled to a perpetual injunction against the defendants, as prayed for in his bill, and to an account of the profits realized by them on the sale of the infringing map, for which purpose the cause will be referred to the master.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISION OF SECRETARY OF THE INTERIOR.

DISCLAIMER UNDER RULE 42—SPECIFIC REFERENCES REQUIRED.

Rule 42 contemplates such specific reference as will clearly identify the particular application referred to, and this would seem to be best accomplished by stating the date of filing and the serial number of the application.

DEPARTMENT OF THE INTERIOR,
Washington, January 4, 1884.

SIR: I have considered the question involved in the appeal from the action of your predecessor in the case of John M. Finch, *ex parte*. It appears that Mr. Finch has filed two applications for patents for improvements in dust-collectors. In one the specific device is shown and described, but not claimed, and in the other the device is shown, described, and claimed. The drawings accompanying the applications are identical.

Rule 42 of the Rules of Practice is as follows:

When an applicant makes two or more applications relating to the same subject-matter of invention, all showing but only one claiming the same thing, those not claiming it must contain disclaimers thereof with references to the application claiming it.

The applicant filed a disclaimer in the words:

I do not in this case claim any invention except those specifically set forth in the claims hereof, preferring to claim any other patentable feature shown or described in another application, which I have filed as a division of this case.

This general reference to another application, &c., was not regarded by your Office as sufficient to meet the requirement of the rule, and the applicant was called upon to specify the particular application by stating the date it was filed and its serial number. From this requirement the appeal is taken.

I concur in the opinion of the Commissioner that the rule contemplates such specific reference as will clearly identify the particular application referred to, and this would seem to be best accomplished by stating the date of filing and the serial number of the application.

The decision of the Commissioner is affirmed. The papers belonging to the files of your Office are herewith returned.

Very respectfully,

H. M. TELLER,
Secretary.

The Commissioner of Patents.

COMMISSIONER'S DECISIONS.

EX PARTE FINCH.

Decided April 6, 1883.

DISCLAIMER UNDER RULE 42—SPECIFIC REFERENCES REQUIRED.

Rule 42 contemplates such specific reference as will clearly identify the particular application referred to, and this should be effected by stating the serial number and date of filing of the application.

DUST-COLLECTORS.

INTERLOCUTORY APPEAL.

Application of John M. Finch filed December 11, 1882.

Messrs. Doubleday & Bliss for the applicant.

MARBLE, *Commissioner:*

Applicant has filed two applications for patents for improvements in dust-collectors. The drawings accompanying the applications are identical. In one the specific device is shown and described but not claimed, and in the other the device is shown, described, and claimed. The Examiner requires the applicant, if he desires to take out his patent for the specific device, to make a reference to his application in which the device was shown and described but not claimed, the claim in the latter application being broader than in the former. This requirement was made under Rule 42 of the Rules of Practice, which reads as follows:

When an applicant makes two or more applications relating to the same subject-matter of invention, all showing but only one claiming the same thing, those not claiming it must contain disclaimers thereof, with references to the application claiming it.

Under this rule the applicant claims that it is sufficient for him to refer to another pending application, in which the device is shown but not claimed, without giving the date of its filing or serial number.

It will be observed that the rule above quoted requires that where two or more applications are filed by the same inventor, all showing the same subject-matter of invention, but claiming it in distinct parts, that the applications not claiming a particular part must contain disclaimers thereof, "with reference to *the* application claiming it." There is no way of specifying the particular application in which the invention is claimed except by stating in the other applications filed its date of filing or serial number. If such statement be given, any person interested in any particular patent which may issue, or, in case one application is passed to issue before the others, can ascertain by inquiry where such application is, and what it contains and claims. This, I think, is the object and purpose of the rule. In requiring that such reference should be made in the present case the Examiner did not exceed his duty; on the contrary, he would have been remiss in his duty had he failed to make such requirement. Purchasers of rights under patents granted are entitled to be notified, so far as possible, of any application or patent which subordinates the patent under which they obtain their rights. If an application is pending which, when it ripens into a patent, will subordinate the patent which they desire to purchase, or under which they are operating, they have the right to be notified of such application, in order that they may protect their rights.

The decision is affirmed.

EX PARTES GRUSON AND SCHUMANN.

Decided January 5, 1884.

1. OATH—SECTION 4892 REVISED STATUTES CONSTRUED.

Section 4892 Revised Statutes does not authorize an applicant who is a resident of a foreign country to make oath to his application before any officer other than those designated in said section. They are "any minister, *chargé d'affaires*, consul, or commercial agent holding commission under the Government of the United States, or any notary public of the foreign country in which the applicant may be."

2. SAME—AUTHORITY TO ADMINISTER OATHS DERIVED FROM UNITED STATES STATUTE ALONE.

Such designated officials in administering the oath act by virtue of the authority conferred by the statute of the United States, and not by virtue of any power or authority conferred by the foreign government.

3. SAME—OFFICER NOT AUTHORIZED.

An oath taken before a judge of the royal Prussian court is not sufficient.

APPEAL from Primary Examiner.

ARMOR-PLATED GUN-CARRIAGES.

Application of Hermann Gruson and Max Schumann, filed April 19, 1883.

Messrs. Knight Brothers for the applicants.

BUTTERWORTH, *Commissioner:*

The question raised on this appeal is as to the sufficiency of the oath accompanying the application. Applicants are residents of Germany, and took and subscribed the oath to their application before a judge of the royal Prussian court at Buckau. The Examiner rejected the application as not being in compliance with the requirements of the Revised Statutes, section 4892, which provides that the—

> * * * Oath may be made before any person within the United States authorized by law to administer oaths, or, when the applicant resides in a foreign country, before any minister, *chargé d'affaires*, consul, or commercial agent holding commission under the Government of the United States, or before any notary public of the foreign country in which the applicant may be.

The section just quoted is so clear and distinct that there is no necessity for resorting to rules of construction. That it is perfectly competent for Congress to designate the officers in this country or elsewhere before whom the oath shall be taken cannot be doubted. It has pleased Congress in the present instance to do precisely that thing. If the applicant resides in the United States, the oath may be administered by any officer authorized to administer an oath, the evidence of his authority being attested by the seal of his office, or a certificate from some competent authority declaratory of the fact. The statute does not say that when the applicant is a resident of some other country he may make and subscribe the oath before any officer authorized to administer an oath, but states with particularity before *what* officer the oath shall be taken; and those mentioned are ministers, *chargé d'affaires*, consuls, and commercial agents holding commissions under the Government of the United States, or any notary public of the foreign country in which the applicant may be. It is urged that this is merely directory, and that the oath may be administered by any officer in the foreign country who has authority under the laws of such country to administer oaths. The statute does not admit of any such construction.

It is further urged that "the German government does not permit consuls or other American officers to administer oaths to German subjects." This may be true, but if so, it could not change or modify the construction of a statute of the United States which is clear and explicit in its terms, even though such strict construction might greatly embarrass German subjects in the matter of procuring patents in the United States.

It is urged also that a notary in Germany is not authorized to administer an oath—that he acts merely as a conveyancer. That may be so, but whether it is or not the statute has designated notaries, American consuls, ministers, commercial agents, and *chargé d'affaires* as persons who may administer oaths to applicants for patents in this country. It has mentioned no others, either specifically or by implication. Such designated officials in administering the oath act by virtue of the authority conferred by the statute of the United States, and not by virtue of any power or authority conferred by the foreign government. It might, therefore, well be doubted whether the German government has by law forbidden citizens or residents of that empire from taking the oath required before the officials authorized by the law of the United States to administer the same.

It is also urged that the judge of the royal Prussian court performs, in part at least, many of the functions which appertain to a notary public in the United States. If counsel is correct in this, that fact could not change or modify my ruling in this case. If the German government for any reason declines to permit the officers mentioned in the statute of the United States to administer oaths to applicants who are citizens or residents of Germany, and thereby makes it difficult for them to comply with the requirements of our laws regulating applications for patents, such fact would offer no valid reason for a departure from the plain requirements of an act of Congress prescribing the mode of procedure in the matter of framing applications for patents by citizens or residents of foreign countries.

The provisions of our law are liberal. If, however, hardship results from an observance of them, as is claimed in this case, relief must be sought by a modification of the law, and not by disregarding it. I am of opinion, however, that it is very exceptional for a foreign applicant to hesitate in the matter of taking the required oath before some one of the officials designated. If, as suggested, the government of Germany forbids it, the remedy might very properly be sought in an appeal to that government to modify the law or regulation to the extent of doing away with such prohibition.

The Examiner's action is approved and affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Oregon.

CHAPMAN *v.* FERRY *et al.*

Decided December 3, 1883.

1. PRINTED COPY OF TITLE OF BOOK, &c.

The "printed" copy of the title of a book or other article required by section 4956 of the Revised Statutes to be delivered or mailed to the Librarian of Congress, may be "printed" with a pen as well as type, with or without the aid of tracing-paper.

2. DEPOSIT OF COPIES OF WORK WITH LIBRARIAN.

The copies of a copyright work required by section 4959 of the Revised Statutes to be deposited with the Librarian of Congress within ten days after publication, may be so deposited after the printing of the work and before its formal publication.

3. COPYRIGHT OF MAP—INFRINGEMENT OF.

It is difficult to say in some cases what constitutes an infringement of the copyright of a map; but where the subsequent map appears to have been substantially copied from the prior one, without alteration or revision except in scale and color, there is clearly an infringement, which authorizes a court of equity to enjoin the sale of such infringing map, and to require the publisher to account for the profits arising from the sale thereof.

SUIT in equity for an injunction and an account.

Mr. H. Y. Thompson for the plaintiff.
Mr. Frederick V. Holman for the defendants.

DEADY, *J.:*

This suit is brought against the defendants to obtain an injunction and an account, because of an alleged infringement by them of the plaintiff's copyright of a "Map of the Cities of Portland, East Portland, and the Town of Albina," obtained by him in 1874. The suit was commenced on May 13, 1881. A demurrer to the original bill was sustained, on the ground that the title of the map could not be copyrighted, and because it did not appear that the plaintiff had performed the several acts necessary to obtain a copyright. (*Parkinson* v. *Laselle*, 3 Sawy. 330.) On March 18, 1882, an amended bill was filed, to which a demurrer was sustained, so far as it prayed for a discovery of the number of copies of the defendants' map that had been disposed of and were still on hand, and for a surrender of the latter and the plates on which they were printed. (8 Sawy., 191; S. C., 12 Fed. Rep., 693.)

It appears from the amended bill that at and before the commencement of this suit the plaintiff was the author and proprietor of a map of the cities and towns aforesaid, entitled as aforesaid, drawn upon a scale of about eight hundred feet to the inch, for which he duly obtained a copyright in the year 1874; that on May 10, 1881, the defendants published five hundred copies of a certain map with the same title as the plaintiff's, and then and thereafter sold three hundred copies of the same at five dollars a copy; and that in the preparation of said map the defendants copied the map of the plaintiff without alteration, except to enlarge the scale to five hundred feet to the inch, and change the colors of the lines of the land-claims upon which these towns are located, and thereby wrongfully appropriated the skill and labor of the plaintiff. On September 15, 1882, the defendants answered so much of the amended bill as was not included in the demurrer thereto, by which they deny any knowledge or information as to the plaintiff's alleged copyright, and admit the publication and sale of a map by them, as stated in the bill, but allege that their map includes many additions, improvements, and changes, not in the plaintiff's, and deny that in the preparation of their map they copied the whole of the plaintiff's map, but admit that they made use of said map for comparison, and, in small part, for compiling their map, and allege that by reason of the imperfections in the same, and the changes and additions to the towns aforesaid since the publication thereof, and prior to the publication of the defendants', the former had "become of little value and unsalable."

It satisfactorily appears that the plaintiff duly complied with the law in obtaining his copyright. The plaintiff testifies that he filed a tracing of the printed title of his map with the Librarian of Congress; but it is contended that this is not a "printed" copy of such title as is required by section 4956 of the Revised Statutes. The "copy" of such title furnished the plaintiff by said librarian in pursuance of section 4957 of the Revised Statutes does not indicate what was the character in this respect of the title deposited with him. It is described in the certificate of the librarian simply as "the title of a map." A tracing is a mechanical copy or fac-simile of an original, produced by following its lines, with a pen or pencil, through a transparent medium, called "tracing-paper." The map, together with the title in Roman letters, was engraved on stone and then printed, and a copy of this printed title thus made was filed with the librarian. This, I think, was a substantial compliance with the statute. A "printed" copy can only be required for convenience of reading as compared with ordinary script or writing. But a copy of the title which has the form and appearance of a printed one, whether made by an impression upon type or with a pen, with or without the aid of tracing-paper, is so far a printed copy. The result and not the means by which the printing is accomplished is the thing to be considered. As legible a copy of the title may be printed or produced with a pen as with type.

The defendants also object that it does not appear from the evidence that the plaintiff deposited two copies of his map in the mail, addressed to the librarian, within ten days *after* its publication, as provided in section 4959 of the Revised Statutes; but, as they contend, it appears such copies were deposited in the mail some time after the map was printed, but *before* it was published or offered for sale. It appears that the copies of the map were deposited in the library of Congress on January 23d—just one month after the copy of the title was. At that time the mail from here to Washington was from twelve to fourteen days in transit, so that it is quite certain that the copies were mailed here near about January 10, 1874. The map was then printed, of course, but how long before is not clear or material. Probably it had not then been formally published or offered for sale to the public. The plaintiff says in his testimony:

> I sent them [the maps] on before I offered any copies for sale.

The objection then comes to this, that it is not sufficient to mail the copies after printing and before formal publication, but that the same must be sent to the librarian after publication. The purpose of the statute is to secure a collection in the library of Congress of all the works copyrighted under the laws of the United States, and so two copies of each are required to be delivered or mailed to the librarian at an early period after publication—not less than ten days. But if the proprietor of the work will take the pains to send the copies on the very day of publication, I see no reason why he may not; and if a day or two, or ten, should intervene between the printing and formal publication of a work, what purpose of the statute is not as well served if the proprietor should be diligent enough to mail or deliver the copies before such publication? None that I can conceive of. The statute must have a reasonable construction in this respect, having in view the purpose for which it was made, and this is, that the copies cannot be delivered or mailed later than ten days after publication, but may be before.

From the evidence it appears that the defendants employed a civil engineer and draftsman to compile or prepare the original of their map, and that in so doing he used the map of the plaintiff and three other

older uncopyrighted maps, one of which was in manuscript, together with the public records and common observation, but no actual surveys. The city of Portland and its suburbs, which are the subject of these maps, having been improved and increased in population during the seven years that elapsed between their publication, that of the defendants contains some matter that is not found on the plaintiff's.

Questions of infringement of copyright are often very difficult to decide. The distinctions between the lawful and unlawful use of a prior publication are sometimes very fine and almost inappreciable. They have been called the "metaphysics of the law." (*Folsom* v. *Marsh*, 2 Story, 105.) A person who bestows his skill and time in the surveys, research, and observation necessary to the making of a correct map of any place or locality does not thereby provent any other person from using the same means to accomplish the same end. The natural objects, public records, and surveys from which a map is made are open to the examination of any one; but it is clear that no person has a right to sit down and copy the map of another, and thereby defraud the latter of the profit of his labor and skill. (*Gray* v. *Russel*, 1 Story, 18; *Blunt* v. *Patten*, 2 Paine, 397; *Cary* v. *Longman*, 1 East, 358; High, Inj., sec. 647.) At the same time, it is not every use of a prior publication that is considered an unlawful infringement. *Bona fide* quotations from a book do not constitute such an infringement. But as absolute originality is not possible in the case of a map, a person may take material from prior publications, provided he bestows on it such skill and labor, in revision or otherwise, as to produce an original result. But the appropriations must not be denied, and the alterations must not be merely colorable, nor the result a servile imitation of the original. (Cop. Law Copyr., 181, 183; High, Inj., sec. 647.)

It is not very clear from the evidence what use was made of the plaintiff's map in the compilation of the defendants', unless it was substantially copied. It is admitted by the defendants, and their draftsman so testifies, that it was used for comparison and correction. But this may mean more or less. The defendants' map may have been so far compared with and corrected by the plaintiff's as to make the former not only like the latter, but practically a copy of it. So far as the defendants' map was corrected by the plaintiff's it was in effect a copy of it. Save the additions on the defendants' map, indicating the changes and improvements that had taken place since the publication of the plaintiff's map, there is no difference between them, except that the former is on a larger scale than the other, and has some lines printed in colors; and yet it is possible, although they are both so far alike, that one was not copied from the other, but only compiled from the same sources, but the probabilities are otherwise. There is a singular coincidence in the two maps that tends strongly to prove that one was copied from the other. On the plaintiff's map, block 106, in Carnthers' addition to Caruthers' addition, appears with a square piece out of the northwest corner, caused by a re-entering angle. This is the first time that said block appears in that form on any map. The plaintiff testifies that he entered it on his map in that form as the result of a survey made by himself that he has since demonstrated to be incorrect. The defendants must have copied it from the plaintiff's map, and the fact that they copied such a singular error, which appears on no other map, indicates strongly that they copied the plaintiff's map indiscriminately and generally.

Another coincidence is quite as convincing in the same direction. The plaintiff's map shows that South First street, in Carnthers' addition to Carnthers' addition, does not conform in line and width to the same street in Carnthers' addition to Portland, and it is the only one except the defendants' on which the fact appears; while from the testimony of the plaintiff it is shown they do conform on the county records, and that he ascertained the want of conformity from actual survey. Now, as the defendants' map is not made from actual surveys, but from other maps and public records, they must have copied this feature of their work from the plaintiff's; and if the plaintiff was mistaken, either as to the error in the form of block 106 or the conformity of South First street on the county records, the defendants might easily have shown it. But they have not attempted to do so, and the facts thereabout must be taken as stated by the witness. Add to this the admission made in the testimony of the defendants' draftsman to the effect that he got all he could ont of the plaintiff's map, and "never thought of its being copyrighted," and the only reasonable inference from the premises is that in the compilation of the defendants' map they substantially copied the plaintiff's, and are therefore so far guilty of an infringement upon his copyright.

The plaintiff is entitled to a perpetual injunction against the defendants, as prayed for in his bill, and to an accounnt of the profits realized by them on the sale of the infringing map, for which purpose the cause will be referred to the master.

DEPARTMENT OF THE INTERIOR,
Washington, January 15, 1884.

SIR: I am directed by the Secretary to inform you that the order of this Department, dated November 14, 1883, by which Walter H. Wills and Norma W. Wills, (W. H. Wills & Co.,) of this city, were disbarred from practice before the Department and its bureaus, has this day been rescinded.

Very respectfully,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

Issue of January 22, 1884.

DESIGNS.

14,551 to 14,554, inclusive.—CARPET.—*Albert Beaumont*, Philadelphia, Pa. Applications filed November 21, 1883. Term of patents 3½ years.

14,555.—STOVE.—*James Dwyer*, Detroit, Mich., assignor to *The Peninsular Stove Company*, same place. Application filed October 1, 1883. Term of patent 7 years.

14,556 and 14,557.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed November 30, 1883. Term of patents 3½ years.

14,558.—SPOKE-SOCKET.—*George Minchin*, Shakespeare, Ontario, Canada. Application filed November 3, 1883. Term of patent 14 years.

14,559.—LADY'S POLONAISE.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19, 1884. Term of patent 3½ years.

14,560.—FIRE-ESCAPE CLAMP.—*Edward H. Reynolds*, Cadillac, Mich., assignor to himself and *William Cassler*, same place. Application filed May 5, 1883. Term of patent 14 years.

14,561.—LADY'S WRAP.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19,.1883. Term of patent 3½ years.

14,562.—LADY'S WALKING-SKIRT.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19, 1883. Term of patent 3½ years.

14,563.—BURIAL-CASKET.—*Levi K. Smedes*, Mount Vernon, assignor to *Taylor & Co.* New York, N. Y. Application filed November 8, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,858.—COMPOUND OIL OF GAULTHERIA.—*Elizabeth H. Bell*, Philadelphia, Pa. Application filed November 23, 1883.

"The representation of a stalk of gaultheria or winter-green."

10,859.—BOTTLED MALT LIQUORS.—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 29, 1883.

"A crest representing a sitting animal upon a wreath above a monogram."

10,860.—LINEN THREAD.—*Finlayson, Bousfield & Co.*, Johnstone, county of Renfrew, Scotland. Application filed December 19, 1883.

"The representation of a stag on a circular red ground."

10,861.—LINEN THREAD.—*Finlayson, Bousfield & Co.*, Johnstone, county of Renfrew, Scotland. Application filed December 19, 1883.

"The representation of the Saint Andrews cross."

10,862.—LINEN THREAD.—*Finlayson, Bousfield & Co.*, Johnstone, county of Renfrew, Scotland. Application filed December 19, 1883.

"The representation of a shield."

10,863.—LINEN THREAD.—*Finlayson, Bousfield & Co.*, Johnstone, county of Renfrew, Scotland. Application filed December 19, 1883.

"A representation of a stag, which is preferably placed standing, with a hill in the background."

10,864.—SUMAC AND OTHER LEAVES, TREE-BARKS, AND EXTRACTS THEREOF.—*Rothe & Lips*, New York, N. Y. Application filed December 26, 1883.

"The letters and characters 'R. & L.' and the representation of an anchor."

10,865.—FLUID PREPARATION FOR USE EITHER INTERNALLY AS A MEDICINE OR EXTERNALLY AS A LINIMENT.—*The Charles A. Vogeler Company*, Baltimore, Md. Application filed December 22, 1883.

"The representation of an aged man with a long beard, and clothed in a loose flowing gown, with sandals on his feet and a hood on his head, and holding in his right hand a bottle, at which he seems to be gazing, his left arm extended, and the hand grasping a staff. He appears to be sitting on the ground, his back partly resting on the trunk of a tree, his left knee drawn up, and his right foot extended."

10,866.—CERTAIN PROPRIETARY REMEDIES AND COMPOUNDS.—*Ephraim S. Wells*, Jersey City, N. J. Application filed December 1, 1883.

"The words or term 'ROUGH ON.'"

10,867.—LAGER-BEER.—*Williamsburgh Brewing Company, (Limited,)* Brooklyn, N. Y. Application filed December 19, 1883.

"The representation of a red ball upon a black ground."

10,868.—SHERRY-WINE.—*Ysasi & Co.*, Jerez de la Frontera, Spain. Application filed December 26, 1883.

"The word 'YSASI'"

10,869.—SHERRY-WINE.—*Ysasi & Co.*, Jerez de la Frontera, Spain. Application filed December 26, 1883.

"The letters 'Y. L.'"

10,870.—CONDUCTING-WIRES FOR ELECTRICAL PURPOSES.—*The Ansonia Brass and Copper Company*, Ansonia, Conn. Application filed December 29, 1883.

"The word 'ACME.'"

10,871.—CARPETS, RUGS, OIL-CLOTHS, AND MATTINGS.—*Bates, Reed & Cooley*, New York, N. Y. Application filed December 29, 1883.

"The representation of a horseshoe."

10,872.—LINEN THREAD.—*Finlayson, Bousfield & Co.*, Johnstone, county of Renfrew, Scotland. Application filed December 19, 1883.

"The representation of a stag and tartan."

10,873.—BISCUIT, WAFERS, AND CRACKERS.—*Holmes & Coutts*, New York, N. Y. Application filed December 26, 1883.

"The representation of the statue of Liberty."

10,874.—CERTAIN PROPRIETARY MEDICINES.—*Astley C. Jennings*, New York, N. Y. Application filed December 27, 1883.

"The word 'ROYALINE.'"

10,875.—CERTAIN PROPRIETARY MEDICINES.—*Astley C. Jennings*, New York, N. Y. Application filed December 27, 1883.

"In the center of a circle is the figure of a crown, below which, in the foreground, is a body of water between two bluffs having trees growing upon their tops. In the background is seen the sun rising from behind low hills. The middle and upper parts of the circle are filled with rays of light radiating from the sun."

10,876.—VELVETEENS.—*Emil S. Levi*, New York, N. Y. Application filed December 28, 1883.

"The word 'CRITERION.'"

10,877.—BITTERS.—*William C. Oesting*, New York, N. Y. Application filed December 26, 1883.

"The arbitrarily-selected word symbol 'GERMANIA.'"

10,878.—SHEEP-DIP.—*Joseph O. Richardson*, St. Louis, Mo. Application filed December 27, 1883.

"The letters, or word, or word-symbol 'NICOTOL.'"

LABELS.

3,838.—Title: "FLINT PEBBLES."—*Johan Robert Haing*, New York, N. Y. Application filed December 27, 1883.

3,839.—Title: "BURKE'S LIGHT SPARKLING PALE ALE."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 29, 1883.

3,840.—Title: "EXTRA FOREIGN STOUT."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 29, 1883.

3,841.—Title: "ALLSOPP'S INDIA PALE ALE."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 29, 1883.

3,842.—Title: "NONPAREIL OLD TOM GIN."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 31, 1883.

3,843.—Title: "BURKE'S FINE OLD IRISH WHISKY."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 31, 1883.

3,844.—Title: "GARNKIRK FINEST SCOTCH MALT."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 31, 1883.

3,845.—Title: "BURKE'S FINEST OLD JAMAICA RUM."—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed December 31, 1883.

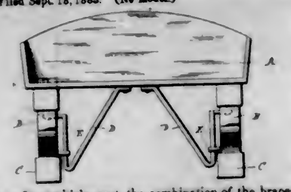
3,846.—Title: "DR. J. W. CHILES' LIGHTNING LINIMENT."—*John W. Chiles*, Dayton, Ohio. Application filed December 28, 1883.

3,847.—Title: "DR. J. W. CHILES' WONDERFUL SPASMODIC COLIC AND WATER CURE."—*John W. Chiles*, Dayton, Ohio. Application filed December 28, 1883.

3,848.—Title: "DR. GOODWIN'S FACIEI-LOTIO (FACE LOTION.)"—*Goodwin & Thurston*, Minneapolis, Minn. Application filed December 29, 1883.

3,849.—Title: "GRINNELL'S UNIVERSAL BALSAM."—*Marcus Grinnell*, Mount Pleasant, Mich. Application filed December 27, 1883.

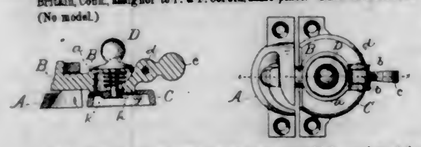
3,850.—Title: "GENERAL CROOK" (FOR CIGARS.)—*Albert F. Rothfuss*, Fort Scott, Kans. Application filed December 31, 1883.



3,851.—Title: "GREAT VEGETABLE PAIN CONQUEROR."—*Charles A. Thomas*, Rushville, Ohio. Application filed December 27, 1883.

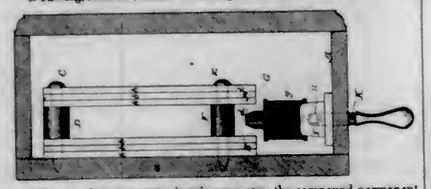
3,852.—Title: "THE SHAKER" (FOR A CURATIVE SIRUP.)—*A. J. White*, New York, N. Y. Application filed December 28, 1883.

PATENTS



GRANTED JAN. 22, 1884.

292,151. VEHICLE-SEAT SPRING. WILLIS R. D. ALLEN, Hardman, Oreg. Filed Sept. 18, 1883. (No model.)



Claim.—In a vehicle-seat, the combination of the braces secured thereto at one end, extending obliquely and downwardly, and then vertically, with the springs having clips which receive said braces, and having their upper portions rigidly secured thereto, substantially as described.

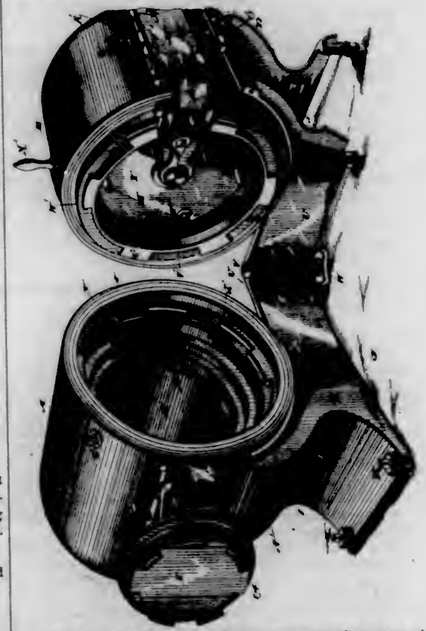
292,152. WINDOW AND DOOR BUTTON. AUGUST AHLENS, New Britain, Conn., assignor to P. & F. Corbin, same place. Filed Oct. 15, 1883. (No model.)

Claim.—The herein-described sash-fastener, which consists of the sweep B, having chambered hub *a*, ears *b b*, the latch-lever *c*, pivoted at *d*, and provided with the lug *h* and forked rear end, the base-plate C, having mortises *e g g*, the pivotal post D, and the spring *k*, substantially as described, and for the purpose specified.

292,153. MAGNETO-ELECTRIC GENERATOR. WILLIAM J. BOWEN, Norwalk, Ohio, assignor to himself, T. T. Kockaler, Cincinnati, Ohio, and Z. C. Thwing, Marshall, Mich. Filed Aug. 20, 1883. (No model.)

Claim.—In a magneto-electric generator, the compound permanent magnet B, consisting, essentially, of steel bars *b*, collar D, of magnetic material, collar F, of non-magnetic material, and screws C and E, entering the back *a* of case A, as and for the purpose herein shown and described.

292,154. STEAM-BOILER. GEORGE B. BRAYTON, Boston, Mass. Filed Dec. 29, 1882. (No model.)



Claim.—1. The combination, within a suitable casing, of a central fire-pot, an annular falling flue, and a boiler-coil overlying the fire-pot surrounding the same, and having its base located in said falling flue, substantially as described.

2. The combination, within a suitable casing, of a central fire-pot and a boiler-coil surrounding said fire-pot, and composed of a series of connected flat or helical coils connected alternately at their inner and outer convolutions, substantially as described.

3. The combination, within a suitable casing, of a central fire-pot, an annular falling flue, and a boiler-coil composed of a series of connected flat or helical coils surrounding said fire-pot, and a flat coil above said series of coils and overhanging the fire-pot, substantially as described.

4. The combination, with the coil-boiler, of the central fire-pot or furnace, a falling flue, a main stack communicating with said flue, a branch flue connecting the furnace at its top with the main stack, and a damper in said branch flue, substantially as described.

292,155. SAFE. THOMAS M. BRIDTWALL, Kansas City, Mo. Filed Jan. 19, 1883. (No model.)

Claim.—1. A safe consisting of two or more parts whose open ends are constructed similarly in cross-section, and provided with interlocking means, one of said parts being adapted to partially rotate, whereby said ends are fitted together and securely locked, substantially as set forth.

2. A safe consisting of two parts, each having a chamber to receive valuables, said parts being constructed to closely fit together and be securely interlocked by a partial rotation of one of said parts, substantially as set forth.

3. The combination, with a safe consisting of two parts, each having a chamber to receive valuables, of segments arranged within and without the respective parts, and adapted to be interlocked by the partial rotation of one of said parts to lock the parts together, substantially as set forth.

4. A safe consisting of two parts mounted upon independent standards, one of which is stationary and adjustable, while the other standard is adapted to be moved when the parts of the safe are joined, substantially as set forth.

5. The combination, in a safe, of two parts adapted to be interlocked with independent hinged standards, one of said standards having rollers upon which it moves, and each carrying the respective parts, substantially as set forth.

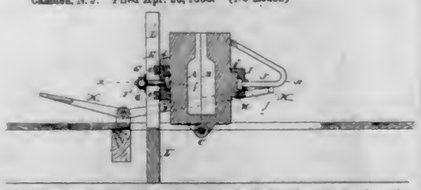
6. The combination, with a safe consisting of two parts, of independent standards connected by a hinge whose pintle projects into a slot formed in a supporting-bed, substantially as set forth.

7. The combination, with a safe consisting of two parts, closed at one end and open at the other, adapted to have their open ends secured together, and respectively provided with a chamber to receive valuables, of doors located within the said parts and arranged to close their respective chambers, substantially as set forth.

8. In a safe, the combination, with a removable door, of a hinged carrier supported upon the safe and adapted to be attached to and detached from the door, substantially as described.

9. The combination, with a safe consisting of two parts, the ends of which are adapted to be secured together, each part having a chamber to receive valuables, of circular doors for said chambers, and carriers supported upon the safe and adapted to be attached to the doors when the safe is open and to be detached from them when the same is closed, substantially as set forth.

10. The combination, with a safe consisting of two parts, the open ends of which are adapted to be secured together, each part having a chamber to receive valuables, of circular doors for said chambers, carriers supported upon the outside of each part, adapted to be attached to the doors when the safe is open and to be detached from them when the same is closed, and means for adjusting the carriers, substantially as set forth.



11. A safe-body composed of a series of rings, each made in a single piece, and provided with interlocking contiguous surfaces, and bolts for securing the rings together, substantially as set forth.

12. A safe composed, essentially, of a series of united rings, the outer edges of the opposite faces of which are corrugated, the inner edges of the rings being provided with transverse holes, which receive the bolts by which the rings are united, substantially as set forth.

13. The combination, with a safe-body consisting of a series of rings, of a disk or disks secured to said body to form one end of the safe, and a suitable door, substantially as set forth.

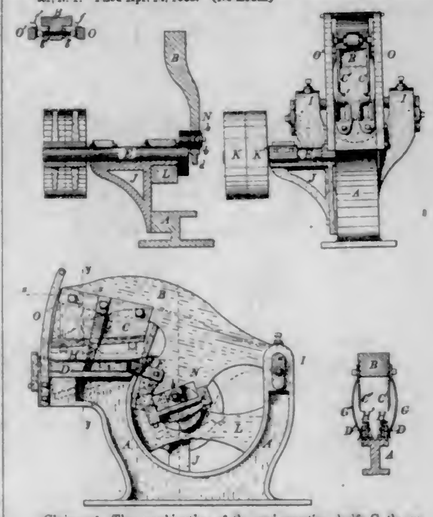
14. The combination, with a series of united rings, the opposite faces of which are corrugated and interlocked, the inner periphery of the endmost ring being provided with a dovetail, of a disk having the edge of the inner face arranged to interlock with the corrugated outer surface of the endmost ring, and two disks secured to the inner face of the disk aforesaid, their peripheries being mortised to receive the dovetail of the endmost ring, substantially as set forth.

292,156. GLASS-MOLD. ANDREW J. CHRISTIE and JAMES J. CHRISTIE, Camden, N. J. Filed Apr. 20, 1883. (No model.)

Claim.—1. A mold-body, in combination with a block adapted to carry a replaceable handle, the said block being detachably connected to said mold-body, substantially as and for the purpose specified.

2. A mold-body provided with a dovetailed lug or its equivalent, in combination with a block having a dovetailed slot and adapted to fit upon said lug, and a bolt or handle supported and carried by said block, substantially as and for the purpose specified.

3. A mold-body and a supporting-standard, in combination with a dovetailed connection between said body and standard, substantially as and for the purpose specified.



4. A mold-body having a dovetailed groove and a supporting-standard also having a dovetailed groove, in combination with a dovetailed connection between said body and standard, which consists of a double dovetailed block, substantially as and for the purpose specified.

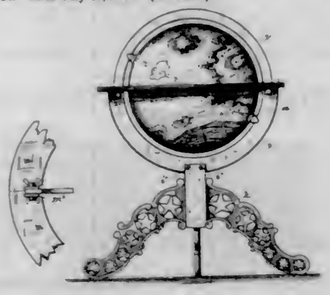
5. A mold-body having a dovetailed groove and a supporting-standard, in combination with a dovetailed block and means to secure said block to the standard, substantially as and for the purpose specified.

6. The combination of a mold-body, a supporting-block, and a standard, the said block being secured to the body by means of a dovetailed connection, substantially as and for the purpose specified.

7. The combination of a mold-body, a supporting-block, a standard, and detachable handles, the said block being secured to the body by means of a dovetailed connection, substantially as and for the purpose specified.

292,157. MACHINE FOR LAPPING HOOPS. JOHN CONNELL, Rochester, N. Y. Filed Apr. 14, 1883. (No model.)

Claim.—1. The combination of the reciprocating knife C, the recessed shear-block D, provided with the stop *l*, and the guide F, and suitable connecting mechanism adapted to support the shear-block and to impart reciprocating motion to the knife, substantially as described.



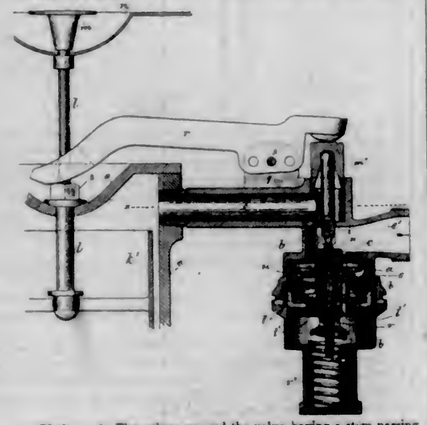
2. The combination of the reciprocating knife C, the recessed shear-block D, provided with stop *l*, and the guard G, and suitable connecting mechanism adapted to support the shear-block and to impart reciprocating motion to the knife, substantially as described.

3. The combination of the reciprocating knife C, the recessed shear-block D, provided with stop *l*, guide F, and guard G, and suitable connecting mechanism adapted to support the shear-block and to impart reciprocating motion to the knife, substantially as described.

4. The combination of the reciprocating knife C, the recessed shear-block D, provided with stop *l*, guide F, and the stripper H, and suitable connecting mechanism adapted to support the shear-block and to impart reciprocating motion to the knife, substantially as described.

5. In combination with a single reciprocating knife-head, the knives C C′, recessed shear-blocks D D′, provided with stops *l l*′, and the guides F F′, adapted and arranged to produce the proper bevel on each end of the hoop, and suitable connecting mechanism adapted to support the shear-block and to impart reciprocating motion to the knife, substantially as and for the purposes described.

292,158. GLOBE AND GLOBE-SUPPORT. JOHN DAVIS, Allegheny, Pa. Filed July 19, 1883. (No model.)



Claim.—1. A globe consisting of two hemispherical shells, each shell constructed of an inner layer of stretched textile fabric, a middle stiffening-layer of leather or similar suitable material, and an outer layer of stretched textile fabric, all of said layers cemented together, substantially as and for the purposes described.

2. The globe-axle *a*, provided upon one extremity with a shoulder, *c*, spring *d*, and fingers *f g*, and upon the other extremity with fingers *f*′, substantially as described, whereby the inclination of the axis of the globe may be changed, as set forth.

3. The combination, with the meridian-plate *i*, of the semicircular horizon-plates *m*, provided with recesses *m*′ and flanges *m*², substantially as described, whereby the said horizon-plates are secured to said meridian-plate, as set forth.

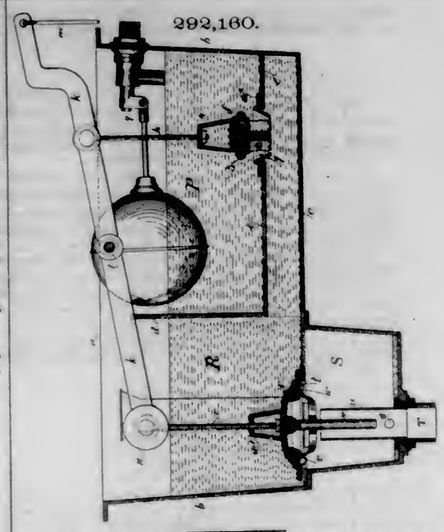
4. As an article of manufacture, the within-described globe and globe-support, consisting of the globe provided with axle-bearings, the axle *a*, provided upon one extremity with spring *d*, guide *e*, fixed finger *f*, and movable finger *g*, and upon the other end with fingers *f*′, the horizon-plates *m*, having recesses *m*′ and flanges *m*², meridian-plate *i*, and base *k*, all arranged and operated in the manner and for the purposes set forth.

292,159. WATER-CLOSET VALVE. JOHN DEMAREST, New York, N. Y., assignor to the J. L. Mott Iron Works, same place. Filed Mar. 21, 1883. (No model.)

Claim.—1. The valve-case and the valve having a stem passing through a septum in the case, a tubular arm, *g*, above the septum, extending to the closet, and a deflecting-thimble upon the upper end of the valve-stem, substantially as set forth.

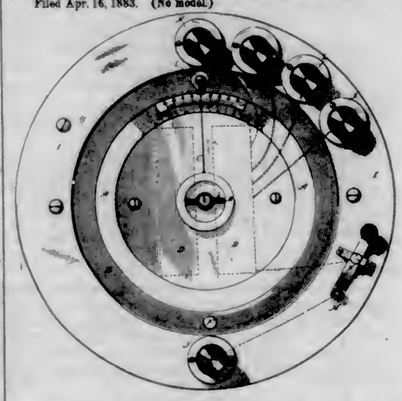
2. In a water-closet valve, the combination, with the valve-case, of the arm *g*, the lever above said arm for actuating the valve, flanges, and holes in the flanges and lever, and a movable pin by which the position of the fulcrum and the movement of the valve may be varied, substantially as set forth.

3. In combination, with the stand-pipe in a water-closet and the poll thereof, a valve and valve-case, a tubular arm between the stand-pipe and valve-case, and a lever pivoted upon the tubular arm and actuated by the poll, substantially as set forth.



4. In a water-closet valve, a case having three branches, one for the inlet-water, another for the pipe leading to the closet-basin, and a third for leakage from the hole through which the valve-stem passes, substantially as set forth.

292,160. CISTERN FOR WATER-CLOSETS. JOHN DEMAREST, New York, N. Y., assignor to the J. L. Mott Iron Works, same place. Filed Apr. 28, 1883. (No model.)



Claim.—1. The lever *k*, having studs cast upon the sides thereof, in combination with the lifter-rods *h* and *x*, terminating at their upper end as eyes, and the screws retaining the eyes of the lifter-rods upon the studs, substantially as specified.

2. The lever *k*, having studs cast upon the sides thereof, in combination with the lifter-rods *h* and *x*, terminating at their upper ends as eyes, the screws retaining the eyes upon the studs, the conical valve-seats, and the valves having rubber rings around them, and each provided with a bail through which the rod passes freely, and provided with a nut or head whereby the valves may be lifted, but are free to rest tightly within the conical seats when dropped, substantially as specified.

292,160.

292,161. GALVANOMETER. ASAHEL K. EATON, Brooklyn, N. Y. Filed Apr. 16, 1883. (No model.)

Claim.—1. A galvanometer consisting of a graduated scale, in combination with a coil or coils, a magnetic needle, and a magnetized ring producing a field symmetrical with respect to the center of motion of the needle, as set forth.

2. A galvanometer consisting of a graduated scale, in combination with a coil or coils, a magnetized ring, and a magnetic needle mounted in the center of said ring, substantially as herein set forth.

3. The combination, in a galvanometer, of a graduated scale, an annular magnet or magnetized ring, and an annular magnetic needle mounted in the center of said ring, substantially as described.

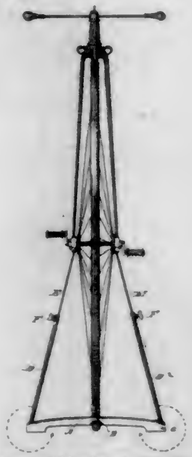
4. The combination, in a galvanometer, with an annular magnetic needle and a coil or coils, substantially as described, of an annular magnet or magnetized ring movable around the needle, as above set forth.

5. The combination, in a galvanometer, of an annular magnetic needle, a coil or coils with convolutions parallel to a line passing through the poles of said needle and the zero-point of the scale, and a removable annular magnet or magnetized ring, as and for the purpose set forth.

6. The combination, with a fixed circular scale, a movable annular magnet or magnetized ring, and a vernier attached thereto, of an annular magnetic needle, a pointer carried thereby, and a coil or coils, all as set forth.

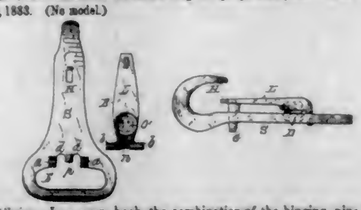
7. The combination, with a magnetized annular galvanometer-needle, of a cross-bar of non-magnetic material, a pivotal support, and a pointer, all as described.

292,162. PENCIL-SHARPENER HOLDER. WALTER KITTREDGE FOSTER, Stoneham, Mass. Filed Nov. 1, 1883. (No model.)



Claim.—1. The pencil-sharpener holder substantially as described, composed of the handle and of the two yokes extending therefrom, consisting of two wires bowed or arched at their middles, and bent toward and lapped on each other, essentially as represented.

2. The combination of the handle, provided, as described, with the notch for receiving the handle of a pencil-sharpener, with the two yokes extending from the handle, and having the said notch between them, consisting of two wires bowed or arched at their middles, and bent toward and lapped on each other, substantially as represented.

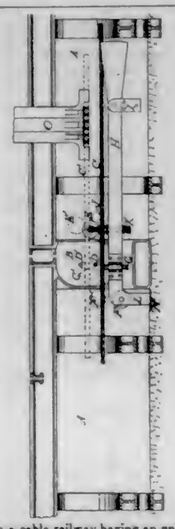


3. The combination of the handle with the two yokes, substantially as described, extending from it, and consisting of two wires bowed or arched at their middles, and bent toward and lapped on each other, and provided with the recesses or beads to receive the base-flange of a pencil-sharpener, all being essentially as represented.

292,163. BICYCLE-SUPPORT. JOHN W. FRY, New York, N. Y. Filed Nov. 13, 1883. (No model.)

Claim.—The improved bicycle-support, constructed of a base-piece transversely notched or curved in the middle to embrace or span the felly of the wheel, and provided with extension-rods pivoted to each end of the base-piece to swing inward into line parallel therewith, and outward to converge toward each other above the base-piece, and engage the hub of the wheel, substantially in the manner and for the purpose herein set forth.

292,164. SNAP-HOOK. JOHN GIBBONS, West Troy, N. Y., assignor to the Union Hardware Manufacturing Company, same place. Filed Oct. 9, 1883. (No model.)



Claim.—In a snap-hook, the combination of the hinging-pins *b b* and the intermediate recess, *N*, on the hinging end of the latch, the bearings *a a*, and the intermediate pin, *p*, on the hook-shank, constructed to connect and operate as and for the purposes herein set forth.

292,165. CABLE-RAILWAY PROPULSION. WILLIAM WALLACE HANSCOM, San Francisco, Cal. Filed Oct. 3, 1883. (No model.)

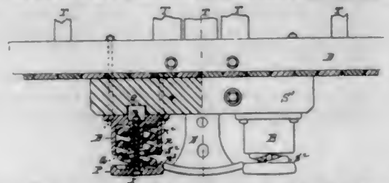
Brief.—Cables, where they cross each other, are prevented from contacting when the lower one is elevated through an approaching grip by means of a tilting bar which carries a pulley upon which runs the upper cable.

292,165.

Claim.—1. In a cable-railway having an underground slotted-tube mechanism, substantially as described, whereby the upper of two or more crossing cables may be raised and lowered and operated by the under cable or cables, so that a proper distance may be maintained between the upper and under of the crossing cables, for the purposes set forth.

2. The swinging bar H, in combination with the sheaves E and G and two or more crossing cables of a cable-railway, substantially as described and set forth.

3. The swinging bar H and swinging sheave E, in combination with the under sheave, F, and the cable C, substantially as described.



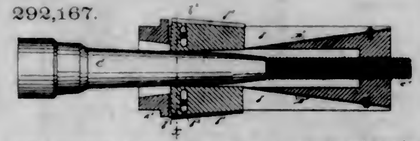
4. The swinging bar H, in combination with the sheaves E F G and the crossing cables C and D, substantially as and for the purpose described.

5. The combination, in a cable-railway where cables cross each other, of a grip for attaching the under cable to the moving car or train, two or more cables crossing each other, and suitable mechanism adapted and arranged to be operated by the under cable for raising the upper cable or cables, for the purposes set forth.

6. The swinging sheave E, in combination with a grip and crossing cables of a cable-railway, substantially as described.

7. In a cable-railway where two or more cables cross, a stop, substantially as described, for limiting the movement of the mechanism which raises and lowers the upper of the crossing cables, for the purposes set forth.

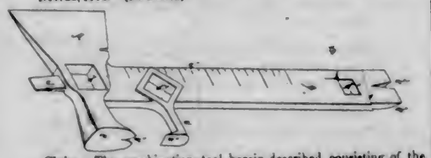
292,166. SPRING-BUFFER. DAVID HOTT, West Albany, assignor of one-half to Charles R. Hicks, Troy, N. Y. Filed June 4, 1883. (No model.)



Claim.—In a rail-car buffer, the combination, with the buffer-sill formed with a chamber, *c*, as shown, of the spring-buffers arranged as stated, and consisting of the spring-box B, having its rear face chambered, as shown, and formed with the guideway *a* projected outwardly and adapted to admit the passage of a bolt, the buffer-plate P, the bolt I, and interposed spring or springs, the whole arranged and combined to operate substantially as described.

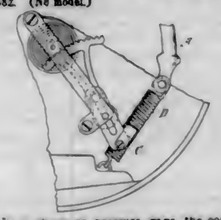
292,167. EXPANDING MANDREL. ALBERT E. LITTLE, Des Plaines, assignor of one-half to George H. Eten, Chicago, Ill. Filed May 7, 1883. (No model.)

Claim.—1. In an expanding wrench or mandrel, a shell or hollow cylinder formed with longitudinal openings or slots in its sides, and provided with two or more dogs having serrated faces, and formed with one or more guide-slots and pins passing through the same to secure them



292,167.

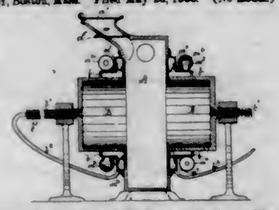
from displacement, in combination with an expander formed tapering, and provided with a screw-shank, and means for the engagement of a wrench or spanner, substantially as shown and described.



2. In an expanding wrench or mandrel, the hollow cylinder A, open at one end and closed at the other, where it is provided with a screw-threaded hole, *a*, the longitudinal slots *b*, and a series of dogs, B, placed in these slots and secured by pins b^2, passing through slots b^3 in the dogs, in combination with the expander C, formed tapering for a suitable distance, and provided with a screw-shank, *c'*, and means for engagement with a wrench, all constructed and arranged to operate substantially as and for the purpose set forth.

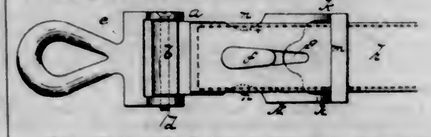
292,168. COMBINATION-TOOL. ALBERT E. LITTLE, Chicago, Ill. Filed Nov. 23, 1883. (No model.)

Claim.—The combination-tool herein described, consisting of the hatchet A, hammer *a*, nail-claws *a' f*, screw-driver *c*, nut-wrenches *b b'* b^2, scale or measure *c'*, hoop-lifter *e e'*, box-opener *d*, and tack-puller *d'*, all constructed, combined, and arranged for operation substantially as shown and described.



292,169. PRESSURE-GAGE. WILLIAM H. MACGREGOR, East Braintree, assignor to the Ashcroft Manufacturing Company, Boston, Mass. Filed Dec. 13, 1882. (No model.)

Claim.—1. In a steam or pressure gage, the combination of a Bourdon tube with a short-range preponderating direct-action spring attached to the free end of the said tube, and adapted to resist by its tension the movement of the free end thereof, and thereby weighing the pressure therein, all substantially as described.



2. In a steam or pressure gage, the combination of a Bourdon tube, a short-range direct-acting spring attached to the free end of said tube, of sufficient strength to counteract its tendency to set under pressure, all substantially as described.

292,170. ATTRITION-MILL. GUSTAVUS R. MAYMADIER and WILLIAM H. CHILEY, Boston, Mass. Filed May 23, 1883. (No model.)

Claim.—In an attrition-mill, the combination, with a perforated receptacle or hopper and the revoluble recessed heads communicating with the receptacle, of an air-chamber communicating with the interior of the receptacle through the perforations and the joints around the heads, and means for forcing air into the air-chamber, substantially as and for the purpose set forth.

292,171. TRACE-COCKEYE ATTACHMENT. GEORGE H. MCDOLE, Jackson, Mich., assignor of one-half to Howard L. Merriman, same place. Filed Aug. 31, 1883. (No model.)

Claim.—The herein-described trace-cockeye attachment, consisting of the plate A, having the loop *m* at one end and the solid projection *b* at its opposite end, and transversely perforated to receive the bolt *d* of the cockeye, said plate provided with the tongue *f*, centrally arranged thereon to receive the eye in the trace A, and having in its sides notches *n n*, in combination with a cockeye, all arranged and operating substantially as shown and described.

292,172. FRICTION-CLUTCH. DANIEL MILLS, Philadelphia, Pa., assignor to the United States Automatic Buttonhole Sewing Machine Company, of New Jersey. Filed June 11, 1883. (No model.)

Claim.—1. The combination of a shaft, a flanged wheel, and a split ring adapted thereto, with a lever to press the ring into frictional contact with the flange of the wheel, and a yoke, D', carrying said ring, and guided on the shaft or a portion of the wheel, substantially as described.

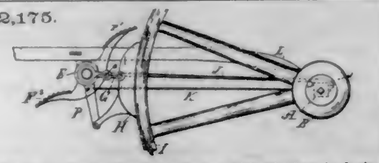
2. The combination of a shaft, a flanged wheel, and a split ring, with an operating-lever, and an inclosing-cap, C, cut away at one point for the passage of a portion of said lever.

3. The combination of a shaft, flanged wheel, and split ring, with an operating-lever, an inclosing-cap adapted to bear on said lever, and a retracting-spring acting on said cap, substantially as specified.

292,173. BELT-FASTENER. JOHN B. NORTON, Philadelphia, Pa. Filed June 5, 1883. (No model.)

Claim.—In a belt-fastening device, the flexible plate B, in combination with two independent plates, C C', provided with teeth *a a*, all constructed and arranged substantially as described.

292,174. CHILD'S CARRIAGE. GEO. R. PEARL, Lynn, Mass. Filed Feb. 12, 1883. (No model.)



Claim.—1. The combination, with the wheels and their supporting-axle, of non-rotating locking-collars mounted and adapted to slide on said axle, a spring or springs for holding them in engagement with said wheels, and a sliding and rotating unlocking-shaft connected to the propeller-handle on the one hand and to said locking-collars on the other hand, and arranged and adapted to be operated from the propeller-handle to move said collars against the stress of their controlling spring or springs, substantially as and for the purposes hereinbefore set forth.

2. The combination, with the propeller handle and axle and its wheels, of the bearings, one on the propeller-handle and one on the axle, the rotatable unlocking-shaft carried thereby, and arranged so as to be capable of not only rotating but also sliding in its lower bearing, and spring-controlled wheel-locking mechanism connected to and adapted to be operated by said shaft, substantially as hereinbefore set forth.

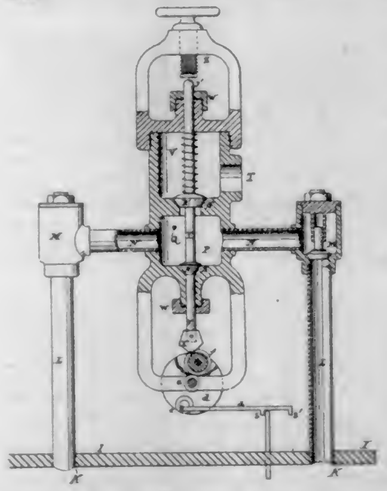
3. The combination, with the propeller-handle, the axle, and the wheels, of the pivoted unlocking lever-handle, the unlocking-shaft capable of sliding movement, and arranged and adapted to be rotated by said lever-handle, and automatic spring-controlled wheel-locking mechanism connected to and operated by said rotary shaft, substantially in the manner set forth, so that a movement of the lever-handle in either direction from its central position will cause the release of the wheels from the control of the locking mechanism.

292,175. WAGON-LOCK. GEO. R. PEARL, Lynn, Mass. Filed June 9, 1883. (No model.)

292,175.

Claim.—1. The combination, with the vehicle-wheels and a brake or lock therefor, of a movable double step actuated to move in one direction by the foot of the occupant on leaving the vehicle, and in the other direction by the foot of the occupant on getting into the vehicle, and mechanism connecting said double step with the brake or lock, whereby the latter is caused to engage or release the wheels, according to the direction in which the double step is moved, substantially as and for the purposes hereinbefore set forth.

2. The vibratory double step F' F² and rocking shaft or sleeve on which the same is mounted, in combination with the vehicle-wheels, the brake or lock, and intermediate mechanism connecting said brake or lock with the double step, the combination being and acting substantially as hereinbefore set forth.

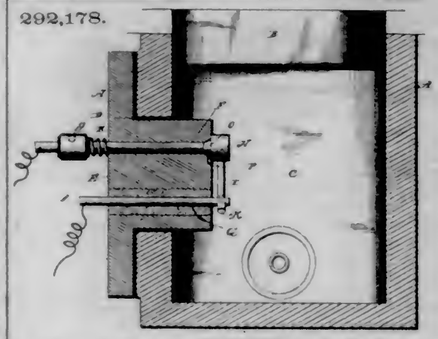


3. The vibratory double step, its rocking sleeve, and rod extending through said sleeve and centrally fixed thereto, in combination with the vehicle-wheels, the brake-shoes, and the system of toggles connecting the same with said step, under the arrangement and for joint operation substantially as hereinbefore set forth.

292,176. SAW FASTENING AND FRAME. HENRY L. PRATT, Brooklyn, N. Y. Filed Nov. 9, 1883. (Model.)

Claim.—The bent pin C, headed at one end and pointed at the other, for holding a saw in its frame, in combination with the bolt D and d'', or their equivalents, substantially as and for the purposes specified.

292,177. VAPOR AND ATMOSPHERIC VALVE FOR STEAM-PUMPS. HENRY S. PUSHLEY, Brooklyn, N. Y. Filed Mar. 21, 1883. (No model.)



Claim.—1. In combination with a vapor pipe or chamber of a steam-pump, substantially as described, the air-chamber P, balance-valve with its seats, and the lifting mechanism X, *f*, *d*, and *a*, operated in connection with the plunger C, substantially as and for the purposes described.

2. The combination, in a steam-pump, of a reciprocating plunger, C, the induction-spaces A, valves F, clearance-spaces D, eduction-valves G, diaphragm I, discharge-space E, vapor-passage L N, check-valve M, balance-valve with its seats S S', and the tripping mechanism *a b d f*, substantially as and for the purposes described.

292,178. EXPLOSIVE-GAS ENGINE. ALEXANDER KIRK RIDER, Walden, N. Y. Filed June 7, 1883. (No model.)

292,178.

Claim.—1. In an explosive-gas engine, the combination, with a bonnet inserted through the cylinder, of an electric circuit-breaker supported by said bonnet, the terminals being located within the motive cylinder, substantially as set forth.

2. In an explosive-gas engine, terminals located within the motive cylinder, one being movable, a spring-arm connected with the movable terminal, and means for laying the said arm under tension and allowing it to suddenly recoil to move the movable terminal and interrupt the circuit, substantially as set forth.

3. In an explosive-gas engine, an igniting-bonnet, arbors extending through said bonnet, terminals respectively secured to the inner ends of said arbors, and means to move one arbor and separate the terminals, substantially as set forth.

4. In an explosive-gas engine, an igniting-bonnet, arbors extending through said bonnet, terminals secured to the inner ends of the arbors, and means to rotate one of the arbors on its longitudinal axis for the purpose of separating the terminals, substantially as set forth.

5. In an explosive-gas engine, an igniting-bonnet, arbors extending through the bonnet, means to insulate one of the arbors therein, terminals attached to the inner ends of the arbors, and means to move one of the arbors to separate the terminals, substantially as set forth.

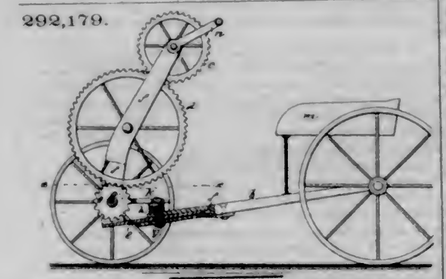
6. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, means to connect the outer ends of the arbors with a generator of electricity, terminals associated with the inner ends of the arbors, and devices to move one arbor or both to separate the terminals, substantially as set forth.

7. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, terminals associated with the inner ends of the arbors, which are provided, one or both, with valve-face bearings fitting in suitable recesses located in the inner face of the bonnet, substantially as set forth.

8. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, terminals associated with the inner ends of the arbors, which are provided, one or both, with valve-face bearings fitting in recesses located on the inner face of the bonnet, and means to maintain the said bearings in the recesses, substantially as set forth.

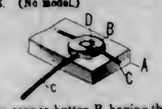
9. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, terminals associated with the inner ends of the arbors, one of which is arranged to be rotated on its longitudinal axis, a vibratory arm having one end rigidly secured to the movable arbor, and means for laying the arm under tension and suddenly releasing it, substantially as set forth.

10. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, terminals associated with the inner ends of the arbors, one of which is movable, a vibratory arm secured to the movable arbor, a momentum-block attached to the outer end of the arm, and means for laying the arm under tension and suddenly releasing it, substantially as set forth.



11. In an explosive-gas engine, an igniting-bonnet, arbors extending through the same, terminals associated with the inner ends of the arbors, one of which is movable, a vibratory arm secured to the movable arbor, and means for laying the arm under tension and suddenly releasing it, and a spring to absorb the vibrations of the arm after its recoil, substantially as set forth.

292,179. VELOCIPEDE. CHRISTIAN F. RILEY, Philadelphia, Pa. Filed June 15, 1883. (Model.)



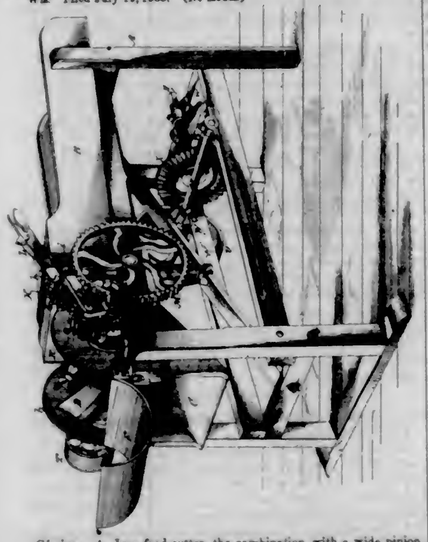
Claim.—1. The combination, with the reach *b* and the axle *a*, of the fifth-wheel *e*, having uprights *f* for the support of the driving-gear, and being arranged in the slot *f'* of the reach *b*, and pivoted to the end of the reach at *g*, substantially as described.

2. The combination of the arms *h*, foot-levers *j*, connecting-rods *k*, and collars *l* with the reach *b*, fifth-wheel *e*, axle *a*, and the driving-gears for applying the power to the axle, substantially as described.

292,179.

292,180. ELECTRICAL CONNECTOR. STEPHEN RYDER, North Attleborough, Mass., assignor of one-half to Joseph Lewis Blaine, same place. Filed Nov. 2, 1883. (No model.)

Claim.—1. The copper button B, having the peripheral rim *b*, with openings for the wires and screw D in combination therewith, for moving it in a downward direction in such manner as to clamp the wires, as described.



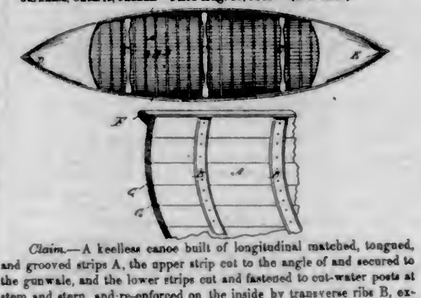
2. The connector described, having the copper button with flange *b*, and rim *b'*, having openings and teeth, in combination with a base-block and securing-screw, as described.

292,181. PROCESS OF MAKING RELIEF PRINTING PLATES OR BLOCKS. PROCTOR R. SUTTON and GEORGE BOYLE, New York, N. Y. Filed Mar. 19, 1883. (No specimens.)

Claim.—1. The sensitive plate composed of gelatine, albumen, glycerine, resin, and bichromate of ammonia, substantially as set forth.

2. The method herein specified of hardening relief gelatine plates, consisting in treating such gelatine plates successively to baths of solutions of bichromate of ammonia, nitrate of silver, sulphate of iron, and ammonium hydrosulphite, substantially as set forth.

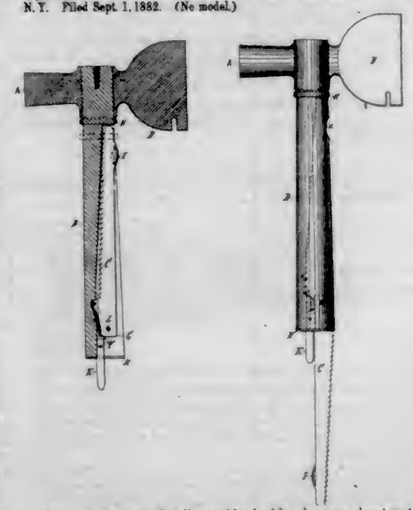
292,182. FEED-CUTTER. CLARENCE CHRISTIAN SMALLEY, Manitowoc, Wis. Filed July 19, 1883. (No model.)



Claim.—1. In a feed-cutter, the combination, with a wide pinion adapted to be rotated upon a fixed stud, and a spur-wheel secured to the shaft of the lower feed-roller, of a removable and reversible double pinion mounted upon a stud, said stud being twice the length of the hub of the double pinion, and having a removable collar thereon, and also having removably connected to its outer end a suitable brace to retain the double pinion and collar in position upon the shaft, substantially as and for the purpose set forth.

2. In a feed-cutter, a rotary shaft, carrying the cutter-knives and a pinion, and having loosely mounted thereon a supporting-brace and a wide pinion adapted to revolve upon a stud attached to said brace and one of the side plates of the machine, in combination with a removable and reversible double pinion mounted upon a stud projecting from a hand-lever, said stud having a bearing-surface twice the length of the double pinion, and provided with a removable collar adapted to slip over the stud to hold said pinion in a reversed position upon either end thereof, for the purpose specified.

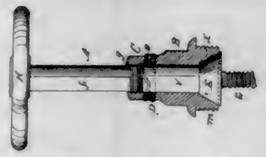
3. In a feed-cutter, a notched quadrant, a pivoted hand-lever, and means for holding it in an adjusted position, in combination with a removable and reversible double pinion supported upon a stud projecting from the side of the lever, said stud being twice the length of the hub of the double pinion, and having thereon a removable collar, and connected at its outer end by a suitable brace to a similar stud, upon which is adapted to revolve a wide pinion, substantially as and for the purpose set forth.



4. In a feed-cutter, an upright throat-plate, substantially of the form shown, having at its lower edge a longitudinal support, and cast with upright flanges arranged in pairs at each end thereof, in combination with a cutting-plate having elongated slots, and clamping-bolts passing through the same and through the longitudinal support, and upright wedges or tapering keys located between the flanges of each pair as a means for adjusting and holding the cutter-plate in the position desired, substantially as and for the purpose described.

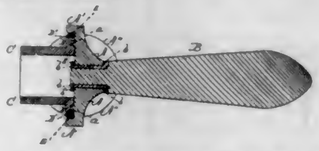
292,183. CONSTRUCTION OF CANOES. JOHN S. STEPHENSON, Ashburnham, Ontario, Canada. Filed Aug. 13, 1883. (No model.)

Claim.—A keelless canoe built of longitudinal matched, tongued, and grooved strips A, the upper strip cut to the angle of and secured to the gunwale, and the lower strips cut and fastened to cut-water posts at stem and stern, and re-enforced on the inside by transverse ribs B, extending from gunwale to gunwale, substantially as set forth.



292,184. COMBINATION-TOOL. WILLIAM G. THOMPSON, Brooklyn, N. Y. Filed Sept. 1, 1882. (No model.)

Claim.—A hammer-handle combined with a hammer-head and a saw-blade, said saw-blade being pivoted to the handle and made to swing



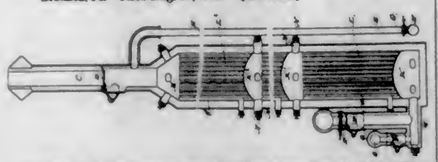
into the same when not in use in such a manner as to then bring the free end of the saw-blade nearest to the hammer-head, a sliding ring being provided for confining said saw-blade in such position, substantially as set forth.

292,185. STEAM-VALVE. DAVID H. THORPE, Somerville, assignor to himself, and John P. Howard, Boston, Mass. Filed June 21, 1883. (No model.)

Claim.—The combination, in a valve, of a neck, B, provided with a valve-seat, *x*, and screw-thread, *m*, a stem, A, passing through said neck and provided at its lower end with a valve, E, and above said neck with a short screw-thread, *g*, the said stem being smaller in diameter above than below said short screw-thread, an adjusting-nut adapted to fit said short screw-thread, and a spring interposed between said nut and the top of said neck, substantially as described.

292,186. CARRIAGE-WRENCH. DAVID TRUE, Salisbury, Mass. Filed July 23, 1883. (No model.)

Claim.—1. In a wrench, the combination, with the bar A, or portion adapted to be rotated by the user, provided with the flange A', of the socket or portion applied to the nut, said socket being provided with the back or base D, which is provided with the groove D', and the elastic ring E, resting in said groove and compressed against the inner surface of said flange, substantially as and for the purpose set forth.



2. In a wrench, the combination of the following elements, viz: the socket or portion adapted to be applied to the nut, the bar or portion adapted to rotate the socket, and an intermediate elastic substance arranged and applied to hold the said socket and bar together by its own elasticity and friction, substantially as and for the purpose hereinbefore set forth.

292,187. COTTON-BATTING. CHARLES G. TYLER, New York, N. Y. Filed Apr. 23, 1883. (No model.)

Claim.—The cotton-batting composed of two sheets of carded cotton and an intermediate open woven fabric, united by adhesive material, substantially as set forth.

292,188. REGENERATIVE HOT-BLAST STOVE. PETER L. WEIMER, Lebanon, Pa. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a regenerative hot-blast stove, two or more regenerative chambers arranged vertically one above the other, and a combustion-chamber at the lower end of each regenerative chamber, in combination with an air-inlet pipe communicating with the upper regenerator, and a hot-air-exit pipe connecting with the lower regenerator, substantially as set forth.

2. In a regenerative hot-blast stove, two or more regenerative chambers arranged vertically one above the other, and a combustion-chamber at the lower end of each regenerative chamber, in combination with an air-inlet pipe communicating with the upper portion of the upper regenerator, and a hot-air-exit pipe and gas-supply pipe communicating with the combustion-chamber of the lower regenerator, substantially as set forth.

3. In a regenerative hot-blast stove, two or more regenerative chambers arranged vertically one above the other, and a combustion-chamber at the lower end of each regenerative chamber, in combination with an air-inlet pipe communicating with the upper regenerative chamber, a hot-air-exit pipe and gas-supply pipe communicating with the combustion-chamber of the lower regenerator, and air-valves for supplying air to the combustion-chambers, substantially as set forth.

4. In a regenerative hot-blast stove, two or more regenerative chambers arranged vertically one above the other, and a combustion-chamber at the lower end of each regenerative chamber, in combination with an air-inlet pipe communicating with the upper regenerative chamber, the hot-air-exit pipe and supply-pipe communicating with the combustion-chamber of the lower regenerator, and valves for closing the hot-air and gas pipes, and for opening and closing the stove at a point above the air-inlet pipe, substantially as set forth.

5. In a regenerative hot-blast stove, the combination, with two or more regenerative chambers arranged vertically one above the other, a combustion-chamber at the lower end of each regenerative chamber, and a stack located over the upper regenerative chamber, of an air-inlet pipe communicating with the stack, and a valve located in the stack at a point above said air-inlet pipe, substantially as set forth.

6. In a regenerative hot-blast stove, the combination, with two or more regenerative chambers arranged vertically one over the other, of combustion-chambers at the lower end of each regenerative chamber, said combustion-chambers gradually decreasing in size from the bottom upward, substantially as set forth.

7. The combination, with a casing and a series of combustion-chambers and regenerators situated in the same vertical plane, of air-flues U', passing upwardly through the regenerators, for the purpose of heating the air admitted through these flues before it reaches the combustion-chamber.

8. In a regenerative hot-blast stove, a regenerator formed from brick of Greek-cross shape, substantially as set forth.

9. In a regenerative hot-blast stove, a regenerator formed of alternate layers composed of Greek-cross brick and straight brick with beveled ends, the brick of said alternate layers being arranged to break joints with each other.

10. In a regenerator hot-blast stove, a regenerator formed of alternate courses of the Greek-cross bricks I and the straight blocks or bricks J, the said bricks being provided with grooves or gutters on one surface, and corresponding projections on the opposite surface, substantially as set forth.

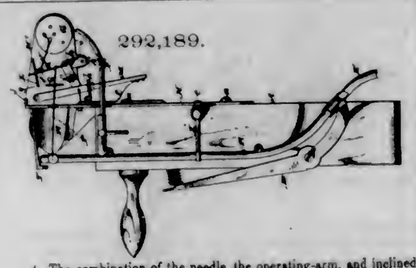
11. In a regenerative hot-blast stove, the combustion-chamber formed by projecting each successive course of brick inwardly until they meet in the center, forming a dome-shaped roof, substantially as set forth.

12. The combination, with a metallic casing, adapted to be lined with fire-brick and provided with a recess or space, and a hollow valve-seat situated within said casing, of a hollow valve pivoted within said casing, the spindles of the said valve being hollow and projecting beyond said casing, and water supply and exhaust pipes communicating with the said valve and seat, substantially as set forth.

13. The combination, with the casing Q, provided with the recess T', the hollow valve-seat R, and the pinions T, secured to a shaft, the latter being journaled in arms secured to the casing, of the hollow valve, the segment rack-bars, and water supply and waste pipes, substantially as set forth.

14. In a regenerative hot-blast stove, the combination, with a casing lined with fire-brick and containing two or more regenerative chambers arranged vertically one above the other and provided with a stack, and a water-cooled valve located within the stack, of an air-inlet pipe communicating with the upper regenerator, a gas-inlet pipe and hot-air-exit pipe communicating with the lower regenerator, and water-cooled valves situated in the hot-air and gas pipes, substantially as set forth.

15. The combination, with the casing, the series of regenerators and combustion-chambers and the valve D, of the pipe E, valve G, and pipes P and O, substantially as set forth.



292,189. PAINT-DISTRIBUTER. JOHN P. WHIPPLE, Milwaukee, Wis. Filed Nov. 20, 1883. (Model.)

Claim.—1. The combination of the wind-wheel, the needle-operating arm provided with the eye, the pitman connected to the eye of the operating-arm at one end, and provided at the other end with an eye, and a pin with an enlarged end for securing the pitman through its eye to the wind-wheel, substantially as set forth.

2. The combination of the wind-wheel, the tapering needle provided with an eye at one end, the operating-arm passed through the eye of the needle, and the pitman for connecting the needle-arm with the wind-wheel, substantially as and for the purpose set forth.

3. The combination of the wind-wheel, the needle-operating arm provided with the eye, and the pitman connected with the wind-wheel and joined to the eye of the operating-arm, substantially as described.

292,189.

4. The combination of the needle, the operating-arm, and inclined rest for the said arm, substantially as described.

5. The combination of the needle-operating arm, and the needle having an eye and connected with the operating-arm thereby, substantially as described.

6. The combination of the needle-operating arm, the spring-actuated lever, and means for connecting the said lever and arm, substantially as described.

7. The combination of the needle-operating arm, the spring-actuated lever, and the link-connection between the said arm and lever, substantially as described.

8. The combination of the needle-operating arm, the spring-actuated lever, means for connecting said lever and arm, and the guide-rod for the lever, substantially as described.

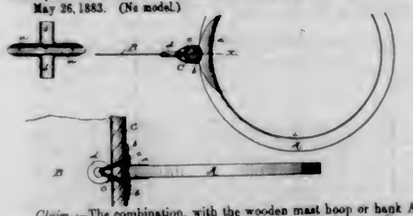
9. The combination of the band-piece, the air-jet tube and pipe for supplying air through said tube to the needle, an adjustable plate carrying the needle, and the lever passing down from the upper part of the band-piece and connected with the plate carrying the needle, so as to adjust the same, substantially as described.

10. The combination of the pigment-receptacle, the tapering needle, the pipe for supplying an air-jet to the needle, and means for projecting and guiding the needle in a straight line, substantially as and for the purpose set forth.

11. The combination of the pigment-receptacle, the bow-needle, a support for holding the pigment-carrying portion of said needle from contact with the pigment-receptacle, a pipe supplying an air-jet to the needle, and means for projecting the needle, substantially as described.

12. The combination of the wind-wheel, the needle-operating arm, the pitman connecting the said arm and wind-wheel, the needle having an eye-connection with said operating-arm, an inclined rest for said arm, and the lever for varying the stroke and throw of the needle, substantially as described.

13. The combination of the wind-wheel, the needle-operating arm, the pitman-connection between said arm and wheel, the needle connected to said arm, and the support for the needle extending beyond the pipe for supplying an air-jet to the needle, substantially as described.

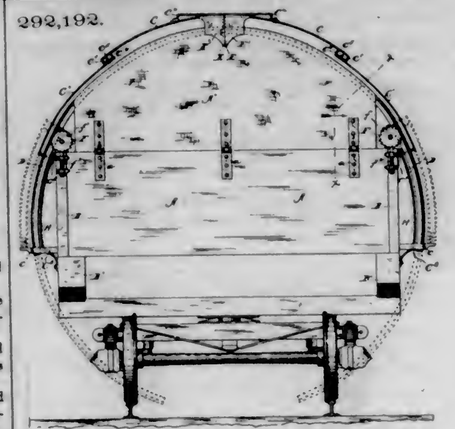


14. In a paint-distributer, the bow-needle having its shank flattened at an angle to the bow, substantially as described.

292,190. BASE-BALL BAT. WILLIAM WILLIAMS, Huntingdon, Pa. Filed June 29, 1883. (No model.)

Claim.—As a new article of manufacture, a base-ball bat composed wholly or in part of pulp molded and condensed, substantially as described.

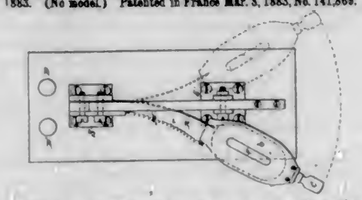
292,191. MAST-HOOP. JOHN H. WYGANT, Hackensack, N. J. Filed May 26, 1883. (No model.)



Claim.—The combination, with the wooden mast hoop or hank A, of the plate *a*, permanently secured to the inside of said hoop in position to cover its splice, and provided with arms *b*, by which the hoop may be lashed to the leech-rope, all substantially as described.

292,192. RAILWAY-CAR. RICHARD H. WYMAN, Evanston, Ill. Filed Nov. 23, 1883. (No model.)

Claim.—1. A movable cover for railway freight or coal cars, consisting of the plates C C C' C', having segmental racks D D attached



292,192.

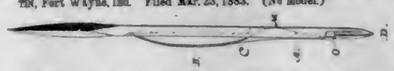
thereto, shafts F, pinions *f*, ratchets *f'*, guide-bars H, eyebolts C⁶, and brackets C⁸, whereby the car may be wholly uncovered while loading and unloading, substantially as and for the purpose set forth.

2. A movable sectional cover for railway freight or coal cars, consisting of the plates C C C' C', having segmental racks D D attached thereto, shafts F, pinions *f*, ratchets *f'*, guide-bars H, eyebolts C⁶, brackets C⁸, and plates for aprons E, substantially as and for the purpose set forth.

292,193. APPARATUS FOR TRANSMITTING ELECTRIC SIGNALS. BRUNO ARDANT-ABAKANOWICZ, Paris, France. Filed May 26, 1883. (No model.) Patented in France Mar. 3, 1883, No. 141,869.

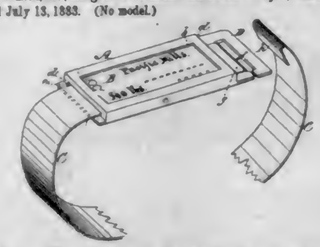
Claim.—1. A transmitting device for generating alternating electric currents, consisting, essentially, of a magnetic pole or poles, and a relatively vibratory coil or helix adapted to move back and forth through and beyond the magnetic field, when said pole or poles is or are arranged midway of the normal limit of vibration of said coil, whereby when the latter is at mid-vibration and at maximum velocity it shall be in closest proximity to said pole or poles, and when at either extremity of its vibration it shall be most remote therefrom, all combined and operating substantially as and to the effect set forth.

2. The combination of a spring-mounted coil or helix adapted to vibrate back and forth through and beyond the magnetic field of a fixed magnet, with said magnet arranged with its pole or poles midway of the normal limit of vibration of said coil, so that the latter shall be in closest proximity to said pole or poles when at mid-vibration and at maximum speed, and with a commutator vibrating with said coil or helix, and adapted to reverse the polarity of the terminal connections of the latter at each extremity of the vibration, substantially as and for the purposes set forth.



292,194. CROSSCUT-SAW. ELIAS C. ATKINS, Indianapolis, Ind. Filed June 25, 1883. (No model.)

Claim.—A saw-blade having a convex cutting-edge, a concave back



edge, and having both ends wider than the center, substantially as and for the purpose set forth.

292,195. SHOE-MAKER'S SEWING-NEEDLE. ALEXANDER W. ABBOTT, Fort Wayne, Ind. Filed Mar. 23, 1883. (No model.)

Claim.—The combination, with the needle having an open eye and a longitudinal groove, of a spring, C, having a tenon, I, and pivoted in said groove, all substantially as set forth.

292,196. TAG-HOLDER FOR COTTON-BALES. HENRY L. AYER, East Wilton, Me., assignor to himself and Alton E. Ayer, Boston, Mass. Filed July 13, 1883. (No model.)

Claim.—1. The within-described metallic holder for tags, cards, &c., consisting of a plate, A, having an opening, *b*, and provided on its under surface with downwardly-projecting side flanges, *c c*, and end flanges, *d d*, the latter having slots *e e* for the passage of the bale-hoop, which is adapted to pass beneath the tag or card and confine it within the recess formed by the flanges *c c d d*, substantially as set forth.

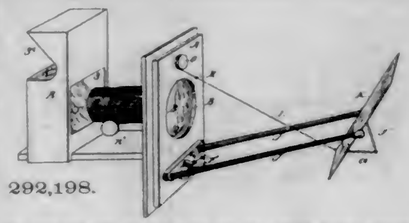
2. The plate or holder A, having an opening, *b*, and provided on its under side with downwardly-projecting side flanges, *c c*, and end flanges, *d d*, having slots *e e*, in combination with the bale-hoop C, adapted to pass through the slots *e e* and extend from one end of the holder to the other beneath the tag or card, to confine the latter within the recess in the under side of the plate A, formed by the flanges *c c d d*, all constructed to operate substantially in the manner and for the purpose set forth.

3. The plate or holder A, having an opening, *b*, and downwardly-projecting side flanges, *c c*, and end flanges, *d d*, having slots *e e*, and provided with an extension, D, having a transverse slot, *f*, substantially as and for the purpose described.

292,197. EXTENSION FRUIT-DISH HOLDER. CHAS. S. BARBOUR, New Haven, Conn. Filed July 17, 1883. (No model.)

Claim.—1. A dish or plate holder having horizontally-adjustable arms to adapt the same to hold dishes and similar receptacles of different sizes, substantially as set forth.

2. A dish or plate holder having horizontally-adjustable legs A and arms B, substantially as and for the purpose set forth.



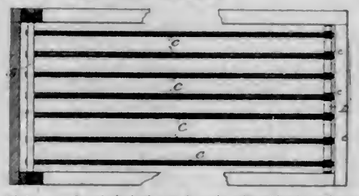
3. In a dish or plate holder, the combination of the legs A and arms B of the disk C, adapted to receive and form a bearing for the inner ends of said legs and arms, and means, substantially as described, for clamping said disk, arms, and legs together.

4. A dish or plate holder having rotatable dish-grasping arms, substantially as and for the purpose set forth.

5. A dish or plate holder having horizontally-adjustable and rotatable dish-grasping arms, as and for the purpose set forth.

292,198. HELIOSTAT OR PORTE LUMIERE. WILLIAM S. BARSTOW, Brooklyn, N. Y. Filed Oct. 31, 1883. (No model.)

Claim.—1. The combination, in a window-heliostat, with a vertical supporting-board provided with a lens-opening and suitable lens-tubes, of a detachable bar pivoted centrally against the board upon the outer end of a pivotal pin or shaft led through the board, to be operated from the inside, a spring-catch for securing the bar to the pivot-pin, parallel



292,198.

rods extending from each end of said bar, and a mirror pivoted between the ends of said rods, all substantially in the manner and for the purpose herein set forth.

2. The combination, in a window-heliostat, with a vertical supporting-board provided with a lens-opening and fitted with suitable lens-tubes secured thereon, of parallel rods adapted to revolve upon a common pivotal axis at a right angle to the board, a mirror pivoted between said arms, a spring actuating said mirror to force its lower end outward, and a cord leading from the lower end of the mirror to a pulley rotating in bearings in the board, to provide for the vertical adjustment of the mirror, substantially in the manner and for the purpose herein set forth.

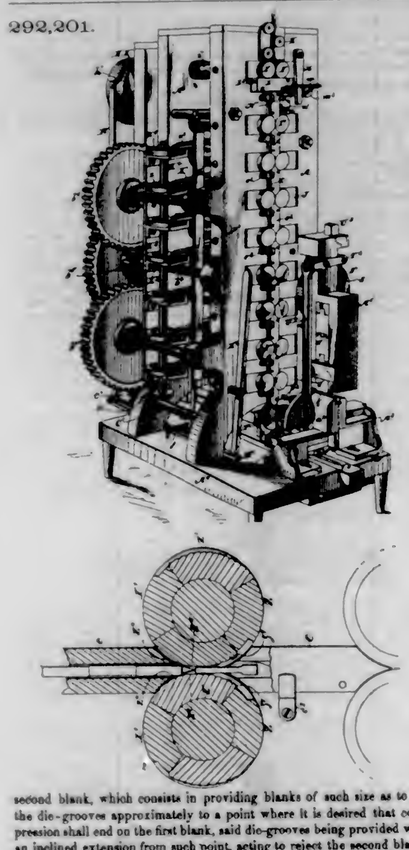
3. The combination, with a board or frame, A, adapted for insertion in the window or other opening, and provided with an opening, B, to receive a lens and tube, and a mirror, K, supported outside of said board upon pivotal supports admitting of its adjustment both in line parallel with the board and about an axis at right angles thereto, a case, R, fitted upon a supporting-base projecting from the board on the side opposite the mirror, and provided with an opening in line with the lens-opening on the board, a mirror, T, fixed within the case opposite said opening at an angle therewith, a second mirror, T', fixed in the top of the case parallel with the first, to deflect the rays therefrom through an opening, S', in the front of the case, and a transparent plate, S', interposed between the mirrors, all substantially in the manner and for the purpose herein set forth.

292,199. FRUIT-DRYING RACK. ROBERT M. BELLINGER, Blissfield, Mich. Filed Aug. 10, 1883. (No model.)

Claim.—1. In a fruit-drying rack, a plurality of horizontal rails connected at one end to a vertical post or bar and the other end adapted to fit into notches, whereby the movement of one of the vertical posts will permit of the passage of or removal of fruit upon the rails, substantially as described.

2. As an improved article of manufacture, the fruit-drying rack, consisting of a vertical post or bar provided with a plurality of horizontal rails, upon which fruit may be strung, and a vertical post or bar provided with a corresponding plurality of notches adapted to receive the free ends of the horizontal rails, substantially as described.

292,200. CARRIAGE-SPRING. THOS. R. BEVANS, Kalamazoo, Mich. Filed May 1, 1883. (No model.)



Claim.—The combination, with a pair of springs which are loosely supported at each outer end and located end to end in the same horizontal line beneath a bolster, of a bolster having a bearing-surface at each end loosely resting on the springs, and centrally and loosely connecting with the inner end of each spring between the bearing-points of said bolster, substantially as set forth.

292,201. HORSESHOE-NAIL MACHINE. GEORGE JOSEPH CAPEWELL, Cheshire, Conn. Filed Apr. 30, 1883. (Model.)

Claim.—1. As an improvement in the art of manufacturing horseshoe-nails, the particular adaptation, herein described, of the nail-blank and dies to one another for the purpose of enabling the latter to expel a

292,201.

second blank, which consists in providing blanks of such size as to fill the die-grooves approximately to a point where it is desired that compression shall end on the first blank, said die-grooves being provided with an inclined extension from such point, acting to reject the second blank, substantially as described.

2. In a machine for making horseshoe-nails, a set of rolls for compressing the blanks, each of these rolls having dies set into its periphery or fastened thereon, these dies having die-grooves in their faces, the line of junction or contact of the dies passing through the point in the groove where the pressure or pinch begins or at any point between it and the large end of the pocket which receives the head of the blank.

3. A pair of compressing-rolls provided with die-grooves having at their large ends pockets which are deeper than the remaining parts of said grooves and larger than the heads of the blanks.

4. In a machine for making horseshoe-nails, a clutch for engaging the driving-wheel, and thereby turning the driving-shaft, in combination with a device for disengaging said clutch from said wheel, a dog or detent which normally prevents this disengagement, and devices which automatically remove said dog or detent when the blanks become clogged in the guideway.

5. In combination with a series of compressing die-grooved rolls and a guideway which conducts the blanks to and from each pair of said rolls, a series of slides working into and out of the said guideway between each pair of said rolls, and a series of cams and levers actuating said slides, each one of these levers being made in two sections, which are adapted to yield on encountering a blank or other obstacle, substantially as set forth.

6. In combination with a series of compressing die-grooved rolls and a guideway which conducts the blanks to and from each pair of said rolls, a series of slides working into and out of the said guideway between each pair of said rolls, a series of sectional yielding levers for operating said slides, and devices which permit the automatic unshipping of the clutch which drives the machine when a shaft or bar forming part of said devices is engaged by a shoulder on any one of said levers in the act of yielding, as aforesaid.

7. In combination with the driving-wheel, driving-shaft, and the clutch for connecting and disconnecting them, the shipping-levers and notched connecting rod or bar for operating said clutch, the retracting-spring for unshipping the same, the spring-pressed dog, which engages with said notch to lock said clutch against the action of said unshipping-spring, and a lever and a shaft and arm operated by said lever for removing said dog from said notch, substantially as set forth.

8. In combination with the feeding-rolls and compressing-rolls, an interposed cutting-blade and sliding plunger, a pendent arm carrying a piece arranged to be forced against the outer end of said plunger, and a shaft carrying two horns or cams, which act on said pendent arm, substantially as set forth.

9. The combination of a pair of feed-rolls with a set of compressing devices, a cutting blade or blades, and an adjustable finger, which supports the end of the wire or bar and regulates the length of the blanks, substantially as set forth.

10. A circular plate or wheel provided with cross-passages having four equidistant openings in its periphery, in combination with compressing-rolls and a guideway discharging into said passages as they successively assume a vertical position, and devices which give said wheel a step-by-step motion of one-fourth of a circle at each step, for the purposes set forth.

11. A rotary wheel and devices for giving it a step-by-step motion of one-fourth of a circle at each step, said devices consisting of a ratchet or notched collar on a shaft whereby said wheel is rotated, driving and retaining pawls, and the necessary operating and freeing devices, whereby said shaft is given its step-by-step motion, in combination with devices for beveling, pointing, and heading the blanks carried by said wheel as they successively reach the points where said devices are respectively located.

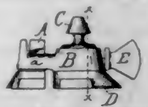
12. A wheel rotating with a step-by-step motion and adapted to carry the blanks with their ends protruding, as stated, in combination with a beveling-anvil and punch or plunger which bevel the end of the blank, substantially as set forth, and the notched and toothed collar Q' on the shaft of said wheel, a loose collar carrying the driving-dog Q⁴, means for alternately advancing and withdrawing this dog to rotate the former collar step by step, and the two retaining-pawls, and means for automatically freeing the same, as stated.

13. A wheel rotating with a step-by-step motion and adapted to carry the blanks with their ends protruding, as stated, in combination with a stationary blade and a plunger, whereby the surplus metal is trimmed from the point after the latter has been beveled, as set forth, and the notched and toothed collar, driving-dog, retaining-pawls, and actuating and freeing devices, substantially as described.

14. A wheel provided with heading-dies arranged transversely to the periphery of the wheel which receives the blanks of metal and carries them round in a step-by-step motion, in combination with a heading-die and a clamping-die, which are carried against said blanks, substantially as set forth.

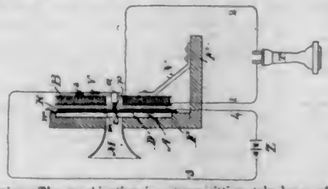
15. A wheel provided with heading-dies which receive the blanks of metal, in combination with a slide carrying a heading-die, and a clamping-die, and devices which give to said slide a compound, lengthwise, and upward and downward motion, in order that the same slide may apply to and remove from the blank both the vertically-operating clamping-die and the horizontally-operating heading-die, substantially as set forth.

16. In combination with a vertical wheel arranged to receive the blanks from the guideway, rotating with a step-by-step motion, and provided with passages extending through it, as stated, and a second wheel arranged horizontally and having corresponding rotation, a plunger and operating devices whereby said plunger is caused to pass through said passages as they are successively presented, and force the blanks therefrom into the dies or receptacles of the horizontal wheel, for the purpose set forth.



17. A feeding-plunger which operates on the blanks after they have left the compressing-rolls, in combination with unclutching mechanism for stopping the machine, a detent which prevents the operation of said unclutching mechanism, and a device connected to said feeding-plunger which removes said detent when said plunger meets with an obstruction, substantially as set forth.

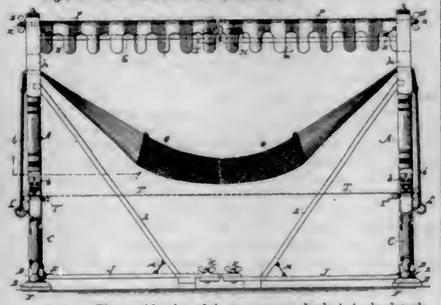
18. A feeding-plunger and its operating-lever, the latter being in two normally-rigid sections, which are adapted to yield and separate at the upper end of the lower section when said plunger meets with resistance, in combination with a clutch and its unshipping-spring, and devices for allowing said spring to operate, the latter devices being operated by the engagement of the lower section of said lever therewith when its upper end separates from the upper section, substantially as set forth.



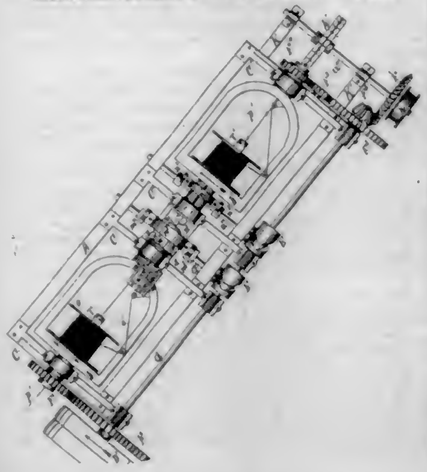
292,202. FASTENING FOR MEETING-RAILS OF SASHES. JAS. CRAMBERS, New Britain, Conn., assignor to the Kompshall Manufacturing Company, same place. Filed Oct. 15, 1883. (Model.)

Claim.—The improved sash-fastener herein described, consisting of the base-plate having the lug *d*, the chambered sweep having the stop-lugs *b b*, and the latch-lever E, extending into the chambered sweep, said lever constructed to act upon one side of the lug *d*, while one of lugs *b* engages the opposite side of *d*, substantially as described, and for the purpose specified.

292,202.



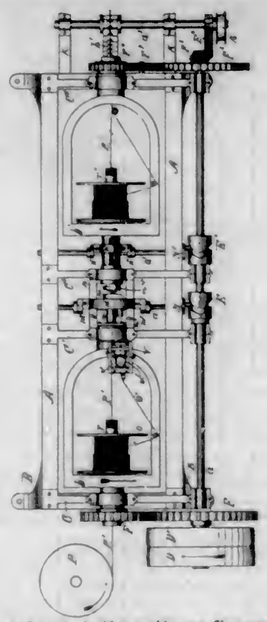
292,203. TELEPHONE-TRANSMITTER. JOSEPH H. CHEEVER, Somerville, Mass. Filed June 25, 1883. (No model.)



Claim.—The combination, in a transmitting-telephone, of a diaphragm, a vibrating primary helix in a battery-circuit, and a variable resistance consisting of two points or buttons in loose contact with one another, also included in the battery-circuit with a secondary helix adapted to form part of a closed telephone-circuit supported in inductive proximity to the primary helix, substantially as described.

292,204. PORTABLE HAMMOCK-SUPPORT. ROBERT C. COOK, Chicago, Ill. Filed June 23, 1883. (No model.)

Claim.—The combination of the posts or standards A A, the detachable feet or base-pieces B B, the folding legs or braces C C, hinged at their upper ends to the said posts, the folding and extensible bars J J, hinged to the said posts and detachably connected to each other, the detachable extensibly-connected bars G G', the detachable braces L L, the hammock, and the tilting awning, substantially as and for the purposes specified.



292,205. METHOD OF APPLYING BARBS TO FENCE-WIRE. JAMES H. COON, Des Moines, Iowa. Filed Nov. 22, 1883. (No model.)

Claim.—The process of manufacturing barbed fence-wire, which consists in rotating the barb-wire around the main fence-wire in one direction and simultaneously coiling the free end of the barb-wire around said main wire in the opposite direction and afterward severing the barb-wire, substantially as described.

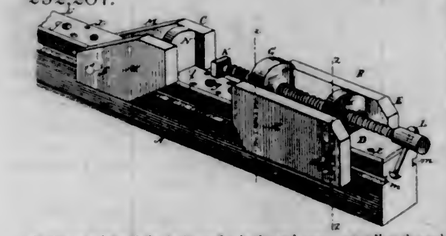
292,206. WIRE-BARBING MACHINE. JAMES H. COON, Des Moines, Iowa. Filed Aug. 24, 1883. (No model.)

Brief.—The main wire is pulled continuously through the machine by a sprocket-wheel. The barb-wire is fed across the main wire and between a head and a barb-former, which together move forward. During the forward movement the head rotates and winds the reel end of the barb-wire around the main wire in one direction, and while so doing overtakes the barb-former, which at the same time is winding the free end of the barb-wire around the main wire in the opposite direction. The wound portion of the barb-wire is then severed from the reel portion by cutters—one mounted on and advancing with the head, the other rotating with the winder, but not moving longitudinally. Then another barbless wire is intertwisted with the barbed wire and spooled in any known way.

Claim.—1. In a wire-barbing machine, two fliers rotating in opposite directions, with means for supporting and advancing the main wire continuously, and means for supporting the barb-wire, in combination with reciprocating mechanism for applying barbs, substantially as described.

2. In a wire-barbing machine, the flier *b*, reciprocating dogs *v* and *v'*, curved guide *d*, and reciprocating head *m*, in combination with the rotating and reciprocating tube *n* and barb-former n^4, substantially as and for the purpose set forth.

3. In a wire-barbing machine, the rotating and reciprocating head *m* and cutter *r*, in combination with the continuously-rotating cutter r^2, substantially as and for the purpose set forth.

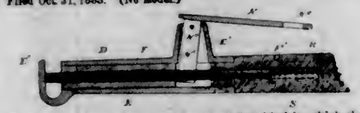


4. In a wire-barbing machine, the rotating and reciprocating head *m* and cutter *r*, in combination with the rotating and reciprocating barb-former n^4 and the continuously-rotating cutter r^2, substantially as and for the purpose set forth.

5. In a wire-barbing machine, mechanism for rotating the barb-wire around the main fence-wire in one direction, in combination with mechanism for simultaneously coiling the free end of the barb-wire around the main fence-wire in the opposite direction, substantially as described.

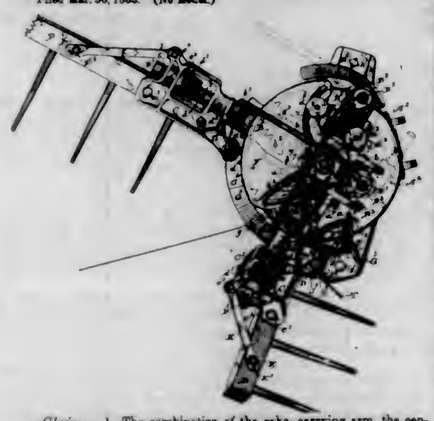
292,207. CLAMP. PHILIP F. CORBETT, Boston, Mass. Filed Apr. 6, 1883. (No model.)

Claim.—1. In a clamping-vise, a head-stock composed of downwardly-projecting cheeks or side pieces provided with inwardly-projecting studs that slide in side grooves of the body, the uprights G and H, connecting the side pieces, a pin or dog adapted to enter a series of holes



292,207.

in the top plate of the body, and a horizontal screw extending through and engaging both uprights, in combination with the body provided with a longitudinal groove on each side, and with a tail-stock, substantially as described.



2. In a clamping-vise, a tail-stock composed of downwardly-projecting cheeks or side pieces provided with inwardly-projecting studs that slide in side grooves of the body, the cross-bar N, between the cheeks, and a pin adapted to enter a series of holes in the top plate of the body, in combination with the body provided with a longitudinal groove on each side, and a head-stock provided with uprights G and H, and a screw which engages both of said uprights, substantially as described.

292,208. HORSE-DETACHER. CHAUNCY L. CROWELL, Peoria, Ill. Filed Oct. 31, 1883. (No model.)

Claim.—In a horse-detaching device of that kind in which there is a cylindrical opening, F', ferrule E, having hook E', and a rod, F, at each end of the single-tree thereof, as shown, the combination, with such a single-tree, ferrule, and hook, of hollow boss E^2, formed as a part of said ferrule, the angle-iron N N', pivoted to and in the same, and the rod F, having a slot therein, as and for the purpose set forth.

292,209. HARVESTER. GEORGE G. CROWLEY, Little Falls, N. Y. Filed Mar. 30, 1883. (No model.)

Claim.—1. The combination of the rake-carrying arm, the centrally-open oscillating bracket having the bearing-perforations at its opposite ends, the rod of the rake-carrying arm about which the bracket oscillates, the conical coiled spring having connection at one end with the rod and bearing against the bracket at its opposite end, and the conical hub of the bracket projecting into said spring, substantially as and for the purpose hereinbefore set forth.

2. The combination of the rake-post head, and the front section of the cam provided with the feet by which it is connected with the rake-post head, and recessed between its feet, substantially as and for the purpose hereinbefore set forth.

3. The combination of the rake-post head, the forwardly-extending arm thereof, the front section of the cam, its foot secured to said arm, and its foot underlapping the rake-post head and secured thereto, substantially as and for the purpose hereinbefore set forth.

4. The combination of the rake-post head, its rearwardly-projecting arm, the steeply-inclined rear cam-section secured thereto, the front cam-section, and the switch pivoted to it, as and for the purpose described.

5. The combination of the inside cam-section, the steeply-inclined rear cam-section, the front cam-section with its wedge-like rail, the rake-carrying arms linked in pairs, and the rotary rake-carrier, substantially as and for the purpose hereinbefore set forth.

6. The combination, substantially as hereinbefore set forth, of the rake-post, the inside cam-section, the front cam-section, the switch, the side cam-section, and the rear cam-section having the space between it and the side section, for the purpose described.

7. The combination, substantially as hereinbefore set forth, of the rake-post, the rotary rake-carrier, the rake-carrying arms, the spring-actuated oscillating brackets, their inwardly-inclined roller-carrying arms, the rake-arms linked in pairs and to which the brackets are secured, the inside cam-section, the front cam-section having the cam-track and wedge-like cam-rail, the switch, means for locking and releasing it, the side cam-section, and the rear cam-section having a space between it and the side section, for the purpose described.

8. The combination of the cam-casting or front section having the recess, and the rake-controlling mechanism secured in said recess, substantially as hereinbefore set forth.

9. The combination of the cam-switch, mechanism connected therewith for automatically controlling the rakes, the supporting and protecting casing, and the removable face-plate of the casing, substantially as hereinbefore set forth.

10. The combination, substantially as hereinbefore set forth, of the series of rake-arms acting either simply to reel or both to reel and rake, the movable cam-switch actuated by the non-raking arms, the tripping-lever for dogging and releasing the switch, automatically-operating adjustable rake-controlling mechanism actuating the tripping-lever, mechanism connected with and actuated by the movements of the switch for operating the controlling mechanism to adjust the tripping-lever to its dogging position, and mechanism connected with the controlling mechanism and actuated by the raking-arms for resetting the controlling mechanism at each raking action.

11. The combination, substantially as hereinbefore set forth, of the series of rake-arms acting either simply to reel or both to reel and rake, the cam-switch to which movement is imparted by the non-raking arms, the tripping-lever for dogging and releasing the switch, automatically-operating rake-controlling mechanism actuating the tripping-lever, mechanism connected with and actuated by the movements of the switch for operating the controlling mechanism to adjust the tripping-lever to its dogging position, mechanism connected with the controlling mechanism and actuated by the raking-arms for resetting the controlling mechanism at each raking action, and means by which to hasten or retard the raking action by throwing in a rake out of turn.

12. The combination, substantially as hereinbefore set forth, of the combined rake and reel arms, their oscillating brackets, the bracket-rollers, the cam-switch moved by the passage of said rollers when the rake-arms act merely to reel, the tripping-lever, automatically-operating rake-controlling mechanism actuating the tripping-lever, mechanism connected with and actuated by the movements of the switch for operating the controlling mechanism to adjust the tripping-lever for locking the switch and causing the raking action of the rake-arms by the travel of their bracket-rollers beneath the switch, mechanism connected with the controlling mechanism and actuated by the bracket-rollers of the raking-arms for resetting the controlling mechanism at each raking action, and the rod for actuating the tripping-lever by either thrusting or pulling strains to hasten or retard the raking action.

13. The combination, substantially as hereinbefore set forth, of the cam-switch, the tripping-lever, the ratchet of the rake-controlling mechanism, the ratchet-spring, means by which to limit the movement imparted to the ratchet by the action of its spring, means for actuating the ratchet by the rake-arms when acting simply to reel, the pivoted arm actuated by the ratchet for lifting the tripping-lever to dog the cam-switch, and means actuated by the rake-arms when raking to release the ratchet for actuation by its spring, for the purpose described.

14. The combination of the cam-switch, the tripping-lever, the ratchet, its spring, the ratchet-actuating pawl, means connected with the switch for operating the pawl, the dog acting on the ratchet, the lug on the outer face of the ratchet, the arm actuated by the lug for lifting the tripping-lever, and tripping mechanism actuated by a raking-arm for freeing the ratchet from the dog and pawl, substantially as and for the purpose hereinbefore set forth.

15. The combination, substantially as hereinbefore set forth, of the spring-connected pinion and ratchet provided with the inner lugs, the rocking dog, the reciprocating pawl, the tripping-lever, the vibrating arm to which the dog is secured, means for actuating said arm at each raking action to trip the dog, and the trip-connection between the dog and pawl, for the purpose described.

16. The combination of the reciprocating pawl-carrying bar, the cam-switch with which it is connected, the pawl, and the ratchet of the rake-controlling mechanism, substantially as and for the purpose hereinbefore set forth.

17. The combination of the ratchet of the rake-controlling mechanism, the rocking dog, the vibrating arm with which the dog is connected, and the trip-lug connected with said arm and actuated at each raking action to cause the dog to release the ratchet, substantially as and for the purpose hereinbefore set forth.

18. The combination of the ratchet, the dog, the pawl, its arm provided with the lug overhanging the dog, the trip-lug actuating at each raking action, and means connecting it with the dog, substantially as and for the purpose hereinbefore set forth.

19. The combination, substantially as hereinbefore set forth, of the recessed ratchet-disk, the pinion, the fixed stud upon which the ratchet and pinion are mounted, the lug on the inner face of the ratchet, the lug on the corresponding face of the pinion, the spring connecting the ratchet and pinion, means for adjusting the ratchet and pinion and for locking the latter in position, with the inner lugs of the ratchet and pinion in contact, the cam-switch, means actuated thereby for turning the ratchet against the pressure of its spring, and by which the ratchet-lug is separated from that of the pinion, the tripping-lever, its pivot, the spring-actuated arm for lifting and yieldingly supporting the lever, and the lug on the ratchet for elevating the arm, for the purpose described.

20. The combination of the tripping-lever, its heel-pivot, the lifting-arm yieldingly supporting the tripping-lever, and means connecting the lever and arm for preventing undue downward movement of the latter, substantially as and for the purpose hereinbefore set forth.

21. The combination of the tripping-lever, the lifting-arm, the spring between the lever and arm, and the lug of the arm overlapping the side rib of the lever, substantially as and for the purpose hereinbefore set forth.

22. The combination of the casing of the rake-controlling mechanism, the reciprocating pawl-carrying bar, the pawl pivoted thereto, the dog, the ratchet, the arm of the pawl provided with the lug overhanging the dog, and means for tripping the dog and pawl to free the ratchet, substantially as and for the purpose hereinbefore set forth.

23. The combination, substantially as hereinbefore set forth, of the cam-switch, the tripping-lever for dogging and releasing the switch, the adjustable rake-controlling mechanism actuating the tripping-lever, means for setting said controlling mechanism, means for indicating its adjustment, mechanism actuated by the rake-arms when simply reeling for operating the controlling mechanism to adjust the tripping-lever to its dogging position, and mechanism actuated by the rake-arms when raking for resetting the controlling mechanism.

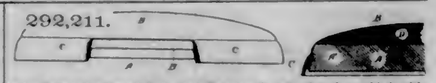
24. The combination of the casing, the rake-controlling mechanism, the tripping-lever actuated thereby, and the adjusting-rack and indicator, substantially as and for the purpose hereinbefore set forth.

25. The combination of the rake-controlling mechanism, the rack-bar engaging the pinion of said mechanism, and provided with the recesses, the guideway for the rack provided with lugs for engagement with the recesses of the rack-bar, and the spring-actuated rod acting upon the rack-bar, substantially as and for the purpose hereinbefore set forth.

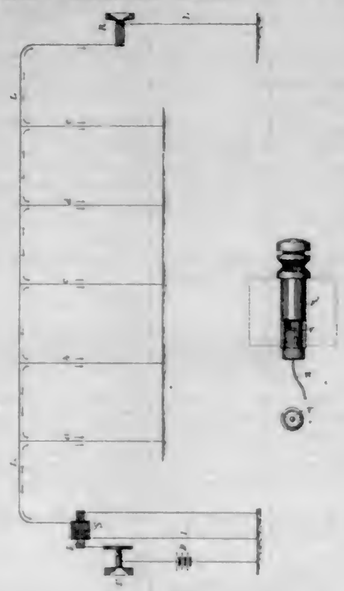
26. The combination of the series of combined rake and reel arms, the cam, the cam-switch, the rake-actuated trip-lug, its rock-shaft, the ratchet of the rake-controlling mechanism, and the ratchet-actuating pawl and dog having connection with said rock-shaft, substantially as and for the purpose hereinbefore set forth.

27. The combination of the rake-post head, the pendent bearing attached thereto, the rock-shaft mounted in said bearing, the trip-lug at one end of the rock-shaft, the crank at the opposite end thereof, the link-rod, the vibrating rod connected by the link-rod with the crank of the rock-shaft, and the dog, substantially as and for the purpose hereinbefore set forth.

28. The combination of the rake-controlling mechanism, the tripping-lever and the setting and indicating rack-bar engaging the pinion of the controlling mechanism for adjusting said mechanism to act upon the tripping-lever either constantly or at intervals, or not to act at all thereon, substantially as and for the purpose hereinbefore set forth.



292,210. SPRING-HINGE. HENRY B. DODGE, East Somerville, MASS. Filed Oct. 6, 1883. (No model.)



Claim.—A hinge composed of the stationary member, which consists of the fastening-plate *a*, having the lugs *a'* and supports a^2 and a^3, and the spring *c*, supported upon the said supports a^2 and a^3, combined with the pivoted member *b*, having the fastening-plate *b'* and plane surfaces 2, 3, and 4, to be acted upon by the spring, whereby the blind, door, or other movable part is held in different positions, substantially as described.

292,211. STOOL-SEAT. JOHN S. DUNLAP, Peoria, Ill. Filed Sept. 29, 1883. (No model.)

Claim.—As a seat for a stool or similar article of furniture, the circular foundation-board A, having its edge chamfered and provided with the groove A', as shown and described, in combination with a covering, B, of fabric or similar material, and the thin metal ring C, contracted in diameter at its upper edge, substantially as and for the purpose specified.

292,212. TELEPHONIC TRANSMISSION. WILLIAM H. ECKERT, New York, N. Y. Filed Dec. 4, 1882. (No model.)

Claim.—1. The combination of a telephonic transmitter, a telephonic receiver, a main line forming that part of a telephonic circuit over which telephonic communication is effected, as distinguished from the return portion of the circuit, and a series of earth-branches distributed along the length of the direct portion of the circuit, substantially as specified.

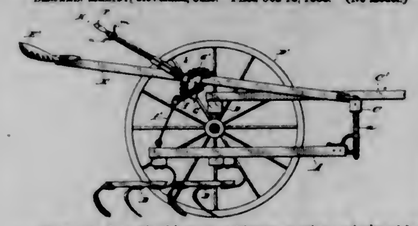
2. The method of preventing inductive effects upon telephonic lines from interfering with the transmission of articulate speech or sound, which consists in establishing an approximately uniform leakage along the line, which shall not be sufficiently great that it will materially weaken, divert, or dissipate the main-line signaling-impulses, substantially as specified.

3. The combination of a telephonic main line, a series of main-line supports insulated from the telegraph-poles, and an occasional support, as specified, electrically connecting the line with a telegraph-pole or its cross-arm, substantially as described.

4. The combination of a telegraph-pole or pole and cross-arm of wood or other partial insulating material, an iron or other conducting pin set directly in the pole or cross-arm, and a main telephonic line supported by said pin without the intervention of insulating material, as specified.

5. The combination of an iron or other conducting pin to which a main line is immediately attached, set in the pole or the cross-arm of the pole of wood or other partial insulating material, and a lightning-arrester connecting said conducting pin or support to earth.

6. The combination of line-wire L, hollow pin F, a pole or pole and cross-arm forming a partial insulator, metal piece V, plug K, and ground-wire W.

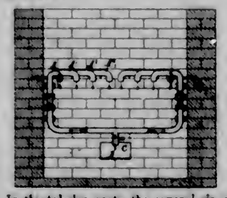


292,213. DUST-PAN. SARAH T. FISHER, Springfield, Ohio. Filed Nov. 13, 1883. (No model.)

Claim.—As an improved article of manufacture, the herein-described dust-pan, consisting of base *a*, top *b*, sides *c*, and lips *f*, the whole adapted to be bent in the form described, and provided with the vertical tube *g*, to receive a handle, as and for the purpose set forth.

292,213.

292,214. WHEEL-HARROW. THEODORE D. GERE, Owego, N. Y., and BENJAMIN MALTBY, Cleveland, Ohio. Filed Oct. 18, 1883. (No model.)



Claim.—1. In a wheel-harrow, cultivator, or other agricultural implement, the combination of a hinged frame provided with plows or teeth, a hinged frame carrying the driver's seat, an axle interposed between the two frames, and mechanism connected with the frame carrying the driver's seat, whereby the plow or other frame can be held above the ground by the seat-frame resting on the axle, or the seat-frame held above the axle by the plow resting on the ground, substantially as set forth.

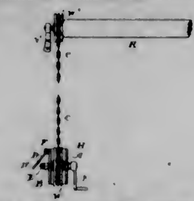
2. In a wheel-harrow, cultivator, or other agricultural implement, the combination of a wheeled frame, a plow, or toothed frame, pivotally secured to the wheeled frame in front of the axle, a frame carrying the driver's seat, pivotally secured to the wheeled frame in front of the axle, and mechanism connecting the seat and plow frames, whereby the weight of the seat-frame and driver can be thrown on the plow-frame, or the weight of the seat-frame and driver be supported by the axle while the plows or diggers are in the ground, substantially as set forth.

3. The combination, with the axle and seat and plow frames, of the shaft, the segment secured to the seat-frame, the segment rigidly secured to the shaft, the lever loosely secured on the shaft between the segments and provided with spring-actuated catches, and the links *f'*, connecting the shaft and plow-frame, substantially as set forth.

292,215. GRATE. DANIEL MCBRIDE GRAHAM, Chicago, Ill. Filed May 1, 1883. (No model.)

Claim.—1. In the tubular grate, the several air-conducting bars thereof, formed or constructed at their upper ends to discharge air downward into the grate, and having the ends of each of such bars arranged to extend inward a distance greater than those of the bar next in advance.

2. A grate having tubular bars bent or constructed at their upper ends, so as to discharge air downward into it, (the said grate,) and each provided with an air-induct at its middle or lower part.



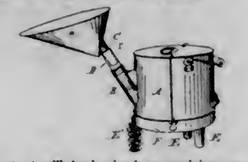
3. A grate having tubular side and bottom bars, A A', &c., constructed or bent at their upper ends, so as to discharge air downward into it, and also having front bars, B, arranged and combined with the tubular bars, or the front one of the set thereof, substantially as set forth, the said tubular bars being provided with air-inlets, whereby air, when fuel may be in combustion in the grate, may be drawn into the said tubular grate-bars and discharged from them upon the top of such fuel, as set forth.

4. The combination of the air-box C and its register D with the series of tubular grate-bars A A', &c., communicating with said box, and at their upper ends bent downward, or having educts to discharge air into the grate or upon the fuel when therein and on fire, as set forth.

5. The combination of the air-box C and its register D, the series of tubular grate-bars A A', &c., and the series of front grate-bars, B, arranged and adapted substantially as set forth.

292,216. DEVICE FOR RAISING AND LOWERING AWNINGS. JACOB GEMMERICH and EMIL E. LUCAS, Peoria, Ill. Filed June 5, 1883. (No model.)

292,216.

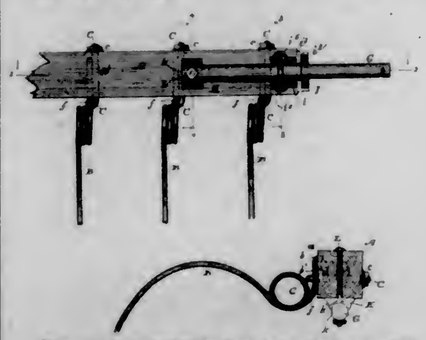


Claim.—1. In a device for raising and lowering awnings, the axle A, having polygonal head B, wheel W, and suitable bearings, in combination with the latch D, having opening D' to fit said head B, and means for preventing said latch from slipping off from said head, substantially as and for the purpose specified.

2. The wheel W and axle A, having head B and eye F, in combination with suitable frame, and the latch D, swiveled thereto and having the opening D', for the purpose set forth.

3. An awning-roller, R, having wheel W', and the axle A, having wheel W, whereby to transmit its motion of rotation to said roller-wheel W, through a suitable chain, in combination with frame or box H, staple F, and the latch D, having opening D', for receiving a polygonal or prismatic head formed at the end of said axle, substantially as and for the purpose herein described.

4. The axle A, having head B, with eye E therein, and the crank-arm K, in combination with the box H, staple F, latch D, having opening D', wheels W W', and chain C, substantially as and for the purpose specified.



292,217. MILK-BUCKET. JOHN F. GUILLOZ and JUDSON D. PERRY, Detroit, Mich. Filed July 31, 1883. (No model.)

Claim.—1. A milk-bucket having a receiving-cup, as *a*, and adapted to be used as a stool, said bucket being provided with two rigid supporting-legs and one or more yielding ones, whereby the cup may be raised or lowered at will, substantially as described.

2. The combination of the milk-bucket A, inlet-pipe B, rubber tube D, strainer C, rigid legs E E, and yielding leg E', substantially as and for the purposes described.

292,218. HORSE HAY-RAKE. WILLIAM H. HALL, Tiffin, Ohio. Filed Aug. 1, 1882. (No model.)

Claim.—1. A rake-tooth of the form shown—that is, having the inwardly-bent upper end or tang to enter a socket in the rear face of the rake-head, the perpendicular shank to lie vertically along said rear face beneath the socket, the coil, and the body part or tine.

2. A rake-tooth formed with a straight shank to lie against the rear face of the rake-head, and with the first bend of its coil elongated to overset the return and succeeding bends.

3. The wooden rake-head having sockets in its rear face near its top, to receive the tang of the tooth, and perforations lower down and to one side of a perpendicular line from the corresponding sockets to receive a hook-bolt, whereby the shank of the tooth is firmly clamped.

4. The wooden rake-head having sockets in its rear face near its top, to receive the bent upper end or tang of the tooth, perpendicular grooves beneath these sockets to receive the shank of the tooth, and perforations to one side of the grooves to receive a hook-bolt, whereby the fastening is rendered complete.

5. The combination of the wooden rake-head having sockets and perforations along its rear face, in the relative arrangement set forth, the rake-tooth having the bent upper end or tang, perpendicular shank and coil, and the hook-bolt, substantially as described.

6. The combination of the rake-head or wooden axle, grooved at its ends, as described, the castings having ribs to take into said grooves, and seats for the body or shank of the stub-axle, the eyebolt fitting over the stub-axle and passing through the end casting and wooden head, and the straight bolt passing through the inner end of the axle, the second casting, and the head.

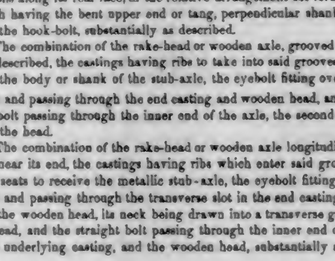
7. The combination of the rake-head or wooden axle longitudinally grooved near its end, the castings having ribs which enter said grooves, and also seats to receive the metallic stub-axle, the eyebolt fitting over said axle and passing through the transverse slot in the end casting and through the wooden head, its neck being drawn into a transverse groove in said head, and the straight bolt passing through the inner end of the axle, the underlying casting, and the wooden head, substantially as described.

8. The end casting having a seat for the reception of the stub-axle, a bore or slot for the passage of a bolt attaching stub-axle and casting to the wooden head, and a sand-band for the protection of the inner end of the wheel-hub.

9. The end casting formed, substantially as described, with a seat for the stub-axle, a rib to take into a longitudinal groove in the wooden head, and a sand-band to cover and protect the inner end of the wheel-hub.

10. The end casting formed, substantially as described, with a seat for the metallic stub-axle, a rib or flange to take into a longitudinal groove in the wooden head, and a shoulder to abut against the end of said head.

11. The end casting formed, substantially as described, with a semi-cylindrical seat for the reception of the metallic stub-axle, a rib or flange to take into a longitudinal groove in the wooden head, a shoulder to abut against the end of said head, a sand-band to cover and protect the inner end of the wheel-hub, and a bore or transverse slot for the reception of a bolt to secure it and the stub-axle to the head.

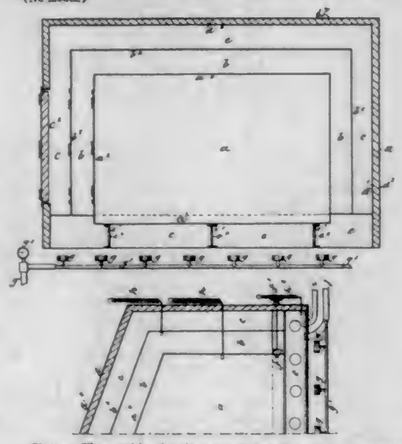


292,219. HARVESTER-TRUCK. ROBERT HAMILTON, Franklin, Ind. Filed Nov. 26, 1883. (No model.)

Claim.—1. A truck consisting of an axle, a pair of wheels on said axle, center-pole *b*, bounds *c c*, draft-pole *e*, and means for adjustably securing said draft-pole to said center-pole, all combined substantially as and for the purpose set forth.

2. In a harvester-truck, the combination, with a harvester, of a truck consisting of an axle, a pair of wheels on said axle, and an adjustable sliding draft-pole secured to said axle and adapted to pass through the grain-wheel of said harvester, for the purpose specified.

292,220. APPARATUS FOR PRODUCING COLORS OR DESIGNS ON SURFACES. GEORGE HAND SMITH, Chelsea, County of Middlesex, England. Filed Aug. 20, 1883. (No model.)

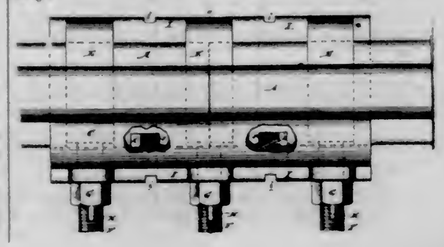


Claim.—1. The combination, in apparatus for use in the process of coloring or producing color or designs in or upon animal, vegetable, or mineral substances, according to the process described, consisting of a removable operating holder or chamber, *a*, for containing the articles treated, provided with valves, a heat-retaining chamber, *b*, with one or more surrounding air cells or chambers, *c*, and packed non-conducting shell or casing *d*, said air-chambers containing liquid for generating vapor, and a water bath, with heating appliances and regulating means thereto, constructed or arranged and operated substantially as described and shown.

2. In combination, a removable holder, *a*, air cells or chambers, and the shell *d*, surrounding said holder, as shown and described, and means for maintaining the desired differential temperature between the article under treatment and the vapor surrounding it, all substantially as set forth.

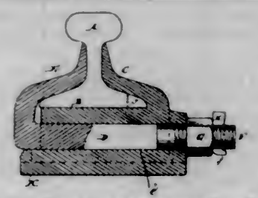
3. In an apparatus for use in the process of coloring or producing color or designs in or upon animal, vegetable, or mineral substances, the combination of two or more inclosing-walls surrounding a removable holder or operating-chamber, provided with a valve composed of a perforated plate, a^2, arranged to be slid and adjusted to any desired position on a correspondingly-perforated bottom of holder *a*, to control the supply of vapor admitted to such holder, all substantially as set forth.

292,221. APPARATUS FOR STAINING AND COLORING. GEORGE HAND SMITH, Chelsea, County of Middlesex, England. Filed Aug. 20, 1883. (No model.)



Claim.—The combination, in apparatus employed in coloring, printing, or producing colors or shades of colors or designs in or upon animal, vegetable, and mineral substances, of an inner operating-chamber, *a*, with doors a^2, liquid-tray a', water bath *e*, with outlet and supply thereto, the surrounding heat-retaining air cells or chambers *b* and *c*, with doors b^2 and c^2, and walls b^3 c^3, water-cock *f*, gas-burners *g*, or their equivalents, and means for regulating heat applied, all substantially as and for the purpose described.

292,222. PRODUCING AND FIXING COLORS AND DESIGNS ON SURFACES. GEORGE HAND SMITH, Chelsea, County of Middlesex, England. Filed Aug. 31, 1883. (No specimens.)



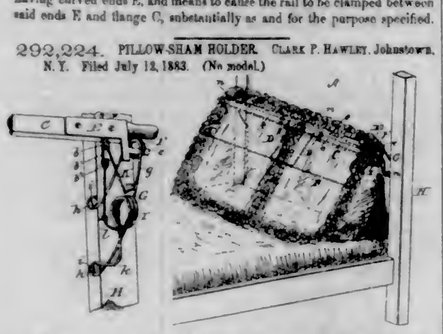
Claim.—The process herein described of treating marble, stone, or other materials to which have been applied colors or color-producing matters with heat in a chamber, so as to raise the temperature of the atmosphere of the chamber to the desired maximum temperature, and then progressively, or by stages with intermissions during which the temperature is sustained at certain points, lowering such temperature, so as to produce and maintain a state of the atmosphere or vapor around the articles treated productive of penetration of such colors, marks, or devices into the solid, substantially as described.

292,223. RAIL-JOINT. CHARLES F. HARTMAN, Keller's Church, Pa. Filed Apr. 26, 1883. (No model.)

Brief.—The rails have slots near their ends to receive lugs on the chair, and the bolts have threaded and curved ends, the latter of which extend up to the head of the rail on the opposite side from the chair-flange.

292,223.

Claim.—1. In a rail-joint, a chair upon which the adjacent ends of two rails rest, provided with a clamping-flange shaped to conform to the rail, as shown, in combination with clamps or clamping-bolts, which are held and guided by said chair, and having their ends curved, to conform also to the shape of the rail, the rail ends being firmly clamped between said flange and clamping-bolts, substantially as shown, and means to prevent said rail ends being drawn out of the chair, substantially as and for the purpose specified.



2. In a rail-joint, a chair upon which the adjacent ends of two rails rest, provided with a clamping-flange and retaining-lugs, in combination with the rails having slots near their ends, and clamping-bolts, the ends of said bolts and flange being shaped to conform to the sides of the rail, as shown, one of said clamping-bolts being arranged over the juncture of the two rail ends, substantially as and for the purpose specified.

3. In a rail-joint, the chair B, provided with lugs J J, flange C, extending up to the head of the rail, and transverse apertures C', in combination with rail ends A, having slots A' near their ends, bolts D, having curved ends E, and nuts G, substantially as and for the purpose specified.
